Sodium ascorbate–pyrogallol solution: Transfer 10 g of sodium ascorbate and 5 g of pyrogallol to a 100-mL volumetric flask, and add sufficient water to dissolve. Add 1.7 mL of sulfuric acid, and dilute with water to volume.

Lecithin solution: 5 mg/mL of lecithin in 2,2,4-trimethylpentane

Mobile phase: *n*-Hexane and ethyl acetate (99.7:0.3)

Standard solution: 15 µg/mL of retinyl acetate from USP Vitamin A RS in 2,2,4-trimethylpentane

System suitability stock solution: 15 µg/mL of retinyl palmitate in 2,2,4-trimethylpentane

System suitability solution: Mix equal volumes of the *System suitability stock solution* and the *Standard solution* to obtain concentrations of 7.5 µg/mL each of retinyl acetate and retinyl palmitate.

Sample solution: [NOTE—This preparation is suitable for the determination of vitamin A, vitamin D, and vitamin E, when present in the formulation.] Weigh NLT 20 Capsules in a tared weighing bottle. Using a sharp blade if necessary, carefully open the Capsules, without loss of shell material, and transfer the contents to a 100-mL beaker. Remove any contents adhering to the empty shells by washing with several portions of ether. Discard the washings, and dry the Capsule shells with the aid of a current of dry air. Weigh the empty Capsule shells in the tared weighing bottle, and calculate the net weight of the Capsule contents. Transfer a portion of the Capsule contents, equivalent to 30 µg of the labeled amount of cholecalciferol or ergocalciferol (vitamin D), to a container with a polytetrafluoroethylene-lined screw cap. If vitamin D is not present in the formulation, use a portion, equivalent to 90 mg of the labeled amount of vitamin E. If vitamin E is not present in the formulation, use a portion, equivalent to 2.5 mg of the labeled amount of vitamin A, as retinol. Add 0.5 g of sodium bicarbonate, 1.5 mL of *Lecithin solution*, and 12.5 mL of 2,2,4-trimethylpentane, and disperse on a vortex mixer. Add 6 mL of *Sodium ascorbate-pyrogallol solution*, shake slowly, and allow the solution to degas. Continue shaking until the evolution of gas has ceased, and then shake for an additional 12 min. Add 6 mL of dimethyl sulfoxide, mix on a vortex mixer to form a suspension, and shake for 12 min. Add 6 mL of 3 *N* methanolic sulfuric acid solution, mix on a vortex mixer to form a suspension, and shake for 12 min. Add 12.5 mL of 2,2,4-trimethylpentane, mix on a vortex mixer to form a suspension, and shake for 10 min. Centrifuge for 10 min to break up the emulsion and to clarify the supernatant. [NOTE—The supernatant is used for the determination of vitamin A, and also vitamin D and vitamin E, if present in the formulation.] If necessary, quantitatively dilute a volume of the supernatant with 2,2,4-trimethylpentane to obtain a concentration close to that of the *Standard solution*.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 325 nm

Column: 4.6-mm × 25-cm; 5-µm packing L24

Flow rate: 1.5 mL/min

Injection size: 40 µL

System suitability

Sample: *System suitability solution*

Suitability requirements

Resolution: NLT 8.0 between all-*trans*-retinyl acetate and all-*trans*-retinyl palmitate

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak area for all-*trans*-retinyl acetate from the *Standard solution* and the peak area of all-*trans*-retinyl acetate or all-*trans*-retinyl palmitate from the *Sample solution*.

Calculate the percentage of the labeled amount of vitamin A, as retinol (C₂₀H₃₀O), in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times F \times 100$$

r_U = peak area of the all-*trans*-retinyl ester from the *Sample solution*

r_S = peak area of the all-*trans*-retinyl ester from the *Standard solution*

C_S = concentration of retinyl acetate (C₂₂H₃₂O₂) from USP Vitamin A RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of vitamin A, as retinol (C₂₀H₃₀O) in the *Sample solution* (µg/mL)

F = factor used to convert retinyl acetate, the ester form present in USP Vitamin A RS, to retinol, 0.872

[NOTE—Account for the initial extraction volume of 26.5 mL of 2,2,4-trimethylpentane to calculate the nominal concentration. The molar responses of retinyl acetate and retinyl palmitate are equivalent.]

Acceptance criteria: 90.0%–165.0% of the labeled amount of vitamin A, as retinol (C₂₀H₃₀O)

• VITAMIN A, Method 3

[NOTE—Where a vitamin A ester (retinyl acetate or retinyl palmitate) is indicated in the following procedure, use the chemical form present in the formulation. USP Vitamin A RS is retinyl acetate. It is to be used where USP Vitamin A RS is specified. Use low-actinic glassware throughout this procedure.]

Extraction solvent: *n*-Hexane and methylene chloride (3:1)

Potassium hydroxide solution: 800 mg/mL of potassium hydroxide in water. [NOTE—Cautiously add the potassium hydroxide to the water. Mix, and cool.]

Diluent: 10 mg/mL of pyrogallol in alcohol

Mobile phase: *n*-Hexane and isopropyl alcohol (92:8)

Standard stock solution: 30 µg/mL of retinyl acetate from USP Vitamin A RS in *Diluent*. [NOTE—This solution may be stored in a refrigerator for 1 week.]

Standard solution: Dilute a volume of *Standard stock solution* with *Diluent* to obtain a concentration of 1 µg/mL of retinyl acetate from USP Vitamin A RS. Transfer 10.0 mL of this solution to a stoppered 125-mL flask, and add 5 mL of water, 5 mL of *Diluent*, and 3 mL of *Potassium hydroxide solution*. Insert the stopper tightly, shake for 15 min over a water bath maintained at 60 ± 5°, and cool to room temperature. Add 7 mL of water and 25.0 mL of *Extraction solvent*. Insert the stopper tightly, and shake vigorously for 60 s. Rinse the sides of the flask with 60 mL of water, and allow to stand for 10 min until the layers separate. Withdraw a portion of the organic layer for injection into the chromatograph. This *Standard solution* contains 0.34 µg/mL of retinol.

Sample solution: Weigh NLT 20 Capsules in a tared weighing bottle. Open the Capsules, without loss of shell material, and transfer the contents to a 100-mL beaker. Remove any contents adhering to the empty shells by washing with several portions of ether. Discard the washings, and dry the Capsule shells with the aid of a current of dry air. Weigh the empty Capsule shells in the tared weighing bottle, and calculate the net weight of the Capsule contents. Transfer a portion of the Capsule contents, equivalent to 1.5 mg of retinyl acetate, to a stoppered 125-mL flask. Add 5 mL of water, 15 mL of *Diluent*, and 3 mL of *Potassium hydroxide solution*. Insert the stopper tightly, shake for 15 min over a water bath maintained at 60 ± 5°, and cool to room temperature. Add 7 mL of water and 25.0 mL of *Extraction solvent*. Insert the stopper tightly, and shake vigorously for 60 s or longer, if necessary, for complete extraction. Rinse the sides of the flask with 60 mL of water, and allow to stand for 10 min until the layers separate. [NOTE—Do not shake, because an emulsion may form.] Withdraw a portion of the organic layer, and dilute quantitatively, and stepwise if necessary, with *Extraction solvent*, to obtain a concentration of 0.34 µg/mL of retinol.

• **CHOLECALCIFEROL OR ERGOCALCIFEROL (VITAMIN D),**

Method 3

[NOTE—Where vitamin D (cholecalciferol or ergocalciferol) is specified in the following procedure, use the chemical form present in the formulation and the relevant USP Reference Standard. Use low-actinic glassware throughout this procedure.]

Diluted acetic acid: Glacial acetic acid solution (1 in 10) in water

Phenolphthalein solution: 10 mg/mL of phenolphthalein in alcohol

Potassium hydroxide solution: Slowly dissolve 14 g of potassium hydroxide in a mixture of 31 mL of dehydrated alcohol and 5 mL of water. Prepare fresh daily.

Extraction solvent: Methylene chloride and isopropyl alcohol (99.8:0.2)

Mobile phase: Acetonitrile and methanol (91:9)

Standard stock solution: 0.2 mg/mL of USP Cholecalciferol RS or USP Ergocalciferol RS in dehydrated alcohol. [NOTE—Prepare fresh every 4 weeks. Store in a freezer.]

Standard solution: [NOTE—Condition the solid-phase extraction column specified for use in the *Standard solution* and the *Sample solution* by initially washing the column with 4.0 mL of a mixture of methylene chloride and isopropyl alcohol (4:1), followed by 5.0 mL of *Extraction solvent*. Do not allow the column to dry.]

Dilute a volume of the *Standard stock solution* with dehydrated alcohol to obtain a concentration of 5 $\mu\text{g/mL}$ of USP Cholecalciferol RS or USP Ergocalciferol RS. Prepare this solution fresh daily. Transfer 2.0 mL of this solution to a stoppered 125-mL flask. Add 15.0 mL of water and 15.0 mL of *Potassium hydroxide solution*, insert the stopper, and shake for 30 min in a water bath maintained at 60°. Allow to cool to room temperature, and transfer the contents of the flask to a 250-mL separatory funnel. Add 15.0 mL of water to the flask, insert the stopper, shake vigorously, and transfer this solution to the separatory funnel. Rinse the flask with 60 mL of *n*-hexane, and transfer the rinsing to the separatory funnel. Insert the stopper, shake vigorously for 90 s, and allow to stand for 15 min until the layers separate. Drain and discard the aqueous layer. Add 15.0 mL of water to the hexane layer in the separatory funnel, insert the stopper, and shake vigorously. Allow to stand for 10 min until the layers separate, and discard the aqueous layer. Add 1 drop of *Phenolphthalein solution* and 15.0 mL of water to the separatory funnel. Add *Diluted acetic acid* dropwise, with shaking, until the washing is neutral. Allow to stand for 10 min until the layers separate. Drain and discard the aqueous layer. Filter the hexane layer through anhydrous sodium sulfate supported by a small pledget of cotton into a 100-mL round-bottom flask. Rinse the funnel and sodium sulfate with a few mL of *n*-hexane, and collect the rinsings in the same flask. Evaporate the hexane in the flask on a rotary evaporator at 50° to dryness. Immediately add 2.0 mL of *Extraction solvent* to dissolve the residue. Transfer this solution to a freshly conditioned solid-phase extraction column containing silica packing with a sorbent mass-to-column volume ratio of 500 mg to 2.8 mL or equivalent, rinse the round-bottom flask with 1.0 mL of *Extraction solvent*, and transfer to the column. Elute the column with 2.0 mL of *Extraction solvent*, and discard this fraction. Elute the column with 7.0 mL of *Extraction*

solvent, and collect the eluate in a suitable flask. Place the flask in a warm water bath maintained at 42°, and evaporate the solvent with the aid of a stream of nitrogen. Immediately add 2.0 mL of acetonitrile to the residue, and use the solution for injection into the chromatograph.

Sample solution: Proceed as directed for the *Sample solution* in *Vitamin A, Method 3*, through “calculate the net weight of the Capsule contents.” Transfer a portion of the Capsule contents, equivalent to 10 μg of ergocalciferol or cholecalciferol, to a stoppered 125-mL flask, and proceed as directed for the *Standard solution*, beginning with “Add 15.0 mL of water and 15.0 mL of *Potassium hydroxide solution*”.

Relative standard deviation: NMT 3.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas. Calculate the percentage of the labeled amount of alpha tocopherol ($C_{29}H_{50}O_2$), alpha tocopheryl acetate ($C_{31}H_{52}O_3$), or alpha tocopheryl acid succinate ($C_{33}H_{54}O_5$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of the relevant vitamin E form from the *Sample solution*

r_S = peak area of the relevant vitamin E form from the *Standard solution*

C_S = concentration of the corresponding USP Reference Standard in the *Standard solution* (mg/mL)

C_U = nominal concentration of the corresponding form of vitamin E in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–165.0% of the labeled amount of vitamin E as alpha tocopherol ($C_{29}H_{50}O_2$), alpha tocopheryl acetate ($C_{31}H_{52}O_3$), or alpha tocopheryl acid succinate ($C_{33}H_{54}O_5$)

• VITAMIN E, Method 2

[NOTE—Where vitamin E (alpha tocopherol, alpha tocopheryl acetate, or alpha tocopheryl acid succinate) is specified in the following procedure, use the chemical form present in the formulation and the relevant USP Reference Standard. Use low-actinic glassware throughout this procedure.]

Mobile phase: Mix 240 mL of methanol with 10 mL of water followed by 0.5 mL of 50% phosphoric acid, and dilute with acetonitrile to 1000 mL.

System suitability solution: 2 mg/mL each of USP Alpha Tocopherol RS, USP Alpha Tocopheryl Acetate RS, and USP Alpha Tocopheryl Acid Succinate RS in methanol

Standard solution: 2 mg/mL of USP Alpha Tocopherol RS, USP Alpha Tocopheryl Acetate RS, or USP Alpha Tocopheryl Acid Succinate RS in methanol

3 N methanolic sulfuric acid solution: Cautiously mix sulfuric acid and methanol (9 in 100) in a 100-mL volumetric flask. [NOTE—Dissolve in a portion of methanol, cool, and then dilute to final volume.]

Sodium ascorbate–pyrogallol solution: Transfer 10 g of sodium ascorbate and 5 g of pyrogallol to a 100-mL volumetric flask. Add sufficient water to dissolve. Add 1.7 mL of sulfuric acid, and dilute with water to volume.

Lecithin solution: 5 mg/mL of lecithin in 2,2,4-trimethylpentane

Sample solution: Proceed as directed for the *Sample solution* in *Vitamin A, Method 2*, through “calculate the net weight of the Capsule contents.” Transfer a portion of the Capsule contents, equivalent to 55 mg of vitamin E, to a container having a polytetrafluoroethylene-lined screw cap. Add 0.5 g of sodium bicarbonate, 1.5 mL of *Lecithin solution*, and 12.5 mL of 2,2,4-trimethylpentane, and disperse on a vortex mixer. Add 6 mL of *Sodium ascorbate–pyrogallol solution*, shake slowly, and allow the solution to degas. Continue shaking until the evolution of gas has ceased, and then shake for an additional 12 min. Add 6 mL of dimethyl sulfoxide, mix on a vortex mixer to form a suspension, and shake for 12 min. Add 6 mL of 3 N *methanolic sulfuric acid solution*, mix on a vortex mixer to form a suspension, and shake for 12 min. Add 12.5 mL of 2,2,4-trimethylpentane, mix on a vortex mixer to form a suspension, and shake for 10 min. Centrifuge for 10 min to break up the emulsion and to clarify the supernatant layer. Transfer a volume of the supernatant 2,2,4-trimethylpentane layer to a suitable volumetric flask, the volume of the specimen withdrawn from the 2,2,4-trimethylpentane layer and the size of the volumetric flask being such that the final concentration of the *Sample solution* is equivalent to that of the *Standard solution*. Evaporate nearly to dryness, add several mL of methanol, and evaporate the remaining 2,2,4-trimethylpentane. Dilute with methanol to volume.

Chromatographic system

[NOTE—The relative retention times for alpha tocopheryl acid succinate, alpha tocopherol, and alpha tocopheryl acetate are about 0.6, 0.8, and 1.0, respectively.]

Suitability requirements

Resolution: NLT 4.0 between alpha tocopheryl acid succinate and alpha tocopherol and NLT 3.0 between alpha tocopherol and alpha tocopheryl acetate, *System suitability solution*

Relative standard deviation: NMT 3.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas. Calculate the percentage of the labeled amount of alpha tocopherol ($C_{29}H_{50}O_2$), alpha tocopheryl acetate ($C_{31}H_{52}O_3$), or alpha tocopheryl acid succinate ($C_{33}H_{54}O_5$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of the relevant vitamin E form from the *Sample solution*

r_S = peak area of the relevant vitamin E form from the *Standard solution*

C_S = concentration of the corresponding USP Reference Standard in the *Standard solution* (mg/mL)

C_U = nominal concentration of the corresponding form of vitamin E in the *Sample solution* (mg/mL)

[NOTE—Account for the initial extraction volume of 26.5 mL of 2,2,4-trimethylpentane and the dilution factor to exchange the solvent from 2,2,4-trimethylpentane to methanol to calculate the nominal concentration.]

Acceptance criteria: 90.0%–165.0% of the labeled amount of vitamin E as alpha tocopherol ($C_{29}H_{50}O_2$), alpha tocopheryl acetate ($C_{31}H_{52}O_3$), or alpha tocopheryl acid succinate ($C_{33}H_{54}O_5$)

• **VITAMIN E, Method 3**

[NOTE—Where vitamin E (alpha tocopherol, alpha tocopheryl acetate, or alpha tocopheryl acid succinate) is specified in the following procedure, use the chemical form present in the formulation and the relevant USP Reference Standard. Use low-actinic glassware throughout this procedure.]

Diluent: Acetonitrile and ethyl acetate (1:1)

Mobile phase: Methanol, acetonitrile, and *n*-hexane (46.5:46.5:7.0)

Standard solution: 0.3 mg/mL of USP Alpha Tocopherol RS in methanol

Sample solution: Proceed as directed for the *Sample solution* in *Vitamin A, Method 3* through “calculate the net weight of the Capsule contents”. Transfer a portion of the Capsule contents, equivalent to 8.0 mg of alpha tocopherol, to a glass-stoppered conical flask. Add 25.0 mL of water, 25.0 mL of dehydrated alcohol, and 3.5 g of potassium hydroxide pellets. Shake for 1 h in a water bath maintained at 55°, cool, and transfer with the aid of a minimum volume of water to a 125-mL separatory funnel. Rinse the flask with 50 mL of *n*-hexane, and add the rinsing to the separatory funnel. Insert the stopper, shake vigorously for 60 s, and allow the layers to separate. Drain the aqueous layer into a second 250-mL separatory funnel, and repeat the extraction with 50 mL of *n*-hexane. Discard the aqueous layer and combine the hexane extracts. Wash the combined extracts with 25 mL of water, allow the layers to separate, and discard the aqueous layer. Add 3 drops of glacial acetic acid, and repeat the washing procedure two more times. Filter the washed hexane layer through anhydrous sodium sulfate into a 250-mL round-bottom flask. Rinse the funnel and sodium sulfate with a few mL of *n*-hexane, and add the rinsing to the hexane solution in the flask. Place the flask in a water bath maintained at 50°, and evaporate the hexane solution with the aid of a rotary evaporator to dryness. Immediately add 25.0 mL of *Diluent*, and swirl to dissolve the residue.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 291 nm

Column: 4.6-mm × 25-cm; packing L1

Column temperature: 40°

Flow rate: 3 mL/min

Injection size: 20 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 5.0%

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of vitamin E as alpha tocopherol ($C_{29}H_{50}O_2$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area for alpha tocopherol from the *Sample solution*

r_S = peak area for alpha tocopherol from the *Standard solution*

C_S = concentration of alpha tocopherol in the *Standard solution* (mg/mL)

C_U = nominal concentration of alpha tocopherol the *Sample solution* (mg/mL)

[NOTE—Calculate the content of alpha tocopheryl acetate ($C_{31}H_{52}O_3$) or alpha tocopheryl acid succinate ($C_{33}H_{54}O_5$) by dividing the content, in mg/Capsule of

vitamin E as alpha tocopherol ($C_{29}H_{50}O_2$), by the factor 0.91 or 0.81, respectively.]

Acceptance criteria: 90.0%–165.0% of the labeled amount of vitamin E as alpha tocopherol ($C_{29}H_{50}O_2$), alpha tocopheryl acetate ($C_{31}H_{52}O_3$) or alpha tocopheryl succinate ($C_{33}H_{54}O_5$)

• **PHYTONADIONE**

[NOTE—Use low-actinic glassware throughout this procedure.]

Mobile phase: Methanol and water (19:1)

Standard stock solution: 200 µg/mL of USP

Phytonadione RS in methanol. Dissolve with the aid of sonication if necessary.

Standard solution: 20 µg/mL of USP Phytonadione RS from the *Standard stock solution* diluted with methanol

System suitability solution: 0.65 mg/mL of USP Alpha Tocopheryl Acetate RS and 20 µg/mL of USP

Phytonadione RS from the *Standard stock solution* diluted with methanol. [NOTE—Dissolve USP Alpha Tocopheryl Acetate RS in a portion of methanol, add the *Standard stock solution*, and then dilute with methanol to volume.]

Sample solution: Proceed as directed for the *Sample solution* in *Vitamin A, Method 1*. Transfer NLT 20 mL of this solution retained as specified in the directions for the *Sample solution* in *Vitamin A, Method 1* to a suitable container, and evaporate, if necessary, in vacuum at room temperature to dryness. Transfer the contents of the flask to a suitable volumetric flask with the aid of methanol, and dilute with methanol to volume to obtain a concentration of 20 µg/mL of phytonadione.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 8-mm × 10-cm; 5-µm packing L1

Flow rate: 2 mL/min

Injection size: 100 µL

System suitability

Samples: *Standard solution* and *System suitability solution*

[NOTE—The relative retention times for alpha tocopheryl acetate and phytonadione are about 0.68 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 5 between alpha tocopheryl acetate and phytonadione, *System suitability solution*

Relative standard deviation: NMT 3.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*
Measure the peak areas. Calculate the percentage of the labeled amount of phytonadione ($C_{31}H_{46}O_2$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of phytonadione from the *Sample solution*

r_S = peak area of phytonadione from the *Standard solution*

C_S = concentration of USP Phytonadione RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of phytonadione in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–165.0% of the labeled amount of phytonadione ($C_{31}H_{46}O_2$)

• **BETA CAROTENE**

[NOTE—Use low-actinic glassware throughout this procedure.]

Potassium hydroxide solution: Dissolve 58.8 g of potassium hydroxide in 50 mL of water.

Iodine solution: Transfer 10 mg of iodine to a 100-mL volumetric flask. Dissolve in cyclohexane, and dilute with cyclohexane to volume. Dilute 10 mL of this

solution with cyclohexane to 100 mL. [NOTE—Prepare this solution fresh daily.]

Sample solution A (for preparations containing beta carotene in oil solutions): Proceed as directed in *Vitamin A, Method 1*, except use cyclohexane instead of *n*-hexane as the extraction solvent, and dilute the filtered extracts with cyclohexane to obtain a concentration of 2 µg/mL of beta carotene.

Sample solution B (for preparations containing beta carotene in dry powder): Remove the contents of NLT 20 Capsules by cutting open the Capsules. Mix, and determine the weight of the contents. Transfer a quantity of the Capsule contents, equivalent to 2 mg of beta carotene, to a 500-mL saponification flask. Add 100 mL of alcohol, 6 mL of *Potassium hydroxide solution*, and a magnetic stirring bar. Attach an air condenser to the flask, and heat under reflux for 45 min with constant stirring. Cool to room temperature. Add 170 mL of solvent hexane, and stir for 30 min. Quantitatively transfer the contents of the flask to a 500-mL separatory funnel with portions of solvent hexane. Allow the layers to separate for 5–10 min, and transfer the upper organic layer to a 500-mL volumetric flask. Transfer the lower aqueous layer into the saponification flask. Add 170 mL of solvent hexane, and stir for an additional 20 min. Quantitatively transfer the contents of the saponification flask to the separatory funnel with the aid of portions of solvent hexane. Allow the layers to separate for 10 min. Drain the lower aqueous layer, and discard. Transfer the organic layer to the volumetric flask containing the previously collected organic layer. Rinse the separatory funnel with small portions of solvent hexane, and transfer the washings to the volumetric flask. Dilute the hexane extracts with solvent hexane to volume. Add 3 g of anhydrous sodium sulfate, shake, and allow to settle. Quantitatively transfer a volume of this solution, equivalent to 100 µg of beta carotene, to a 50-mL volumetric flask. Evaporate under a stream of nitrogen to dryness, and immediately add cyclohexane. Add 2 mL of *Iodine solution*, and heat for 15 min in a water bath maintained at 65°. Cool rapidly, and dilute with cyclohexane to volume.

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Vis

Analytical wavelength: 452 nm

Blank: Cyclohexane

Analysis

Sample: *Sample solution A* or *Sample solution B*

Determine the absorbance against the *Blank*. Calculate the percentage of the labeled amount of beta carotene ($C_{40}H_{56}$) in the portion of Capsules taken:

$$\text{Result} = (A_U/F) \times (100/C_U)$$

A_U = absorbance of *Sample solution A* or *Sample solution B*

F = absorptivity of beta carotene at 452 nm, 223

C_U = nominal concentration of beta carotene in *Sample solution A* or *Sample solution B* (mg/mL)

Acceptance criteria: 90.0%–165.0% of the labeled amount of beta carotene ($C_{40}H_{56}$)

PERFORMANCE TESTS

• DISINTEGRATION AND DISSOLUTION OF DIETARY SUPPLEMENTS

(2040): Meet the requirements

• **WEIGHT VARIATION OF DIETARY SUPPLEMENTS** (2091): Meet the requirements

CONTAMINANTS

• **MICROBIAL ENUMERATION TESTS** (2021): The total aerobic microbial count does not exceed 3000 cfu/g, and the total combined molds and yeasts count does not exceed 300 cfu/g.

• **ABSENCE OF SPECIFIED MICROORGANISMS** (2022): Meet the requirements of the tests for absence of *Salmonella* species, *Escherichia coli*, and *Staphylococcus aureus*.

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.

• **LABELING:**¹ Label the Capsules to state that the product is Oil-Soluble Vitamins Capsules. The label also states the quantity of each vitamin/dosage unit and, where necessary, the chemical form in which it is present. Where the product contains vitamin E, the label also indicates whether it is the *d*- or *dl*- form. Where more than one assay method is given for a particular vitamin, the labeling states the assay method used only if *Method 1* is not used.

Add the following:

▲ Oil-Soluble Vitamins Oral Solution

DEFINITION

Oil-Soluble Vitamins Oral Solution contains two or more of the following oil-soluble vitamins: Vitamin A, as retinol or esters of retinol in the form of retinyl acetate or retinyl palmitate; Vitamin D, as ergocalciferol (Vitamin D₂) or cholecalciferol (Vitamin D₃); Vitamin E, as alpha tocopherol, alpha tocopheryl acetate, or alpha tocopheryl acid succinate; Phytonadione (Vitamin K₁); and beta carotene. It contains NLT 90.0% and NMT 150.0% of the labeled amounts of vitamin A, as retinol equivalent ($C_{20}H_{30}O$); vitamin D, as cholecalciferol ($C_{27}H_{44}O$) or ergocalciferol ($C_{28}H_{44}O$); vitamin E, as alpha tocopherol ($C_{29}H_{50}O_2$), alpha tocopheryl acetate ($C_{31}H_{52}O_3$), or alpha tocopheryl

¹ USP Units of activity for vitamins, where such exist or formerly existed, are equivalent to the corresponding international units, where such formerly existed. The USP Unit for Vitamin E has been discontinued. International units (IU) for vitamins also have been discontinued; however, the use of IU on the labels of vitamin products continues. Where articles are labeled in terms of Units in addition to the required labeling, the relationship of the USP Units or IU to mass is as follows. One USP Vitamin A Unit = 0.3 µg of all-*trans*-retinol (vitamin A alcohol) or 0.344 µg of all-*trans*-retinyl acetate (vitamin A acetate) or 0.55 µg of all-*trans*-retinyl palmitate (vitamin A palmitate), and 1 µg of retinol (3.3 USP Vitamin A Units) = 1 retinol equivalent (RE); 1 IU of beta carotene = 0.6 µg of all-*trans*-beta carotene; 1 USP Vitamin D Unit = 0.025 µg of ergocalciferol or cholecalciferol; and 1 mg of *dl*-alpha tocopherol = 1.1 former USP Vitamin E Units, 1 mg of *dl*-alpha tocopheryl acetate = 1 former USP Vitamin E Unit, 1 mg of *dl*-alpha tocopheryl acid succinate = 0.89 former USP Vitamin E Unit, 1 mg of *d*-alpha tocopherol = 1.49 former USP Vitamin E Units, and 1 mg of *d*-alpha tocopheryl acetate = 1.36 former USP Vitamin E Units, 1 mg of *d*-alpha tocopheryl acid succinate = 1.21 former USP Vitamin E Units. In terms of *d*-alpha tocopherol equivalents, 1 mg of *d*-alpha tocopheryl acetate = 0.91, 1 mg of *d*-alpha tocopheryl acid succinate = 0.81, 1 mg of *dl*-alpha tocopherol = 0.74, 1 mg of *dl*-alpha tocopheryl acetate = 0.67, and 1 mg of *dl*-alpha tocopheryl acid succinate = 0.60.

acid succinate ($C_{33}H_{54}O_5$); phytonadione ($C_{31}H_{46}O_2$); and beta carotene ($C_{40}H_{56}$).

STRENGTH

• VITAMIN A

[NOTE—Use low-actinic glassware throughout this procedure.]

Mobile phase: *n*-Hexane

Standard solution 1: 13 µg/mL of retinol from USP Retinyl Acetate RS in *n*-hexane

Standard solution 2: 13 µg/mL of retinol from USP Retinyl Palmitate RS in *n*-hexane

System suitability solution: Mix equal volumes of *Standard solution 1* and *Standard solution 2*.

Sample solution: Equivalent to 13 µg/mL of retinol from an accurately measured volume of Oral Solution in *n*-hexane

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 325 nm

Column: 4.6-mm × 15-cm; packing L8

Flow rate: 1 mL/min

Injection volume: 40 µL

System suitability

Sample: *System suitability solution*

Suitability requirements

Resolution: NLT 10 between all-*trans*-retinyl acetate and all-*trans*-retinyl palmitate

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution 1* or *Standard solution 2* and *Sample solution*

Calculate the percentage of the labeled amount of vitamin A, as retinol ($C_{20}H_{30}O$), in the portion of Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of the all-*trans*-retinyl ester from the *Sample solution*

r_S = peak area of the all-*trans*-retinyl ester from the appropriate *Standard solution*

C_S = concentration of retinol in the appropriate *Standard solution* (µg/mL)

C_U = nominal concentration of vitamin A, as retinol, in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–150.0% of the labeled amount of vitamin A as retinol equivalent ($C_{20}H_{30}O$)

• VITAMIN D

[NOTE—Where vitamin D (cholecalciferol or ergocalciferol) is specified in the following procedure, use the chemical form present in the formulation and the relevant USP Reference Standard. Use low-actinic glassware throughout this procedure.]

Mobile phase: *n*-Hexane and isopropyl alcohol (99:1)

Standard solution: 2 µg/mL of USP Cholecalciferol RS or USP Ergocalciferol RS in *n*-hexane

System suitability solution: Heat a volume of the *Standard solution* at 60° for 1 h to partially isomerize vitamin D (cholecalciferol or ergocalciferol) to its corresponding precursor.

Sample stock solution: Equivalent to 20 µg/mL of cholecalciferol or ergocalciferol from an accurately measured volume of Oral Solution in *n*-hexane

Sample solution: Transfer 5.0 mL of the *Sample stock solution* to a container having a polytetrafluoroethylene-lined screw cap and heat, with constant shaking, for 1 h in a water bath maintained at 60° to obtain a solution containing vitamin D (cholecalciferol or ergocalciferol) and its corresponding precursor. Cool, and dilute with *n*-hexane to obtain a solution containing 2 µg/mL of cholecalciferol or ergocalciferol.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 265 nm

Column: 4.6-mm × 15-cm; 3-µm packing L8

Flow rate: 1 mL/min

Injection volume: 100 µL

System suitability

Sample: *System suitability solution*

Suitability requirements

Resolution: NLT 10 between the vitamin D form present and its corresponding precursor

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas for vitamin D. Calculate the percentage of the labeled amount of cholecalciferol ($C_{27}H_{44}O$) or ergocalciferol ($C_{28}H_{44}O$) in the portion of Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times F \times 100$$

r_U = peak area of cholecalciferol or ergocalciferol from the *Sample solution*

r_S = peak area of cholecalciferol or ergocalciferol from the *Standard solution*

C_S = concentration of USP Cholecalciferol RS or USP Ergocalciferol RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of cholecalciferol or ergocalciferol in the *Sample solution* (µg/mL)

F = correction factor to account for the average amount of pre-vitamin D present in the *Sample solution*, 1.09

Acceptance criteria: 90.0%–150.0% of the labeled amount of vitamin D as cholecalciferol ($C_{27}H_{44}O$) or ergocalciferol ($C_{28}H_{44}O$)

• VITAMIN E

[NOTE—Where vitamin E (alpha tocopherol, alpha tocopheryl acetate, or alpha tocopheryl acid succinate) is specified in the following procedure, use the chemical form present in the formulation and the relevant USP Reference Standard. Use low-actinic glassware throughout this procedure.]

Solution A: Phosphoric acid solution in water (1 in 100)

Mobile phase: Methanol and *Solution A* (19:1)

Standard solution: 2 mg/mL of USP Alpha Tocopherol RS, USP Alpha Tocopheryl Acetate RS, or USP Alpha Tocopheryl Acid Succinate RS in methanol

Sample solution: Equivalent to 2.0 mg/mL of alpha tocopherol, alpha tocopheryl acetate, or alpha tocopheryl acid succinate from an accurately measured volume of Oral Solution in methanol

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 291 nm

Column: 4.6-mm × 15-cm; 5-µm packing L1

Flow rate: 1 mL/min

Injection volume: 50 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 1.5

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of alpha tocopherol ($C_{29}H_{50}O_2$), alpha tocopheryl acetate ($C_{31}H_{52}O_3$), or alpha tocopheryl acid succinate ($C_{33}H_{54}O_5$) in the portion of Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of the relevant vitamin E form from the *Sample solution*

r_s = peak area of the relevant vitamin E form from the *Standard solution*

C_s = concentration of the corresponding USP Reference Standard in the *Standard solution* (mg/mL)

C_U = nominal concentration of the corresponding form of vitamin E in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–150.0% of the labeled amount of vitamin E

• PHYTONADIONE (VITAMIN K₁)

[NOTE—Use low-actinic glassware throughout this procedure.]

Mobile phase: Methanol and water (19:1)

Standard stock solution: 200 µg/mL of USP

Phytonadione RS in methanol. Dissolve with the aid of sonication if necessary.

Standard solution: 20 µg/mL of USP Phytonadione RS from the *Standard stock solution* diluted with methanol

System suitability solution: 0.65 mg/mL of USP Alpha Tocopheryl Acetate RS and 20 µg/mL of USP

Phytonadione RS from the *Standard stock solution* diluted with methanol. [NOTE—Dissolve USP Alpha Tocopheryl Acetate RS in a portion of methanol, add the *Standard stock solution*, and then dilute with methanol to volume.]

Sample solution: Equivalent to 20 µg/mL of phytonadione from an accurately measured volume of Oral Solution in methanol

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm × 15-cm; 5-µm packing L1

Flow rate: 1 mL/min

Injection volume: 50 µL

System suitability

Samples: *Standard solution* and *System suitability solution*

Suitability requirements

Resolution: NLT 5 between alpha tocopheryl acetate and phytonadione, *System suitability solution*

Relative standard deviation: NMT 3.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of phytonadione (C₃₁H₄₆O₂) in the portion of Oral Solution taken:

$$\text{Result} = (r_U/r_s) \times (C_s/C_U) \times 100$$

r_U = peak area from the *Sample solution*

r_s = peak area from the *Standard solution*

C_s = concentration of USP Phytonadione RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of phytonadione in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–150.0% of the labeled amount of phytonadione (C₃₁H₄₆O₂)

• BETA CAROTENE

[NOTE—Use low-actinic glassware.]

Mobile phase: Transfer 50 mg of butylated hydroxytoluene into a 1-L volumetric flask, and dissolve with 20 mL of 2-propanol. Add 0.2 mL of N-ethyl-diisopropylamine, 25 mL of 0.2% ammonium acetate solution, 455 mL of acetonitrile, and about 450 mL of methanol. Allow the solution to reach room temperature, and dilute with methanol to volume.

Diluent: 50 µg/mL of butylated hydroxytoluene in alcohol

System suitability solution: Transfer 20 mg of USP Beta Carotene System Suitability RS to a 50-mL volumetric flask. Add 1 mL of water, 4 mL of tetrahydrofuran, and sonicate for 5 min. Dilute with *Diluent* to volume and

sonicate for 5 min. Cool to room temperature, pass the suspension through a membrane filter of 0.45-µm pore size, and use the clear filtrate.

Standard stock solution: 60 µg/mL of USP Beta Carotene RS in tetrahydrofuran

Standard solution A: Transfer 5.0 mL of the *Standard stock solution* into a 100-mL volumetric flask, add 5.0 mL of tetrahydrofuran, and dilute with *Diluent* to volume.

Determine the concentration of *Standard solution A* from the concentration of *Standard solution B* as described below.

Standard solution B: Transfer 5.0 mL of the *Standard stock solution* into a 100-mL volumetric flask, and dilute with cyclohexane to volume. Prepare in triplicate.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* <851>.)

Analytical wavelength: 457 nm

Cell path: 1 cm

Blank: Cyclohexane

Analysis

Sample: *Standard solution B*

Calculate the concentration of total beta carotene (mg/mL) as all-*trans*-beta carotene (C₄₀H₅₆) in *Standard solution B*. [NOTE—The concentration of *Standard solution B* equals the concentration of *Standard solution A*.]

$$\text{Result} = A/F$$

A = average absorbance of the three preparations of *Standard solution B*

F = absorptivity of pure all-*trans*-beta carotene in cyclohexane, 250

Sample stock solution: Transfer an accurately measured volume of Oral Solution equivalent to 20 mg of beta carotene to a 250-mL volumetric flask. Add 250 mg of butylated hydroxytoluene, 120 mL of methylene chloride, and 100 mL of alcohol. Shake the flask until the sample is completely dissolved or suspended. Let the mixture stand in the dark until it reaches room temperature (about 2 h). Add methylene chloride to volume, and shake again vigorously.

Sample solution: Dilute a volume of the *Sample stock solution* with a mixture of methylene chloride and *Diluent* (1:1) to obtain the final concentration of beta carotene of 3 µg/mL. Pass through a membrane filter of 0.45-µm pore size.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV-Vis 448 nm

Column: 4.6-mm × 25-cm; 5-µm packing L68

Column temperature: 30°

Flow rate: 0.6 mL/min

Injection volume: 20 µL

System suitability

Samples: *System suitability solution* and *Standard solution A*

[NOTE—The approximate relative retention times of the components in the *System suitability solution* are listed in *Table 1*.]

Table 1

Name	Relative Retention Time	Relative Response Factor
All- <i>trans</i> -alpha carotene	0.93	1.1
All- <i>trans</i> -beta carotene	1.00	1
9- <i>cis</i> -Beta carotene	1.07	1
13- <i>cis</i> -Beta carotene	1.17	1.2
15- <i>cis</i> -Beta carotene	1.21	1.4

Suitability requirements

Chromatogram similarity: The chromatogram from the *System suitability solution* is similar to the reference chromatogram provided with the lot of USP Beta Carotene System Suitability RS being used.

Resolution: NLT 1.5 between beta carotene and alpha carotene and between beta carotene and 9-*cis*-beta carotene, *System suitability solution*

Tailing factor: NMT 2.0 for the beta carotene peak, *Standard solution A*

Relative standard deviation: NMT 2.0% for the beta carotene peak from replicate injections, *Standard solution A*

Analysis

Samples: *Standard solution A* and *Sample solution*
Calculate the percentage of all-*trans*-beta carotene in the portion of Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of all-*trans*-beta carotene from the *Sample solution*

r_S = peak area of all-*trans*-beta carotene from *Standard solution A*

C_S = concentration of all-*trans*-beta carotene in *Standard solution A* as determined by the spectrometric procedure

C_U = nominal concentration of beta carotene in the *Sample solution*

Acceptance criteria: 90.0%–150.0% of the labeled amount of beta carotene ($C_{40}H_{56}$)

OTHER COMPONENTS

- **ALCOHOL DETERMINATION, Method I <611>** (if present): 90.0%–120.0% of the labeled amount of C_2H_5OH

CONTAMINANTS

- **MICROBIAL ENUMERATION TESTS <2021>**: The total aerobic microbial count does not exceed 3×10^3 cfu/mL, and the combined molds and yeasts count does not exceed 3×10^2 cfu/mL.
- **ABSENCE OF SPECIFIED MICROORGANISMS <2022>**: Meets the requirements of the tests for absence of *Salmonella* species, and *Escherichia coli*

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, under an inert gas or with a minimum of headspace.
- **LABELING:**¹ The label states that the product is Oil-Soluble Vitamins Oral Solution. The label states the quantity of each vitamin present in a given volume of Oral Solution and, where necessary, the chemical form in which a vitamin is present. Where the product contains vitamin E, the label indicates whether it is the *d*- or *dl*- form.

¹ USP Units of activity for vitamins, where such exist or formerly existed, are equivalent to the corresponding international units, where such formerly existed. The USP Unit for Vitamin E has been discontinued. International units (IU) for vitamins also have been discontinued; however, the use of IU on the labels of vitamin products continues. Where articles are labeled in terms of Units in addition to the required labeling, the relationship of the USP Units or IU to mass is as follows. One USP Vitamin A Unit = 0.3 µg of all-*trans*-retinol (vitamin A alcohol) or 0.344 µg of all-*trans*-retinyl acetate (vitamin A acetate) or 0.55 µg of all-*trans*-retinyl palmitate (vitamin A palmitate), and 1 µg of retinol (3.3 USP Vitamin A Units) = 1 retinol equivalent (RE); 1 IU of beta carotene = 0.6 µg of all-*trans*-beta carotene; 1 USP Vitamin D Unit = 0.025 µg of ergocalciferol or cholecalciferol; and 1 mg of *d*-alpha tocopherol = 1.1 former USP Vitamin E Units, 1 mg of *d*-alpha tocopheryl acetate = 1 former USP Vitamin E Unit, 1 mg of *d*-alpha tocopheryl acid succinate = 0.89 former USP Vitamin E Unit, 1 mg of *d*-alpha tocopherol = 1.49 former USP Vitamin E Units, 1 mg of *d*-alpha tocopheryl acetate = 1.36 former USP Vitamin E Units, and 1 mg of *d*-alpha tocopheryl acid succinate = 1.21 former USP Vitamin E Units. In terms of *d*-alpha tocopherol equivalents, 1 mg of *d*-alpha tocopheryl acetate = 0.91, 1 mg of *d*-alpha tocopheryl acid succinate = 0.81, 1 mg of *d*-alpha tocopherol = 0.74, 1 mg of *dl*-alpha tocopheryl acetate = 0.67, and 1 mg of *dl*-alpha tocopheryl acid succinate = 0.60.

USP Retinyl Palmitate RS▲^{USP36}

Oil-Soluble Vitamins Tablets**DEFINITION**

Oil-Soluble Vitamins Tablets contain two or more of the following oil-soluble vitamins: Vitamin A, Vitamin D as Ergocalciferol (Vitamin D₂) or Cholecalciferol (Vitamin D₃), Vitamin E, Phytonadione (Vitamin K₁), and Beta Carotene. Tablets contain NLT 90.0% and NMT 165.0% of the labeled amounts of vitamin A ($C_{20}H_{30}O$) as retinol or esters of retinol in the form of retinyl acetate ($C_{22}H_{32}O_2$) or retinyl palmitate ($C_{36}H_{46}O_2$); vitamin D as cholecalciferol ($C_{27}H_{44}O$) or ergocalciferol ($C_{28}H_{44}O$); vitamin E as alpha tocopherol ($C_{29}H_{50}O_2$), alpha tocopheryl acetate ($C_{31}H_{52}O_3$), or alpha tocopheryl acid succinate ($C_{33}H_{54}O_5$); phytonadione ($C_{31}H_{46}O_2$); and beta carotene ($C_{40}H_{56}$).

Oil-Soluble Vitamins Tablets contain no other vitamins or any minerals. They may contain other labeled added substances that are generally recognized as safe, in amounts that are unobjectionable.

STRENGTH

[NOTE—In the following assays, where more than one assay method is given for an individual ingredient, the requirements may be met by following any one of the specified methods, the method used being stated in the labeling only if Method 1 is not used.]

• VITAMIN A, Method 1

[NOTE—Where the use of a vitamin A ester (retinyl acetate or retinyl palmitate) is specified in the following procedure, use the chemical form present in the formulation. USP Vitamin A RS is retinyl acetate. It is to be used where USP Vitamin A RS is specified. Use low-actinic glassware throughout this procedure.]

Mobile phase: *n*-Hexane

Standard solution: 15 µg/mL of retinyl acetate from USP Vitamin A RS in *n*-hexane

System suitability stock solution: 15 µg/mL of retinyl palmitate in *n*-hexane

System suitability solution: Mix equal volumes of *System suitability stock solution* and the *Standard solution* to obtain concentrations of 7.5 µg/mL each of retinyl acetate and retinyl palmitate.

Sample solution: Finely powder NLT 20 Tablets. Transfer a portion of the powder, equivalent to 5 Tablets, to a container having a polytetrafluoroethylene-lined screw cap. Add 10 mL of dimethyl sulfoxide and 15 mL of *n*-hexane, and shake for 45 min on a wrist-action shaker in a water bath maintained at 60°. [NOTE—Set up the wrist-action shaker to ensure that the contents of the container are mixed vigorously and thoroughly.] Centrifuge at 3000 rpm for 10 min, and transfer the hexane layer by means of a pipet to a 100-mL volumetric flask. Add 15 mL of *n*-hexane to the dimethyl sulfoxide layer, shake thoroughly for 5 min, and transfer the hexane layer by means of a pipet to the 100-mL volumetric flask. Repeat this extraction with three additional 15-mL portions of *n*-hexane. Dilute the extracts in the volumetric flask with *n*-hexane to volume. Dilute a 10-mL volume of this solution with *n*-hexane to obtain a solu-

tion with a concentration of 15 µg/mL of vitamin A as retinol (C₂₀H₃₀O).

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 325 nm

Column: 4.6-mm × 15-cm; 3-µm packing L8

Flow rate: 1 mL/min

Injection size: 40 µL

System suitability

Sample: *System suitability solution*

Suitability requirements

Resolution: NLT 10 between all-*trans*-retinyl acetate and all-*trans*-retinyl palmitate

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak area for all-*trans*-retinyl acetate from the *Standard solution* and the peak area for all-*trans*-retinyl acetate or all-*trans*-retinyl palmitate in the chromatogram of the *Sample solution*. For products containing vitamin A acetate or vitamin A palmitate, calculate the percentage of the labeled amount of vitamin A, as retinol (C₂₀H₃₀O) in the portion of the Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times F \times 100$$

r_U = peak area of the all-*trans*-retinyl ester from the *Sample solution*

r_S = peak area of the all-*trans*-retinyl ester from the *Standard solution*

C_S = concentration of retinyl acetate (C₂₂H₃₂O₂) from USP Vitamin A RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of vitamin A, as retinol (C₂₀H₃₀O) in the *Sample solution* (µg/mL)

F = factor used to convert retinyl acetate, the ester form present in USP Vitamin A RS, to retinol, 0.872

[NOTE—The molar responses of retinyl acetate and retinyl palmitate are equivalent.]

Acceptance criteria: 90.0%–165.0% of the labeled amount of vitamin A, as retinol (C₂₀H₃₀O)

• VITAMIN A, Method 2

[NOTE—Where a vitamin A ester (retinyl acetate or retinyl palmitate) is indicated in the following procedure, use the chemical form present in the formulation. USP Vitamin A RS is retinyl acetate. It is to be used where USP Vitamin A RS is specified. Use low-actinic glassware throughout this procedure.]

3 N methanolic sulfuric acid solution: Cautiously add 9 mL of sulfuric acid to 80 mL of methanol in a 100-mL volumetric flask. Cool, and dilute with methanol to volume.

Sodium ascorbate–pyrogallol solution: Transfer 10 g of sodium ascorbate and 5 g of pyrogallol to a 100-mL volumetric flask, and add sufficient water to dissolve. Add 1.7 mL of sulfuric acid, and dilute with water to volume.

Lecithin solution: 5 mg/mL of lecithin in 2,2,4-trimethylpentane

Mobile phase: *n*-Hexane and ethyl acetate (99.7:0.3)

Standard solution: 15 µg/mL of retinyl acetate from USP Vitamin A RS in 2,2,4-trimethylpentane

System suitability stock solution: 15 µg/mL of retinyl palmitate in 2,2,4-trimethylpentane

System suitability solution: Mix equal volumes of the *System suitability stock solution* and the *Standard solution* to obtain concentrations of 7.5 µg/mL each of retinyl acetate and retinyl palmitate.

Sample solution: [NOTE—This preparation is suitable for the determination of vitamin A, vitamin D, and vitamin E, when present in the formulation.] Finely powder NLT 20 Tablets. If vitamin D is present in the formulation,

transfer a portion of the powder, equivalent to 30 µg of the labeled amount of cholecalciferol or ergocalciferol, to a container having a polytetrafluoroethylene-lined screw cap. If vitamin D is not present in the formulation, use a portion of the powder, equivalent to 90 mg of the labeled amount of vitamin E (as alpha tocopherol, alpha tocopheryl acetate, or alpha tocopheryl hemisuccinate). If vitamin E is not present in the formulation, use a portion of the powder, equivalent to 2.5 mg of the labeled amount of retinyl acetate or retinyl palmitate. Add 0.5 g of sodium bicarbonate, 1.5 mL of *Lecithin solution*, and 12.5 mL of 2,2,4-trimethylpentane, and disperse on a vortex mixer. Add 6 mL of *Sodium ascorbate–pyrogallol solution*, shake slowly, and allow the solution to degas. Continue shaking until the evolution of gas has ceased, and then shake for an additional 12 min. Add 6 mL of dimethyl sulfoxide, mix on a vortex mixer to form a suspension, and shake for 12 min. Add 6 mL of 3 N methanolic sulfuric acid solution, mix on a vortex mixer to form a suspension, and shake for 12 min. Add 12.5 mL of 2,2,4-trimethylpentane, mix on a vortex mixer to form a suspension, and shake for 10 min. Centrifuge for 10 min to break up the emulsion and to clarify the supernatant. [NOTE—The supernatant is used for the determination of vitamin A, and also vitamin D and vitamin E, if present in the formulation.] If necessary, quantitatively dilute a volume of the supernatant with 2,2,4-trimethylpentane to obtain a concentration close to that of the *Standard solution*.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 325 nm

Column: 4.6-mm × 25-cm; 5-µm packing L24

Flow rate: 1.5 mL/min

Injection size: 40 µL

System suitability

Sample: *System suitability solution*

Suitability requirements

Resolution: NLT 8.0 between all-*trans*-retinyl acetate and all-*trans*-retinyl palmitate

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak area for all-*trans*-retinyl acetate from the *Standard solution* and the peak area of all-*trans*-retinyl acetate or all-*trans*-retinyl palmitate from the *Sample solution*.

Calculate the percentage of the labeled amount of vitamin A, as retinol (C₂₀H₃₀O), in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times F \times 100$$

r_U = peak area of the all-*trans*-retinyl ester from the *Sample solution*

r_S = peak area of the all-*trans*-retinyl ester from the *Standard solution*

C_S = concentration of retinyl acetate (C₂₂H₃₂O₂) from USP Vitamin A RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of vitamin A, as retinol (C₂₀H₃₀O) in the *Sample solution* (µg/mL)

F = factor used to convert retinyl acetate, the ester form present in the USP Vitamin A RS, to retinol, 0.872

[NOTE—Account for the initial extraction volume of 26.5 mL of 2,2,4-trimethylpentane to calculate the nominal concentration. The molar responses of retinyl acetate and retinyl palmitate are equivalent.]

Acceptance criteria: 90.0%–165.0% of the labeled amount of vitamin A, as retinol (C₂₀H₃₀O)

• VITAMIN A, Method 3

[NOTE—Where a vitamin A ester (retinyl acetate or retinyl palmitate) is indicated in the following procedure, use

the chemical form present in the formulation. USP Vitamin A RS is retinyl acetate. It is to be used where USP Vitamin A RS is specified. Use low-actinic glassware throughout this procedure.]

Extraction solvent: *n*-Hexane and methylene chloride (3:1)

Potassium hydroxide solution: 800 mg/mL of potassium hydroxide in water. [NOTE—Cautiously add potassium hydroxide in water. Mix, and cool.]

Diluent: 10 mg/mL of pyrogallol in alcohol

Mobile phase: *n*-Hexane and isopropyl alcohol (92:8)

Standard stock solution: 30 µg/mL of retinyl acetate from USP Vitamin A RS in *Diluent*. [NOTE—This solution may be stored in a refrigerator for 1 week.]

Standard solution: Dilute a volume of *Standard stock solution* with *Diluent* to obtain a concentration of 1 µg/mL of USP Vitamin A RS. Transfer 10.0 mL of this solution to a stoppered 125-mL flask, and add 5 mL of water, 5 mL of *Diluent*, and 3 mL of *Potassium hydroxide solution*. Insert the stopper tightly, shake for 15 min over a water bath maintained at 60 ± 5°, and cool to room temperature. Add 7 mL of water and 25.0 mL of *Extraction solvent*. Insert the stopper tightly, and shake vigorously for 60 s. Rinse the sides of the flask with 60 mL of water, and allow to stand for 10 min until the layers separate. Withdraw a portion of the organic layer for injection into the chromatograph. This *Standard solution* contains 0.34 µg/mL of retinol.

Sample solution: Finely powder a counted number of Tablets. Transfer a portion of the powder, equivalent to 1.5 mg of retinyl acetate, to a stoppered 125-mL flask. Add 5 mL of water, 15 mL of *Diluent*, and 3 mL of *Potassium hydroxide solution*. Insert the stopper tightly, shake for 15 min over a water bath maintained at 60 ± 5°, and cool to room temperature. Add 7 mL of water and 25.0 mL of *Extraction solvent*. Insert the stopper tightly, and shake vigorously for 60 s or longer, if necessary, for complete extraction. Rinse the sides of the flask with 60 mL of water, and allow to stand for 10 min until the layers separate. [NOTE—Do not shake, because an emulsion may form.] Withdraw a portion of the organic layer, and dilute with *Extraction solvent* to obtain a concentration of 0.34 µg/mL of retinol.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*).

Mode: LC

Detector: UV 335 nm

Column: 6.2-mm × 8-cm; packing L3

Column temperature: 40°

Flow rate: 4 mL/min

Injection size: 50 µL

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for 13-*cis*-retinol and all-*trans*-retinol are 0.92 and 1.0, respectively.]

Suitability requirements

Relative standard deviation: NMT 5.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas for all-*trans*-retinol and 13-*cis*-retinol. Calculate the percentage of the labeled amount of vitamin A, as retinol (C₂₀H₃₀O), in the portion of Tablets taken:

$$\text{Result} = (r_{T1}/r_{T2}) \times (C_S/C_U) \times F \times 100$$

r_{T1} = sum of the areas of the all-*trans*-retinol and 13-*cis*-retinol peaks from the *Sample solution*

r_{T2} = sum of the areas of the all-*trans*-retinol and 13-*cis*-retinol peaks from the *Standard solution*

C_S = concentration of retinyl acetate (C₂₃H₃₂O₂) from USP Vitamin A RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of vitamin A, as retinol (C₂₀H₃₀O) in the *Sample solution* (µg/mL)

F = factor used to convert retinyl acetate, the ester form present in USP Vitamin A RS, to retinol, 0.872

Acceptance criteria: 90.0%–165.0% of the labeled amount of vitamin A, as retinol (C₂₀H₃₀O)

• CHOLECALCIFEROL OR ERGOCALCIFEROL (VITAMIN D),

Method 1

[NOTE—Where vitamin D (cholecalciferol or ergocalciferol) is specified in the following procedure, use the chemical form present in the formulation and the relevant USP Reference Standard. Use low-actinic glassware throughout this procedure.]

Mobile phase: *n*-Hexane and isopropyl alcohol (99:1)

Standard solution: 2 µg/mL of USP Cholecalciferol RS or USP Ergocalciferol RS in *n*-hexane

System suitability solution: Heat a volume of the *Standard solution* at 60° for 1 h to partially isomerize vitamin D (cholecalciferol or ergocalciferol) to its corresponding precursor.

Sample solution: Proceed as directed for the *Sample solution* in *Vitamin A, Method 1*. Transfer NLT 20 mL of this solution to a suitable container, and evaporate, if necessary, in vacuum at room temperature to obtain a concentration of 2 µg/mL of cholecalciferol or ergocalciferol.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*).

Mode: LC

Detector: UV 265 nm

Column: 4.6-mm × 15-cm; 3-µm packing L8

Flow rate: 1 mL/min

Injection size: 100 µL

System suitability

Sample: *Standard solution* and *System suitability solution*

Suitability requirements

Resolution: NLT 10 between the vitamin D form present and its corresponding precursor, *System suitability solution*

Relative standard deviation: NMT 3.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas for vitamin D. Calculate the percentage of the labeled amount of cholecalciferol (C₂₇H₄₄O) or ergocalciferol (C₂₈H₄₄O) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times F \times 100$$

r_U = peak area of cholecalciferol or ergocalciferol from the *Sample solution*

r_S = peak area of cholecalciferol or ergocalciferol from the *Standard solution*

C_S = concentration of USP Cholecalciferol RS or USP Ergocalciferol RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of cholecalciferol or ergocalciferol in the *Sample solution* (µg/mL)

F = correction factor to account for the average amount of previtamin D present in the *Sample solution*, 1.09

Acceptance criteria: 90.0%–165.0% of the labeled amount of vitamin D as cholecalciferol (C₂₇H₄₄O) or ergocalciferol (C₂₈H₄₄O)

• CHOLECALCIFEROL OR ERGOCALCIFEROL (VITAMIN D),

Method 2

[NOTE—Where vitamin D (cholecalciferol or ergocalciferol) is specified in the following procedure, use the chemical form present in the formulation and the relevant USP Reference Standard. Use low-actinic glassware throughout this procedure.]

3 N methanolic sulfuric acid solution, Sodium ascorbate–pyrogallol solution, Lecithin solution, and Sample solution: Proceed as directed in *Vitamin A, Method 2*.

Mobile phase: *n*-Hexane and tertiary butyl alcohol (98.75:1.25)

Standard solution: 1 µg/mL of USP Cholecalciferol RS or USP Ergocalciferol RS in 2,2,4-trimethylpentane

System suitability solution: Heat a volume of the *Standard solution* at 60° for 1 h to partially isomerize vitamin D (cholecalciferol or ergocalciferol) to its corresponding precursor.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 265 nm

Column: 4.6-mm × 25-cm; 5-µm packing L24

Flow rate: 1 mL/min

Injection size: 40 µL

System suitability

Sample: *Standard solution* and *System suitability solution*

Suitability requirements

Resolution: NLT 4.0 between the vitamin D form present and its corresponding precursor, *System suitability solution*

Relative standard deviation: NMT 3.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas for vitamin D. Calculate the percentage of the labeled amount of cholecalciferol (C₂₇H₄₄O) or ergocalciferol (C₂₈H₄₄O) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of cholecalciferol or ergocalciferol from the *Sample solution*

r_S = peak area of cholecalciferol or ergocalciferol from the *Standard solution*

C_S = concentration of USP Cholecalciferol RS or USP Ergocalciferol RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of cholecalciferol or ergocalciferol in the *Sample solution* (µg/mL)

[NOTE—Account for the initial extraction volume of 26.5 mL of 2,2,4-trimethylpentane to calculate the nominal concentration.]

Acceptance criteria: 90.0%–165.0% of the labeled amount of vitamin D as cholecalciferol (C₂₇H₄₄O) or ergocalciferol (C₂₈H₄₄O)

• CHOLECALCIFEROL OR ERGOCALCIFEROL (VITAMIN D), Method 3

[NOTE—Where vitamin D (cholecalciferol or ergocalciferol) is specified in the following procedure, use the chemical form present in the formulation and the relevant USP Reference Standard. Use low-actinic glassware throughout this procedure.]

Diluted acetic acid: Glacial acetic acid solution (1 in 10) in water

Phenolphthalein solution: 10 mg/mL of phenolphthalein in alcohol

Potassium hydroxide solution: Slowly dissolve 14 g of potassium hydroxide in a mixture of 31 mL of dehydrated alcohol and 5 mL of water. Prepare fresh daily.

Extraction solvent: Methylene chloride and isopropyl alcohol (99.8:0.2)

Mobile phase: Acetonitrile and methanol (91:9)

Standard stock solution: 0.2 mg/mL of USP Cholecalciferol RS or USP Ergocalciferol RS in dehydrated alcohol. [NOTE—Prepare fresh every 4 weeks. Store in a freezer.]

Standard solution: [NOTE—Condition the solid-phase extraction column specified for use in the *Standard solution* and the *Sample solution* by initially washing the column with 4.0 mL of a mixture of methylene chloride and isopropyl alcohol (4:1), followed by 5.0 mL of *Extraction solvent*. Do not allow the column to dry.]

Dilute a volume of *Standard stock solution* with dehydrated alcohol to obtain a concentration of 5 µg/mL of USP Cholecalciferol RS or USP Ergocalciferol RS. Prepare this solution fresh daily. Transfer 2.0 mL of this solution to a stoppered 125-mL flask. Add 15.0 mL of water and 15.0 mL of *Potassium hydroxide solution*, insert the stopper, and shake for 30 min in a water bath maintained at 60°. Allow to cool to room temperature, and transfer the contents of the flask to a 250-mL separatory funnel. Add 15.0 mL of water to the flask, insert the stopper, shake vigorously, and transfer this solution to the separatory funnel. Rinse the flask with 60 mL of *n*-hexane, and transfer the rinsing to the separatory funnel. Insert the stopper, shake vigorously for 90 s, and allow to stand for 15 min until the layers separate. Drain and discard the aqueous layer. Add 15.0 mL of water to the hexane layer in the separatory funnel, insert the stopper, and shake vigorously. Allow to stand for 10 min until the layers separate, and discard the aqueous layer. Add 1 drop of *Phenolphthalein solution* and 15.0 mL of water to the separatory funnel. Add *Diluted acetic acid* dropwise, with shaking, until the washing is neutral. Allow to stand for 10 min until the layers separate. Drain and discard the aqueous layer. Filter the hexane layer through anhydrous sodium sulfate supported by a small pledget of cotton into a 100-mL, round-bottom flask. Rinse the funnel and sodium sulfate with a few mL of *n*-hexane, and collect the rinsings in the same flask. Evaporate the hexane in the flask on a rotary evaporator at 50° to dryness. Immediately add 2.0 mL of *Extraction solvent* to dissolve the residue. Transfer this solution to a freshly conditioned solid-phase extraction column containing silica packing with a sorbent mass-to-column volume ratio of 500 mg to 2.8 mL or equivalent, rinse the round-bottom flask with 1.0 mL of *Extraction solvent*, and transfer to the column. Elute the column with 2.0 mL of *Extraction solvent*, and discard this fraction. Elute the column with 7.0 mL of *Extraction solvent*, and collect the eluate in a suitable flask. Place the flask in a warm water bath maintained at 42°, and evaporate the solvent with the aid of a stream of nitrogen. Immediately add 2.0 mL of acetonitrile to the residue, and use the solution for injection into the chromatograph.

Sample solution: Finely powder NLT 20 Tablets.

Transfer a portion of the powder, equivalent to 10 µg of cholecalciferol or ergocalciferol, to the stoppered 125-mL flask, and proceed as directed for the *Standard solution*, beginning with "Add 15.0 mL of water and 15.0 mL of *Potassium hydroxide solution*".

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 265 nm

Column: 4.6-mm × 25-cm; 5-µm packing L1

Column temperature: 27°

Flow rate: 0.7 mL/min

Injection size: 15 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 4.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas for vitamin D. Calculate the percentage of the labeled amount of cholecalciferol

(C₂₇H₄₄O) or ergocalciferol (C₂₈H₄₄O) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- r_U = peak area of cholecalciferol or ergocalciferol from the *Sample solution*
 r_S = peak area of cholecalciferol or ergocalciferol from the *Standard solution*
 C_S = concentration of USP Cholecalciferol RS or USP Ergocalciferol RS in the *Standard solution* (μg/mL)
 C_U = nominal concentration of cholecalciferol or ergocalciferol in the *Sample solution* (μg/mL)

Acceptance criteria: 90.0%–165.0% of the labeled amount of vitamin D as cholecalciferol (C₂₇H₄₄O) or ergocalciferol (C₂₈H₄₄O)

• VITAMIN E, Method 1

[NOTE—Where vitamin E (alpha tocopherol, alpha tocopheryl acetate, or alpha tocopheryl acid succinate) is specified in the following procedure, use the chemical form present in the formulation and the relevant USP Reference Standard. Use low-actinic glassware throughout this procedure.]

Solution A: Phosphoric acid solution (1 in 100) in water

Mobile phase: Methanol and *Solution A* (19:1)

System suitability solution: Prepare a 0.65-mg/mL solution of USP Ergocalciferol RS in methanol. Transfer 1.0 mL of this solution to a 100-mL volumetric flask containing 100 mg of USP Alpha Tocopheryl Acetate RS. Dissolve in 30 mL of methanol, with the aid of sonication if necessary, and dilute with methanol to volume. Store this solution in a refrigerator.

Standard solution: 2 mg/mL of USP Alpha Tocopherol RS, USP Alpha Tocopheryl Acetate RS, or USP Alpha Tocopheryl Acid Succinate RS in methanol

Sample solution: Proceed as directed for the *Sample solution* in *Vitamin A, Method 1*. Transfer NLT 20 mL of this solution to a suitable container, and evaporate in vacuum at room temperature to dryness. Transfer the residue with the aid of methanol to a suitable volumetric flask, and dilute with methanol to volume to obtain a concentration of 2 mg/mL of alpha tocopherol, alpha tocopheryl acetate, or alpha tocopheryl acid succinate.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 8-mm × 10-cm; 5-μm packing L1

Flow rate: 2 mL/min

Injection size: 100 μL

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for ergocalciferol and alpha tocopheryl acetate are about 0.5 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 12 between ergocalciferol and alpha tocopheryl acetate, *System suitability solution*

Tailing factor: Between 0.8 and 1.2, *System suitability solution*

Relative standard deviation: NMT 3.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*
 Measure the peak areas. Calculate the percentage of the labeled amount of alpha tocopherol (C₂₉H₅₀O₂), alpha tocopheryl acetate (C₃₁H₅₂O₃), or alpha tocopheryl acid succinate (C₃₃H₅₄O₅) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of the relevant vitamin E form from the *Sample solution*

r_S = peak area of the relevant vitamin E form from the *Standard solution*

C_S = concentration of the corresponding USP Reference Standard in the *Standard solution* (mg/mL)

C_U = nominal concentration of the corresponding form of vitamin E in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–165.0% of the labeled amount of vitamin E as alpha tocopherol (C₂₉H₅₀O₂), alpha tocopheryl acetate (C₃₁H₅₂O₃), or alpha tocopheryl acid succinate (C₃₃H₅₄O₅)

• VITAMIN E, Method 2

[NOTE—Where vitamin E (alpha tocopherol, alpha tocopheryl acetate, or alpha tocopheryl acid succinate) is specified in the following procedure, use the chemical form present in the formulation and the relevant USP Reference Standard. Use low-actinic glassware throughout this procedure.]

Mobile phase: Mix 240 mL of methanol with 10 mL of water followed by 0.5 mL of 50% phosphoric acid, and dilute with acetonitrile to 1000 mL.

System suitability solution: 2 mg/mL each of USP Alpha Tocopherol RS, USP Alpha Tocopheryl Acetate RS, and USP Alpha Tocopheryl Acid Succinate RS in methanol

Standard solution: 2 mg/mL of USP Alpha Tocopherol RS, USP Alpha Tocopheryl Acetate RS, or USP Alpha Tocopheryl Acid Succinate RS in methanol

Sample solution: Proceed as directed for *Sample solution* in *Vitamin A, Method 2*. Transfer a volume of the supernatant 2,2,4-trimethylpentane to a suitable volumetric flask, the volume of the specimen withdrawn from the 2,2,4-trimethylpentane and the size of the volumetric flask being such that the final concentration of the *Sample solution* is equivalent to that of the *Standard solution*. Evaporate nearly to dryness, add several mL of methanol, and evaporate the remaining 2,2,4-trimethylpentane. Dilute with methanol to volume.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 4.6-mm × 25-cm; 5-μm packing L1

Flow rate: 1.5 mL/min

Injection size: 25 μL

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for alpha tocopheryl acid succinate, alpha tocopherol, and alpha tocopheryl acetate are about 0.6, 0.8, and 1.0, respectively.]

Suitability requirements

Resolution: NLT 4.0 between alpha tocopheryl acid succinate and alpha tocopherol; NLT 3.0 between alpha tocopherol and alpha tocopheryl acetate, *System suitability solution*

Relative standard deviation: NMT 3.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*
 Measure the peak areas. Calculate the percentage of the labeled amount of alpha tocopherol (C₂₉H₅₀O₂), alpha tocopheryl acetate (C₃₁H₅₂O₃), or alpha tocopheryl acid succinate (C₃₃H₅₄O₅) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of the relevant vitamin E form from the *Sample solution*

- r_s = peak area of the relevant vitamin E form from the *Standard solution*
 C_s = concentration of the corresponding USP Reference Standard in the *Standard solution* (mg/mL)
 C_U = nominal concentration of the corresponding form of vitamin E in the *Sample solution* (mg/mL)

[NOTE—Account for the initial extraction volume of 26.5 mL of 2,2,4-trimethylpentane and the dilution factor to exchange the solvent from 2,2,4-trimethylpentane to methanol to calculate the nominal concentration.]

Acceptance criteria: 90.0%–165.0% of the labeled amount of vitamin E as alpha tocopherol ($C_{29}H_{50}O_2$), alpha tocopheryl acetate ($C_{31}H_{52}O_3$), or alpha tocopheryl acid succinate ($C_{33}H_{54}O_5$)

• **VITAMIN E, Method 3**

Diluent: Acetonitrile and ethyl acetate (1:1)

Mobile phase: Methanol, acetonitrile, and *n*-hexane (46.5:46.5:7.0)

Standard solution: 0.3 mg/mL of USP Alpha Tocopherol RS in methanol

Sample solution: Finely powder NLT 20 Tablets.

Transfer a portion of the powder, equivalent to 8 mg of alpha tocopherol, to a 125-mL flask fitted with a ground-glass joint. Add 25.0 mL of water, 25.0 mL of dehydrated alcohol, and 3.5 g of potassium hydroxide pellets. Shake for 1 h in a water bath maintained at 55°. Cool, and transfer with the aid of a minimum volume of water to a 125-mL separatory funnel. Rinse the flask with 50 mL of *n*-hexane, and add the rinsing to the separatory funnel. Insert the stopper, shake vigorously for 60 s, and allow the layers to separate. Drain the aqueous layer into a second 250-mL separatory funnel, and repeat the extraction with 50 mL of *n*-hexane. Discard the aqueous layer, and combine the hexane extracts. Wash the combined extracts with 25 mL of water, allow the layers to separate, and discard the aqueous layer. Add 3 drops of glacial acetic acid, and repeat the washing procedure two more times. Filter the washed hexane layer through anhydrous sodium sulfate into a 250-mL round-bottom flask. Rinse the funnel and sodium sulfate with a few mL of *n*-hexane, and add the rinsing to the hexane solution in the flask. Place the flask in a water bath maintained at 50°, and evaporate the hexane solution with the aid of a rotary evaporator to dryness. Immediately add 25.0 mL of *Diluent*, and swirl to dissolve the residue.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 291 nm

Column: 4.6-mm × 25-cm; packing L1

Column temperature: 40°

Flow rate: 3 mL/min

Injection size: 20 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 5.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas. Calculate the percentage of the labeled amount of vitamin E as alpha tocopherol ($C_{29}H_{50}O_2$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of alpha tocopherol from the *Sample solution*

r_S = peak area of alpha tocopherol from the *Standard solution*

C_S = concentration of alpha tocopherol in the *Standard solution* (mg/mL)

C_U = nominal concentration of vitamin E as alpha tocopherol in the *Sample solution* (mg/mL)

[NOTE—Calculate the content of alpha tocopheryl acetate ($C_{31}H_{52}O_3$) or alpha tocopheryl acid succinate ($C_{33}H_{54}O_5$) by dividing the content, in mg/Tablet of vitamin E as alpha tocopherol ($C_{29}H_{50}O_2$), by the factor 0.91 or 0.81, respectively.]

Acceptance criteria: 90.0%–165.0% of the labeled amount of vitamin E as alpha tocopherol ($C_{29}H_{50}O_2$), alpha tocopheryl acetate ($C_{31}H_{52}O_3$), or alpha tocopheryl acid succinate ($C_{33}H_{54}O_5$)

• **PHYTONADIONE, Method 1**

[NOTE—Use low-actinic glassware throughout this procedure.]

Mobile phase: Methanol and water (19:1)

Standard stock solution: 200 µg/mL of USP

Phytonadione RS in methanol. Dissolve with the aid of sonication if necessary.

Standard solution: 20 µg/mL of USP Phytonadione RS from *Standard stock solution* diluted with methanol

System suitability solution: 0.65 mg/mL of USP Alpha Tocopheryl Acetate RS and 20 µg/mL of USP

Phytonadione RS from *Standard stock solution* diluted with methanol. [NOTE—Dissolve USP Alpha Tocopheryl Acetate RS in a portion of methanol, add the *Standard stock solution*, and then dilute with methanol to volume.]

Sample solution: Transfer NLT 20 mL of the solution retained as specified in the directions for *Sample solution* in *Vitamin A, Method 1* to a suitable container, and evaporate in vacuum at room temperature to dryness. Transfer the residue with the aid of methanol to a suitable volumetric flask, and dilute with methanol to volume to obtain a concentration of 20 µg/mL of phytonadione.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 8-mm × 10-cm; 5-µm packing L1

Flow rate: 2 mL/min

Injection size: 100 µL

System suitability

Samples: *Standard solution* and *System suitability solution*

[NOTE—The relative retention times for alpha tocopheryl acetate and phytonadione are 0.68 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 5 between alpha tocopheryl acetate and phytonadione, *System suitability solution*

Relative standard deviation: NMT 3.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas. Calculate the percentage of the labeled amount of phytonadione ($C_{31}H_{46}O_2$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area for phytonadione from the *Sample solution*

r_S = peak area for phytonadione from the *Standard solution*

C_S = concentration of USP Phytonadione RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of phytonadione in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–165.0% of the labeled amount of phytonadione ($C_{31}H_{46}O_2$)

• **PHYTONADIONE, Method 2**

[NOTE—Use low-actinic glassware throughout this procedure.]

Solvent: Methanol and isopropyl alcohol (19:1)

Mobile phase: Mix 800 mL of methanol, 200 mL of methylene chloride, 0.1 mL of glacial acetic acid, 1.36 g of zinc chloride, and 0.41 g of sodium acetate.

Internal standard solution: 5 µg/mL of menaquinone 4 (vitamin K₂) in *Solvent*. [NOTE—A concentrated stock solution of menaquinone 4 (100 µg/mL) can be stored for 2 months in a refrigerator.]

Standard stock solution: 5 µg/mL of USP Phytonadione RS, prepared by dissolving in methylene chloride with the aid of sonication, and diluting with *Solvent* to final volume

Standard solution: Transfer 1.0 mL of the *Standard stock solution* and 1.0 mL of the *Internal standard solution* to a suitable flask and dilute with *Solvent* to 5 mL. Pass through a membrane filter of 0.45-µm or finer pore size.

Sample solution: Finely powder NLT 20 Tablets. To a centrifuge tube fitted with a cap transfer an amount of powder, not exceeding 800 mg and equivalent to an amount of phytonadione not exceeding 50 µg. Add 4 mL of water. Insert the stopper, and mix using a vortex mixer until the sample is dispersed. Place the tube in a water bath at 60° for 5 min. Remove from the bath, and again shake or mix using a vortex mixer for 1 min while the preparation is still hot. Add 8 mL of alcohol, and swirl the contents to mix. Place the tube in a water bath at 60° for 5 min. Remove from the bath, and again shake or mix using a vortex mixer for 2 min while the preparation is still hot. Cool to room temperature. Add a volume of *Internal standard solution*, equivalent to 1.0 mL per each 5 µg of the expected amount of phytonadione in the aliquot taken. Add 20.0 mL of petroleum ether, and cap the tube tightly. Shake or mix using a vortex mixer for 15 min to thoroughly mix the contents. Centrifuge to separate the two layers. Transfer a volume of the top layer of petroleum ether, equivalent to 5–50 µg of the nominal amount of phytonadione, to an appropriate flask. Place the flask in a water bath at 35°–45°, and evaporate the solvent under a stream of nitrogen until an oily residue is left. Dissolve the residue in a volume of *Solvent* to obtain a concentration of 1 µg/mL of phytonadione.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: Fluorometric detector set at 320 nm for excitation and 420 nm for emission

Column: 4.6-mm × 25-cm; 5-µm, end-capped packing L1, and a postcolumn reactor constituted with a 4.6-mm × 3-cm PEEK column tightly packed with zinc powder. [NOTE—Prepare the postcolumn reactor daily, or as necessary, to meet the system suitability requirements.]

Flow rate: 1 mL/min

Injection size: 25 µL

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for the internal standard and phytonadione are 1.0 and 1.4, respectively.]

Suitability requirements

Column efficiency: NLT 2500 theoretical plates for the phytonadione peak

Tailing factor: NMT 1.5 for the phytonadione peak

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of phytonadione (C₃₁H₄₆O₂) in the portion of Tablets taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = peak response ratio of phytonadione to that of the internal standard from the *Sample solution*

R_S = peak response ratio of phytonadione to that of the internal standard from the *Standard solution*

C_S = concentration of USP Phytonadione RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of phytonadione in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–165.0% of labeled amount of phytonadione (C₃₁H₄₆O₂)

• **BETA CAROTENE**

[NOTE—Use low-actinic glassware throughout this procedure.]

Potassium hydroxide solution: Dissolve 58.8 g of potassium hydroxide in 50 mL of water.

Iodine solution: 0.01 mg/mL of iodine in cyclohexane.

[NOTE—Prepare this solution fresh daily]

Sample solution: Weigh NLT 20 Tablets. Grind the Tablets to a fine powder, and transfer a quantity of the powder, equivalent to 2 mg of beta carotene, to a 500-mL saponification flask. Add 100 mL of alcohol, 6 mL of *Potassium hydroxide solution*, and a magnetic stirring bar. Attach an air condenser to the flask, and heat under reflux for 45 min with constant stirring. Cool to room temperature, add 170 mL of solvent hexane, and stir for 30 min. Quantitatively transfer the contents of the flask to a 500-mL separatory funnel with portions of solvent hexane. Allow the layers to separate for 5–10 min, and transfer the upper organic layer to a 500-mL volumetric flask. Transfer the lower aqueous layer into the saponification flask, add 170 mL of solvent hexane, and stir for an additional 20 min. Quantitatively transfer the contents of the saponification flask to the separatory funnel with the aid of portions of solvent hexane. Allow the layers to separate for 10 min. Drain the lower aqueous layer, and discard. Transfer the organic layer to the volumetric flask containing the previously collected organic layer. Rinse the separatory funnel with small portions of solvent hexane, and transfer the washings to the volumetric flask. Dilute the hexane extracts with solvent hexane to volume, add 3 g of anhydrous sodium sulfate, shake, and allow to settle. Quantitatively transfer a volume of this solution, equivalent to 100 µg of beta carotene, to a 50-mL volumetric flask. Evaporate under a stream of nitrogen to dryness, and immediately add cyclohexane. Add 2 mL of *Iodine solution*, and heat for 15 min in a water bath maintained at 65°. Cool rapidly, and dilute with cyclohexane to volume.

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* <851>.)

Mode: Vis

Analytical wavelength: 452 nm

Blank: Cyclohexane

Analysis

Sample: *Sample solution*

Determine the absorbance against the *Blank*. Calculate the percentage of the labeled amount of beta carotene (C₄₀H₅₆) in the portion of Tablets taken:

$$\text{Result} = (A_U/F) \times (100/C_U)$$

A_U = absorbance of the *Sample solution*
 F = absorptivity of beta carotene at 452 nm, 223
 C_U = nominal concentration of beta carotene in the
Sample solution (mg/mL)

Acceptance criteria: 90.0%–165.0% of the labeled amount of beta carotene ($C_{40}H_{56}$)

PERFORMANCE TESTS

- **DISINTEGRATION AND DISSOLUTION OF DIETARY SUPPLEMENTS** (2040): Meet the requirements for *Disintegration*
- **WEIGHT VARIATION OF DIETARY SUPPLEMENTS** (2091): Meet the requirements

CONTAMINANTS

- **MICROBIAL ENUMERATION TESTS** (2021): The total aerobic microbial count does not exceed 3000 cfu/g, and the combined molds and yeasts count does not exceed 300 cfu/g.
- **ABSENCE OF SPECIFIED MICROORGANISMS** (2022): Meet the requirements of the tests for absence of *Salmonella* species, *Escherichia coli*, and *Staphylococcus aureus*

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.
- **LABELING:**¹ Label the Tablets to state that the product is Oil-Soluble Vitamins Tablets. The label also states the quantity of each vitamin/dosage unit and where necessary the chemical form in which it is present. Where the product contains vitamin E, the label indicates whether it is the *d*- or *dl*-form. Where more than one assay method is given for a particular vitamin, the labeling states the assay method used only if *Method 1* is not used.
- **USP REFERENCE STANDARDS** (11)
 - USP Alpha Tocopherol RS
 - USP Alpha Tocopheryl Acetate RS
 - USP Alpha Tocopheryl Acid Succinate RS

 - USP Vitamin A RS

¹ USP Units of activity for vitamins, where such exist or formerly existed, are equivalent to the corresponding international units, where such formerly existed. The USP Unit for Vitamin E has been discontinued. International units (IU) for vitamins also have been discontinued; however, the use of IU on the labels of vitamin products continues. Where articles are labeled in terms of Units in addition to the required labeling, the relationship of the USP Units or IU to mass is as follows. One USP Vitamin A Unit = 0.3 μ g of all-*trans*-retinol (vitamin A alcohol) or 0.344 μ g of all-*trans*-retinyl acetate (vitamin A acetate) or 0.55 μ g of all-*trans*-retinyl palmitate (vitamin A palmitate), and 1 μ g of retinol (3.3 USP Vitamin A Units) = 1 retinol equivalent (RE); 1 IU of beta carotene = 0.6 μ g of all-*trans*-beta carotene; 1 USP Vitamin D Unit = 0.025 μ g of ergocalciferol or cholecalciferol; and 1 mg of *dl*-alpha tocopherol = 1.1 former USP Vitamin E Units, 1 mg of *dl*-alpha tocopheryl acetate = 1 former USP Vitamin E Unit, 1 mg of *dl*-alpha tocopheryl acid succinate = 0.89 former USP Vitamin E Unit, 1 mg of *d*-alpha tocopherol = 1.49 former USP Vitamin E Units, and 1 mg of *d*-alpha tocopheryl acetate = 1.36 former USP Vitamin E Units, 1 mg of *d*-alpha tocopheryl acid succinate = 1.21 former USP Vitamin E Units. In terms of *d*-alpha tocopherol equivalents, 1 mg of *d*-alpha tocopheryl acetate = 0.91, 1 mg of *d*-alpha tocopheryl acid succinate = 0.81, 1 mg of *dl*-alpha tocopherol = 0.74, 1 mg of *dl*-alpha tocopheryl acetate = 0.67, and 1 mg of *dl*-alpha tocopheryl acid succinate = 0.60.

Add the following:

▲ Oil-Soluble Vitamins with Minerals Capsules

DEFINITION

Oil-Soluble Vitamins with Minerals Capsules contain two or more of the following oil-soluble vitamins: Vitamin A, as retinol or esters of retinol in the form of retinyl acetate or retinyl palmitate; Vitamin D as ergocalciferol (Vitamin D₂) or cholecalciferol (Vitamin D₃); Vitamin E, as alpha tocopherol, alpha tocopheryl acetate, or alpha tocopheryl acid succinate; Phytonadione (Vitamin K₁); beta carotene; and one or more minerals derived from substances generally recognized as safe, furnishing one or more of the following elements in ionizable form: boron, calcium, chromium, copper, fluorine, iodine, iron, magnesium, manganese, molybdenum, nickel, phosphorus, potassium, selenium, tin, vanadium, and zinc. Capsules contain NLT 90.0% and NMT 165.0% of the labeled amounts of vitamin A, as retinol equivalent ($C_{20}H_{30}O$); vitamin D, as cholecalciferol ($C_{27}H_{44}O$) or ergocalciferol ($C_{28}H_{44}O$); vitamin E, as alpha tocopherol ($C_{29}H_{50}O_2$), alpha tocopheryl acetate ($C_{31}H_{52}O_3$), or alpha tocopheryl acid succinate ($C_{33}H_{54}O_5$); phytonadione ($C_{31}H_{46}O_2$); and beta carotene ($C_{40}H_{56}$); NLT 90.0% and NMT 125.0% of the labeled amount of calcium (Ca), copper (Cu), iron (Fe), magnesium (Mg), manganese (Mn), phosphorus (P), potassium (K), and zinc (Zn); and NLT 90.0% and NMT 160.0% of the labeled amounts of boron (B), chromium (Cr), fluorine (F), iodine (I), molybdenum (Mo), nickel (Ni), selenium (Se), tin (Sn), and vanadium (V).

They may contain other labeled added substances that are generally recognized as safe, in amounts that are unobjectionable.

STRENGTH

• VITAMIN A

[NOTE—Use low-actinic glassware throughout this procedure.]

Mobile phase: *n*-Hexane

Standard solution 1: 13 μ g/mL of retinol from USP Retinyl Acetate RS in *n*-hexane

Standard solution 2: 13 μ g/mL of retinol from USP Retinyl Palmitate RS in *n*-hexane

System suitability solution: Mix equal volumes of *Standard solution 1* and *Standard solution 2*.

Sample solution: Transfer the contents of NLT 20 Capsules to a suitable container, mix, and weigh. Transfer a portion of the mixture, equivalent to 5 Capsules, to a container having a polytetrafluoroethylene-lined screw cap. [NOTE—For hard gelatin Capsules, remove, as completely as possible, the contents of NLT 20 Capsules by cutting open the Capsule shells, transferring the shells and their contents to a suitable container, and triturating to a homogeneous mass. Transfer a portion of the mass, equivalent to 5 Capsules, to a container having a polytetrafluoroethylene-lined screw cap.] Add 10 mL of dimethyl sulfoxide and 15 mL of *n*-hexane, and shake for 45 min in a water bath maintained at 60°. Centrifuge at 3000 rpm for 10 min, and transfer the hexane layer by means of a pipet to a 100-mL volumetric flask. Add 15 mL of *n*-hexane to the dimethyl sulfoxide layer, shake thoroughly for 5 min, and transfer the hexane layer by means of a pipet to the 100-mL volumetric flask. Repeat this extraction with three additional 15-mL portions of *n*-hexane. Dilute the extracts in the volumetric flask with *n*-hexane to volume. Further dilute this solution with *n*-hexane to obtain a solution with a concentration of 13 μ g/mL of vitamin A as retinol ($C_{20}H_{30}O$).

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 325 nm

Column: 4.6-mm × 15-cm; packing L8

Flow rate: 1 mL/min

Injection volume: 40 µL

System suitability

Sample: *System suitability solution*

Suitability requirements

Resolution: NLT 10 between all-*trans*-retinyl acetate and all-*trans*-retinyl palmitate

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution 1* or *Standard solution 2* and *Sample solution*

Calculate the percentage of the labeled amount of vitamin A, as retinol (C₂₀H₃₀O), in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of the all-*trans*-retinyl ester from the *Sample solution*

r_S = peak area of the all-*trans*-retinyl ester from the appropriate *Standard solution*

C_S = concentration of retinol in the appropriate *Standard solution* (µg/mL)

C_U = nominal concentration of vitamin A, as retinol, in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–165.0% of the labeled amount of vitamin A as retinol equivalent (C₂₀H₃₀O)

• **VITAMIN D**

[NOTE—Where vitamin D (cholecalciferol or ergocalciferol) is specified in the following procedure, use the chemical form present in the formulation and the relevant USP Reference Standard. Use low-actinic glassware throughout this procedure.]

Mobile phase: *n*-Hexane and isopropyl alcohol (99:1)

Standard solution: 2 µg/mL of USP Cholecalciferol RS or USP Ergocalciferol RS in *n*-hexane

System suitability solution: Heat a volume of the *Standard solution* at 60° for 1 h to partially isomerize vitamin D (cholecalciferol or ergocalciferol) to its corresponding precursor.

Sample solution: Transfer NLT 20 mL of a solution prepared as directed for the *Sample solution* in *Vitamin A* to a suitable container, and concentrate, if necessary, in vacuum at room temperature to obtain a solution with an expected concentration of 2 µg/mL of cholecalciferol or ergocalciferol.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 265 nm

Column: 4.6-mm × 15-cm; 3-µm packing L8

Flow rate: 1 mL/min

Injection volume: 100 µL

System suitability

Sample: *System suitability solution*

Suitability requirements

Resolution: NLT 10 between the vitamin D form present and its corresponding precursor

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of cholecalciferol (C₂₇H₄₄O) or ergocalciferol (C₂₈H₄₄O) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times F \times 100$$

r_U = peak area of cholecalciferol or ergocalciferol from the *Sample solution*

r_S = peak area of cholecalciferol or ergocalciferol from the *Standard solution*

C_S = concentration of USP Cholecalciferol RS or USP Ergocalciferol RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of cholecalciferol or ergocalciferol in the *Sample solution* (µg/mL)

F = correction factor to account for the average amount of pre-vitamin D present in the *Sample solution*, 1.09

Acceptance criteria: 90.0%–165.0% of the labeled amount of vitamin D as cholecalciferol (C₂₇H₄₄O) or ergocalciferol (C₂₈H₄₄O)

• **VITAMIN E**

[NOTE—Where vitamin E (alpha tocopherol, alpha tocopheryl acetate, or alpha tocopheryl acid succinate) is specified in the following procedure, use the chemical form present in the formulation and the relevant USP Reference Standard. Use low-actinic glassware throughout this procedure.]

Solution A: Phosphoric acid solution (1 in 100) in water

Mobile phase: Methanol and *Solution A* (19:1)

Standard solution: 2 mg/mL of USP Alpha Tocopherol RS, USP Alpha Tocopheryl Acetate RS, or USP Alpha Tocopheryl Acid Succinate RS in methanol

Sample solution: Transfer NLT 20 mL of the solution prepared as directed for the *Sample solution* in *Vitamin A* to a suitable container, and evaporate in vacuum at room temperature to dryness. Transfer the residue with the aid of methanol to a suitable volumetric flask, and dilute with methanol to volume to obtain a concentration of 2 mg/mL of alpha tocopherol, alpha tocopheryl acetate, or alpha tocopheryl acid succinate.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 291 nm

Column: 4.6-mm × 15-cm; 5-µm packing L1

Injection volume: 50 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 1.5

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of alpha tocopherol (C₂₉H₅₀O₂), alpha tocopheryl acetate (C₃₁H₅₂O₃), or alpha tocopheryl acid succinate (C₃₃H₅₄O₅) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of the relevant vitamin E form from the *Sample solution*

r_S = peak area of the relevant vitamin E form from the *Standard solution*

C_S = concentration of the corresponding USP Reference Standard in the *Standard solution* (mg/mL)

C_U = nominal concentration of the corresponding form of vitamin E in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–165.0% of the labeled amount of vitamin E

• **PHYTONADIONE (VITAMIN K₁)**

[NOTE—Use low-actinic glassware throughout this procedure.]

Mobile phase: Methanol and water (19:1)

Standard stock solution: 200 µg/mL of USP

Phytonadione RS in methanol. Dissolve with the aid of sonication if necessary.

Standard solution: 20 µg/mL of USP Phytonadione RS from the *Standard stock solution* diluted with methanol

System suitability solution: 0.65 mg/mL of USP Alpha Tocopheryl Acetate RS and 20 µg/mL of USP Phytonadione RS from the *Standard stock solution* diluted with methanol. [NOTE—Dissolve USP Alpha Tocopheryl Acetate RS in a portion of methanol, add the *Standard stock solution*, and then dilute with methanol to volume.]

Sample solution: Transfer NLT 20 mL of the solution prepared as directed for the *Sample solution in Vitamin A* to a suitable container, and evaporate in vacuum at room temperature to dryness. Transfer the residue with the aid of methanol to a suitable volumetric flask, and dilute with methanol to volume to obtain a concentration of 20 µg/mL of phytonadione.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm × 15-cm; 5-µm packing L1

Flow rate: 1 mL/min

Injection volume: 50 µL

System suitability

Samples: *Standard solution* and *System suitability solution*

Suitability requirements

Resolution: NLT 5 between alpha tocopheryl acetate and phytonadione, *System suitability solution*

Relative standard deviation: NMT 3.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of phytonadione (C₃₁H₄₆O₂) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area from the *Sample solution*

r_S = peak area from the *Standard solution*

C_S = concentration of USP Phytonadione RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of phytonadione in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–165.0% of the labeled amount of phytonadione (C₃₁H₄₆O₂)

• BETA CAROTENE

[NOTE—Use low-actinic glassware.]

Mobile phase: Transfer 50 mg of butylated hydroxytoluene into a 1-L volumetric flask, and dissolve with 20 mL of 2-propanol. Add 0.2 mL of N-ethyldiisopropylamine, 25 mL of 0.2% ammonium acetate solution, 455 mL of acetonitrile, and about 450 mL of methanol. Allow the solution to reach to room temperature, and dilute with methanol to volume.

Diluent: 50 µg/mL of butylated hydroxytoluene in alcohol

System suitability solution: Transfer 20 mg of USP Beta Carotene System Suitability RS to a 50-mL volumetric flask. Add 1 mL of water, 4 mL of tetrahydrofuran, and sonicate for 5 min. Dilute with *Diluent* to volume, and sonicate for 5 min. Cool to room temperature, pass the suspension through a membrane filter of 0.45-µm pore size, and use the clear filtrate.

Standard stock solution: 60 µg/mL of USP Beta Carotene RS in tetrahydrofuran

Standard solution A: Transfer 5.0 mL of the *Standard stock solution* into a 100-mL volumetric flask, add 5.0 mL of tetrahydrofuran, and dilute with *Diluent* to volume.

Determine the concentration of *Standard solution A* from the concentration of *Standard solution B* as described below.

Standard solution B: Transfer 5.0 mL of the *Standard stock solution* into a 100-mL volumetric flask, and dilute with cyclohexane to volume. Prepare in triplicate.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* <851>.)

Analytical wavelength: 457 nm

Cell path: 1 cm

Blank: Cyclohexane

Analysis

Sample: *Standard solution B*

Calculate the concentration of total beta carotene (mg/mL) as all-*trans*-beta carotene (C₄₀H₅₆) in *Standard solution B*. [NOTE—The concentration of *Standard solution B* equals the concentration of *Standard solution A*.]

$$\text{Result} = A/F$$

A = average absorbance of the three preparations of *Standard solution B*

F = absorptivity of pure all-*trans*-beta carotene in cyclohexane, 250

Sample solution: Transfer NLT 20 mL of the solution prepared as directed for the *Sample solution in Vitamin A* to a suitable container, and evaporate in vacuum at room temperature to dryness. Dissolve the residue in a mixture of methylene chloride and *Diluent* (1:1), and dilute with the same mixture to obtain a concentration of 3 µg/mL of beta carotene. Pass through a membrane filter of 0.45-µm pore size if necessary.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV-Vis 448 nm

Column: 4.6-mm × 25-cm; 5-µm packing L68

Column temperature: 30°

Flow rate: 0.6 mL/min

Injection volume: 20 µL

System suitability

Samples: *System suitability solution* and *Standard solution A*

[NOTE—The approximate relative retention times of the components in the *System suitability solution* are listed in *Table 1*.]

Table 1

Name	Relative Retention Time	Relative Response Factor
All- <i>trans</i> -alpha carotene	0.93	1.1
All- <i>trans</i> -beta carotene	1.00	1
9- <i>cis</i> -Beta carotene	1.07	1
13- <i>cis</i> -Beta carotene	1.17	1.2
15- <i>cis</i> -Beta carotene	1.21	1.4

Suitability requirements

Chromatogram similarity: The chromatogram from the *System suitability solution* is similar to the reference chromatogram provided with the lot of USP Beta Carotene System Suitability RS being used.

Resolution: NLT 1.5 between beta carotene and alpha carotene and between beta carotene and 9-*cis*-beta carotene, *System suitability solution*

Tailing factor: NMT 2.0 for the beta carotene peak, *Standard solution A*

Relative standard deviation: NMT 2.0% for the beta carotene peak from replicate injections, *Standard solution A*

Analysis

Samples: *Standard solution A* and *Sample solution*

Calculate the percentage of all-*trans*-beta carotene in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- r_u = peak area of all-*trans*-beta carotene from the *Sample solution*
 r_s = peak area of all-*trans*-beta carotene from *Standard solution A*
 C_s = concentration of all-*trans*-beta carotene in *Standard solution A* as determined by spectrometric procedure
 C_u = nominal concentration of beta carotene in the *Sample solution*

Acceptance criteria: 90.0%–165.0% of the labeled amount of beta carotene ($C_{40}H_{56}$)

• **CALCIUM, Method 1**

Lanthanum chloride solution: 267 mg/mL of lanthanum chloride heptahydrate in 0.125 N hydrochloric acid

Calcium standard solution: 400 µg/mL of calcium. Dissolve 1.001 g of calcium carbonate, previously dried at 300° for 3 h and cooled in a desiccator for 2 h, in 25 mL of 1 N hydrochloric acid. Boil to expel carbon dioxide, and dilute with water to 1000 mL.

Standard stock solution: 100 µg/mL of calcium from the *Calcium standard solution* diluted with 0.125 N hydrochloric acid

Standard solutions: Into separate 100-mL volumetric flasks pipet 1.0, 1.5, 2.0, 2.5, and 3.0 mL of the *Standard stock solution*. To each flask add 1.0 mL of *Lanthanum chloride solution*, and dilute with 0.125 N hydrochloric acid to volume to obtain concentrations of 1.0, 1.5, 2.0, 2.5, and 3.0 µg/mL of calcium.

Polysorbate 80 solution: Polysorbate 80 and alcohol (1:10)

Sample solution: Transfer 5 Capsules to a 100-mL volumetric flask. [NOTE—For hard gelatin Capsules, weigh NLT 20 Capsules. Open the Capsules, without loss of shell material, and transfer the contents to a suitable container. Remove any contents adhering to the empty shells by washing with several portions of ether. Discard the washings, and allow the Capsule shells to dry. Weigh the empty Capsule shells, calculate the net weight of the Capsule contents, and transfer a portion of the Capsule contents, equivalent to 5 Capsules, to a 100-mL volumetric flask.] Add 15 mL of water, 10 mL of 6 N hydrochloric acid, and 1 mL of *Polysorbate 80 solution* to the flask. Heat on a hot plate or steam bath, with intermittent swirling, until the Capsules are completely disintegrated or the contents are dissolved. Boil gently for an additional 15 min. Cool, dilute with water to volume, and filter, discarding the first 5 mL of the filtrate. Dilute this solution with 0.125 N hydrochloric acid, to obtain a concentration of 2 µg/mL of calcium, adding 1 mL of *Lanthanum chloride solution* per 100 mL of the final volume.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry

Analytical wavelength: Calcium emission line at 422.7 nm

Lamp: Calcium hollow-cathode

Flame: Nitrous oxide–acetylene

Blank: 0.125 N hydrochloric acid containing 1 mL of *Lanthanum chloride solution* per 100 mL

Analysis

Samples: *Standard solutions* and *Sample solution*
 Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in µg/mL, of calcium, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, C , in mg/mL, of calcium in the *Sample solution*.

Calculate the percentage of the labeled amount of calcium (Ca) in the portion of Capsules taken:

$$\text{Result} = (C/C_u) \times 100$$

C = measured concentration of calcium in the *Sample solution* (µg/mL)

C_u = nominal concentration of calcium in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–125.0% of the labeled amount of calcium (Ca)

• **CHROMIUM, Method 1**

Chromium standard solution: 1000 µg/mL of chromium from potassium dichromate, previously dried at 120° for 4 h in water. Store in a polyethylene bottle.

Standard stock solution: 10 µg/mL of chromium from *Chromium standard solution* diluted with 6 N hydrochloric acid and water (1 in 20)

Standard solutions: Transfer 10.0 and 20.0 mL of the *Standard stock solution* to separate 100-mL volumetric flasks, and transfer 15.0 and 20.0 mL of the *Standard stock solution* to separate 50-mL volumetric flasks. Dilute the contents of each of the four flasks with 0.125 N hydrochloric acid to volume to obtain concentrations of 1.0, 2.0, 3.0, and 4.0 µg/mL of chromium.

Sample solution: Proceed as directed in *Calcium, Method 1*, except prepare the *Sample solution* to contain 2.5 µg/mL of chromium and omit the use of the *Lanthanum chloride solution*.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry

Analytical wavelength: Chromium emission line at 357.9 nm

Lamp: Chromium hollow-cathode

Flame: Air–acetylene

Blank: 0.125 N hydrochloric acid

Analysis

Samples: *Standard solutions* and *Sample solution*
 Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in µg/mL, of chromium, and draw the straight line best fitting the four plotted points. From the graph so obtained, determine the concentration, C , in µg/mL, of chromium in the *Sample solution*.

Calculate the percentage of the labeled amount of chromium (Cr) in the portion of Capsules taken:

$$\text{Result} = (C/C_u) \times 100$$

C = measured concentration of chromium in the *Sample solution* (µg/mL)

C_u = nominal concentration of chromium in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–160.0% of the labeled amount of chromium (Cr)

• **COPPER, Method 1**

Copper standard solution: Dissolve 1.00 g of copper foil in a minimum volume of a 50% solution of nitric acid, and dilute with a 1% solution of nitric acid to 1000 mL. This solution contains 1000 µg/mL of copper.

Standard stock solution: 100 µg/mL of copper from the *Copper standard solution* diluted with 0.125 N hydrochloric acid

Standard solutions: To separate 200-mL volumetric flasks transfer 1.0, 2.0, 4.0, 6.0, and 8.0 mL of the *Standard stock solution*. Dilute with 0.125 N hydrochloric acid to volume to obtain concentrations of 0.5, 1.0, 2.0, 3.0, and 4.0 µg/mL of copper.

Sample solution: Proceed as directed in *Calcium, Method 1*, except prepare the *Sample solution* to contain 2 µg/mL of copper and omit the use of the *Lanthanum chloride solution*.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry

Analytical wavelength: Copper emission line at 324.7 nm

Lamp: Copper hollow-cathode
Flame: Air-acetylene
Blank: 0.125 N hydrochloric acid

Analysis

Samples: *Standard solutions* and *Sample solution*
 Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in $\mu\text{g/mL}$, of copper, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, C , in $\mu\text{g/mL}$, of copper in the *Sample solution*.

Calculate the percentage of the labeled amount of copper (C_u) in the portion of Capsules taken:

$$\text{Result} = (C/C_u) \times 100$$

C = measured concentration of copper in the *Sample solution* ($\mu\text{g/mL}$)

C_u = nominal concentration of copper in the *Sample solution* ($\mu\text{g/mL}$)

Acceptance criteria: 90.0%–125.0% of the labeled amount of copper (C_u)

• FLUORIDE, Method 1

[NOTE—Store all solutions in plastic containers.]

3 M sodium acetate solution: Dissolve 408 g of sodium acetate in 600 mL of water contained in a 1000-mL volumetric flask. Allow the solution to equilibrate to room temperature, and dilute with water to volume. Adjust with a few drops of acetic acid to a pH of 7.0.

Sodium citrate solution: Dissolve 222 g of sodium citrate in 250 mL of water in a 1000-mL volumetric flask. Add 28 mL of perchloric acid, and dilute with water to volume.

Fluoride standard stock solution: 500 $\mu\text{g/mL}$ of fluoride from a quantity of sodium fluoride in water, previously dried at 100° for 4 h and cooled in a desiccator

Intermediate stock solution A: 100 $\mu\text{g/mL}$ of fluoride from the *Fluoride standard stock solution* diluted with water

Intermediate stock solution B: 10 $\mu\text{g/mL}$ of fluoride from the *Fluoride standard stock solution* diluted with water

Standard solutions: To five separate 100-mL volumetric flasks transfer 3.0, 5.0, and 10.0 mL of *Intermediate stock solution B* and 5.0 and 10.0 mL of *Intermediate stock solution A*. To each flask add 10.0 mL of 1 N hydrochloric acid, 25 mL of 3 M *sodium acetate solution*, and 25.0 mL of *Sodium citrate solution*. Dilute the contents of each flask with water to volume to obtain concentrations of 0.3, 0.5, 1.0, 5.0, and 10.0 $\mu\text{g/mL}$ of fluoride.

Sample solution: Remove the contents of Capsules by cutting open the Capsules. Mix, and determine the weight of the contents. Transfer a quantity of the mixed Capsule contents, equivalent to 200 μg of fluoride, to a 100-mL volumetric flask. Add 10.0 mL of 1 N hydrochloric acid, 25.0 mL of 3 M *sodium acetate solution*, and 25.0 mL of *Sodium citrate solution*. Dilute with water to volume.

Analysis

Samples: *Standard solutions* and *Sample solution*
 To separate plastic beakers, each containing a plastic-coated stirring bar, transfer 50.0 mL each of the *Standard solutions* and the *Sample solution*. Measure the potentials (see pH (791)), in mV, of the *Standard solutions* and the *Sample solution*, with a pH meter capable of a minimum reproducibility of ± 0.2 mV and equipped with a fluoride-specific ion-indicating electrode and a calomel reference electrode. [NOTE—When taking measurements, immerse the electrodes in the solution, stir on a magnetic stirrer having an

insulated top until equilibrium is attained (1–2 min), and record the potential. Rinse and dry the electrodes between measurements, taking care to avoid damaging the crystal of the specific-ion electrode.]

Plot the logarithms of fluoride concentrations, in $\mu\text{g/mL}$, of the *Standard solutions* versus potential, in mV. From the standard response curve so obtained and the measured potential of the *Sample solution*, determine the concentration, C , in $\mu\text{g/mL}$, of fluoride in the *Sample solution*.

Calculate the percentage of the labeled amount of fluorine (F) in the portion of Capsules taken:

$$\text{Result} = (C/C_u) \times 100$$

C = measured concentration of fluoride in the *Sample solution* ($\mu\text{g/mL}$)

C_u = nominal concentration of fluoride in the *Sample solution* ($\mu\text{g/mL}$)

Acceptance criteria: 90.0%–160.0% of the labeled amount of fluorine (F)

• FLUORIDE, Method 2

[NOTE—Use plastic containers and deionized water throughout this procedure.]

pH 10.0 buffer: Add 214 mL of 0.1 N sodium hydroxide to 1000 mL of 0.05 M sodium bicarbonate.

Mobile phase: Alcohol, 0.1 N sulfuric acid, and water (20:5:175)

Standard stock solution: 220 $\mu\text{g/mL}$ of USP Sodium Fluoride RS in water. This solution contains 100 $\mu\text{g/mL}$ of fluoride.

Standard solution: [NOTE—Condition the solid-phase extraction column specified for use in the *Standard solution* and the *Sample solution* in the following manner. Using a vacuum at a pressure not exceeding 5 mm of mercury, wash the column with one column volume of methanol followed by one column volume of *pH 10.0 buffer*. Do not allow the column top to dry. If the top of the column becomes dry, recondition the column.] Transfer 10.0 mL of the *Standard stock solution* to a 100-mL volumetric flask. Add 75 mL of water, and adjust with 0.1 N sodium hydroxide to a pH of 10.4 ± 0.1 . Dilute with water to volume. Filter, discarding the first 15 mL of the filtrate. Transfer 25.0 mL of the filtrate to a 50-mL volumetric flask, add 15.0 mL of water, and adjust with 0.1 N sodium hydroxide to a pH of 10.0. Dilute with *pH 10.0 buffer* to volume. Elute a portion of this solution through a 3-mL solid-phase extraction column containing L1 packing that is connected through an adaptor to a second solid-phase extraction column containing sulfonylpropyl strong cation-exchange packing. Discard the first 3 mL of the eluate, and collect the rest of the eluate in a suitable flask for injection into the chromatograph.

Sample solution: Weigh NLT 20 Capsules in a tared weighing bottle. Open the Capsules, without loss of shell material, and transfer the contents to a 100-mL container. If necessary, remove any contents adhering to the empty shells by washing with several portions of ether. Discard the washings, and dry the Capsule shells with the aid of a current of dry air. Weigh the empty Capsule shells in the tared weighing bottle, and calculate the net weight of the Capsule contents. Transfer a portion of the Capsule contents, equivalent to 1 mg of fluorine, to a 100-mL volumetric flask. Add 15 mL of water, and shake vigorously. Rinse the sides of the flask with 15 mL of water, and allow to stand for 10 min. Dilute with water to 85 mL, adjust with 1 N sodium hydroxide to a pH of 10.4 ± 0.1 , and dilute with water to 100 mL. Proceed as directed for the *Standard solution*, beginning with "Filter, discarding the first 15 mL of the filtrate."

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: Conductivity

Columns

Guard: 4.6-mm × 3-cm; packing L17

Analytical: 7.8-mm × 30-cm; packing L17

Flow rate: 0.5 mL/min

Injection volume: 100 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas for fluoride. Calculate the percentage of the labeled amount of fluorine (F) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area from the *Sample solution*

r_S = peak area from the *Standard solution*

C_S = concentration of fluoride in the *Standard solution* (µg/mL)

C_U = nominal concentration of fluorine in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–160.0% of the labeled amount of fluorine (F)

• **IODIDE, Method 1**

Bromine water: To 20 mL of bromine in a glass-stoppered bottle add 100 mL of water. Insert the stopper into the bottle, and shake. Allow to stand for 30 min, and use the supernatant.

Analysis

Sample: Capsules

Remove the contents of Capsules by cutting open the Capsules. Mix, and determine the weight of the contents. Transfer a quantity of the contents, equivalent to 3 mg of iodine, to a nickel crucible. Add 5 g of sodium carbonate, 5 mL of 50% (w/v) sodium hydroxide solution, and 10 mL of alcohol, taking care that the entire specimen is moistened. Heat the crucible on a steam bath to evaporate the alcohol, then dry the crucible at 100° for 30 min to prevent spattering upon subsequent heating. Transfer the crucible with its contents to a furnace heated to 500°, and heat the crucible for 15 min. [NOTE—Heating at 500° is necessary to carbonize any organic matter present; a higher temperature may be used, if necessary, to ensure complete carbonization of all organic matter.]

Cool the crucible, add 25 mL of water, cover the crucible with a watchglass, and boil gently for 10 min. Filter the solution, and wash the crucible with boiling water, collecting the filtrate and washings in a beaker. Add phosphoric acid until the solution is neutral to methyl orange, then add 1 mL excess of phosphoric acid. Add excess of *Bromine water*, and boil the solution gently until colorless and then for 5 min longer. Add a few crystals of salicylic acid, and cool the solution to 20°. Add 1 mL of phosphoric acid and 0.5 g of potassium iodide, and titrate the liberated iodine with 0.005 N sodium thiosulfate VS, adding starch TS when the liberated iodine color has nearly disappeared.

Calculate the percentage of the labeled amount of iodine (I) in the portion of Capsules taken:

$$\text{Result} = V \times N_A \times F \times I_{me} \times (A_w/W) \times (100/L)$$

V = volume of sodium thiosulfate consumed (mL)

N_A = actual normality of the sodium thiosulfate solution used

F = correction factor to convert mg to µg, 1000 µg/mL

I_{me} = milliequivalent of I, 21.16 mg/meq

A_w = average weight of the Capsules content

W = weight of the sample of Capsules content taken

L = labeled amount of iodine (µg/Capsule)

Acceptance criteria: 90.0%–160.0% of the labeled amount of iodine (I)

• **IODIDE, Method 2**

Analysis: Proceed as directed in *Automated Methods of Analysis* (16), *Assay for Iodide*.

Acceptance criteria: 90.0%–160.0% of the labeled amount of iodine (I)

• **IRON, Method 1**

Iron standard stock solution: Transfer 100 mg of iron powder to a 1000-mL volumetric flask. Dissolve in 25 mL of 6 N hydrochloric acid, dilute with water to volume, and mix.

Standard solutions: To separate 100-mL volumetric flasks transfer 2.0, 4.0, 5.0, 6.0, and 8.0 mL of *Iron standard stock solution*. Dilute the contents of each flask with 0.125 N hydrochloric acid to volume to obtain concentrations of 2.0, 4.0, 5.0, 6.0, and 8.0 µg/mL of iron.

Polysorbate 80 solution: Prepare as directed in *Calcium, Method 1*.

Sample solution: Proceed as directed in *Calcium, Method 1*, except prepare the *Sample solution* to contain a concentration of 5 µg/mL of iron and omit the use of the *Lanthanum chloride solution*.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry

Analytical wavelength: Iron emission line at 248.3 nm

Lamp: Iron hollow-cathode

Flame: Air–acetylene

Blank: 0.125 N hydrochloric acid

Analysis

Samples: *Standard solutions* and *Sample solution*
Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in µg/mL, of iron, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, C , in µg/mL, of iron in the *Sample solution*.

Calculate the percentage of the labeled amount of iron (Fe) in the portion of Capsules taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of iron in the *Sample solution* (µg/mL)

C_U = nominal concentration of iron in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–125.0% of the labeled amount of iron (Fe)

• **MAGNESIUM, Method 1**

Lanthanum chloride solution: Prepare as directed in *Calcium, Method 1*.

Magnesium standard solution: Transfer 1.0 g of magnesium ribbon to a 1000-mL volumetric flask, dissolve in 50 mL of 6 N hydrochloric acid, dilute with water to volume, and mix to obtain a solution with a known concentration of 1000 µg/mL of magnesium.

Standard stock solution: 20 µg/mL of magnesium from *Magnesium standard solution* diluted with 0.125 N hydrochloric acid

Standard solutions: To separate 100-mL volumetric flasks transfer 1.0, 1.5, 2.0, 2.5, and 3.0 mL of the *Standard stock solution*. To each flask add 1.0 mL of *Lanthanum chloride solution*, and dilute with 0.125 N hydrochloric acid to volume to obtain concentrations of 0.2, 0.3, 0.4, 0.5, and 0.6 µg/mL of magnesium.

Polysorbate 80 solution: Prepare as directed in *Calcium, Method 1*.

Sample solution: Proceed as directed in *Calcium, Method 1*, except prepare the *Sample solution* to contain 0.4 µg/mL of magnesium.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry

Analytical wavelength: Magnesium emission line at 285.2 nm

Lamp: Magnesium hollow-cathode

Flame: Air-acetylene

Blank: 0.125 N hydrochloric acid containing 1 mL of *Lanthanum chloride solution* per 100 mL

Analysis

Samples: *Standard solutions* and *Sample solution*

Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in µg/mL, of magnesium, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, C , in µg/mL, of magnesium in the *Sample solution*.

Calculate the percentage of the labeled amount of magnesium (Mg) in the portion of Capsules taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of magnesium in the *Sample solution* (µg/mL)

C_U = nominal concentration of magnesium in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–125.0% of the labeled amount of magnesium (Mg)

• **MANGANESE, Method 1**

Manganese standard stock solution: Transfer 1.00 g of manganese to a 1000-mL volumetric flask. Dissolve in 20 mL of nitric acid, dilute with 6 N hydrochloric acid to volume, and mix to obtain a solution with a concentration of 1000 µg/mL of manganese.

Standard stock solution: 50 µg/mL of manganese from the *Manganese standard stock solution* diluted with 0.125 N hydrochloric acid

Standard solutions: To separate 100-mL volumetric flasks transfer 1.0, 1.5, 2.0, 3.0, and 4.0 mL of the *Standard stock solution*. Dilute the contents of each flask with 0.125 N hydrochloric acid to volume to obtain solutions with known concentrations of 0.5, 0.75, 1.0, 1.5, and 2.0 µg/mL of manganese.

Polysorbate 80 solution: Prepare as directed in *Calcium, Method 1*.

Sample solution: Proceed as directed in *Calcium, Method 1*, except prepare the *Sample solution* to contain 1 µg/mL of manganese and omit the use of the *Lanthanum chloride solution*.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry

Analytical wavelength: Manganese emission line at 279.5 nm

Lamp: Manganese hollow-cathode

Flame: Air-acetylene

Blank: 0.125 N hydrochloric acid

Analysis

Samples: *Standard solutions* and *Sample solution*

Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in µg/mL, of manganese, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, C , in µg/mL, of manganese in the *Sample solution*.

Calculate the percentage of the labeled amount of manganese (Mn) in the portion of Capsules taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of manganese in the *Sample solution* (µg/mL)

C_U = nominal concentration of manganese in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–125.0% of the labeled amount of manganese (Mn)

• **MOLYBDENUM, Method 1**

Diluent: 20 mg/mL of ammonium chloride in water
Molybdenum standard solution: Transfer 1.0 g of molybdenum wire to a 1000-mL volumetric flask, and dissolve in 50 mL of nitric acid, warming if necessary. Dilute with water to volume, and mix to obtain a solution with a concentration of 1000 µg/mL of molybdenum.

Standard stock solution: 100 µg/mL of molybdenum from the *Molybdenum standard solution* diluted with water

Standard solutions: To separate 100-mL volumetric flasks transfer 2.0, 10.0, and 25.0 mL of the *Standard stock solution*, and add 5.0 mL of perchloric acid to each flask. Gently boil the solution in each flask for 15 min, cool to room temperature, and dilute each with *Diluent* to volume to obtain concentrations of 5.0, 10.0, and 25.0 µg/mL of molybdenum.

Polysorbate 80 solution: Prepare as directed in *Calcium, Method 1*.

Sample solution: Proceed as directed in *Calcium, Method 1*, except take a number of Capsules or a portion of Capsule contents equivalent to 1000 µg of molybdenum and make appropriate dilutions to obtain a final concentration of 10 µg/mL of molybdenum, omitting the addition of the *Lanthanum chloride solution*.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry

Analytical wavelength: Molybdenum emission line at 313.3 nm

Lamp: Molybdenum hollow-cathode

Flame: Nitrous oxide-acetylene

Blank: *Diluent* and perchloric acid (20:1)

Analysis

Samples: *Standard solutions* and *Sample solution*

Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in µg/mL, of molybdenum, and draw the straight line best fitting the three plotted points. From the graph so obtained, determine the concentration, C , in µg/mL, of molybdenum in the *Sample solution*.

Calculate the percentage of the labeled amount of molybdenum (Mo) in the portion of Capsules taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of molybdenum in the *Sample solution* (µg/mL)

C_U = nominal concentration of molybdenum in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–160.0% of the labeled amount of molybdenum (Mo)

• **MOLYBDENUM, Method 2**

Sodium fluoride solution: Add 200 mL of water to 10 g of sodium fluoride, stir until the solution is saturated, and filter. Store in a polyethylene bottle.

Ferrous sulfate solution: 4.98 mg/mL of ferrous sulfate in water

Potassium thiocyanate solution: 200 mg/mL of potassium thiocyanate in water

20% Stannous chloride solution: Transfer 40 mg of stannous chloride to a beaker, add 20 mL of 6.5 N hydrochloric acid solution, and heat the solution until the stannous chloride is dissolved. Cool, and dilute with water to 100 mL.

Diluted stannous chloride solution: 20% *Stannous chloride solution* diluted with water (1 in 25). Prepare this solution fresh at the time of use.

Standard solution: 20 µg/mL of molybdenum in water

Sample: Remove the contents of a counted number of Capsules by cutting open the Capsules. Mix, and determine the weight of the contents. Use a quantity of the Capsule contents, equivalent to 40 µg of molybdenum.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: UV-Vis

Analytical wavelength: 465 nm

Cell: 1 cm

Blank: Amyl alcohol

Analysis

Samples: *Standard solution* and *Sample*

Transfer the *Sample* and 2.0 mL of the *Standard solution* to separate 200-mL beakers. Add 20 mL of nitric acid to each beaker. Cover each beaker with a watchglass, and boil slowly on a hot plate for 45 min. Cool to room temperature. Add 6 mL of perchloric acid, cover the beakers with a watchglass, and continue the heating until digestion is complete, as indicated when the liquid becomes colorless or pale yellow. Evaporate the solutions in the beakers to dryness. Rinse the sides of the beakers and the watchglasses with water, and add more water to complete 50 mL in each beaker. Gently boil the water solution for a few min. Cool to room temperature. Add 2 drops of methyl orange TS, and neutralize with ammonium hydroxide. Add 8.2 mL of hydrochloric acid. Quantitatively transfer the contents of the beakers to separate 100-mL volumetric flasks, rinse the beakers with water, transfer the rinsings to the corresponding volumetric flasks, and dilute with water to volume. Transfer 50.0 mL of each solution to separatory funnels. To each separatory funnel add 1.0 mL of *Sodium fluoride solution*, 0.5 mL of *Ferrous sulfate solution*, 4.0 mL of *Potassium thiocyanate solution*, 1.5 mL of 20% *Stannous chloride solution*, and 15.0 mL of amyl alcohol, and shake the separatory funnel for 1 min. Allow the layers to separate, and discard the aqueous layers. Add 25 mL of *Diluted stannous chloride solution* to each separatory funnel, and shake gently for 15 s. Allow the layers to separate, and discard the aqueous layers. Transfer the organic layer from each separatory funnel to a centrifuge tube, and centrifuge at 2000 rpm for 10 min. Determine the absorbances of the organic phases obtained from the *Standard solution* and the *Sample*, and correct with the *Blank*.

Calculate the percentage of the labeled amount of molybdenum (Mo) in the portion of Capsules taken:

$$\text{Result} = (A_U/A_S) \times [(V \times C_S)/M_U] \times 100$$

A_U = absorbance of the *Sample*

A_S = absorbance of the *Standard solution*

V = volume of the *Standard solution* analyzed, 2.0 mL

C_S = concentration of molybdenum in the *Standard solution* (µg/mL)

M_U = nominal amount of molybdenum in the *Sample* (µg)

Acceptance criteria: 90.0%–160.0% of the labeled amount of molybdenum (Mo)

• PHOSPHORUS, Method 1

Sulfuric acid solution: Cautiously add sulfuric acid to water (37.5: 100), and mix.

Ammonium molybdate solution: 50 mg/mL of ammonium molybdate in *Sulfuric acid solution* and water (2:3). [NOTE—Dissolve in water first, and then dilute with the *Sulfuric acid solution* to volume.]

Hydroquinone solution: 5 mg/mL of hydroquinone in water. Add one drop of sulfuric acid per 100 mL of solution.

Sodium bisulfite solution: 200 mg/mL of sodium bisulfite in water

Phosphorus standard stock solution: Weigh 4.395 g of monobasic potassium phosphate, previously dried at 105° for 2 h and stored in a desiccator, and transfer to a 1000-mL volumetric flask. Dissolve in water, add 6 mL of sulfuric acid as a preservative, dilute with water to volume, and mix to obtain a solution with a concentration of 1000 µg/mL of phosphorus.

Standard solution: 20 µg/mL of phosphorus from the *Phosphorus standard stock solution* diluted with water

Sample solution: Remove the contents of Capsules by cutting open the Capsules. Mix, and determine the weight of the contents. Transfer a quantity of the Capsule contents, equivalent to 100 mg of phosphorus, to 25 mL of nitric acid, and digest on a hot plate for 30 min. Add 15 mL of hydrochloric acid, and continue the digestion to the cessation of brown fumes. Cool, and transfer the contents of the flask to a 500-mL volumetric flask with the aid of small portions of water. Dilute with water to volume. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, and dilute with water to volume.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Vis

Analytical wavelength: 650 nm

Cell: 1 cm

Analysis

Samples: *Standard solution* and *Sample solution*

To three separate 25-mL volumetric flasks transfer 5.0 mL each of the *Standard solution*, the *Sample solution*, and water to provide the blank. To each of the three flasks add 1.0 mL each of *Ammonium molybdate solution*, *Hydroquinone solution*, and *Sodium bisulfite solution*, and swirl to mix. Dilute the contents of each flask with water to volume, and allow the flasks to stand for 30 min. Determine the absorbances of the solutions against the blank.

Calculate the percentage of the labeled amount of phosphorus (P) in the portion of Capsules taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

A_U = absorbance of the *Sample solution*

A_S = absorbance of the *Standard solution*

C_S = concentration of phosphorus in the *Standard solution* (µg/mL)

C_U = nominal concentration of phosphorus in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–125.0% of the labeled amount of phosphorus (P)

• POTASSIUM

Potassium standard solution: 100 µg/mL of potassium from potassium chloride, previously dried at 105° for 2 h, in water

Standard stock solution: 10 µg/mL of potassium from the *Potassium standard solution* diluted with 0.125 N hydrochloric acid

Standard solutions: Transfer 5.0, 10.0, 15.0, 20.0, and 25.0 mL of the *Standard stock solution* to separate 100-mL volumetric flasks. Dilute the contents of each flask with 0.125 N hydrochloric acid to volume to obtain solutions containing 0.5, 1.0, 1.5, 2.0, and 2.5 µg/mL of potassium.

Polysorbate 80 solution: Prepare as directed in *Calcium*, Method 1.

Sample solution: Proceed as directed in *Calcium*, Method 1, except prepare the *Sample solution* to contain 1.5 µg/mL of potassium and omit the use of the *Lanthanum chloride solution*.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry
Analytical wavelength: Potassium emission line at 766.5 nm
Lamp: Potassium hollow-cathode
Flame: Air–acetylene
Blank: Water

Analysis

Samples: *Standard solutions* and *Sample solution*
 Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in µg/mL, of potassium, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, *C*, in µg/mL, of potassium in the *Sample solution*.

Calculate the percentage of the labeled amount of potassium (*K*) in the portion of Capsules taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of potassium in the *Sample solution* (µg/mL)

C_U = nominal concentration of potassium in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–125.0% of the labeled amount of potassium (*K*)

• SELENIUM, Method 1

Diluent: Prepare as directed in *Molybdenum, Method 1*.

Selenium standard solution: [CAUTION—Selenium is toxic; handle it with care.] Dissolve 1 g of metallic selenium in a minimum volume of nitric acid. Evaporate to dryness, add 2 mL of water, and evaporate to dryness. Repeat the addition of water and the evaporation to dryness three times. Dissolve the residue in 3 N hydrochloric acid, transfer to a 1000-mL volumetric flask, and dilute with 3 N hydrochloric acid to volume to obtain a concentration of 1000 µg/mL of selenium.

Standard stock solution: 100 µg/mL of selenium from the *Selenium standard solution* diluted with water

Standard solutions: To separate 100-mL volumetric flasks transfer 5.0, 10.0, and 25.0 mL of the *Standard stock solution*, and add 5.0 mL of perchloric acid to each flask. Gently boil the solutions for 15 min, cool to room temperature, and dilute each with *Diluent* to volume to obtain solutions with concentrations of 5.0, 10.0, and 25.0 µg/mL of selenium.

Sample solution: Remove the contents of Capsules by cutting open the Capsules. Mix, and determine the weight of the contents. Transfer a quantity of the Capsule contents, equivalent to 1000 µg of selenium, to a suitable flask, and add 12 mL of nitric acid. [NOTE—The volume of nitric acid may be varied to ensure that the powder is uniformly dispersed.] Carefully swirl the flask to disperse the test specimen. Sonicate for 10 min or until the test specimen is completely dissolved. Gently boil the solution for 15 min, and cool to room temperature. Carefully add 8 mL of perchloric acid to the flask, heat the flask until perchloric acid fumes appear, and swirl the flask to dissipate the fumes. Repeat the heating and swirling until the fumes appear again. Cool to room temperature. Transfer the contents of the flask to a 50-mL volumetric flask with the aid of the *Diluent*, and dilute with *Diluent* to volume.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry
Analytical wavelength: Selenium emission line at 196.0 nm

Lamp: Selenium hollow-cathode
Flame: Air–acetylene
Blank: *Diluent* and perchloric acid (20:1)

Analysis

Samples: *Standard solutions* and *Sample solution*
 Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in µg/mL, of selenium, and draw the straight line best fitting the three plotted points. From the graph so obtained, determine the concentration, *C*, in µg/mL, of selenium in the *Sample solution*.

Calculate the percentage of the labeled amount of selenium (*Se*) in the portion of Capsules taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of selenium in the *Sample solution* (µg/mL)

C_U = nominal concentration of selenium in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–160.0% of the labeled amount of selenium (*Se*)

• SELENIUM, Method 2

Hydrochloric acid solution: Hydrochloric acid diluted with water (1 in 10)

50% Ammonium hydroxide solution: Ammonium hydroxide diluted with water (1 in 2)

Reagent A: 9 mg/mL of edetate disodium and 25 mg/mL of hydroxylamine hydrochloride in water. [NOTE—Dissolve edetate disodium in a portion of water first, then add hydroxylamine hydrochloride, and dilute with water to volume.]

Reagent B: Transfer 200 mg of 2,3-diaminonaphthalene to a 250-mL separatory funnel, and add 200 mL of 0.1 N hydrochloric acid. Wash the solution with three 40-mL portions of cyclohexane, and discard the cyclohexane layer. Filter the solution into a brown bottle, and cover the solution with a 1-cm layer of cyclohexane. This solution is stable for 1 week if stored in a refrigerator.

Standard stock solution: [CAUTION—Selenium is toxic; handle it with care.] Dissolve 1 g of metallic selenium in a minimum volume of nitric acid. Evaporate to dryness, add 2 mL of water, and evaporate to dryness. Repeat the addition of water and evaporation to dryness three times. Dissolve the residue in 3 N hydrochloric acid, transfer to a 1000-mL volumetric flask, and dilute with 3 N hydrochloric acid to volume to obtain a solution with a concentration of 1000 µg/mL of selenium. Dilute a volume of the solution with 0.125 N hydrochloric acid to obtain a concentration of 2.0 µg/mL of selenium.

Standard solution: Transfer 10 mL of the *Standard stock solution* to a glass-stoppered flask. Add 1 mL of perchloric acid and 1 mL of *Hydrochloric acid solution*, and dilute with water to 20 mL.

Sample solution: Remove the contents of Capsules by cutting open the Capsules. Mix, and determine the weight of the contents. Transfer a quantity of the Capsule contents, equivalent to 20 µg of selenium, to a suitable flask. Add 10 mL of nitric acid, and warm gently on a hot plate. Continue heating until the initial nitric acid reaction has subsided, then add 3 mL of perchloric acid.

[CAUTION—Exercise care at this stage, because perchloric acid reaction becomes vigorous.] Continue heating on the hot plate until the appearance of white fumes of perchloric acid or until the digest begins to darken. Add 0.5 mL of nitric acid, and resume heating, adding additional amounts of nitric acid if further darkening occurs. Digest for 10 min after the first appearance of perchloric acid fumes or until the digest becomes colorless. Cool the flask. Add 2.5 mL of *Hydrochloric acid solution*, and return the flask to the hot

plate to expel residual nitric acid. Heat the mixture for 3 min after it begins to boil. Cool the flask to room temperature, and dilute with water to 20 mL.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: UV

Analytical wavelength: 380 nm

Cell: 1 cm

Blank: 1 mL of perchloric acid and 1 mL of Hydrochloric acid solution diluted with water to 20 mL

Analysis

Samples: *Standard solution* and *Sample solution*

Treat the *Sample solution*, the *Standard solution*, and the *Blank* as follows. Add 5 mL of *Reagent A* to each flask, and swirl gently to mix. Adjust the solution in each flask with 50% *Ammonium hydroxide solution* to a pH of 1.1 ± 0.1 . Add 5 mL of *Reagent B* to each flask, and swirl gently to mix. Place the flasks in a water bath maintained at 50°, and equilibrate for 30 min, taking care that the flasks are covered to protect them from light. Cool to room temperature, and transfer the contents of each flask to separate separatory funnels. Transfer 10.0 mL of cyclohexane to each separatory funnel, and extract vigorously for 1 min. Discard the aqueous layer. Transfer the cyclohexane layer to a centrifuge tube, and centrifuge at 1000 rpm for 1 min to remove any remaining water. Determine the absorbances of the solutions obtained from the *Samples* against the solution obtained from the *Blank*.

Calculate the percentage of the labeled amount of selenium (Se) in the portion of Capsules taken:

$$\text{Result} = (A_U/A_S) \times [(V \times C_S)/M_U] \times 100$$

A_U = absorbances of the cyclohexane layer from the *Sample solution*

A_S = absorbances of the cyclohexane layer from the *Standard solution*

V = volume of the *Standard stock solution* used to prepare the *Standard solution*, 10 mL

C_S = concentration of selenium in the *Standard stock solution* (µg/mL)

M_U = nominal amount of selenium in the *Sample solution* (µg)

Acceptance criteria: 90.0%–160.0% of the labeled amount of selenium (Se)

• ZINC, Method 1

Zinc standard solution: 1000 µg/mL of zinc from zinc oxide in 5 M hydrochloric acid (3.89 mg/mL) and diluted with water to final volume. [NOTE—Dissolve in 5 M hydrochloric acid by warming, if necessary, cool, and then dilute to final volume.]

Standard stock solution: 50 µg/mL of zinc from *Zinc standard solution* diluted with 0.125 N hydrochloric acid

Standard solutions: Transfer 1.0, 2.0, 3.0, 4.0, and 5.0 mL of the *Standard stock solution* to separate 100-mL volumetric flasks. Dilute the contents of each flask with 0.125 N hydrochloric acid to volume to obtain concentrations of 0.5, 1.0, 1.5, 2.0, and 2.5 µg/mL of zinc.

Polysorbate 80 solution: Prepare as directed in *Calcium, Method 1*.

Sample solution: Proceed as directed in *Calcium, Method 1*, except prepare the *Sample solution* to contain 2 µg/mL of zinc and omit the use of the *Lanthanum chloride solution*.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry

Analytical wavelength: Zinc emission line at 213.8 nm

Lamp: Zinc hollow-cathode

Flame: Air-acetylene

Blank: 0.125 N hydrochloric acid

Analysis

Samples: *Standard solutions* and *Sample solution*

Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in µg/mL, of zinc, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, C , in µg/mL, of zinc in the *Sample solution*.

Calculate the percentage of the labeled amount of zinc (Zn) in the portion of Capsules taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of zinc in the *Sample solution* (µg/mL)

C_U = nominal concentration of zinc in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–125.0% of the labeled amount of zinc (Zn)

• BORON, NICKEL, TIN, and VANADIUM, Method 1; CALCIUM, CHROMIUM, COPPER, IRON, MAGNESIUM, MANGANESE, PHOSPHORUS, and ZINC, Method 2; MOLYBDENUM and SELENIUM, Method 3

Stock aqua regia solution: Prepare a mixture of hydrochloric acid and nitric acid (3:1) by adding the nitric acid to the hydrochloric acid. [NOTE—Periodically vent the solution in an appropriate fume hood.]

Diluent: Prepare a mixture of *Stock aqua regia solution* and water (1:9) by adding one volume of *Stock aqua regia solution* to two volumes of water. Dilute with additional water to volume, and mix well.

System suitability solution: Prepare a mixture of 1000 mg/L of yttrium in 5% nitric acid solution, 1000 mg/L of scandium in 5% nitric acid solution, and *Diluent* (1:1:198), and mix.

Standard stock solution 1 (Ca, Cu, Fe, Mg, Mn, P, and Zn): [NOTE—It is only necessary to include the minerals of interest in the solution.] Using commercially available element standard (single- or multi-element) solutions in 5% nitric acid solution, pipet the appropriate amount of element standard solution into a volumetric flask, and dilute with 5% nitric acid solution to obtain a solution having final concentrations of about 1000 mg/L of calcium, 100 mg/L of copper, 250 mg/L of iron, 500 mg/L of magnesium, 100 mg/L of manganese, 800 mg/L of phosphorus, and 250 mg/L of zinc.

Standard stock solution 2 (B, Cr, Mo, Ni, Se, Sn, and V): [NOTE—It is only necessary to include the minerals of interest in the solution.] Using commercially available element standard (single- or multi-element) solutions in 20% hydrochloric acid solution, pipet the appropriate amount of element standard solution into a volumetric flask, and dilute with 20% hydrochloric acid solution to obtain a solution having final concentrations of about 200 mg/L of boron, and 100 mg/L each of chromium, molybdenum, nickel, selenium, tin, and vanadium.

Standard solutions: Prepare a mixture of *Standard stock solution 1* and *Standard stock solution 2*, as required, in *Diluent*, to prepare a six-point calibration curve to bracket the concentration range of each mineral of interest.

Sample solution: Weigh, then transfer 5 Capsules to a 250-mL volumetric flask, and heat gently on a hot plate until the contents begin to release. Cautiously add 25 mL of *Stock aqua regia solution* in 5-mL increments, and swirl. Heat, continue to swirl until the Capsules dissolve into the acid, immediately remove from the heat source, and add 150 mL of water. Cool, and dilute with water to volume. Filter about 30 mL into a centrifuge tube, using a 5-µm pore size nylon syringe

filter. If necessary, make any further adjustments using the *Diluent*.

Instrumental conditions

(See *Plasma Spectrochemistry* <730>.)

Mode: Inductively coupled plasma spectrometry, using a spectrometer set to measure the emission of each mineral of interest at about the corresponding wavelength. [NOTE—The operating conditions may be developed and optimized based on the manufacturer's recommendation. The wavelengths selected should be demonstrated experimentally to provide sufficient specificity, sensitivity, linearity, accuracy, and precision.]

System suitability

[NOTE—Analyze the *System suitability solution*, and obtain the response as directed in the *Analysis*.]

Suitability requirements

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solutions* and *Sample solution*
Determine the emission of each mineral of interest in the *Standard solutions* and *Sample solution* with an inductively coupled plasma system using the *Diluent* as the blank. Plot the emission of the *Standard solutions* versus the concentration, in mg/L, of the minerals of interest, and draw the straight line best fitting the plotted points. From the graph so obtained, determine the concentration, *C*, in mg/L, for each mineral of interest in the *Sample solution*.

Calculate the percentage of the labeled amount for each mineral taken:

$$\text{Result} = C \times (V/W) \times F \times (C_w/L) \times 100$$

C = measured concentration of the *Sample solution* (mg/L)

V = volume of the *Sample solution* (L)

W = sample weight (mg)

F = dilution factor of the *Sample solution*

C_w = average Capsule weight (mg)

L = labeled amount per Capsule (mg)

Acceptance criteria: 90.0%–125.0% of the labeled amount of calcium (Ca), copper (Cu), iron (Fe), magnesium (Mg), manganese (Mn), phosphorus (P), and zinc (Zn); and 90.0%–160.0% of the labeled amounts of boron (B), chromium (Cr), molybdenum (Mo), nickel (Ni), selenium (Se), tin (Sn), and vanadium (V)

PERFORMANCE TESTS

• **DISINTEGRATION AND DISSOLUTION** <2040>: Meet the requirements for *Dissolution*

• **WEIGHT VARIATION** (2091): Meet the requirements

CONTAMINANTS

• **MICROBIAL ENUMERATION TESTS** <2021>: The total aerobic microbial count does not exceed 3×10^3 cfu/g, and the combined molds and yeasts count does not exceed 3×10^2 cfu/g.

• **ABSENCE OF SPECIFIED MICROORGANISMS** <2022>: Meet the requirements of the tests for absence of *Salmonella* species, *Escherichia coli*, and *Staphylococcus aureus*

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.

• **LABELING:**¹ The label states that the product is Oil-Soluble Vitamins with Minerals Capsules. The label also states the quantity of each vitamin and mineral per dosage unit and, where necessary, the chemical form in which a vitamin is present and also states the salt form of the mineral used as the source of each element. Where the product contains vitamin E, the label indicates whether it is the *d*- or *dl*- form. Where more than one assay method is given for a particular vitamin or mineral, the labeling states with which assay method the product complies only if *Method 1* is not used.

Add the following:

▲ Oil-Soluble Vitamins with Minerals Oral Solution

DEFINITION

Oil-Soluble Vitamins with Minerals Oral Solution contains two or more of the following oil-soluble vitamins: Vitamin A, as retinol or esters of retinol in the form of retinyl acetate or retinyl palmitate; Vitamin D as ergocalciferol (Vitamin D₂) or cholecalciferol (Vitamin D₃); Vitamin E, as alpha tocopherol, alpha tocopheryl acetate, or alpha tocopheryl acid succinate; Phytonadione (Vitamin K₁); beta carotene; and one or more minerals derived from substances generally recognized as safe, furnishing one or more of the following elements in ionizable form: chromium, fluorine, iodine, iron, magnesium, manganese, molybdenum, and zinc. It contains NLT 90.0% and NMT 150.0% of the labeled amounts of vitamin A, as retinol equivalent (C₂₀H₃₀O); vitamin D, as cholecalciferol (C₂₇H₄₄O) or ergocalciferol (C₂₈H₄₄O); vitamin E, as alpha tocopherol (C₂₉H₅₀O₂), alpha tocopheryl acetate (C₃₁H₅₂O₂), or alpha tocopheryl acid succinate (C₃₃H₅₄O₅); phytonadione (C₃₁H₄₆O₂); and beta carotene (C₄₀H₅₆); NLT 90.0% and NMT 160.0% of the labeled amounts of chromium (Cr), fluorine (F), iodine (I), and molybdenum (Mo); and NLT 90.0% and NMT 125.0% of the labeled amounts of iron (Fe), magnesium (Mg), manganese (Mn), and zinc (Zn).

¹ USP Units of activity for vitamins, where such exist or formerly existed, are equivalent to the corresponding international units, where such formerly existed. The USP Unit for Vitamin E has been discontinued. International units (IU) for vitamins also have been discontinued; however, the use of IU on the labels of vitamin products continues. Where articles are labeled in terms of Units in addition to the required labeling, the relationship of the USP Units or IU to mass is as follows. One USP Vitamin A Unit = 0.3 µg of all-*trans*-retinol (vitamin A alcohol) or 0.344 µg of all-*trans*-retinyl acetate (vitamin A acetate) or 0.55 µg of all-*trans*-retinyl palmitate (vitamin A palmitate), and 1 µg of retinol (3.3 USP Vitamin A Units) = 1 retinol equivalent (RE); 1 IU of beta carotene = 0.6 µg of all-*trans*-beta carotene; 1 USP Vitamin D Unit = 0.025 µg of ergocalciferol or cholecalciferol; and 1 mg of *dl*-alpha tocopherol = 1.1 former USP Vitamin E Units, 1 mg of *dl*-alpha tocopheryl acetate = 1 former USP Vitamin E Unit, 1 mg of *dl*-alpha tocopheryl acid succinate = 0.89 former USP Vitamin E Unit, 1 mg of *d*-alpha tocopherol = 1.49 former USP Vitamin E Units, and 1 mg of *d*-alpha tocopheryl acetate = 1.36 former USP Vitamin E Units, 1 mg of *d*-alpha tocopheryl acid succinate = 1.21 former USP Vitamin E Units. In terms of *d*-alpha tocopherol equivalents, 1 mg of *d*-alpha tocopheryl acetate = 0.91, 1 mg of *d*-alpha tocopheryl acid succinate = 0.81, 1 mg of *dl*-alpha tocopherol = 0.74, 1 mg of *dl*-alpha tocopheryl acetate = 0.67, and 1 mg of *dl*-alpha tocopheryl acid succinate = 0.60.

STRENGTH**• VITAMIN A**

[NOTE—Use low-actinic glassware throughout this procedure.]

Mobile phase: *n*-Hexane

Standard solution 1: 13 µg/mL of retinol from USP Retinyl Acetate RS in *n*-hexane

Standard solution 2: 13 µg/mL of retinol from USP Retinyl Palmitate RS in *n*-hexane

System suitability solution: Mix equal volumes of *Standard solution 1* and *Standard solution 2*.

Sample solution: Transfer an accurately measured volume of Oral Solution, equivalent to 3.25 mg of retinol, to a separatory funnel containing 10 mL of water and 20 mL of dehydrated alcohol. Add 100 mL of *n*-hexane, insert the stopper, and shake for 1 min. Allow the layers to separate, drain the aqueous layer into another separatory funnel, and repeat the extraction with 100 mL of *n*-hexane. Discard the aqueous layer, and combine the hexane extracts. Wash the combined extracts with 25 mL of water, allow the layers to separate, and discard the aqueous layer. Filter the washed hexane layer through anhydrous sodium sulfate into a 250-mL volumetric flask. Rinse the funnel and sodium sulfate with *n*-hexane, and add the rinsing to the hexane solution in the flask. Dilute the extracts in the volumetric flask with *n*-hexane to volume to obtain a solution with a concentration of 13 µg/mL of vitamin A as retinol (C₂₀H₃₀O).

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 325 nm

Column: 4.6-mm × 15-cm; packing L8

Flow rate: 1 mL/min

Injection volume: 40 µL

System suitability

Sample: *System suitability solution*

Suitability requirements

Resolution: NLT 10 between all-*trans*-retinyl acetate and all-*trans*-retinyl palmitate

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution 1* or *Standard solution 2* and *Sample solution*

Calculate the percentage of the labeled amount of vitamin A, as retinol (C₂₀H₃₀O), in the portion of Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of the all-*trans*-retinyl ester from the *Sample solution*

r_S = peak area of the all-*trans*-retinyl ester from the appropriate *Standard solution*

C_S = concentration of retinol in the appropriate *Standard solution* (µg/mL)

C_U = nominal concentration of vitamin A, as retinol, in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–150.0% of the labeled amount of vitamin A as retinol equivalent (C₂₀H₃₀O)

• VITAMIN D

[NOTE—Where vitamin D (cholecalciferol or ergocalciferol) is specified in the following procedure, use the chemical form present in the formulation and the relevant USP Reference Standard. Use low-actinic glassware throughout this procedure.]

Mobile phase: *n*-Hexane and isopropyl alcohol (99:1)

Standard solution: 2 µg/mL of USP Cholecalciferol RS or USP Ergocalciferol RS in *n*-hexane

System suitability solution: Heat a volume of the *Standard solution* at 60° for 1 h to partially isomerize vitamin D (cholecalciferol or ergocalciferol) to its corresponding precursor.

Sample stock solution: Using an accurately measured volume of Oral Solution, equivalent to 5.0 mg of cholecalciferol or ergocalciferol, proceed as directed for the *Sample solution* in *Vitamin A* to obtain a solution with a concentration of 20 µg/mL of cholecalciferol or ergocalciferol in *n*-hexane.

Sample solution: Transfer 5.0 mL of the *Sample stock solution* to a container having a polytetrafluoroethylene-lined screw cap. Heat, with constant shaking, for 1 h in a water bath maintained at 60° to obtain a solution containing vitamin D (cholecalciferol or ergocalciferol) and its corresponding precursor. Cool, and dilute with *n*-hexane to obtain a solution containing 2 µg/mL of cholecalciferol or ergocalciferol.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 265 nm

Column: 4.6-mm × 15-cm; 3-µm packing L8

Flow rate: 1 mL/min

Injection volume: 100 µL

System suitability

Sample: *System suitability solution*

Suitability requirements

Resolution: NLT 10 between the vitamin D form present and its corresponding precursor

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of cholecalciferol (C₂₇H₄₄O) or ergocalciferol (C₂₈H₄₄O) in the portion of Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times F \times 100$$

r_U = peak area of cholecalciferol or ergocalciferol from the *Sample solution*

r_S = peak area of cholecalciferol or ergocalciferol from the *Standard solution*

C_S = concentration of USP Cholecalciferol RS or USP Ergocalciferol RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of cholecalciferol or ergocalciferol in the *Sample solution* (µg/mL)

F = correction factor to account for the average amount of pre-vitamin D present in the *Sample solution*, 1.09

Acceptance criteria: 90.0%–150.0% of the labeled amount of vitamin D as cholecalciferol (C₂₇H₄₄O) or ergocalciferol (C₂₈H₄₄O)

• VITAMIN E

[NOTE—Where vitamin E (alpha tocopherol, alpha tocopheryl acetate, or alpha tocopheryl acid succinate) is specified in the following procedure, use the chemical form present in the formulation and the relevant USP Reference Standard. Use low-actinic glassware throughout this procedure.]

Solution A: Phosphoric acid solution (1 in 100) in water

Mobile phase: Methanol and *Solution A* (19:1)

Standard solution: 2 mg/mL of USP Alpha Tocopherol RS, USP Alpha Tocopheryl Acetate RS, or USP Alpha Tocopheryl Acid Succinate RS in methanol

Sample solution: Transfer NLT 20 mL of the solution prepared as directed for the *Sample solution* in *Vitamin A* to a suitable container, and evaporate in vacuum at room temperature to dryness. Transfer the residue with the aid of methanol to a suitable volumetric flask, and dilute with methanol to volume to obtain a concentration of 2 mg/mL of alpha tocopherol, alpha tocopheryl acetate, or alpha tocopheryl acid succinate.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC
Detector: UV 291 nm
Column: 4.6-mm × 15-cm; 5-μm packing L1
Flow rate: 1 mL/min
Injection volume: 50 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 1.5

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of alpha tocopherol ($C_{29}H_{50}O_2$), alpha tocopheryl acetate ($C_{31}H_{52}O_3$), or alpha tocopheryl acid succinate ($C_{33}H_{54}O_5$) in the portion of Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of the relevant vitamin E form from the *Sample solution*

r_S = peak area of the relevant vitamin E form from the *Standard solution*

C_S = concentration of the corresponding USP Reference Standard in the *Standard solution* (mg/mL)

C_U = nominal concentration of the corresponding form of vitamin E in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–150.0% of the labeled amount of vitamin E

• **PHYTONADIONE (VITAMIN K₁)**

[NOTE—Use low-actinic glassware throughout this procedure.]

Mobile phase: Methanol and water (19:1)

Standard stock solution: 200 μg/mL of USP Phytonadione RS in methanol. Dissolve with the aid of sonication if necessary.

Standard solution: 20 μg/mL of USP Phytonadione RS from the *Standard stock solution* diluted with methanol

System suitability solution: 0.65 mg/mL of USP Alpha Tocopheryl Acetate RS and 20 μg/mL of USP Phytonadione RS from the *Standard stock solution* diluted with methanol. [NOTE—Dissolve USP Alpha Tocopheryl Acetate RS in a portion of methanol, add the *Standard stock solution*, and then dilute with methanol to volume.]

Sample solution: Transfer NLT 20 mL of the solution prepared as directed for the *Sample solution* in *Vitamin A* to a suitable container, and evaporate in vacuum at room temperature to dryness. Transfer the residue with the aid of methanol to a suitable volumetric flask, and dilute with methanol to volume to obtain a concentration of 20 μg/mL of phytonadione.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm × 15-cm; 5-μm packing L1

Flow rate: 1 mL/min

Injection volume: 50 μL

System suitability

Samples: *Standard solution* and *System suitability solution*

Suitability requirements

Resolution: NLT 5 between alpha tocopheryl acetate and phytonadione, *System suitability solution*

Relative standard deviation: NMT 3.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of phytonadione ($C_{31}H_{46}O_2$) in the portion of Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area from the *Sample solution*

r_S = peak area from the *Standard solution*

C_S = concentration of USP Phytonadione RS in the *Standard solution* (μg/mL)

C_U = nominal concentration of phytonadione in the *Sample solution* (μg/mL)

Acceptance criteria: 90.0%–150.0% of the labeled amount of phytonadione ($C_{31}H_{46}O_2$)

• **BETA CAROTENE**

[NOTE—Use low-actinic glassware.]

Mobile phase: Transfer 50 mg of butylated hydroxytoluene into a 1-L volumetric flask, and dissolve with 20 mL of 2-propanol. Add 0.2 mL of *N*-ethyl-diisopropylamine, 25 mL of 0.2% ammonium acetate solution, 455 mL of acetonitrile, and about 450 mL of methanol. Allow the solution to reach room temperature, and dilute with methanol to volume.

Diluent: 50 μg/mL of butylated hydroxytoluene in alcohol

System suitability solution: Transfer 20 mg of USP Beta Carotene System Suitability RS to a 50-mL volumetric flask. Add 1 mL of water, 4 mL of tetrahydrofuran, and sonicate for 5 min. Dilute with *Diluent* to volume, and sonicate for 5 min. Cool to room temperature, pass the suspension through a membrane filter of 0.45-μm pore size, and use the clear filtrate.

Standard stock solution: 60 μg/mL of USP Beta Carotene RS in tetrahydrofuran

Standard solution A: Transfer 5.0 mL of the *Standard stock solution* into a 100-mL volumetric flask, add 5.0 mL of tetrahydrofuran, and dilute with *Diluent* to volume.

Determine the concentration of *Standard solution A* from the concentration of *Standard solution B* as described below.

Standard solution B: Transfer 5.0 mL of the *Standard stock solution* into a 100-mL volumetric flask, and dilute with cyclohexane to volume. Prepare in triplicate.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* <851>.)

Analytical wavelength: 457 nm

Cell path: 1 cm

Blank: Cyclohexane

Analysis

Sample: *Standard solution B*

Calculate the concentration of total beta carotene (mg/mL) as all-*trans*-beta carotene ($C_{40}H_{56}$) in *Standard solution B*. [NOTE—The concentration of *Standard solution B* equals the concentration of *Standard solution A*.]

$$\text{Result} = A/F$$

A = average absorbance of the three preparations of *Standard solution B*

F = absorptivity of pure all-*trans*-beta carotene in cyclohexane, 250

Sample solution: Transfer NLT 20 mL of the solution prepared as directed for the *Sample solution* in *Vitamin A* to a suitable container, and evaporate in vacuum at room temperature to dryness. Dissolve the residue in a mixture of methylene chloride and *Diluent* (1:1), and dilute with the same mixture to obtain a concentration of 3 μg/mL of beta carotene. Pass through a membrane filter of 0.45-μm pore size if necessary.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC
Detector: UV-Vis 448 nm
Column: 4.6-mm × 25-cm; 5-μm packing L68
Column temperature: 30°
Flow rate: 0.6 mL/min
Injection volume: 20 μL

System suitability

Samples: *System suitability solution* and *Standard solution A*

[NOTE—The approximate relative retention times of the components in the *System suitability solution* are listed in Table 1.]

Table 1

Name	Relative Retention Time	Relative Response Factor
All-trans-alpha carotene	0.93	1.1
All-trans-beta carotene	1.00	1
9-cis-Beta carotene	1.07	1
13-cis-Beta carotene	1.17	1.2
15-cis-Beta carotene	1.21	1.4

Suitability requirements

Chromatogram similarity: The chromatogram from the *System suitability solution* is similar to the reference chromatogram provided with the lot of USP Beta Carotene System Suitability RS being used.

Resolution: NLT 1.5 between beta carotene and alpha carotene and between beta carotene and 9-cis-beta carotene, *System suitability solution*

Tailing factor: NMT 2.0 for the beta carotene peak, *Standard solution A*

Relative standard deviation: NMT 2.0% for the beta carotene peak from replicate injections, *Standard solution A*

Analysis

Samples: *Standard solution A* and *Sample solution*

Calculate the percentage of all-trans-beta carotene in the portion of Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of all-trans-beta carotene from the *Sample solution*

r_S = peak area of all-trans-beta carotene from *Standard solution A*

C_S = concentration of all-trans-beta carotene in *Standard solution A* as determined by spectrometric procedure

C_U = nominal concentration of beta carotene in the *Sample solution*

Acceptance criteria: 90.0%–150.0% of the labeled amount of beta carotene ($C_{40}H_{56}$)

• CHROMIUM

Chromium standard solution: 1000 μg/mL of chromium from potassium dichromate, previously dried at 120° for 4 h in water. Store in a polyethylene bottle.

Standard stock solution: 10 μg/mL of chromium from the *Chromium standard solution* diluted with 6 N hydrochloric acid and water (1 in 20)

Standard solutions: Transfer 10.0 and 20.0 mL of the *Standard stock solution* to separate 100-mL volumetric flasks, and transfer 15.0 and 20.0 mL of the *Standard stock solution* to separate 50-mL volumetric flasks. Dilute the contents of each of the four flasks with 0.125 N hydrochloric acid to volume to obtain concentrations of 1.0, 2.0, 3.0, and 4.0 μg/mL of chromium.

Sample solution: Dilute an accurately measured volume of Oral Solution to obtain a solution equivalent to 2.5 μg/mL of chromium in 0.125 N hydrochloric acid.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometer

Lamp: Chromium hollow-cathode

Flame: Air-acetylene

Analytical wavelength: 357.9 nm

Blank: 0.125 N hydrochloric acid

Analysis

Samples: *Standard solutions* and *Sample solution*

Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus concentration, in μg/mL, of chromium, and draw the straight line best fitting the four plotted points. From the graph so obtained, determine the concentration, C , in μg/mL, of chromium in the *Sample solution*.

Calculate the percentage of the labeled amount of chromium (Cr) in the portion of Oral Solution taken:

$$\text{Result} = (C/C_U) \times 100$$

C = concentration of chromium in the *Standard solution* (μg/mL)

C_U = nominal concentration of chromium in the *Sample solution* (μg/mL)

Acceptance criteria: 90.0%–160.0% of the labeled amount of chromium (Cr)

• FLUORIDE

[NOTE—Use plastic containers throughout this procedure.]

Ascorbic acid solution: 70 mg/mL of ascorbic acid in water

Mobile phase: Alcohol, water, and 1 N sulfuric acid (50:449:1)

Standard stock solution: 220 μg/mL of USP Sodium Fluoride RS in water. This solution contains 100 μg/mL of fluoride.

Standard solution: Transfer 5.0 mL of the *Standard stock solution* to a 100-mL volumetric flask. Add 2 mL of *Ascorbic acid solution*, 10 mL of alcohol, and about 70 mL of water, and mix. Adjust with 1 N sodium hydroxide to a pH of 4.25 ± 0.05 . Dilute with water to volume, and mix to obtain 5 μg/mL of fluoride solution.

Sample solution: Transfer an accurately measured volume of the Oral Solution, equivalent to 0.5 mg of fluoride, to a 100-mL volumetric flask. Add 1 drop of hydrochloric acid, 10 mL of alcohol, and about 75 mL of water, and mix. Adjust with 1 N sodium hydroxide to a pH of 4.25 ± 0.05 . Dilute with water to volume.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: Conductivity

Columns

Guard: 4.6-mm × 3-cm; packing L17

Analytical: 7.8-mm × 30-cm; packing L17

Flow rate: 0.6 mL/min

Injection volume: 100 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas of fluoride. Calculate the percentage of the labeled amount of fluorine (F) in the portion of Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of fluoride from the *Sample solution*
 r_S = peak area of fluoride from the *Standard solution*

C_S = concentration of fluoride in the *Standard solution* (μg/mL)

C_U = nominal concentration of fluorine in the
Sample solution ($\mu\text{g/mL}$)

Acceptance criteria: 90.0%–160.0% of the labeled amount of fluorine (F)

• **IODIDE, Method 1**

Mobile phase: Dissolve 5.15 g of tetrabutylammonium bromide in 320 mL of acetonitrile. Dilute with water to 2000 mL.

System suitability solution: Transfer 0.13 g of potassium iodide and 0.5 g of potassium iodate to a 100-mL volumetric flask. Dissolve in *Mobile phase*, using sonication if necessary, dilute with *Mobile phase* to volume, and mix. Transfer 1.0 mL of this solution to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Transfer 25.0 mL of this solution to a 100-mL volumetric flask, and dilute with *Mobile phase* to volume.

Standard stock solution: 1.3 mg/mL of potassium iodide in *Mobile phase*. This solution has a concentration of 1 mg/mL of iodide.

Standard solution: 2.5 $\mu\text{g/mL}$ of iodide from the *Standard stock solution* in *Mobile phase*

Sample solution: Dilute an accurately measured volume of the Oral Solution to obtain a solution with a concentration of 2.5 $\mu\text{g/mL}$ of iodine in *Mobile phase*.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 225 nm

Column: 4.6-mm \times 15-cm; packing L1

Flow rate: 1.5 mL/min

Injection volume: 30 μL

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for iodate and iodide are about 0.32 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 2.5 between iodate and iodide, *System suitability solution*

Relative standard deviation: NMT 2.0% for the iodide peak, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of iodine (I) in the portion of Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of iodide from the *Sample solution*

r_S = peak area of iodide from the *Standard solution*

C_S = concentration of iodide in the *Standard solution* ($\mu\text{g/mL}$)

C_U = nominal concentration of iodine in the *Sample solution* ($\mu\text{g/mL}$)

Acceptance criteria: 90.0%–160.0% of the labeled amount of iodine (I)

• **IODIDE, Method 2**

Analysis: Proceed as directed for *Automated Methods of Analysis* (16), *Assay for Iodide*.

Acceptance criteria: 90.0%–160.0% of the labeled amount of iodine (I)

• **IRON**

Iron standard stock solution: Transfer 100 mg of iron powder to a 1000-mL volumetric flask. Dissolve in 6 N hydrochloric acid, and dilute with water to volume.

Standard solutions: To separate 100-mL volumetric flasks, transfer 2.0, 4.0, 5.0, 6.0, and 8.0 mL of *Iron standard stock solution*. Dilute the contents of each flask with 0.125 N hydrochloric acid to volume to obtain concentrations of 2.0, 4.0, 5.0, 6.0, and 8.0 $\mu\text{g/mL}$ of iron.

Sample solution: 6 $\mu\text{g/mL}$ of iron from the Oral Solution in 0.125 N hydrochloric acid

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* <851>.)

Mode: Atomic absorption spectrophotometer

Lamp: Iron hollow-cathode

Flame: Air–acetylene

Analytical wavelength: 248.3 nm

Blank: 0.125 N hydrochloric acid

Analysis

Samples: *Standard solutions* and *Sample solution*

Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus concentration, in $\mu\text{g/mL}$, of iron, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, C , in $\mu\text{g/mL}$, of iron in the *Sample solution*.

Calculate the percentage of the labeled amount of iron (Fe) in the portion of Oral Solution taken:

$$\text{Result} = (C/C_U) \times 100$$

C = concentration of iron in the *Sample solution* from the graph ($\mu\text{g/mL}$)

C_U = nominal concentration of iron in the *Sample solution* ($\mu\text{g/mL}$)

Acceptance criteria: 90.0%–125.0% of the labeled amount of iron (Fe)

• **MAGNESIUM**

Magnesium standard solution: Transfer 1.00 g of magnesium ribbon to a 1000-mL volumetric flask. Dissolve in 50 mL of 6 N hydrochloric acid, and dilute with water to volume.

Standard stock solution: 20 $\mu\text{g/mL}$ of magnesium from *Magnesium standard solution* in 0.125 N hydrochloric acid

Standard solutions: To separate 100-mL volumetric flasks transfer 5.0, 7.5, 10.0, 12.5, and 15.0 mL of *Standard stock solution*. Dilute with 0.125 N hydrochloric acid to volume to obtain concentrations of 1.0, 1.5, 2.0, 2.5, and 3.0 $\mu\text{g/mL}$ of magnesium.

Sample solution: 2.5 $\mu\text{g/mL}$ of magnesium from the Oral Solution in 0.125 N hydrochloric acid

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* <851>.)

Mode: Atomic absorption spectrophotometer

Analytical wavelength: 285.2 nm

Lamp: Magnesium hollow-cathode

Flame: Air–acetylene

Blank: 0.125 N hydrochloric acid

Analysis

Samples: *Standard solutions* and *Sample solution*

Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus concentration, in $\mu\text{g/mL}$, of magnesium, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, C , in $\mu\text{g/mL}$, of magnesium in the *Sample solution*.

Calculate the percentage of the labeled amount of magnesium (Mg) in the portion of Oral Solution taken:

$$\text{Result} = (C/C_U) \times 100$$

C = concentration of magnesium in the *Sample solution* from the graph ($\mu\text{g/mL}$)

C_U = nominal concentration of magnesium in the *Sample solution* ($\mu\text{g/mL}$)

Acceptance criteria: 90.0%–125.0% of the labeled amount of magnesium (Mg)

• **MANGANESE**

Manganese standard solution: Transfer 1.0 g of manganese to a 1000-mL volumetric flask. Dissolve in 20 mL of nitric acid, and dilute with 6 N hydrochloric acid to volume.

Standard stock solution: 50 µg/mL of manganese from the *Manganese standard stock solution* in 0.125 N hydrochloric acid

Standard solutions: To separate 100-mL volumetric flasks transfer 1.0, 1.5, 2.0, 3.0, and 4.0 mL of the *Standard stock solution*. Dilute the contents of each flask with 0.125 N hydrochloric acid to volume to obtain solutions having known concentrations of 0.5, 0.75, 1.0, 1.5, and 2.0 µg/mL of manganese.

Sample solution: Dilute an accurately measured volume of the Oral Solution to obtain 1.5 µg/mL of manganese in 0.125 N hydrochloric acid.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometer

Analytical wavelength: 279.5 nm

Lamp: Manganese hollow-cathode

Flame: Air-acetylene

Blank: 0.125 N hydrochloric acid

Analysis

Samples: *Standard solutions* and *Sample solution*
Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus concentration, in µg/mL, of manganese, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, *C*, in µg/mL, of manganese in the *Sample solution*.

Calculate the percentage of the labeled amount of manganese (Mn) in the portion of Oral Solution taken:

$$\text{Result} = (C/C_U) \times 100$$

C = concentration of manganese in the *Sample solution* from the graph (µg/mL)

C_U = nominal concentration of manganese in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–125.0% of the labeled amount of manganese (Mn)

• MOLYBDENUM

Molybdenum standard solution: Transfer 1.0 g of molybdenum wire to a 1000-mL volumetric flask, and dissolve in 50 mL of nitric acid, warming if necessary. Dilute with water to volume.

Standard stock solution: 100 µg/mL of molybdenum from the *Molybdenum standard solution* in water

Standard solutions: To separate 100-mL volumetric flasks transfer 0.5, 1.0, 1.5, 2.0, and 3.0 mL of the *Standard stock solution*. Add 0.125 N hydrochloric acid to volume, and mix to obtain the solutions having known concentrations of about 0.5, 1.0, 1.5, 2.0, and 3.0 µg/mL of molybdenum.

Sample solution: Dilute an accurately measured volume of the Oral Solution to obtain 1.5 µg/mL of molybdenum from the Oral Solution in 0.125 N hydrochloric acid.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometer

Analytical wavelength: 313.3 nm

Lamp: Molybdenum hollow-cathode

Flame: Nitrous oxide-acetylene

Blank: 0.125 N hydrochloric acid

Analysis

Samples: *Standard solutions* and *Sample solution*
Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus concentration, in µg/mL, of molybdenum, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, *C*, in µg/mL, of molybdenum in the *Sample solution*.

Calculate the percentage of the labeled amount of molybdenum (Mo) in the portion of Oral Solution taken:

$$\text{Result} = (C/C_U) \times 100$$

C = concentration of molybdenum in the *Sample solution* from the graph (µg/mL)

C_U = nominal concentration of molybdenum in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–160.0% of the labeled amount of molybdenum (Mo)

• ZINC

Zinc standard solution: Transfer 311 mg of zinc oxide to a 250-mL volumetric flask, and add 80 mL of 6 N hydrochloric acid, warming if necessary to dissolve. Cool, dilute with water to volume, and mix to obtain a solution having a known concentration of 1000 µg/mL of zinc.

Standard stock solution: 50 µg/mL of zinc from the *Zinc standard solution* in 0.125 N hydrochloric acid

Standard solutions: Transfer 1.0, 2.0, 3.0, 4.0, and 5.0 mL of the *Standard stock solution* to separate 100-mL volumetric flasks. Dilute the contents of each flask with 0.125 N hydrochloric acid to volume to obtain concentrations of 0.5, 1.0, 1.5, 2.0, and 2.5 µg/mL of zinc.

Sample solution: Dilute an accurately measured volume of Oral Solution to obtain 1.5 µg/mL of zinc in 0.125 N hydrochloric acid.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometer

Analytical wavelength: 213.8 nm

Lamp: Zinc hollow-cathode

Flame: Air-acetylene

Blank: 0.125 N hydrochloric acid

Analysis

Samples: *Standard solutions* and *Sample solution*
Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus concentration, in µg/mL, of zinc, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, *C*, in µg/mL, of zinc in the *Sample solution*.

Calculate the percentage of the labeled amount of zinc (Zn) in the portion of Oral Solution taken:

$$\text{Result} = (C/C_U) \times 100$$

C = concentration of zinc in the *Sample solution* from the graph (µg/mL)

C_U = nominal concentration of zinc in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–125.0% of the labeled amount of zinc (Zn)

OTHER COMPONENTS

- **ALCOHOL DETERMINATION, Method I (611)** (if present): 90.0%–120.0% of the labeled amount of C₂H₅OH

CONTAMINANTS

- **MICROBIAL ENUMERATION TESTS (2021):** The total aerobic microbial count does not exceed 3×10^3 cfu/mL, and the combined molds and yeasts count does not exceed 3×10^2 cfu/mL.
- **ABSENCE OF SPECIFIED MICROORGANISMS (2022):** Meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, under an inert gas or with a minimum of headspace.

- **LABELING:**¹ The label states that the product is Oil-Soluble Vitamins with Minerals Oral Solution. The label states the quantity of each vitamin and mineral in a given volume of the Oral Solution and, where necessary, the chemical form in which a vitamin is present, and states also the salt form of the mineral used as the source of each element. Where the product contains vitamin E, the label indicates whether it is the *d*- or *dl*-form. Where more than one assay method is given for a particular mineral, the labeling states with which assay method the product complies only if *Method 1* is not used.

- **USP REFERENCE STANDARDS** (11)

Add the following:

▲ Oil-Soluble Vitamins with Minerals Tablets

DEFINITION

Oil-Soluble Vitamins with Minerals Tablets contain two or more of the following oil-soluble vitamins: Vitamin A, as retinol or esters of retinol in the form of retinyl acetate or retinyl palmitate; Vitamin D as ergocalciferol (Vitamin D₂) or cholecalciferol (Vitamin D₃); Vitamin E, as alpha tocopherol, alpha tocopheryl acetate or alpha tocopheryl acid succinate; Phytonadione (Vitamin K₁); beta carotene; and one or more minerals derived from substances generally recognized as safe, furnishing one or more of the following elements in ionizable form: boron, calcium, chromium, copper, fluorine, iodine, iron, magnesium, manganese, molybdenum, nickel, phosphorus, potassium, selenium, tin, vanadium, and zinc. Tablets contain NLT 90.0% and NMT 165.0% of the labeled amounts of vitamin A, as retinol equivalent (C₂₀H₃₀O); vitamin D, as cholecalciferol (C₂₇H₄₄O) or ergocalciferol (C₂₈H₄₄O); vitamin E, as alpha tocopherol (C₂₉H₅₀O₂), alpha tocopheryl acetate (C₃₁H₅₂O₃), or alpha tocopheryl acid succinate (C₃₃H₅₄O₅); phytonadione (C₃₁H₄₆O₂); and beta carotene (C₄₀H₅₆); NLT 90.0% and NMT 125.0% of the labeled amounts of calcium (Ca), copper (Cu), iron (Fe), manganese (Mn), magnesium (Mg), phosphorus (P), potassium

¹ USP Units of activity for vitamins, where such exist or formerly existed, are equivalent to the corresponding international units, where such formerly existed. The USP Unit for Vitamin E has been discontinued. International units (IU) for vitamins also have been discontinued. However, the use of IU on the labels of vitamin products continues. Where articles are labeled in terms of Units in addition to the required labeling, the relationship of the USP Units or IU to mass is as follows. One USP Vitamin A Unit = 0.3 µg of all-*trans*-retinol (vitamin A alcohol) or 0.344 µg of all-*trans*-retinyl acetate (vitamin A acetate) or 0.55 µg of all-*trans*-retinyl palmitate (vitamin A palmitate), and 1 µg of retinol (3.3 USP Vitamin A Units) = 1 retinol equivalent (RE); 1 IU of beta carotene = 0.6 µg of all-*trans*-beta carotene; 1 USP Vitamin D Unit = 0.025 µg of ergocalciferol or cholecalciferol; and 1 mg of *dl*-alpha tocopherol = 1.1 former USP Vitamin E Units, 1 mg of *dl*-alpha tocopheryl acetate = 1 former USP Vitamin E Unit, 1 mg of *dl*-alpha tocopheryl acid succinate = 0.89 former USP Vitamin E Unit, 1 mg of *d*-alpha tocopherol = 1.49 former USP Vitamin E Units, 1 mg of *d*-alpha tocopheryl acetate = 1.36 former USP Vitamin E Units, and 1 mg of *d*-alpha tocopheryl acid succinate = 1.21 former USP Vitamin E Units. In terms of *d*-alpha tocopherol equivalents, 1 mg of *d*-alpha tocopheryl acetate = 0.91, 1 mg of *d*-alpha tocopheryl acid succinate = 0.81, 1 mg of *dl*-alpha tocopherol = 0.74, 1 mg of *dl*-alpha tocopheryl acetate = 0.67, and 1 mg of *dl*-alpha tocopheryl acid succinate = 0.60.

(K), and zinc (Zn); and NLT 90.0% and NMT 160.0% of the labeled amounts of boron (B), chromium (Cr), fluorine (F), iodine (I), molybdenum (Mo), nickel (Ni), selenium (Se), tin (Sn), and vanadium (V).

They may contain other labeled added substances that are generally recognized as safe, in amounts that are unobjectionable.

STRENGTH

• VITAMIN A

[NOTE—Use low-actinic glassware throughout this procedure.]

Mobile phase: *n*-Hexane

Standard solution 1: 13 µg/mL of retinol from USP Retinyl Acetate RS in *n*-hexane

Standard solution 2: 13 µg/mL of retinol from USP Retinyl Palmitate RS in *n*-hexane

System suitability solution: Mix equal volumes of *Standard solution 1* and *Standard solution 2*.

Sample solution: Finely powder NLT 20 Tablets. To a portion of the powder, equivalent to 5 Tablets, add 15 mL of water, and sonicate for 5 min. Add 15 mL of *n*-hexane, and shake for 15 min in a water bath maintained at 60°. Add 10 mL of dimethyl sulfoxide, and shake for an additional period of 30 min in a water bath maintained at 60°. Centrifuge at 3000 rpm for 10 min, and transfer the hexane layer by means of a pipet to a 100-mL volumetric flask. Add 15 mL of *n*-hexane to the dimethyl sulfoxide layer, shake thoroughly for 5 min, and transfer the hexane layer by means of a pipet to the 100-mL volumetric flask. Repeat this extraction with three additional 15-mL portions of *n*-hexane. Dilute the extracts in the volumetric flask with *n*-hexane to volume. Further dilute this solution with *n*-hexane to obtain a solution with a concentration equivalent to 13 µg/mL of retinol (C₂₀H₃₀O).

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 325 nm

Column: 4.6-mm × 15-cm; packing L8

Flow rate: 1 mL/min

Injection volume: 40 µL

System suitability

Sample: *System suitability solution*

Suitability requirements

Resolution: NLT 10 between all-*trans*-retinyl acetate and all-*trans*-retinyl palmitate

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution 1* or *Standard solution 2* and *Sample solution*

Calculate the percentage of the labeled amount of vitamin A, as retinol (C₂₀H₃₀O), in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of the all-*trans*-retinyl ester from the *Sample solution*

r_S = peak area of the all-*trans*-retinyl ester from the appropriate *Standard solution*

C_S = concentration of retinol in the appropriate *Standard solution* (µg/mL)

C_U = nominal concentration of vitamin A, as retinol, in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–165.0% of the labeled amount of vitamin A as retinol equivalent (C₂₀H₃₀O)

• VITAMIN D

[NOTE—Where vitamin D (cholecalciferol or ergocalciferol) is specified in the following procedure, use the chemical form present in the formulation and the relevant USP Reference Standard. Use low-actinic glassware throughout this procedure.]

Mobile phase: *n*-Hexane and isopropyl alcohol (99:1)
Standard solution: 2 µg/mL of USP Cholecalciferol RS or USP Ergocalciferol RS in *n*-hexane

System suitability solution: Heat a volume of the *Standard solution* at 60° for 1 h to partially isomerize vitamin D (cholecalciferol or ergocalciferol) to its corresponding precursor.

Sample solution: Transfer NLT 20 mL of the solution prepared as directed for the *Sample solution* in *Vitamin A* to a suitable container, and evaporate, if necessary, in vacuum at room temperature to obtain a concentration of 2 µg/mL of cholecalciferol or ergocalciferol.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 265 nm

Column: 4.6-mm × 15-cm; 3-µm packing L8

Flow rate: 1 mL/min

Injection volume: 100 µL

System suitability

Sample: *System suitability solution*

Suitability requirements

Resolution: NLT 10 between the vitamin D form present and its corresponding precursor

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of cholecalciferol (C₂₇H₄₄O) or ergocalciferol (C₂₈H₄₄O) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times F \times 100$$

r_U = peak area of cholecalciferol or ergocalciferol from the *Sample solution*

r_S = peak area of cholecalciferol or ergocalciferol from the *Standard solution*

C_S = concentration of USP Cholecalciferol RS or USP Ergocalciferol RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of cholecalciferol or ergocalciferol in the *Sample solution* (µg/mL)

F = correction factor to account for the average amount of pre-vitamin D present in the *Sample solution*, 1.09

Acceptance criteria: 90.0%–165.0% of the labeled amount of vitamin D as cholecalciferol (C₂₇H₄₄O) or ergocalciferol (C₂₈H₄₄O)

• VITAMIN E

[NOTE—Where vitamin E (alpha tocopherol, alpha tocopheryl acetate, or alpha tocopheryl acid succinate) is specified in the following procedure, use the chemical form present in the formulation and the relevant USP Reference Standard. Use low-actinic glassware throughout this procedure.]

Solution A: Phosphoric acid solution in water (1 in 100)

Mobile phase: Methanol and *Solution A* (19:1)

Standard solution: 2 mg/mL of USP Alpha Tocopherol RS, USP Alpha Tocopheryl Acetate RS, or USP Alpha Tocopheryl Acid Succinate RS in methanol

Sample solution: Transfer NLT 20 mL of the solution prepared as directed for the *Sample solution* in *Vitamin A* to a suitable container, and evaporate in vacuum at room temperature to dryness. Transfer the residue with the aid of methanol to a suitable volumetric flask, and dilute with methanol to volume to obtain a concentration of 2 mg/mL of alpha tocopherol, alpha tocopheryl acetate, or alpha tocopheryl acid succinate.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 291 nm

Column: 4.6-mm × 15-cm; 5-µm packing L1

Flow rate: 1 mL/min

Injection volume: 50 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 1.5

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of alpha tocopherol (C₂₉H₅₀O₂), alpha tocopheryl acetate (C₃₁H₅₂O₃), or alpha tocopheryl acid succinate (C₃₃H₅₄O₅) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of the relevant vitamin E form from the *Sample solution*

r_S = peak area of the relevant vitamin E form from the *Standard solution*

C_S = concentration of the corresponding USP Reference Standard in the *Standard solution* (mg/mL)

C_U = nominal concentration of the corresponding form of vitamin E in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–165.0% of the labeled amount of vitamin E

• PHYTONADIONE (VITAMIN K₁)

[NOTE—Use low-actinic glassware throughout this procedure.]

Mobile phase: Methanol and water (19:1)

Standard stock solution: 200 µg/mL of USP Phytonadione RS in methanol. Dissolve with the aid of sonication if necessary.

Standard solution: 20 µg/mL of USP Phytonadione RS from the *Standard stock solution* diluted with methanol

System suitability solution: 0.65 mg/mL of USP Alpha Tocopheryl Acetate RS and 20 µg/mL of USP Phytonadione RS from the *Standard stock solution* diluted with methanol. [NOTE—Dissolve USP Alpha Tocopheryl Acetate RS in a portion of methanol, add the *Standard stock solution*, and then dilute with methanol to volume.]

Sample solution: Transfer NLT 20 mL of the solution prepared as directed for the *Sample solution* in *Vitamin A* to a suitable container, and evaporate in vacuum at room temperature to dryness. Transfer the residue with the aid of methanol to a suitable volumetric flask, and dilute with methanol to volume to obtain a concentration of 20 µg/mL of phytonadione.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm × 15-cm; 5-µm packing L1

Flow rate: 1 mL/min

Injection volume: 50 µL

System suitability

Samples: *Standard solution* and *System suitability solution*

Suitability requirements

Resolution: NLT 5 between alpha tocopheryl acetate and phytonadione, *System suitability solution*

Relative standard deviation: NMT 3.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of phytonadione ($C_{31}H_{46}O_2$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area from the *Sample solution*
 r_S = peak area from the *Standard solution*
 C_S = concentration of USP Phytonadione RS in the *Standard solution* ($\mu\text{g/mL}$)
 C_U = nominal concentration of phytonadione in the *Sample solution* ($\mu\text{g/mL}$)

Acceptance criteria: 90.0%–165.0% of the labeled amount of phytonadione ($C_{31}H_{46}O_2$)

• **BETA CAROTENE**

[NOTE—Use low-actinic glassware.]

Mobile phase: Transfer 50 mg of butylated hydroxytoluene into a 1-L volumetric flask, and dissolve with 20 mL of 2-propanol. Add 0.2 mL of *N*-ethyl-diisopropylamine, 25 mL of 0.2% ammonium acetate solution, 455 mL of acetonitrile, and about 450 mL of methanol. Allow the solution to reach room temperature, and dilute with methanol to volume.

Diluent: 50 $\mu\text{g/mL}$ of butylated hydroxytoluene in alcohol

System suitability solution: Transfer 20 mg of USP Beta Carotene System Suitability RS to a 50-mL volumetric flask. Add 1 mL of water, 4 mL of tetrahydrofuran, and sonicate for 5 min. Dilute with *Diluent* to volume, and sonicate for 5 min. Cool to room temperature, pass the suspension through a membrane filter of 0.45- μm pore size, and use the clear filtrate.

Standard stock solution: 60 $\mu\text{g/mL}$ of USP Beta Carotene RS in tetrahydrofuran

Standard solution A: Transfer 5.0 mL of the *Standard stock solution* into a 100-mL volumetric flask, add 5.0 mL of tetrahydrofuran, and dilute with *Diluent* to volume.

Determine the concentration of *Standard solution A* from the concentration of *Standard solution B* as follows.

Standard solution B: Transfer 5.0 mL of the *Standard stock solution* into a 100-mL volumetric flask, and dilute with cyclohexane to volume. Prepare in triplicate.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Analytical wavelength: 457 nm

Cell path: 1 cm

Blank: Cyclohexane

Analysis

Sample: *Standard solution B*

Calculate the concentration of total beta carotene (mg/mL) as all-*trans*-beta carotene ($C_{40}H_{56}$) in *Standard solution B*. [NOTE—The concentration of *Standard solution B* equals the concentration of *Standard solution A*.]

$$\text{Result} = A/F$$

A = average absorbance of the three preparations of *Standard solution B*

F = absorptivity of pure all-*trans*-beta carotene in cyclohexane, 250

Sample solution: Transfer NLT 20 mL of the solution prepared as directed for the *Sample solution* in *Vitamin A* to a suitable container, and evaporate in vacuum at room temperature to dryness. Dissolve the residue in a mixture of methylene chloride and *Diluent* (1:1), and dilute with the same mixture to obtain a concentration of 3 $\mu\text{g/mL}$ of beta carotene. Pass through a membrane filter of 0.45- μm pore size, if necessary.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV-Vis 448 nm

Column: 4.6-mm \times 25-cm; 5- μm packing L68

Column temperature: 30°

Flow rate: 0.6 mL/min

Injection volume: 20 μL

System suitability

Samples: *System suitability solution* and *Standard solution A*

The approximate relative retention times of the components in the *System suitability solution* are listed in *Table 1*.

Table 1

Name	Relative Retention Time	Relative Response Factor
All- <i>trans</i> -alpha carotene	0.93	1.1
All- <i>trans</i> -beta carotene	1.00	1
9- <i>cis</i> -Beta carotene	1.07	1
13- <i>cis</i> -Beta carotene	1.17	1.2
15- <i>cis</i> -Beta carotene	1.21	1.4

Suitability requirements

Chromatogram similarity: The chromatogram from the *System suitability solution* is similar to the reference chromatogram provided with the USP Beta Carotene System Suitability RS being used.

Resolution: NLT 1.5 between beta carotene and alpha carotene and between beta carotene and 9-*cis*-beta carotene, *System suitability solution*

Tailing factor: NMT 2.0 for the beta carotene peak, *Standard solution A*

Relative standard deviation: NMT 2.0% for the beta carotene peak from replicate injections, *Standard solution A*

Analysis

Samples: *Standard solution A* and *Sample solution*

Calculate the percentage of all-*trans*-beta carotene in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of all-*trans*-beta carotene in the *Sample solution*

r_S = peak area of all-*trans*-beta carotene in *Standard solution A*

C_S = concentration of all-*trans*-beta carotene in *Standard solution A* as determined by spectrometric procedure

C_U = nominal concentration of beta carotene in the *Sample solution*

Acceptance criteria: 90.0%–165.0% of the labeled amount of beta carotene ($C_{40}H_{56}$)

• **CALCIUM, Method 1**

Lanthanum chloride solution: 267 mg/mL of lanthanum chloride heptahydrate in 0.125 N hydrochloric acid

Calcium standard solution: 400 $\mu\text{g/mL}$ of calcium. Dissolve 1.001 g of calcium carbonate, previously dried at 300° for 3 h and cooled in a desiccator for 2 h, in 25 mL of 1 N hydrochloric acid. Boil to expel carbon dioxide, and dilute with water to 1000 mL.

Standard stock solution: 100 $\mu\text{g/mL}$ of calcium from the *Calcium standard solution* diluted with 0.125 N hydrochloric acid

Standard solutions: Into separate 100-mL volumetric flasks pipet 1.0, 1.5, 2.0, 2.5, and 3.0 mL of the *Standard stock solution*. To each flask add 1.0 mL of *Lanthanum chloride solution*, and dilute with 0.125 N hydrochloric acid to volume to obtain concentrations of 1.0, 1.5, 2.0, 2.5, and 3.0 $\mu\text{g/mL}$ of calcium.

Sample solution: Finely powder NLT 20 Tablets.

Transfer a portion of the powder, equivalent to 5 Tablets, to a porcelain crucible. Heat the crucible in a muffle furnace maintained at 550° for 6–12 h, and cool. Add 60 mL of hydrochloric acid, and boil gently on a hot plate or steam bath for 30 min, intermittently rinsing the inner surface of the crucible with 6 N hydrochloric acid. Cool, and quantitatively transfer the contents of the crucible to a 100-mL volumetric flask. Rinse the crucible with small portions of 6 N hydrochloric acid, and add the rinsings to the flask. Dilute with water to volume, and filter, discarding the first 5 mL of the filtrate. Dilute this solution quantitatively, with 0.125 N hydrochloric acid, to obtain a concentration of 2 µg/mL of calcium, adding 1 mL of *Lanthanum chloride solution* per 100 mL of the final volume.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry

Analytical wavelength: Calcium emission line at 422.7 nm

Lamp: Calcium hollow-cathode

Flame: Nitrous oxide–acetylene

Blank: 0.125 N hydrochloric acid containing 1 mL of *Lanthanum chloride solution* per 100 mL

Analysis

Samples: *Standard solutions* and *Sample solution*
Determine the absorbances of the solutions, against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in µg/mL, of calcium, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, *C*, in µg/mL, of calcium in the *Sample solution*.

Calculate the percentage of the labeled amount of calcium (Ca) in the portion of Tablets taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of calcium in the *Sample solution* (µg/mL)

C_U = nominal concentration of calcium in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–125.0% of the labeled amount of calcium (Ca)

• CHROMIUM, Method 1

Chromium standard solution: 1000 µg/mL of chromium from potassium dichromate, previously dried at 120° for 4 h in water. Store in a polyethylene bottle.

Standard stock solution: 10 µg/mL of chromium from the *Chromium standard solution* diluted with 6 N hydrochloric acid and water (1 in 20)

Standard solutions: Transfer 10.0 and 20.0 mL of the *Standard stock solution* to separate 100-mL volumetric flasks, and transfer 15.0 and 20.0 mL of the *Standard stock solution* to separate 50-mL volumetric flasks. Dilute the contents of each of the four flasks with 0.125 N hydrochloric acid to volume to obtain concentrations of 1.0, 2.0, 3.0, and 4.0 µg/mL of chromium.

Sample solution: Proceed as directed for *Calcium, Method 1*, except prepare the *Sample solution* to contain 2.5 µg/mL of chromium and omit the use of the *Lanthanum chloride solution*.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry

Analytical wavelength: Chromium emission line at 357.9 nm

Lamp: Chromium hollow-cathode

Flame: Air–acetylene

Blank: 0.125 N hydrochloric acid

Analysis

Samples: *Standard solutions* and *Sample solution*
Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in µg/mL, of chromium, and draw the straight line best fitting the four plotted points. From the graph so obtained, determine the concentration, *C*, in µg/mL, of chromium in the *Sample solution*.

Calculate the percentage of the labeled amount of chromium (Cr) in the portion of Tablets taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of chromium in the *Sample solution* (µg/mL)

C_U = nominal concentration of chromium in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–160.0% of the labeled amount of chromium (Cr)

• COPPER, Method 1

Copper standard solution: Dissolve 1.00 g of copper foil in a minimum volume of a 50% solution of nitric acid, and dilute with a 1% solution of nitric acid to 1000 mL. This solution contains 1000 µg/mL of copper.

Standard stock solution: 100 µg/mL of copper from the *Copper standard solution* diluted with 0.125 N hydrochloric acid

Standard solutions: To separate 200-mL volumetric flasks transfer 1.0, 2.0, 4.0, 6.0, and 8.0 mL of the *Standard stock solution*. Dilute with 0.125 N hydrochloric acid to volume to obtain concentrations of 0.5, 1.0, 2.0, 3.0, and 4.0 µg/mL of copper.

Sample solution: Proceed as directed for *Calcium, Method 1*, except to prepare the *Sample solution* to contain 2 µg/mL of copper and omit the use of the *Lanthanum chloride solution*.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry

Analytical wavelength: Copper emission line at 324.7 nm

Lamp: Copper hollow-cathode

Flame: Air–acetylene

Blank: 0.125 N hydrochloric acid

Analysis

Samples: *Standard solutions* and *Sample solution*
Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in µg/mL, of copper, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, *C*, in µg/mL, of copper in the *Sample solution*.

Calculate the percentage of the labeled amount of copper (Cu) in the portion of Tablets taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of copper in the *Sample solution* (µg/mL)

C_U = nominal concentration of copper in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–125.0% of the labeled amount of copper (Cu)

• FLUORIDE, Method 1

[NOTE—Store all solutions in plastic containers.]

3 M sodium acetate solution: Dissolve 408 g of sodium acetate in 600 mL of water contained in a 1000-mL volumetric flask. Allow the solution to equilibrate to room temperature, and dilute with water

to volume. Adjust with a few drops of acetic acid to a pH of 7.0.

Sodium citrate solution: Dissolve 222 g of sodium citrate in 250 mL of water in a 1000-mL volumetric flask. Add 28 mL of perchloric acid, and dilute with water to volume.

Fluoride standard stock solution: 500 µg/mL of fluoride from a quantity of sodium fluoride in water, previously dried at 100° for 4 h and cooled in a desiccator

Intermediate stock solution A: 100 µg/mL of fluoride from the *Fluoride standard stock solution* diluted with water

Intermediate stock solution B: 10 µg/mL of fluoride from the *Fluoride standard stock solution* diluted with water

Standard solutions: To five separate 100-mL volumetric flasks transfer 3.0, 5.0, and 10.0 mL of *Intermediate stock solution B* and 5.0 and 10.0 mL of *Intermediate stock solution A*. To each flask add 10.0 mL of 1 N hydrochloric acid, 25.0 mL of 3 M sodium acetate solution, and 25.0 mL of *Sodium citrate solution*. Dilute the contents of each flask with water to volume to obtain concentrations of 0.3, 0.5, 1.0, 5.0, and 10.0 µg/mL of fluoride.

Sample solution: Transfer a quantity of the finely powdered Tablets, equivalent to 200 µg of fluoride, to a 100-mL volumetric flask. Add 10.0 mL of 1 N hydrochloric acid, 25.0 mL of 3 M sodium acetate solution, and 25.0 mL of *Sodium citrate solution*, and dilute with water to volume.

Analysis

Samples: *Standard solutions* and *Sample solution*
To separate plastic beakers, each containing a plastic-coated stirring bar, transfer 50.0 mL each of the *Standard solutions* and the *Sample solution*. Measure the potentials (see pH (791)), in mV, of the *Standard solutions* and the *Sample solution*, with a pH meter capable of a minimum reproducibility of ±0.2 mV and equipped with a fluoride-specific ion-indicating electrode and a calomel reference electrode. [NOTE—When taking measurements, immerse the electrodes in the solution, stir on a magnetic stirrer having an insulated top until equilibrium is attained (1–2 min), and record the potential. Rinse and dry the electrodes between measurements, taking care to avoid damaging the crystal of the specific-ion electrode.]

Plot the logarithms of fluoride concentrations, in µg/mL, of the *Standard solutions* versus potential, in mV. From the standard response curve so obtained and the measured potential of the *Sample solution*, determine the concentration, *C*, in µg/mL, of fluoride in the *Sample solution*.

Calculate the percentage of the labeled amount of fluorine (*F*) in the portion of Tablets taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of fluoride in the *Sample solution* (µg/mL)

C_U = nominal concentration of fluorine in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–160.0% of the labeled amount of fluorine (*F*)

• FLUORIDE, Method 2

[NOTE—Use plastic containers and deionized water throughout this procedure.]

pH 10.0 buffer: Add 214 mL of 0.1 N sodium hydroxide to 1000 mL of 0.05 M sodium bicarbonate.

Mobile phase: Alcohol, 0.1 N sulfuric acid, and water (20:5:175)

Standard stock solution: 220 µg/mL of USP Sodium Fluoride RS in water. This solution contains 100 µg/mL of fluoride.

Standard solution: [NOTE—Condition the solid-phase extraction column specified for use in the *Standard solution* and the *Sample solution* in the following manner. Using a vacuum at a pressure not exceeding 5 mm of mercury, wash the column with one column volume of methanol followed by one column volume of pH 10.0 buffer. Do not allow the column top to dry. If the top of the column becomes dry, recondition the column.] Transfer 10.0 mL of *Standard stock solution* to a 100-mL volumetric flask. Add 75 mL of water, and adjust with 0.1 N sodium hydroxide to a pH of 10.4 ± 0.1. Dilute with water to volume. Filter, discarding the first 15 mL of the filtrate. Transfer 25.0 mL of the filtrate to a 50-mL volumetric flask, add 15.0 mL of water, and adjust with 0.1 N sodium hydroxide to a pH of 10.0. Dilute with pH 10.0 buffer to volume. Elute a portion of this solution through a 3-mL solid-phase extraction column containing L1 packing that is connected through an adaptor to a second solid-phase extraction column containing sulfonpropyl strong cation-exchange packing. Discard the first 3 mL of the eluate, and collect the rest of the eluate in a suitable flask for injection into the chromatograph.

Sample solution: Finely powder NLT 20 Tablets.

Transfer a portion of powdered Tablets, equivalent to 1 mg of fluorine, in 15 mL of water, and shake vigorously. Rinse the sides of the flask with 15 mL of water, and allow to stand for 10 min. Dilute with water to 85 mL, adjust with 1 N sodium hydroxide to a pH of 10.4 ± 0.1, and dilute with water to 100 mL. Proceed as directed for the *Standard solution*, beginning with "Filter, discarding the first 15 mL of the filtrate."

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: Conductivity

Column

Guard: 4.6-mm × 3-cm; packing L17

Analytical: 7.8-mm × 30-cm; packing L17

Flow rate: 0.5 mL/min

Injection volume: 100 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas for fluoride. Calculate the percentage of the labeled amount of fluorine (*F*) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area from the *Sample solution*

r_S = peak area from the *Standard solution*

C_S = concentration of fluoride in the *Standard solution* (µg/mL)

C_U = nominal concentration of fluorine in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–160.0% of the labeled amount of fluorine (*F*)

• IODIDE, Method 1

Bromine water: To 20 mL of bromine in a glass-stoppered bottle add 100 mL of water. Insert the stopper into the bottle, and shake. Allow to stand for 30 min, and use the supernatant.

Analysis

Sample: Tablets

Transfer an amount of finely powdered Tablets, equivalent to 3 mg of iodide, to a nickel crucible. Add 5 g of sodium carbonate, 5 mL of 50% (w/v) sodium hydroxide solution, and 10 mL of alcohol, taking care that the entire specimen is moistened. Heat the crucible on a steam bath to evaporate the alcohol, then dry the crucible at 100° for 30 min to prevent spattering upon

subsequent heating. Transfer the crucible with its contents to a furnace heated to 500°, and heat the crucible for 15 min. [NOTE—Heating at 500° is necessary to carbonize any organic matter present; a higher temperature may be used, if necessary, to ensure complete carbonization of all organic matter.]

Cool the crucible, add 25 mL of water, cover the crucible with a watchglass, and boil gently for 10 min. Filter the solution, and wash the crucible with boiling water, collecting the filtrate and washings in a beaker. Add phosphoric acid until the solution is neutral to methyl orange, then add 1 mL excess of phosphoric acid. Add excess of *Bromine water*, and boil the solution gently until colorless for 5 min longer. Add a few crystals of salicylic acid, and cool the solution to 20°. Add 1 mL of phosphoric acid and 0.5 g of potassium iodide, and titrate the liberated iodine with 0.005 N sodium thiosulfate VS, adding starch TS when the liberated iodine color has nearly disappeared.

Calculate the percentage of the labeled amount of iodine (I) in the portion of Tablets taken:

$$\text{Result} = V \times N_A \times F \times I_{me} \times (A_w/W) \times (100/L)$$

V = volume of sodium thiosulfate consumed (mL)

N_A = actual normality of the sodium thiosulfate solution used

F = correction factor to convert mg to μg , 1000 $\mu\text{g}/\text{mg}$

I_{me} = milliequivalent of I, 21.16 mg/meq

A_w = average weight of the Tablets

W = weight of the portion of Tablets taken

L = labeled amount of iodine ($\mu\text{g}/\text{Tablet}$)

Acceptance criteria: 90.0%–160.0% of the labeled amount of iodine (I)

- **IODIDE, Method 2:** Proceed as directed in *Automated Methods of Analysis* (16), *Assay for Iodide*.

Acceptance criteria: 90.0%–160.0% of the labeled amount of iodine (I)

- **IRON, Method 1**

Iron standard stock solution: Transfer 100 mg of iron powder to a 1000-mL volumetric flask. Dissolve in 25 mL of 6 N hydrochloric acid, dilute with water to volume, and mix.

Standard solutions: To separate 100-mL volumetric flasks transfer 2.0, 4.0, 5.0, 6.0, and 8.0 mL of the *Iron standard stock solution*. Dilute the contents of each flask with 0.125 N hydrochloric acid to volume to obtain concentrations of 2.0, 4.0, 5.0, 6.0, and 8.0 $\mu\text{g}/\text{mL}$ of iron.

Sample solution: Proceed as directed for *Calcium, Method 1*, except prepare the *Sample solution* to contain a concentration of 5 $\mu\text{g}/\text{mL}$ of iron and omit the use of the *Lanthanum chloride solution*.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry

Analytical wavelength: Iron emission line at 248.3 nm

Lamp: Iron hollow-cathode

Flame: Air–acetylene

Blank: 0.125 N hydrochloric acid

Analysis

Samples: *Standard solutions* and *Sample solution*
Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in $\mu\text{g}/\text{mL}$, of iron, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, C , in $\mu\text{g}/\text{mL}$, of iron in the *Sample solution*.

Calculate the percentage of the labeled amount of iron (Fe) in the portion of Tablets taken:

$$\text{Result} = (C/C_i) \times 100$$

C = measured concentration of iron in the *Sample solution* ($\mu\text{g}/\text{mL}$)

C_i = nominal concentration of iron in the *Sample solution* ($\mu\text{g}/\text{mL}$)

Acceptance criteria: 90.0%–125.0% of the labeled amount of iron (Fe)

- **MAGNESIUM, Method 1**

Lanthanum chloride solution: Prepare as directed in *Calcium, Method 1*.

Magnesium standard solution: Transfer 1.0 g of magnesium ribbon to a 1000-mL volumetric flask, dissolve in 50 mL of 6 N hydrochloric acid, dilute with water to volume, and mix to obtain a solution with a known concentration of 1000 $\mu\text{g}/\text{mL}$ of magnesium.

Standard stock solution: 20 $\mu\text{g}/\text{mL}$ of magnesium from the *Magnesium standard solution* diluted with 0.125 N hydrochloric acid

Standard solutions: To separate 100-mL volumetric flasks transfer 1.0, 1.5, 2.0, 2.5, and 3.0 mL of the *Standard stock solution*. To each flask add 1.0 mL of *Lanthanum chloride solution*, and dilute with 0.125 N hydrochloric acid to volume to obtain concentrations of 0.2, 0.3, 0.4, 0.5, and 0.6 $\mu\text{g}/\text{mL}$ of magnesium.

Sample solution: Proceed as directed for *Calcium, Method 1*, except prepare the *Sample solution* to contain a concentration of 0.4 $\mu\text{g}/\text{mL}$ of magnesium.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry

Analytical wavelength: Magnesium emission line at 285.2 nm

Lamp: Magnesium hollow-cathode

Flame: Air–acetylene

Blank: 0.125 N hydrochloric acid containing 1 mL of *Lanthanum chloride solution* per 100 mL

Analysis

Samples: *Standard solutions* and *Sample solution*
Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in $\mu\text{g}/\text{mL}$, of magnesium, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, C , in $\mu\text{g}/\text{mL}$, of magnesium in the *Sample solution*.

Calculate the percentage of the labeled amount of magnesium (Mg) in the portion of Tablets taken:

$$\text{Result} = (C/C_i) \times 100$$

C = measured concentration of magnesium in the *Sample solution* ($\mu\text{g}/\text{mL}$)

C_i = nominal concentration of magnesium in the *Sample solution* ($\mu\text{g}/\text{mL}$)

Acceptance criteria: 90.0%–125.0% of the labeled amount of magnesium (Mg)

- **MANGANESE, Method 1**

Manganese standard stock solution: Transfer 1.00 g of manganese to a 1000-mL volumetric flask. Dissolve in 20 mL of nitric acid, dilute with 6 N hydrochloric acid to volume, and mix to obtain a solution with a concentration of 1000 $\mu\text{g}/\text{mL}$ of manganese.

Standard stock solution: 50 $\mu\text{g}/\text{mL}$ of manganese from the *Manganese standard stock solution* diluted with 0.125 N hydrochloric acid

Standard solutions: To separate 100-mL volumetric flasks transfer 1.0, 1.5, 2.0, 3.0, and 4.0 mL of the *Standard stock solution*. Dilute the contents of each flask with 0.125 N hydrochloric acid to volume to obtain solutions with known concentrations of 0.5, 0.75, 1.0, 1.5, and 2.0 $\mu\text{g}/\text{mL}$ of manganese.

Sample solution: Proceed as directed for *Calcium, Method 1*, except prepare the *Sample solution* to contain a concentration of 1 $\mu\text{g}/\text{mL}$ of manganese and omit the use of the *Lanthanum chloride solution*.

Instrumental conditions(See *Spectrophotometry and Light-Scattering* (851).)**Mode:** Atomic absorption spectrophotometry**Analytical wavelength:** Manganese emission line at 279.5 nm**Lamp:** Manganese hollow-cathode**Flame:** Air-acetylene**Blank:** 0.125 N hydrochloric acid**Analysis****Samples:** *Standard solutions* and *Sample solution*

Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in $\mu\text{g/mL}$, of manganese, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, C , in $\mu\text{g/mL}$, of manganese in the *Sample solution*.

Calculate the percentage of the labeled amount of manganese (Mn) in the portion of Tablets taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of manganese in the *Sample solution* ($\mu\text{g/mL}$)

C_U = nominal concentration of manganese in the *Sample solution* ($\mu\text{g/mL}$)

Acceptance criteria: 90.0%–125.0% of the labeled amount of manganese (Mn)

• **MOLYBDENUM, Method 1****Diluent:** 20 mg/mL of ammonium chloride in water

Molybdenum standard solution: Transfer 1.0 g of molybdenum wire to a 1000-mL volumetric flask, and dissolve in 50 mL of nitric acid, warming if necessary. Dilute with water to volume, and mix to obtain a solution with a concentration of 1000 $\mu\text{g/mL}$ of molybdenum.

Standard stock solution: 100 $\mu\text{g/mL}$ of molybdenum from the *Molybdenum standard solution* diluted with water

Standard solutions: To separate 100-mL volumetric flasks transfer 2.0, 10.0, and 25.0 mL of the *Standard stock solution*, and add 5.0 mL of perchloric acid to each flask. Gently boil the solution in each flask for 15 min, cool to room temperature, and dilute each with *Diluent* to volume to obtain concentrations of 5.0, 10.0, and 25.0 $\mu\text{g/mL}$ of molybdenum.

Sample solution: Transfer a portion of the powder, equivalent to 1000 μg of molybdenum, to a suitable flask, and add 12 mL of nitric acid. [NOTE—The volume of nitric acid may be varied to ensure that the powder is uniformly dispersed.] Carefully swirl the flask to disperse the test specimen. Sonicate for 10 min, or until the test specimen is completely dissolved. Gently boil the solution for 15 min, and cool to room temperature. Carefully add 8 mL of perchloric acid, heat until perchloric acid fumes appear, and swirl the flask to dissipate the fumes. Repeat the heating and swirling until the fumes appear again. Cool to room temperature. Quantitatively transfer the contents of the flask to a 100-mL volumetric flask with the aid of the *Diluent*, and dilute with *Diluent* to volume.

Instrumental conditions(See *Spectrophotometry and Light-Scattering* (851).)**Mode:** Atomic absorption spectrophotometry**Analytical wavelength:** Molybdenum emission line at 313.3 nm**Lamp:** Molybdenum hollow-cathode**Flame:** Nitrous oxide-acetylene**Blank:** *Diluent* and perchloric acid (20:1)**Analysis****Samples:** *Standard solutions* and *Sample solution*

Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in $\mu\text{g/mL}$, of molybdenum, and draw the straight line best fitting the three plotted

points. From the graph so obtained, determine the concentration, C , in $\mu\text{g/mL}$, of molybdenum in the *Sample solution*.

Calculate the percentage of the labeled amount of molybdenum (Mo) in the portion of Tablets taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of molybdenum in the *Sample solution* ($\mu\text{g/mL}$)

C_U = nominal concentration of molybdenum in the *Sample solution* ($\mu\text{g/mL}$)

Acceptance criteria: 90.0%–160.0% of the labeled amount of molybdenum (Mo)

• **MOLYBDENUM, Method 2**

Sodium fluoride solution: Add 200 mL of water to 10 g of sodium fluoride, stir until the solution is saturated, and filter. Store in a polyethylene bottle.

Ferrous sulfate solution: 4.98 mg/mL of ferrous sulfate in water

Potassium thiocyanate solution: 200 mg/mL of potassium thiocyanate in water

20% Stannous chloride solution: Transfer 40 mg of stannous chloride to a beaker, add 20 mL of 6.5 N hydrochloric acid solution, and heat the solution until the stannous chloride is dissolved. Cool, and dilute with water to 100 mL.

Diluted stannous chloride solution: 20% *Stannous chloride solution* diluted with water (1 in 25). Prepare this solution fresh at the time of use.

Standard solution: 20 $\mu\text{g/mL}$ of molybdenum in water

Sample: A portion of finely powdered Tablets, equivalent to 40 μg of molybdenum

Instrumental conditions(See *Spectrophotometry and Light-Scattering* (851).)**Mode:** UV-Vis**Analytical wavelength:** 465 nm**Cell:** 1 cm**Blank:** Amyl alcohol**Analysis****Samples:** *Standard solution* and *Sample*

Transfer the *Sample* and 2.0 mL of the *Standard solution* to separate 200-mL beakers. Add 20 mL of nitric acid to each beaker. Cover each beaker with a watchglass, and boil slowly on a hot plate for 45 min. Cool to room temperature. Add 6 mL of perchloric acid, cover the beakers with a watchglass, and continue the heating until digestion is complete, as indicated when the liquid becomes colorless or pale yellow. Evaporate the solutions in the beakers to dryness. Rinse the sides of the beakers and the watchglasses with water, and add more water to complete 50 mL in each beaker. Gently boil the water solution for a few min. Cool to room temperature. Add 2 drops of methyl orange TS, and neutralize with ammonium hydroxide. Add 8.2 mL of hydrochloric acid. Quantitatively transfer the contents of the beakers to separate 100-mL volumetric flasks, rinse the beakers with water, transfer the rinsings to the corresponding volumetric flasks, and dilute with water to volume. Transfer 50.0 mL of each solution to separatory funnels. To each separatory funnel add 1.0 mL of *Sodium fluoride solution*, 0.5 mL of *Ferrous sulfate solution*, 4.0 mL of *Potassium thiocyanate solution*, 1.5 mL of 20% *Stannous chloride solution*, and 15.0 mL of amyl alcohol, and shake the separatory funnel for 1 min. Allow the layers to separate, and discard the aqueous layers. Add 25 mL of *Diluted stannous chloride solution* to each separatory funnel, and shake gently for 15 s. Allow the layers to separate, and discard the aqueous layers. Transfer the organic layer from each separatory funnel to a centrifuge tube, and centrifuge at 2000 rpm for 10 min. Determine the absorbances of the organic phases obtained from the *Standard solution* and the *Sample*, and correct with the *Blank*.

Calculate the percentage of the labeled amount of molybdenum (Mo) in the portion of Tablets taken:

$$\text{Result} = (A_U/A_S) \times [(V \times C_S)/M_U] \times 100$$

A_U = absorbance of the *Sample*
 A_S = absorbance of the *Standard solution*
 V = volume of the *Standard solution* analyzed, 2.0 mL
 C_S = concentration of molybdenum in the *Standard solution* (μg/mL)
 M_U = nominal amount of molybdenum in the *Sample* (μg)

Acceptance criteria: 90.0%–160.0% of the labeled amount of molybdenum (Mo)

• PHOSPHORUS, Method 1

Sulfuric acid solution: Cautiously add sulfuric acid to water (37.5:100), and mix.

Ammonium molybdate solution: 50 mg/mL of ammonium molybdate in *Sulfuric acid solution* and water (2:3). [NOTE—Dissolve in water first, and then dilute with *Sulfuric acid solution* to volume.]

Hydroquinone solution: 5 mg/mL of hydroquinone in water. Add one drop of sulfuric acid per 100 mL of solution.

Sodium bisulfite solution: 200 mg/mL of sodium bisulfite in water

Phosphorus standard stock solution: Weigh 4.395 g of monobasic potassium phosphate, previously dried at 105° for 2 h and stored in a desiccator, and transfer to a 1000-mL volumetric flask. Dissolve in water, add 6 mL of sulfuric acid as a preservative, dilute with water to volume, and mix to obtain a solution with a concentration of 1000 μg/mL of phosphorus.

Standard solution: 20 μg/mL of phosphorus from the *Phosphorus standard stock solution* diluted with water

Sample solution: [NOTE—Finely powder and weigh a counted number of Tablets.] Transfer a portion of the powder, equivalent to 100 mg of phosphorus, to 25 mL of nitric acid, and digest on a hot plate for 30 min. Add 15 mL of hydrochloric acid, and continue the digestion to the cessation of brown fumes. Cool, and transfer the contents of the flask to a 500-mL volumetric flask with the aid of small portions of water. Dilute with water to volume. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, and dilute with water to volume.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Vis

Analytical wavelength: 650 nm

Cell: 1 cm

Analysis

Samples: *Standard solution* and *Sample solution*
 To three separate 25-mL volumetric flasks transfer 5.0 mL each of the *Standard solution*, the *Sample solution*, and water to provide the blank. To each of the three flasks add 1.0 mL each of *Ammonium molybdate solution*, *Hydroquinone solution*, and *Sodium bisulfite solution*, and swirl to mix. Dilute the contents of each flask with water to volume, and allow the flasks to stand for 30 min. Determine the absorbances of the solutions against the blank.

Calculate the percentage of the labeled amount of phosphorus (P) in the portion of Tablets taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

A_U = absorbance of the *Sample solution*
 A_S = absorbance of the *Standard solution*
 C_S = concentration of phosphorus in the *Standard solution* (μg/mL)
 C_U = nominal concentration of phosphorus in the *Sample solution* (μg/mL)

Acceptance criteria: 90.0%–125.0% of the labeled amount of phosphorus (P)

• POTASSIUM

Potassium standard solution: 100 μg/mL of potassium from potassium chloride, previously dried at 105° for 2 h, in water

Standard stock solution: 10 μg/mL of potassium from the *Potassium standard solution* diluted with 0.125 N hydrochloric acid

Standard solutions: Transfer 5.0, 10.0, 15.0, 20.0, and 25.0 mL of the *Standard stock solution* to separate 100-mL volumetric flasks. Dilute the contents of each flask with 0.125 N hydrochloric acid to volume to obtain solutions containing 0.5, 1.0, 1.5, 2.0, and 2.5 μg/mL of potassium.

Sample solution: Proceed as directed for *Calcium, Method 1*, except prepare the *Sample solution* to contain a concentration of 1.5 μg/mL of potassium and omit the use of the *Lanthanum chloride solution*.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry

Analytical wavelength: Potassium emission line at 766.5 nm

Lamp: Potassium hollow-cathode

Flame: Air–acetylene

Blank: Water

Analysis

Samples: *Standard solutions* and *Sample solution*
 Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in μg/mL, of potassium, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, C, in μg/mL, of potassium in the *Sample solution*.

Calculate the percentage of the labeled amount of potassium (K) in the portion of Tablets taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of potassium in the *Sample solution* (μg/mL)

C_U = nominal concentration of potassium in the *Sample solution* (μg/mL)

Acceptance criteria: 90.0%–125.0% of the labeled amount of potassium (K)

• SELENIUM, Method 1

Diluent: Prepare as directed in *Molybdenum, Method 1*.

Selenium standard solution: [CAUTION—Selenium is toxic; handle it with care.] Dissolve 1 g of metallic selenium in a minimum volume of nitric acid. Evaporate to dryness, add 2 mL of water, and evaporate to dryness. Repeat the addition of water and the evaporation to dryness three times. Dissolve the residue in 3 N hydrochloric acid, transfer to a 1000-mL volumetric flask, and dilute with 3 N hydrochloric acid to volume to obtain a concentration of 1000 μg/mL of selenium.

Standard stock solution: 100 μg/mL of selenium from the *Selenium standard solution* diluted with water

Standard solutions: To separate 100-mL volumetric flasks transfer 5.0, 10.0, and 25.0 mL of the *Standard stock solution*, and add 5.0 mL of perchloric acid to each flask. Gently boil the solutions for 15 min, cool to room temperature, and dilute each with *Diluent* to volume to obtain solutions with concentrations of 5.0, 10.0, and 25.0 μg/mL of selenium.

Sample solution: Transfer a portion of the powder, equivalent to 1000 μg of selenium, to a suitable flask, and add 12 mL of nitric acid. [NOTE—The volume of nitric acid may be varied to ensure that the powder is uniformly dispersed.] Carefully swirl the flask to disperse the test specimen. Sonicate for 10 min or until the test specimen is completely dissolved. Gently boil the solution for 15 min, and cool to room temperature. Carefully add 8 mL of perchloric acid to the flask, heat

the flask until perchloric acid fumes appear, and swirl the flask to dissipate the fumes. Repeat the heating and swirling until the fumes appear again. Cool to room temperature. Transfer the contents of the flask to a 50-mL volumetric flask with the aid of the *Diluent*, and dilute with *Diluent* to volume.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry

Analytical wavelength: Selenium emission line at 196.0 nm

Lamp: Selenium hollow-cathode

Flame: Air-acetylene

Blank: *Diluent* and perchloric acid (20:1)

Analysis

Samples: *Standard solutions* and *Sample solution*

Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in µg/mL, of selenium, and draw the straight line best fitting the three plotted points. From the graph so obtained, determine the concentration, *C*, in µg/mL, of selenium in the *Sample solution*.

Calculate the percentage of the labeled amount of selenium (Se) in the portion of Tablets taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of selenium in the *Sample solution* (µg/mL)

C_U = nominal concentration of selenium in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–160.0% of the labeled amount of selenium (Se)

• SELENIUM, Method 2

Hydrochloric acid solution: Hydrochloric acid diluted with water (1 in 10)

50% Ammonium hydroxide solution: Ammonium hydroxide diluted with water (1 in 2)

Reagent A: 9 mg/mL of edetate disodium and 25 mg/mL of hydroxylamine hydrochloride in water. [NOTE—Dissolve edetate disodium in a portion of water first, then add hydroxylamine hydrochloride, and dilute with water to volume.]

Reagent B: Transfer 200 mg of 2,3-diaminonaphthalene to a 250-mL separatory funnel, and add 200 mL of 0.1 N hydrochloric acid. Wash the solution with three 40-mL portions of cyclohexane, and discard the cyclohexane layer. Filter the solution into a brown bottle, and cover the solution with a 1-cm layer of cyclohexane. This solution is stable for 1 week if stored in a refrigerator.

Standard stock solution: [CAUTION—Selenium is toxic; handle it with care.] Dissolve 1 g of metallic selenium in a minimum volume of nitric acid. Evaporate to dryness, add 2 mL of water, and evaporate to dryness. Repeat the addition of water and evaporation to dryness three times. Dissolve the residue in 3 N hydrochloric acid, transfer to a 1000-mL volumetric flask, and dilute with 3 N hydrochloric acid to volume to obtain a solution with a concentration of 1000 µg/mL of selenium. Dilute a volume of the solution with 0.125 N hydrochloric acid to obtain a concentration of 2.0 µg/mL of selenium.

Standard solution: Transfer 10 mL of the *Standard stock solution* to a glass-stoppered flask. Add 1 mL of perchloric acid and 1 mL of *Hydrochloric acid solution*, and dilute with water to 20 mL.

Sample solution: Transfer a portion of finely powdered Tablets, equivalent to 20 µg of selenium, to a suitable flask. Add 10 mL of nitric acid, and warm gently on a hot plate. Continue heating until the initial nitric acid reaction has subsided, then add 3 mL of perchloric acid. [CAUTION—Exercise care at this stage, because the perchloric acid reaction becomes vigorous.]

Continue heating on the hot plate until the appearance of white fumes of perchloric acid or until the digest begins to darken. Add 0.5 mL of nitric acid and resume heating, adding additional amounts of nitric acid if further darkening occurs. Digest for 10 min after the first appearance of perchloric acid fumes or until the digest becomes colorless. Cool the flask, add 2.5 mL of *Hydrochloric acid solution*, and return the flask to the hot plate to expel residual nitric acid. Heat the mixture for 3 min after it begins to boil. Cool the flask to room temperature, and dilute with water to 20 mL.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: UV

Analytical wavelength: 380 nm

Cell: 1 cm

Blank: 1 mL of perchloric acid and 1 mL of *Hydrochloric acid solution* diluted with water to 20 mL

Analysis

Samples: *Standard solution* and *Sample solution*

Treat the *Sample solution*, the *Standard solution*, and the *Blank* as follows. Add 5 mL of *Reagent A* to each flask, and swirl gently to mix. Adjust the solution in each flask with 50% *Ammonium hydroxide solution* to a pH of 1.1 ± 0.1. Add 5 mL of *Reagent B* to each flask, and swirl gently to mix. Place the flasks in a water bath maintained at 50°, and equilibrate for 30 min, taking care that the flasks are covered to protect them from light. Cool to room temperature, and transfer the contents of each flask to separate separatory funnels. Transfer 10.0 mL of cyclohexane to each separatory funnel, and extract vigorously for 1 min. Discard the aqueous layer. Transfer the cyclohexane layer to a centrifuge tube, and centrifuge at 1000 rpm for 1 min to remove any remaining water. Determine the absorbances of the solutions obtained from the *Samples* against the solution obtained from the *Blank*.

Calculate the percentage of the labeled amount of selenium (Se) in the portion of Tablets taken:

$$\text{Result} = (A_U/A_S) \times [(V \times C_S)/M_U] \times 100$$

A_U = absorbances of the cyclohexane layer from the *Sample solution*

A_S = absorbances of the cyclohexane layer from the *Standard solution*

V = volume of the *Standard stock solution* used to prepare the *Standard solution*, 10 mL

C_S = concentration of selenium in the *Standard stock solution* (µg/mL)

M_U = nominal amount of selenium in the *Sample solution* (µg)

Acceptance criteria: 90.0%–160.0% of the labeled amount of selenium (Se)

• ZINC, Method 1

Zinc standard solution: 1000 µg/mL of zinc from zinc oxide in 5 M hydrochloric acid (3.89 mg/mL) and diluted with water to final volume. [NOTE—Dissolve in 5 M hydrochloric acid by warming, if necessary, cool, and then dilute to final volume.]

Standard stock solution: 50 µg/mL of zinc from the *Zinc standard stock solution* diluted with 0.125 N hydrochloric acid

Standard solutions: Transfer 1.0, 2.0, 3.0, 4.0, and 5.0 mL of the *Standard stock solution* to separate 100-mL volumetric flasks. Dilute the contents of each flask with 0.125 N hydrochloric acid to volume to obtain concentrations of 0.5, 1.0, 1.5, 2.0, and 2.5 µg/mL of zinc.

Sample solution: Proceed as directed for the *Sample solution* in *Calcium, Method 1*, except prepare the *Sample solution* to contain a concentration of 2 µg/mL of zinc and omit the use of the *Lanthanum chloride solution*.

Instrumental conditions(See *Spectrophotometry and Light-Scattering* (851).)**Mode:** Atomic absorption spectrophotometry**Analytical wavelength:** Zinc emission line at 213.8 nm**Lamp:** Zinc hollow-cathode**Flame:** Air-acetylene**Blank:** 0.125 N hydrochloric acid**Analysis****Samples:** *Standard solutions* and *Sample solution*

Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in $\mu\text{g/mL}$, of zinc, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, C , in $\mu\text{g/mL}$, of zinc in the *Sample solution*.

Calculate the percentage of the labeled amount of zinc (Zn) in the portion of Tablets taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of zinc in the *Sample solution* ($\mu\text{g/mL}$)

C_U = nominal concentration of zinc in the *Sample solution* ($\mu\text{g/mL}$)

Acceptance criteria: 90.0%–125.0% of the labeled amount of zinc (Zn)

- **BORON, NICKEL, TIN, AND VANADIUM, Method 1; CALCIUM, CHROMIUM, COPPER, IRON, MAGNESIUM, MANGANESE, PHOSPHORUS, AND ZINC, Method 2; MOLYBDENUM AND SELENIUM, Method 3**

Stock aqua regia solution: Prepare a mixture of hydrochloric acid and nitric acid (3:1) by adding the nitric acid to the hydrochloric acid. [NOTE—Periodically vent the solution in an appropriate fume hood.]

Diluent: Prepare a mixture of *Stock aqua regia solution* and water (1:9) by adding one volume of *Stock aqua regia solution* to two volumes of water. Dilute with additional water to volume, and mix well.

System suitability solution: Prepare a mixture of 1000 mg/L of yttrium in 5% nitric acid solution, 1000 mg/L of scandium in 5% nitric acid solution, and *Diluent* (1:1:198), and mix.

Standard stock solution 1 (Ca, Cu, Fe, Mg, Mn, P, and Zn): [NOTE—It is only necessary to include the minerals of interest in the solution.] Using commercially available element standard (single- or multi-element) solutions in 5% nitric acid solution, pipet the appropriate amount of element standard solution into a volumetric flask, and dilute with 5% nitric acid solution to obtain a solution having final concentrations of about 1000 mg/L of calcium, 100 mg/L of copper, 250 mg/L of iron, 500 mg/L of magnesium, 100 mg/L of manganese, 800 mg/L of phosphorus, and 250 mg/L of zinc.

Standard stock solution 2 (B, Cr, Mo, Ni, Se, Sn, and V): [NOTE—It is only necessary to include the minerals of interest in the solution.] Using commercially available element standard (single- or multi-element) solutions in 20% hydrochloric acid solution, pipet the appropriate amount of element standard solution into a volumetric flask, and dilute with 20% hydrochloric acid solution to obtain a solution having final concentrations of about 200 mg/L of boron, and 100 mg/L each of chromium, molybdenum, nickel, selenium, tin, and vanadium.

Standard solutions: Prepare a mixture of *Standard stock solution 1* and *Standard stock solution 2*, as required, in *Diluent* to prepare a six-point calibration curve to bracket the concentration range of each mineral of interest.

Sample solution 1 (for Tablets containing minerals found in *Standard stock solution 1* and *Standard stock solution 2*): Weigh and finely powder NLT 20 Tablets. Transfer a portion, equal to 3.5 times the average Tablet weight, to a 250-mL volumetric flask. Slowly add

25 mL of *Stock aqua regia solution* in 5-mL increments followed by mixing. [NOTE—If the sample contains a carbonate, bubbling will occur. Wait until bubbling ends to proceed.] Bring the solution to a boil on a hot plate. Continue to heat gently until fumes cease (about 1 h). [NOTE—If the sample contains selenium, digest for NMT 15 min.] Remove from heat, cool, and dilute with water to volume. Filter about 30 mL into a centrifuge tube using a nylon syringe filter of 5- μm pore size. If necessary, make any further dilutions using the *Diluent*.

Sample solution 2 (for Tablets containing minerals found only in *Standard stock solution 2*): Weigh and finely powder NLT 20 Tablets. Transfer a portion, equal to 3.5 times the average Tablet weight, to a 250-mL volumetric flask. Slowly add 25 mL of *Stock aqua regia solution* in 5-mL increments followed by mixing. [NOTE—If the sample contains a carbonate, bubbling will occur. Wait until bubbling ends to proceed.] Bring the solution to a boil on a hot plate. Continue to heat gently until fumes cease (about 1 h). [NOTE—If the sample contains selenium, digest for NMT 15 min.] Remove from heat, cool, and dilute with water to volume. Filter about 30 mL into a centrifuge tube using a nylon syringe filter of 5- μm pore size. If necessary, make any further dilutions using the *Diluent*.

Sample solution 3 (for Tablets containing minerals found only in *Standard stock solution 1*): Weigh and finely powder NLT 20 Tablets. Transfer a portion, equal to the average Tablet weight, to a 250-mL volumetric flask. Slowly add 25 mL of *Stock aqua regia solution* in 5-mL increments, followed by mixing. [NOTE—If the sample contains a carbonate, bubbling will occur. Wait until bubbling ends to proceed.] Bring the solution to a boil on a hot plate. Continue to heat gently (about 1 h) until fumes cease. Remove from heat, cool, and dilute with water to volume. Filter about 30 mL into a centrifuge tube using a nylon syringe filter of 5- μm pore size. If necessary, make any further dilutions using the *Diluent*.

Instrumental conditions(See *Plasma Spectrochemistry* (730).)

Mode: Inductively coupled plasma spectrometry, using a spectrometer set to measure the emission of each mineral of interest at about the corresponding wavelength. [NOTE—The operating conditions may be developed and optimized based on the manufacturer's recommendation. The wavelengths selected should be demonstrated experimentally to provide sufficient specificity, sensitivity, linearity, accuracy, and precision.]

System suitability

[NOTE—Analyze the *System suitability solution*, and obtain the response as directed in the *Analysis*.]

Suitability requirements

Relative standard deviation: NMT 2.0%

Analysis**Samples:** *Standard solutions* and *Sample solution*

Determine the emission of each mineral of interest in the *Standard solutions* and *Sample solution* with an inductively coupled plasma system using the *Diluent* as the blank. Plot the emission of the *Standard solutions* versus the concentration, in mg/L, of the minerals of interest, and draw the straight line best fitting the plotted points. From the graph so obtained, determine the concentration, C , in mg/L, for each mineral of interest in the *Sample solution*.

Calculate the percentage of the labeled amount for each mineral taken:

$$\text{Result} = C \times (V/W) \times F \times (C_W/L) \times 100$$

C = measured concentration of the relevant element in the *Sample solution* (mg/L)

V = volume of the *Sample solution* (L)

W = sample weight (mg)

F = dilution factor of the *Sample solution*

C_w = average weight (mg/Tablet)

L = label claim (mg/Tablet)

Acceptance criteria: 90.0%–125.0% of the labeled amount of calcium (Ca), copper (Cu), iron (Fe), magnesium (Mg), manganese (Mn), phosphorus (P), and zinc (Zn); and 90.0%–160.0% of the labeled amounts of boron (B), chromium (Cr), molybdenum (Mo), nickel (Ni), selenium (Se), tin (Sn), and vanadium (V)

PERFORMANCE TESTS

- **DISINTEGRATION AND DISSOLUTION** (2040): Meet the requirements for *Dissolution*
- **WEIGHT VARIATION** (2091): Meet the requirements

CONTAMINANTS

- **MICROBIAL ENUMERATION TESTS** (2021): The total aerobic microbial count does not exceed 3×10^3 cfu/g, and the combined molds and yeasts count does not exceed 3×10^2 cfu/g.
- **ABSENCE OF SPECIFIED MICROORGANISMS** (2022): Meet the requirements of the tests for absence of *Salmonella* species, *Escherichia coli*, and *Staphylococcus aureus*

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.
- **LABELING:**¹ The label states that the product is Oil-Soluble Vitamins with Minerals Tablets. The label also states the quantity of each vitamin and mineral per dosage unit and where necessary the chemical form in which a vitamin is present and also states the salt form of the mineral used as the source of each element. Where the product contains vitamin E, the label indicates whether it is the *d*- or *dl*-form. Where more than one assay method is given for a particular mineral, the labeling states with which assay method the product complies only if *Method 7* is not used.
- **USP REFERENCE STANDARDS** (11)
 - USP Alpha Tocopherol RS
 - USP Alpha Tocopheryl Acetate RS
 - USP Alpha Tocopheryl Acid Succinate RS
 - USP Cholecalciferol RS
 - USP Ergocalciferol RS
 - USP Phytonadione RS
 - USP Retinyl Acetate RS
 - USP Retinyl Palmitate RS
 - USP Sodium Fluoride RS▲ USP36

¹ USP Units of activity for vitamins, where such exist or formerly existed, are equivalent to the corresponding international units, where such formerly existed. The USP Unit for Vitamin E has been discontinued. International units (IU) for vitamins also have been discontinued; however, the use of IU on the labels of vitamin products continues. Where articles are labeled in terms of Units in addition to the required labeling, the relationship of the USP Units or IU to mass is as follows. One USP Vitamin A Unit = 0.3 µg of all-*trans*-retinol (vitamin A alcohol) or 0.344 µg of all-*trans*-retinyl acetate (vitamin A acetate) or 0.55 µg of all-*trans*-retinyl palmitate (vitamin A palmitate), and 1 µg of retinol (3.3 USP Vitamin A Units) = 1 retinol equivalent (RE); 1 IU of beta carotene = 0.6 µg of all-*trans*-beta carotene; 1 USP Vitamin D Unit = 0.025 µg of ergocalciferol or cholecalciferol; and 1 mg of *dl*-alpha tocopherol = 1.1 former USP Vitamin E Units, 1 mg of *dl*-alpha tocopheryl acetate = 1 former USP Vitamin E Unit, 1 mg of *dl*-alpha tocopheryl acid succinate = 0.89 former USP Vitamin E Unit, 1 mg of *d*-alpha tocopherol = 1.49 former USP Vitamin E Units, and 1 mg of *d*-alpha tocopheryl acetate = 1.36 former USP Vitamin E Units, 1 mg of *d*-alpha tocopheryl acid succinate = 1.21 former USP Vitamin E Units. In terms of *d*-alpha tocopherol equivalents, 1 mg of *d*-alpha tocopheryl acetate = 0.91, 1 mg of *d*-alpha tocopheryl acid succinate = 0.81, 1 mg of *dl*-alpha tocopherol = 0.74, 1 mg of *dl*-alpha tocopheryl acetate = 0.67, and 1 mg of *dl*-alpha tocopheryl acid succinate = 0.60.

Oil- and Water-Soluble Vitamins Capsules

DEFINITION

Oil- and Water-Soluble Vitamins Capsules contain one or more of the following oil-soluble vitamins: Vitamin A, Vitamin D as Ergocalciferol (Vitamin D₂) or Cholecalciferol (Vitamin D₃), Vitamin E, Phytonadione (Vitamin K₁), and Beta Carotene; and one or more of the following water-soluble vitamins: Ascorbic Acid or its equivalent as Calcium Ascorbate or Sodium Ascorbate, Biotin, Cyanocobalamin, Folic Acid, Niacin or Niacinamide, Dexpanthenol or Panthenol, Pantothenic Acid (as Calcium Pantothenate or Racemic Calcium Pantothenate), Pyridoxine Hydrochloride, Riboflavin, and Thiamine Hydrochloride or Thiamine Mononitrate. Capsules contain NLT 90.0% and NMT 165.0% of the labeled amounts of vitamin A (C₂₀H₃₀O) as retinol or esters of retinol in the form of retinyl acetate (C₂₂H₃₂O₂) or retinyl palmitate (C₃₆H₆₀O₂); vitamin D as cholecalciferol (C₂₇H₄₄O) or ergocalciferol (C₂₈H₄₄O); vitamin E as alpha tocopherol (C₂₉H₅₀O₂), alpha tocopheryl acetate (C₃₁H₅₂O₃), or alpha tocopheryl acid succinate (C₃₃H₅₄O₅); phytonadione (C₃₁H₄₆O₂); and beta carotene (C₄₀H₅₆); and NLT 90.0% and NMT 150.0% of the labeled amounts of ascorbic acid (C₆H₈O₆) or its salts as calcium ascorbate (C₁₂H₁₄CaO₁₂ · 2H₂O) or sodium ascorbate (C₆H₇NaO₆), biotin (C₁₀H₁₆N₂O₃S), cyanocobalamin (C₆₃H₈₈CoN₁₄O₁₄P), folic acid (C₁₉H₁₉N₇O₆), niacin (C₆H₅NO₂) or niacinamide (C₆H₆N₂O), dexpanthenol (C₉H₁₉NO₄) or panthenol (C₉H₁₉NO₄), calcium pantothenate (C₁₈H₃₂CaN₂O₁₀), pyridoxine hydrochloride (C₈H₁₁NO₃ · HCl), riboflavin (C₁₇H₂₀N₄O₆), and thiamine (C₁₂H₁₇ClN₄OS) as thiamine hydrochloride or thiamine mononitrate.

They do not contain any minerals. They may contain other labeled added substances that are generally recognized as safe, in amounts that are unobjectionable.

STRENGTH

• VITAMIN A, *Method 1*

[NOTE—Where the use of a vitamin A ester (retinyl acetate or retinyl palmitate) is specified in the following procedure, use the chemical form present in the formulation. USP Vitamin A RS is retinyl acetate. It is to be used where USP Vitamin A RS is specified. Use low-acid glassware throughout this procedure.]

Mobile phase: *n*-Hexane

Standard solution: 15 µg/mL of retinyl acetate from USP Vitamin A RS in *n*-hexane

System suitability stock solution: 15 µg/mL of retinyl palmitate in *n*-hexane

System suitability solution: Mix equal volumes of *System suitability stock solution* and the *Standard solution* to obtain concentrations of 7.5 µg/mL each of retinyl acetate and retinyl palmitate.

Sample solution: Transfer the contents of NLT 20 Capsules to a suitable container, mix, and weigh. Transfer a portion of the mixture, equivalent to 5 Capsules, to a container having a polytetrafluoroethylene-lined screw cap. [NOTE—For hard gelatin Capsules, remove, as completely as possible, the contents of NLT 20 Capsules by cutting open the Capsule shells, transferring the shells and their contents to a suitable container, and triturating to a homogeneous mass. Transfer a portion of the mass, equivalent to 5 Capsules, to a container having a polytetrafluoroethylene-lined screw cap.] Add 10 mL of dimethyl sulfoxide and 15 mL of *n*-hexane, and shake for 45 min on a wrist-action shaker in a water bath maintained at 60°. [NOTE—Set up the wrist-action shaker to ensure that the contents of the container are mixed vigorously and thoroughly.] Centrifuge at 3000 rpm for 10 min, and transfer the hexane layer by means of a pipet to a 100-mL volumetric flask. Add 15 mL of *n*-hexane to the dimethyl sulfoxide-

ide layer, shake thoroughly for 5 min, and transfer the hexane layer by means of a pipet to the 100-mL volumetric flask. Repeat this extraction with three additional 15-mL portions of *n*-hexane. Dilute the extracts in the volumetric flask with *n*-hexane to volume. Dilute a volume of this solution with *n*-hexane to obtain a solution with a concentration of 15 µg/mL of vitamin A as retinol (C₂₀H₃₀O).

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 325 nm

Column: 4.6-mm × 15-cm; 3-µm packing L8

Flow rate: 1 mL/min

Injection size: 40 µL

System suitability

Sample: *System suitability solution*

Suitability requirements

Resolution: NLT 10 between all-*trans*-retinyl acetate and all-*trans*-retinyl palmitate

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak area for all-*trans*-retinyl acetate obtained from the *Standard solution* and the peak area for all-*trans*-retinyl acetate or all-*trans*-retinyl palmitate in the chromatogram of the *Sample solution*. For products containing vitamin A acetate or vitamin A palmitate, calculate the percentage of the labeled amount of vitamin A, as retinol (C₂₀H₃₀O), in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times F \times 100$$

r_U = peak area of the all-*trans*-retinyl ester from the *Sample solution*

r_S = peak area of the all-*trans*-retinyl ester from the *Standard solution*

C_S = concentration of retinyl acetate (C₂₂H₃₂O₂) from USP Vitamin A RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of vitamin A, as retinol (C₂₀H₃₀O), in the *Sample solution* (µg/mL)

F = factor used to convert retinyl acetate, the ester form present in USP Vitamin A RS, to retinol, 0.872

[NOTE—The molar responses of retinyl acetate and retinyl palmitate are equivalent.]

Acceptance criteria: 90.0%–165.0% of the labeled amount of vitamin A, as retinol (C₂₀H₃₀O)

• VITAMIN A, Method 2

[NOTE—Where a vitamin A ester (retinyl acetate or retinyl palmitate) is indicated in the following procedure, use the chemical form present in the formulation. USP Vitamin A RS is retinyl acetate. It is to be used where USP Vitamin A RS is specified. Use low-actinic glassware throughout this procedure.]

3 N methanolic sulfuric acid solution: Cautiously add 9 mL of sulfuric acid to 80 mL of methanol in a 100-mL volumetric flask. Cool, and dilute with methanol to volume.

Sodium ascorbate–pyrogallol solution: Transfer 10 g of sodium ascorbate and 5 g of pyrogallol to a 100-mL volumetric flask, and add sufficient water to dissolve. Add 1.7 mL of sulfuric acid, and dilute with water to volume.

Lecithin solution: 5 mg/mL of lecithin in 2,2,4-trimethylpentane

Mobile phase: *n*-Hexane and ethyl acetate (99.7:0.3)

Standard solution: 15 µg/mL of retinyl acetate from USP Vitamin A RS in 2,2,4-trimethylpentane

System suitability stock solution: 15 µg/mL of retinyl palmitate in 2,2,4-trimethylpentane

System suitability solution: Mix equal volumes of the *System suitability stock solution* and the *Standard solution*

to obtain concentrations of 7.5 µg/mL each of retinyl acetate and retinyl palmitate.

Sample solution: [NOTE—This preparation is suitable for the determination of vitamin A, vitamin D, and vitamin E, when present in the formulation.] Weigh NLT 20 Capsules in a tared weighing bottle. Using a sharp blade if necessary, carefully open the Capsules, without loss of shell material, and transfer the contents to a 100-mL beaker. Remove any contents adhering to the empty shells by washing with several portions of ether. Discard the washings, and dry the Capsule shells with the aid of a current of dry air. Weigh the empty Capsule shells in the tared weighing bottle, and calculate the net weight of the Capsule contents. Transfer a portion of the Capsule contents, equivalent to 30 µg of the labeled amount of cholecalciferol or ergocalciferol (vitamin D), to a container with a polytetrafluoroethylene-lined screw cap. If vitamin D is not present in the formulation, use a portion, equivalent to 90 mg of the labeled amount of vitamin E. If vitamin E is not present in the formulation, use a portion, equivalent to 2.5 mg of the labeled amount of vitamin A, as retinol. Add 0.5 g of sodium bicarbonate, 1.5 mL of *Lecithin solution*, and 12.5 mL of 2,2,4-trimethylpentane, and disperse on a vortex mixer. Add 6 mL of *Sodium ascorbate–pyrogallol solution*, shake slowly, and allow the solution to degas. Continue shaking until the evolution of gas has ceased, and then shake for an additional 12 min. Add 6 mL of dimethyl sulfoxide, mix on a vortex mixer to form a suspension, and shake for 12 min. Add 6 mL of 3 N methanolic sulfuric acid solution, mix on a vortex mixer to form a suspension, and shake for 12 min. Add 12.5 mL of 2,2,4-trimethylpentane, mix on a vortex mixer to form a suspension, and shake for 10 min. Centrifuge for 10 min to break up the emulsion and to clarify the supernatant. [NOTE—The supernatant is used for the determination of vitamin A, and also vitamin D and vitamin E, if present in the formulation.] If necessary, quantitatively dilute a volume of the supernatant with 2,2,4-trimethylpentane to obtain a concentration close to that of the *Standard solution*.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 325 nm

Column: 4.6-mm × 25-cm; 5-µm packing L24

Flow rate: 1.5 mL/min

Injection size: 40 µL

System suitability

Sample: *System suitability solution*

Suitability requirements

Resolution: NLT 8.0 between all-*trans*-retinyl acetate and all-*trans*-retinyl palmitate

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak area for all-*trans*-retinyl acetate from the *Standard solution* and the peak area of all-*trans*-retinyl acetate or all-*trans*-retinyl palmitate from the *Sample solution*.

Calculate the percentage of the labeled amount of vitamin A, as retinol (C₂₀H₃₀O), in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times F \times 100$$

r_U = peak area of the all-*trans*-retinyl ester from the *Sample solution*

r_S = peak area of the all-*trans*-retinyl ester from the *Standard solution*

C_S = concentration of retinyl acetate (C₂₂H₃₂O₂) from USP Vitamin A RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of vitamin A, as retinol (C₂₀H₃₀O), in the *Sample solution* (µg/mL)

F = factor used to convert retinyl acetate, the ester form present in USP Vitamin A RS, to retinol, 0.872

[NOTE—Account for the initial extraction volume of 26.5 mL of 2,2,4-trimethylpentane to calculate the nominal concentration. The molar responses of retinyl acetate and retinyl palmitate are equivalent.]

Acceptance criteria: 90.0%–165.0% of the labeled amount of vitamin A, as retinol ($C_{20}H_{30}O$)

• **VITAMIN A, Method 3**

[NOTE—Where a vitamin A ester (retinyl acetate or retinyl palmitate) is indicated in the following procedure, use the chemical form present in the formulation. USP Vitamin A RS is retinyl acetate. It is to be used where USP Vitamin A RS is specified. Use low-actinic glassware throughout this procedure.]

Extraction solvent: *n*-Hexane and methylene chloride (3:1)

Potassium hydroxide solution: 800 mg/mL of potassium hydroxide in water. [NOTE—Cautiously add potassium hydroxide in water. Mix, and cool.]

Diluent: 10 mg/mL of pyrogallol in alcohol

Mobile phase: *n*-Hexane and isopropyl alcohol (92:8)

Standard stock solution: 30 µg/mL of retinyl acetate from USP Vitamin A RS in *Diluent*. [NOTE—This solution may be stored in a refrigerator for 1 week.]

Standard solution: Dilute a volume of *Standard stock solution* with *Diluent* to obtain a concentration of 1 µg/mL of retinyl acetate from USP Vitamin A RS. Transfer 10.0 mL of this solution to a stoppered 125-mL flask, and add 5 mL of water, 5 mL of *Diluent*, and 3 mL of *Potassium hydroxide solution*. Insert the stopper tightly, shake for 15 min over a water bath maintained at $60 \pm 5^\circ$, and cool to room temperature. Add 7 mL of water and 25.0 mL of *Extraction solvent*. Insert the stopper tightly, and shake vigorously for 60 s. Rinse the sides of the flask with 60 mL of water, and allow to stand for 10 min until the layers separate. Withdraw a portion of the organic layer for injection into the chromatograph. This *Standard solution* contains 0.34 µg/mL of retinol.

Sample solution: Weigh NLT 20 Capsules in a tared weighing bottle. Open the Capsules, without loss of shell material, and transfer the contents to a 100-mL beaker. Remove any contents adhering to the empty shells by washing with several portions of ether. Discard the washings, and dry the Capsule shells with the aid of a current of dry air. Weigh the empty Capsule shells in the tared weighing bottle, and calculate the net weight of the Capsule contents. Transfer a portion of the Capsule contents, equivalent to 1.5 mg of retinyl acetate, to a stoppered 125-mL flask. Add 5 mL of water, 15 mL of *Diluent*, and 3 mL of *Potassium hydroxide solution*. Insert the stopper tightly, shake for 15 min over a water bath maintained at $60 \pm 5^\circ$, and cool to room temperature. Add 7 mL of water and 25.0 mL of *Extraction solvent*. Insert the stopper tightly, and shake vigorously for 60 s or longer, if necessary, for complete extraction. Rinse the sides of the flask with 60 mL of water, and allow to stand for 10 min until the layers separate. [NOTE—Do not shake, because an emulsion may form.] Withdraw a portion of the organic layer, and dilute quantitatively, and stepwise if necessary, with *Extraction solvent*, to obtain a concentration of 0.34 µg/mL of retinol.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 335 nm

Column: 6.2-mm × 8-cm; packing L3

Column temperature: 40°

Flow rate: 4 mL/min

Injection size: 50 µL

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for 13-*cis*-retinol and all-*trans*-retinol are about 0.92 and 1.0, respectively.]

Suitability requirements

Relative standard deviation: NMT 5.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas for all-*trans*-retinol and 13-*cis*-retinol. Calculate the percentage of the labeled amount of vitamin A, as retinol ($C_{20}H_{30}O$), in the portion of Capsules taken:

$$\text{Result} = (r_{T1}/r_{T2}) \times (C_S/C_U) \times F \times 100$$

r_{T1} = sum of the areas of the all-*trans*-retinol and 13-*cis*-retinol peaks from the *Sample solution*

r_{T2} = sum of the areas of all-*trans*-retinol and 13-*cis*-retinol peaks from the *Standard solution*

C_S = concentration of retinyl acetate ($C_{23}H_{32}O_2$) from USP Vitamin A RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of vitamin A, as retinol ($C_{20}H_{30}O$), in the *Sample solution* (µg/mL)

F = factor used to convert retinyl acetate, the ester form present in USP Vitamin A RS, to retinol, 0.872

Acceptance criteria: 90.0%–165.0% of the labeled amount of vitamin A, as retinol ($C_{20}H_{30}O$)

• **CHOLECALCIFEROL or ERGOCALCIFEROL (VITAMIN D),**

Method 1

[NOTE—Where vitamin D (cholecalciferol or ergocalciferol) is specified in the following procedure, use the chemical form present in the formulation and the relevant USP Reference Standard. Use low-actinic glassware throughout this procedure.]

Mobile phase: *n*-Hexane and isopropyl alcohol (99:1)

Standard solution: 2 µg/mL of USP Cholecalciferol RS or USP Ergocalciferol RS in *n*-hexane

System suitability solution: Heat a volume of the *Standard solution* at 60° for 1 h to partially isomerize vitamin D (cholecalciferol or ergocalciferol) to its corresponding precursor.

Sample solution: Proceed as directed for the *Sample solution* in *Vitamin A, Method 1*. Transfer NLT 20 mL of this solution to a suitable container, and evaporate, if necessary, in a vacuum at room temperature to obtain a solution to obtain a concentration of 2 µg/mL of cholecalciferol or ergocalciferol.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 265 nm

Column: 4.6-mm × 15-cm; 3-µm packing L8

Flow rate: 1 mL/min

Injection size: 100 µL

System suitability

Samples: *Standard solution* and *System suitability solution*

Suitability requirements

Resolution: NLT 10 between the vitamin D form present and its corresponding precursor, *System suitability solution*

Relative standard deviation: NMT 3.0%, *Standard solution*

Analysis**Samples:** *Standard solution* and *Sample solution*

Measure the peak areas for vitamin D. Calculate the percentage of the labeled amount of cholecalciferol ($C_{27}H_{44}O$) or ergocalciferol ($C_{28}H_{44}O$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times F \times 100$$

- r_U = peak area of cholecalciferol or ergocalciferol from the *Sample solution*
 r_S = peak area of cholecalciferol or ergocalciferol from the *Standard solution*
 C_S = concentration of USP Cholecalciferol RS or USP Ergocalciferol RS in the *Standard solution* ($\mu\text{g/mL}$)
 C_U = nominal concentration of cholecalciferol or ergocalciferol in the *Sample solution* ($\mu\text{g/mL}$)
 F = correction factor to account for the average amount of previtamin D present in the *Sample solution*, 1.09

Acceptance criteria: 90.0%–165.0% of the labeled amount of vitamin D as cholecalciferol ($C_{27}H_{44}O$) or ergocalciferol ($C_{28}H_{44}O$)

• **CHOLECALCIFEROL or ERGOCALCIFEROL (VITAMIN D),**

Method 2

[NOTE—Where vitamin D (cholecalciferol or ergocalciferol) is specified in the following procedure, use the chemical form present in the formulation and the relevant USP Reference Standard. Use low-actinic glassware throughout this procedure.]

3 N methanolic sulfuric acid solution, Sodium ascorbate–pyrogallol solution, Lecithin solution, and Sample solution: Proceed as directed in *Vitamin A*, *Method 2*.

Mobile phase: *n*-Hexane and tertiary butyl alcohol (98.75:1.25)

Standard solution: 1 $\mu\text{g/mL}$ of USP Cholecalciferol RS or USP Ergocalciferol RS in 2,2,4-trimethylpentane

System suitability solution: Heat a volume of the *Standard solution* at 60° for 1 h to partially isomerize vitamin D (cholecalciferol or ergocalciferol) to its corresponding precursor.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 265 nm

Column: 4.6-mm \times 25-cm; 5- μm packing L24

Flow rate: 1 mL/min

Injection size: 40 μL

System suitability

Samples: *Standard solution* and *System suitability solution*

Suitability requirements

Resolution: NLT 4.0 between the vitamin D form present and its corresponding precursor, *System suitability solution*

Relative standard deviation: NMT 3.0%, *Standard solution*

Analysis**Samples:** *Standard solution* and *Sample solution*

Measure the peak areas for vitamin D. Calculate the percentage of the labeled amount of cholecalciferol ($C_{27}H_{44}O$) or ergocalciferol ($C_{28}H_{44}O$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- r_U = peak area of cholecalciferol or ergocalciferol from the *Sample solution*
 r_S = peak area of cholecalciferol or ergocalciferol from the *Standard solution*
 C_S = concentration of USP Cholecalciferol RS or USP Ergocalciferol RS in the *Standard solution* ($\mu\text{g/mL}$)

C_U = nominal concentration of cholecalciferol or ergocalciferol in the *Sample solution* ($\mu\text{g/mL}$)

Acceptance criteria: 90.0%–165.0% of the labeled amount of vitamin D as cholecalciferol ($C_{27}H_{44}O$) or ergocalciferol ($C_{28}H_{44}O$)

• **CHOLECALCIFEROL or ERGOCALCIFEROL (VITAMIN D),**

Method 3

[NOTE—Where vitamin D (cholecalciferol or ergocalciferol) is specified in the following procedure, use the chemical form present in the formulation and the relevant USP Reference Standard. Use low-actinic glassware throughout this procedure.]

Diluted acetic acid: Glacial acetic acid solution (1 in 10) in water

Phenolphthalein solution: 10 mg/mL of phenolphthalein in alcohol

Potassium hydroxide solution: Slowly dissolve 14 g of potassium hydroxide in a mixture of 31 mL of dehydrated alcohol and 5 mL of water. Prepare fresh daily.

Extraction solvent: Methylene chloride and isopropyl alcohol (99.8:0.2)

Mobile phase: Acetonitrile and methanol (91:9)

Standard stock solution: 0.2 mg/mL of USP Cholecalciferol RS or USP Ergocalciferol RS in dehydrated alcohol. [NOTE—Prepare fresh every 4 weeks. Store in a freezer.]

Standard solution: [NOTE—Condition the solid-phase extraction column specified for use in the *Standard solution* and the *Sample solution* by initially washing the column with 4.0 mL of a mixture of methylene chloride and isopropyl alcohol (4:1), followed by 5.0 mL of *Extraction solvent*. Do not allow the column to dry.] Dilute a volume of *Standard stock solution* with dehydrated alcohol to obtain a concentration of 5 $\mu\text{g/mL}$ of USP Cholecalciferol RS or USP Ergocalciferol RS. Prepare this solution fresh daily. Transfer 2.0 mL of this solution to a stoppered 125-mL flask. Add 15.0 mL of water and 15.0 mL of *Potassium hydroxide solution*, insert the stopper, and shake for 30 min in a water bath maintained at 60°. Allow to cool to room temperature, and transfer the contents of the flask to a 250-mL separatory funnel. Add 15.0 mL of water to the flask, insert the stopper, shake vigorously, and transfer this solution to the separatory funnel. Rinse the flask with 60 mL of *n*-hexane, and transfer the rinsing to the separatory funnel. Insert the stopper, shake vigorously for 90 s, and allow to stand for 15 min until the layers separate. Drain and discard the aqueous layer. Add 15.0 mL of water to the hexane layer in the separatory funnel, insert the stopper, and shake vigorously. Allow to stand for 10 min until the layers separate, and discard the aqueous layer. Add 1 drop of *Phenolphthalein solution* and 15.0 mL of water to the separatory funnel. Add *Diluted acetic acid* dropwise, with shaking, until the washing is neutral. Allow to stand for 10 min until the layers separate. Drain and discard the aqueous layer. Filter the hexane layer through anhydrous sodium sulfate supported by a small pledget of cotton into a 100-mL round-bottom flask. Rinse the funnel and sodium sulfate with a few mL of *n*-hexane, and collect the rinsings in the same flask. Evaporate the hexane in the flask on a rotary evaporator at 50° to dryness. Immediately add 2.0 mL of *Extraction solvent* to dissolve the residue. Transfer this solution to a freshly conditioned solid-phase extraction column containing silica packing with a sorbent mass-to-column volume ratio of 500 mg to 2.8 mL or equivalent, rinse the round-bottom flask with 1.0 mL of *Extraction solvent*, and transfer to the column. Elute the column with 2.0 mL of *Extraction solvent*, and discard this fraction. Elute the column with 7.0 mL of *Extraction solvent*, and collect the eluate in a suitable flask. Place the flask in a warm water bath maintained at 42°, and evaporate the solvent with the aid of a stream of nitrogen.

Immediately add 2.0 mL of acetonitrile to the residue, and use the solution for injection into the chromatograph.

Sample solution: Proceed as directed for the *Sample solution* in *Vitamin A, Method 3*, through "calculate the net weight of the Capsule contents." Transfer a portion of the Capsule contents, equivalent to 10 µg of ergocalciferol or cholecalciferol, to a stoppered 125-mL flask, and proceed as directed for the *Standard solution*, beginning with "Add 15.0 mL of water and 15.0 mL of *Potassium hydroxide solution*".

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 265 nm

Column: 4.6-mm × 25-cm; 5-µm packing L1

Column temperature: 27°

Flow rate: 0.7 mL/min

Injection size: 15 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 4.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas for vitamin D. Calculate the percentage of the labeled amount of cholecalciferol (C₂₇H₄₄O) or ergocalciferol (C₂₈H₄₄O) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of cholecalciferol or ergocalciferol from the *Sample solution*

r_S = peak area of cholecalciferol or ergocalciferol from the *Standard solution*

C_S = concentration of USP Cholecalciferol RS or USP Ergocalciferol RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of cholecalciferol or ergocalciferol in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–165.0% of the labeled amount of vitamin D as cholecalciferol (C₂₇H₄₄O) or ergocalciferol (C₂₈H₄₄O)

• VITAMIN E, Method 1

[NOTE—Where vitamin E (alpha tocopherol, alpha tocopheryl acetate, or alpha tocopheryl acid succinate) is specified in the following procedure, use the chemical form present in the formulation and the relevant USP Reference Standard. Use low-actinic glassware throughout this procedure.]

Solution A: Phosphoric acid solution (1 in 100) in water

Mobile phase: Methanol and *Solution A* (19:1)

Standard solution: 2 mg/mL of USP Alpha Tocopherol RS, USP Alpha Tocopheryl Acetate RS, or USP Alpha Tocopheryl Acid Succinate RS in methanol

System suitability solution: Prepare a 0.65-mg/mL solution of USP Ergocalciferol RS in methanol. Transfer 1.0 mL of this solution to a 100-mL volumetric flask containing 100 mg of USP Alpha Tocopheryl Acetate RS. Dissolve in 30 mL of methanol, with the aid of sonication if necessary, and dilute with methanol to volume. Store this solution in a refrigerator.

Sample solution: Proceed as directed for the *Sample solution* in *Vitamin A, Method 1*. Transfer NLT 20 mL of this solution to a suitable container, and evaporate if necessary, in a vacuum at room temperature to dryness. Transfer the contents of the flask to a suitable volumetric flask with the aid of methanol, and dilute with methanol to volume, to obtain a concentration of 2 mg/mL of alpha tocopherol, alpha tocopheryl acetate, or alpha tocopheryl acid succinate.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 8-mm × 10-cm; 5-µm packing L1

Flow rate: 2 mL/min

Injection size: 100 µL

System suitability

Samples: *Standard solution* and *System suitability solution*

[NOTE—The relative retention times for ergocalciferol and alpha tocopheryl acetate are about 0.5 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 12 between ergocalciferol and alpha tocopheryl acetate, *System suitability solution*

Tailing factor: Between 0.8 and 1.2, *System suitability solution*

Relative standard deviation: NMT 3.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas. Calculate the percentage of the labeled amount of alpha tocopherol (C₂₉H₅₀O₂), alpha tocopheryl acetate (C₃₁H₅₂O₃), or alpha tocopheryl acid succinate (C₃₃H₅₄O₅) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of the relevant vitamin E form from the *Sample solution*

r_S = peak area of the relevant vitamin E form from the *Standard solution*

C_S = concentration of the corresponding USP Reference Standard in the *Standard solution* (mg/mL)

C_U = nominal concentration of the corresponding form of vitamin E in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–165.0% of the labeled amount of vitamin E as alpha tocopherol (C₂₉H₅₀O₂), alpha tocopheryl acetate (C₃₁H₅₂O₃), or alpha tocopheryl acid succinate (C₃₃H₅₄O₅)

• VITAMIN E, Method 2

[NOTE—Where vitamin E (alpha tocopherol, alpha tocopheryl acetate, or alpha tocopheryl acid succinate) is specified in the following procedure, use the chemical form present in the formulation and the relevant USP Reference Standard. Use low-actinic glassware throughout this procedure.]

Mobile phase: Mix 240 mL of methanol with 10 mL of water, followed by 0.5 mL of 50% phosphoric acid, and dilute with acetonitrile to 1000 mL.

System suitability solution: 2 mg/mL each of USP Alpha Tocopherol RS, USP Alpha Tocopheryl Acetate RS, and USP Alpha Tocopheryl Acid Succinate RS in methanol

Standard solution: 2 mg/mL of USP Alpha Tocopherol RS, USP Alpha Tocopheryl Acetate RS, or USP Alpha Tocopheryl Acid Succinate RS in methanol

3 N methanolic sulfuric acid solution: Cautiously mix sulfuric acid and methanol (9 in 100) in a 100-mL volumetric flask. [NOTE—Dissolve in a portion of methanol, cool, and then dilute to final volume.]

Sodium ascorbate–pyrogallol solution: Transfer 10 g of sodium ascorbate and 5 g of pyrogallol to a 100-mL volumetric flask. Add sufficient water to dissolve. Add 1.7 mL of sulfuric acid, and dilute with water to volume.

Lecithin solution: 5 mg/mL of lecithin in 2,2,4-trimethylpentane

Sample solution: Proceed as directed for the *Sample solution* in *Vitamin A, Method 2*, through "calculate the net weight of the Capsule contents." Transfer a portion of the Capsule contents, equivalent to 55 mg of vitamin E, to a container having a polytetrafluoroethylene-lined screw cap. Add

0.5 g of sodium bicarbonate, 1.5 mL of *Lecithin solution*, and 12.5 mL of 2,2,4-trimethylpentane, and disperse on a vortex mixer. Add 6 mL of *Sodium ascorbate-pyrogallol solution*, shake slowly, and allow the solution to degas. Continue shaking until the evolution of gas has ceased, and then shake for an additional 12 min. Add 6 mL of dimethyl sulfoxide, mix on a vortex mixer to form a suspension, and shake for 12 min. Add 6 mL of 3 *N methanolic sulfuric acid solution*, mix on a vortex mixer to form a suspension, and shake for 12 min. Add 12.5 mL of 2,2,4-trimethylpentane, mix on a vortex mixer to form a suspension, and shake for 10 min. Centrifuge for 10 min to break up the emulsion and to clarify the supernatant layer. Transfer a volume of the supernatant 2,2,4-trimethylpentane layer to a suitable volumetric flask, the volume of the specimen withdrawn from the 2,2,4-trimethylpentane layer and the size of the volumetric flask being such that the final concentration of the *Sample solution* is equivalent to that of the *Standard solution*. Evaporate nearly to dryness, add several mL of methanol, and evaporate the remaining 2,2,4-trimethylpentane. Dilute with methanol to volume.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 4.6-mm × 25-cm; 5-μm packing L1

Flow rate: 1.5 mL/min

Injection size: 25 μL

System suitability

Samples: *Standard solution* and *System suitability solution*

[NOTE—The relative retention times for alpha tocopheryl acid succinate, alpha tocopherol, and alpha tocopheryl acetate are about 0.6, 0.8, and 1.0, respectively.]

Suitability requirements

Resolution: NLT 4.0 between alpha tocopheryl acid succinate and alpha tocopherol and NLT 3.0 between alpha tocopherol and alpha tocopheryl acetate, *System suitability solution*

Relative standard deviation: NMT 3.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas. Calculate the percentage of the labeled amount of alpha tocopherol ($C_{29}H_{50}O_2$), alpha tocopheryl acetate ($C_{31}H_{52}O_3$), or alpha tocopheryl acid succinate ($C_{33}H_{54}O_5$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of the relevant vitamin E form from the *Sample solution*

r_S = peak area of the relevant vitamin E form from the *Standard solution*

C_S = concentration of the corresponding USP Reference Standard in the *Standard solution* (mg/mL)

C_U = nominal concentration of the corresponding form of vitamin E in the *Sample solution* (mg/mL)

[NOTE—Account for the initial extraction volume of 26.5 mL of 2,2,4-trimethylpentane and the dilution factor to exchange the solvent from 2,2,4-trimethylpentane to methanol to calculate the nominal concentration.]

Acceptance criteria: 90.0%–165.0% of the labeled amount of vitamin E as alpha tocopherol ($C_{29}H_{50}O_2$), alpha tocopheryl acetate ($C_{31}H_{52}O_3$), or alpha tocopheryl acid succinate ($C_{33}H_{54}O_5$)

• VITAMIN E, Method 3

Diluent: Acetonitrile and ethyl acetate (1:1)

Mobile phase: Methanol, acetonitrile, and *n*-hexane (46.5:46.5:7.0)

Standard solution: 0.3 mg/mL of USP Alpha Tocopherol RS in methanol

Sample solution: Proceed as directed for the *Sample solution* in *Vitamin A, Method 3*, through “calculate the net weight of the Capsule contents.” Transfer a portion of the Capsule contents, equivalent to 8.0 mg of alpha tocopherol, to a glass-stoppered conical flask. Add 25.0 mL of water, 25.0 mL of dehydrated alcohol, and 3.5 g of potassium hydroxide pellets. Shake for 1 h in a water bath maintained at 55°. Cool, and transfer with the aid of a minimum volume of water to a 125-mL separatory funnel. Rinse the flask with 50 mL of *n*-hexane, and add the rinsing to the separatory funnel. Insert the stopper, shake vigorously for 60 s, and allow the layers to separate. Drain the aqueous layer into a second 250-mL separatory funnel, and repeat the extraction with 50 mL of *n*-hexane. Discard the aqueous layer, and combine the hexane extracts. Wash the combined extracts with 25 mL of water, allow the layers to separate, and discard the aqueous layer. Add 3 drops of glacial acetic acid, and repeat the washing procedure two more times. Filter the washed hexane layer through anhydrous sodium sulfate into a 250-mL round-bottom flask. Rinse the funnel and sodium sulfate with a few mL of *n*-hexane, and add the rinsing to the hexane solution in the flask. Place the flask in a water bath maintained at 50°, and evaporate the hexane solution with the aid of a rotary evaporator to dryness. Immediately add 25.0 mL of *Diluent*, and swirl to dissolve the residue.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 291 nm

Column: 4.6-mm × 25-cm; packing L1

Column temperature: 40°

Flow rate: 3 mL/min

Injection size: 20 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 5.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas. Calculate the percentage of the labeled amount of vitamin E as alpha tocopherol ($C_{29}H_{50}O_2$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of alpha tocopherol from the *Sample solution*

r_S = peak area of alpha tocopherol from the *Standard solution*

C_S = concentration of alpha tocopherol in the *Standard solution* (mg/mL)

C_U = nominal concentration of vitamin E as alpha tocopherol in the *Sample solution* (mg/mL)

[NOTE—Calculate the content of alpha tocopheryl acetate ($C_{31}H_{52}O_3$) or alpha tocopheryl acid succinate ($C_{33}H_{54}O_5$) by dividing the content, in mg/Capsule of vitamin E as alpha tocopherol ($C_{29}H_{50}O_2$), by the factor 0.91 or 0.81, respectively.]

Acceptance criteria: 90.0%–165.0% of the labeled amount of vitamin E as alpha tocopherol ($C_{29}H_{50}O_2$), alpha tocopheryl acetate ($C_{31}H_{52}O_3$), or alpha tocopheryl acid succinate ($C_{33}H_{54}O_5$)

• PHYTONADIONE

[NOTE—Use low-actinic glassware throughout this procedure.]

Mobile phase: Methanol and water (19:1)

Standard stock solution: 200 µg/mL of USP

Phytonadione RS in methanol. Dissolve with the aid of sonication if necessary.

Standard solution: 20 µg/mL of USP Phytonadione RS from *Standard stock solution* diluted with methanol

System suitability solution: 0.65 mg/mL of USP Alpha Tocopheryl Acetate RS and 20 µg/mL of USP Phytonadione RS from *Standard stock solution* diluted with methanol. [NOTE—Dissolve USP Alpha Tocopheryl Acetate RS in a portion of methanol, add the *Standard stock solution*, and then dilute with methanol to volume.]

Sample solution: Transfer NLT 20 mL of the solution retained as specified in the directions for the *Sample solution* in *Vitamin A, Method 1* to a suitable container, and evaporate, if necessary, in a vacuum at room temperature to dryness. Transfer the contents of the flask to a suitable volumetric flask with the aid of methanol, and dilute with methanol to volume to obtain a concentration of 20 µg/mL of phytonadione.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 8-mm × 10-cm; 5-µm packing L1

Flow rate: 2 mL/min

Injection size: 100 µL

System suitability

Samples: *Standard solution* and *System suitability solution*

[NOTE—The relative retention times for alpha tocopheryl acetate and phytonadione are about 0.68 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 5 between alpha tocopheryl acetate and phytonadione, *System suitability solution*

Relative standard deviation: NMT 3.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas. Calculate the percentage of the labeled amount of phytonadione (C₃₁H₄₆O₂) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area for phytonadione from the *Sample solution*

r_S = peak area for phytonadione from the *Standard solution*

C_S = concentration of USP Phytonadione RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of phytonadione in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–165.0% of the labeled amount of phytonadione (C₃₁H₄₆O₂)

• BETA CAROTENE

[NOTE—Use low-actinic glassware throughout this procedure.]

Potassium hydroxide solution: Dissolve 58.8 g of potassium hydroxide in 50 mL of water.

Iodine solution: Transfer 10 mg of iodine to a 100-mL volumetric flask. Dissolve in cyclohexane, and dilute with cyclohexane to volume. Dilute 10 mL of this solution with cyclohexane to 100 mL. [NOTE—Prepare this solution fresh daily.]

Sample solution A (for preparations containing beta carotene in oil solutions): Proceed as directed in *Vitamin A, Method 1*, except use cyclohexane instead of *n*-hexane as the extraction solvent, and dilute the filtered extracts with cyclohexane, to obtain a concentration of 2 µg/mL of beta carotene.

Sample solution B (for preparations containing beta carotene in dry powder): Remove the contents of NLT

20 Capsules by cutting open the Capsules. Mix, and determine the weight of the contents. Transfer a quantity of the Capsule contents, equivalent to 2 mg of beta carotene, to a 500-mL saponification flask. Add 100 mL of alcohol, 6 mL of *Potassium hydroxide solution*, and a magnetic stirring bar. Attach an air condenser to the flask, and heat under reflux for 45 min with constant stirring. Cool to room temperature. Add 170 mL of solvent hexane, and stir for 30 min. Quantitatively transfer the contents of the flask to a 500-mL separatory funnel with portions of solvent hexane. Allow the layers to separate for 5–10 min, and transfer the upper organic layer to a 500-mL volumetric flask. Transfer the lower aqueous layer into the saponification flask. Add 170 mL of solvent hexane, and stir for an additional 20 min. Quantitatively transfer the contents of the saponification flask to the separatory funnel with the aid of portions of solvent hexane. Allow the layers to separate for 10 min. Drain the lower aqueous layer, and discard. Transfer the organic layer to the volumetric flask containing the previously collected organic layer. Rinse the separatory funnel with small portions of solvent hexane, and transfer the washings to the volumetric flask. Dilute the hexane extracts with solvent hexane to volume. Add 3 g of anhydrous sodium sulfate, shake, and allow to settle. Quantitatively transfer a volume of this solution, equivalent to 100 µg of beta carotene, to a 50-mL volumetric flask. Evaporate under a stream of nitrogen to dryness, and immediately add cyclohexane. Add 2 mL of *Iodine solution*, and heat for 15 min in a water bath maintained at 65°. Cool rapidly, and dilute with cyclohexane to volume.

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Vis

Analytical wavelength: 452 nm

Blank: Cyclohexane

Analysis

Samples: *Sample solution A* or *Sample solution B*

Determine the absorbance against the *Blank*. Calculate the percentage of the labeled amount of beta carotene (C₄₀H₅₆) in the portion of Capsules taken:

$$\text{Result} = (A_U/F) \times (100/C_U)$$

A_U = absorbance of *Sample solution A* or *Sample solution B*

F = absorptivity of beta carotene at 452 nm, 223

C_U = nominal concentration of beta carotene in *Sample solution A* or *Sample solution B* (mg/mL)

Acceptance criteria: 90.0%–165.0% of the labeled amount of beta carotene (C₄₀H₅₆)

• ASCORBIC ACID, Method 1

Sample solution: Weigh NLT 20 Capsules in a tared weighing bottle. Open the Capsules, without the loss of shell material, and transfer the contents to a 100-mL beaker. Remove any contents adhering to the empty shells by washing, if necessary, with several portions of ether. Discard the washings, and dry the Capsule shells with the aid of a current of dry air until the odor of ether is no longer perceptible. Weigh the empty Capsule shells in the tared weighing bottle, and calculate the average net weight per Capsule. Transfer a portion of the Capsule contents, equivalent to 100 mg of ascorbic acid, to a 200-mL volumetric flask, and add 75 mL of metaphosphoric–acetic acids TS. Insert a stopper into the flask, and shake by mechanical means for 30 min. Dilute with water to volume. Transfer a portion of the solution to a centrifuge tube, and centrifuge until a clear supernatant is obtained. Pipet 4.0 mL of this solution into a 50-mL conical flask, and add 5 mL of metaphosphoric–acetic acids TS.

Analysis: Titrate with standard dichlorophenol–indophenol solution VS to a rose-pink color that persists

for at least 5 s. Correct for the volume of dichlorophenol-indophenol solution consumed by a mixture of 5.5 mL of metaphosphoric-acetic acids TS and 15 mL of water. From the ascorbic acid equivalent of the standard dichlorophenol-indophenol solution, calculate the content of ascorbic acid in each Capsule.

Acceptance criteria: 90.0%–150.0% of the labeled amount of ascorbic acid ($C_6H_8O_6$)

- **ASCORBIC ACID, Method 2:** Proceed as directed in *Automated Methods of Analysis* (16), Assay for Ascorbic Acid.

Acceptance criteria: 90.0%–150.0% of the labeled amount of ascorbic acid ($C_6H_8O_6$)

- **CALCIUM ASCORBATE, Method 1:** Proceed as directed in *Ascorbic Acid, Method 1*.

Acceptance criteria: 90.0%–150.0% of the labeled amount of calcium ascorbate ($C_{12}H_{14}CaO_{12} \cdot 2H_2O$)

- **CALCIUM ASCORBATE, Method 2:** Proceed as directed in *Automated Methods of Analysis* (16), Assay for Ascorbic Acid.

Acceptance criteria: 90.0%–150.0% of the labeled amount of calcium ascorbate ($C_{12}H_{14}CaO_{12} \cdot 2H_2O$)

- **SODIUM ASCORBATE, Method 1:** Proceed as directed in *Ascorbic Acid, Method 1*.

Acceptance criteria: 90.0%–150.0% of the labeled amount of sodium ascorbate ($C_6H_7NaO_6$)

- **SODIUM ASCORBATE, Method 2:** Proceed as directed in *Automated Methods of Analysis* (16), Assay for Ascorbic Acid.

Acceptance criteria: 90.0%–150.0% of the labeled amount of sodium ascorbate ($C_6H_7NaO_6$)

- **BIOTIN, Method 1**

[NOTE—Use low-actinic glassware throughout this procedure.]

Mobile phase: Mix 85 mL of acetonitrile, 1 g of sodium perchlorate, and 1 mL of phosphoric acid, and dilute with water to 1000 mL.

Standard stock solution: 0.333 mg/mL of USP Biotin RS in dimethyl sulfoxide

Standard solution: 5 µg/mL of USP Biotin RS prepared by diluting the *Standard stock solution* in water

Sample solution: Proceed as directed in *Ascorbic Acid, Method 1*, through “calculate the average net weight per Capsule.” Transfer a portion of the Capsule contents, equivalent to 1 mg of biotin, to a 200-mL volumetric flask. Add 3 mL of dimethyl sulfoxide, and swirl to wet the contents. Place the flask in a water bath at 60°–70° for 5 min. Sonicate for 5 min, dilute with water to volume, and filter.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 200 nm

Column: 4.6-mm × 15-cm; 3-µm packing L7

Flow rate: 1.2 mL/min

Injection size: 100 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the responses for the biotin peaks. Calculate the percentage of the labeled amount of biotin ($C_{10}H_{16}N_2O_3S$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Biotin RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of biotin in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–150.0% of the labeled amount of biotin ($C_{10}H_{16}N_2O_3S$)

- **BIOTIN, Method 2**

[NOTE—Use low-actinic glassware throughout this procedure.]

Dehydrated mixtures yielding formulations similar to the media described herein may be used provided that, when constituted as directed, they have growth-promoting properties equal to or superior to those obtained with the media prepared as described herein.

Standard stock solution: 50 µg/mL of USP Biotin RS in 50% alcohol. Store this solution in a refrigerator.

Standard solution: 0.1 ng/mL of USP Biotin RS in water, prepared by dilution of the *Standard stock solution* with water on the day of the assay

Sample solution: Proceed as directed in *Ascorbic Acid, Method 1*, through “calculate the average net weight per Capsule.” Transfer a portion of the Capsule contents, equivalent to 100 µg of biotin, to a 200-mL volumetric flask. Add 3 mL of 50% alcohol, and swirl to wet the contents. Heat the flask in a water bath at 60°–70° for 5 min. Sonicate for 5 min, dilute with 50% alcohol to volume, and filter. Dilute a volume of the filtrate quantitatively, and stepwise if necessary, with water to obtain a solution having a concentration of 0.1 ng/mL.

Acid-hydrolyzed casein solution: Mix 100 g of vitamin-free casein with 500 mL of 6 N hydrochloric acid, and reflux the mixture for 8–12 h. Remove the hydrochloric acid from the mixture by distillation under reduced pressure until a thick paste remains. Redissolve the resulting paste in water, adjust the solution with 1 N sodium hydroxide to a pH of 3.5 ± 0.1 , and add water to make 1000 mL. Add 20 g of activated charcoal, stir for 1 h, and filter. Repeat the treatment with activated charcoal. Store under toluene in a cool place at a temperature not below 10°. Filter the solution if a precipitate forms during storage.

Cystine-tryptophan solution: Suspend 4.0 g of L-cystine in a solution of 1.0 g of L-tryptophan (or 2.0 g of D,L-tryptophan) in 700–800 mL of water. Heat to 70°–80°, and add dilute hydrochloric acid (1 in 2) dropwise, with stirring, until the solids are dissolved. Cool, and add water to make 1000 mL. Store under toluene in a cool place at a temperature not below 10°.

Adenine-guanine-uracil solution: Dissolve 200 mg each of adenine sulfate, guanine hydrochloride, and uracil, with the aid of heat, in 10 mL of 4 N hydrochloric acid. Cool, and add water to make 200 mL. Store under toluene in a refrigerator.

Polysorbate 80 solution: 100 mg/mL of polysorbate 80 in alcohol

Calcium pantothenate solution: 10 µg/mL of calcium pantothenate in 50% alcohol. Store in a refrigerator.

Riboflavin-thiamine hydrochloride solution: 20 µg/mL of riboflavin and 10 µg/mL of thiamine hydrochloride in 0.02 N acetic acid. Store under toluene, protected from light, in a refrigerator.

p-Aminobenzoic acid-niacin-pyridoxine hydrochloride solution: 10 µg/mL of p-aminobenzoic acid, 50 µg/mL of niacin, and 40 µg/mL of pyridoxine hydrochloride in a mixture of neutralized alcohol and water (1:3). Store in a refrigerator.

Salt solution A: Dissolve 25 g of monobasic potassium phosphate and 25 g of dibasic potassium phosphate in water to make 500 mL. Add 5 drops of hydrochloric acid. Store under toluene.

Salt solution B: Dissolve 10 g of magnesium sulfate, 0.5 g of sodium chloride, 0.5 g of ferrous sulfate, and 0.5 g of manganese sulfate in water to make 500 mL. Add 5 drops of hydrochloric acid, and mix. Store under toluene.

Basal medium stock solution

Acid-hydrolyzed casein solution	25 mL
Cystine-tryptophan solution	25 mL
Polysorbate 80 solution	0.25 mL
Dextrose, anhydrous	10 g
Sodium acetate, anhydrous	5 g
Adenine-guanine-uracil solution	5 mL
Calcium pantothenate solution	5 mL
Riboflavin-thiamine hydrochloride solution	5 mL
p-Aminobenzoic acid-niacin-pyridoxine hydrochloride solution	5 mL
Salt solution A	5 mL
Salt solution B	5 mL

Dissolve the anhydrous dextrose and anhydrous sodium acetate in the solutions previously mixed, and adjust with 1 N sodium hydroxide to a pH of 6.8. Dilute with water to 250 mL.

Stock culture of *Lactobacillus plantarum*: Dissolve 2.0 g of yeast extract in 100 mL of water. Add 500 mg of anhydrous dextrose, 500 mg of anhydrous sodium acetate, and 1.5 g of agar, and heat the mixture on a steam bath, with stirring, until the agar dissolves. Add 10-mL portions of the hot solution to test tubes, close or cover the tubes, sterilize in an autoclave at 121° for 15 min, and allow the tubes to cool in an upright position. Prepare stab cultures in three or more of the tubes, using a pure culture of *Lactobacillus plantarum*,¹ incubating for 16–24 h at a temperature between 30° and 37° held constant to within ±0.5°. Store in a refrigerator. Prepare a fresh stab of the stock culture every week, and do not use for *Inoculum* if the culture is more than 1 week old.

Culture medium: To each of a series of test tubes containing 5.0 mL of *Basal medium stock solution* add 5.0 mL of water containing 0.5 ng of biotin. Plug the tubes with cotton, sterilize in an autoclave at 121° for 15 min, and cool.

Inoculum: [NOTE—A frozen suspension of *Lactobacillus plantarum* may be used as the stock culture, provided it yields an *Inoculum* comparable to a fresh culture.] Make a transfer of cells from the *Stock culture of Lactobacillus plantarum* to a sterile tube containing 10 mL of *Culture medium*. Incubate this culture for 16–24 h at a temperature between 30° and 37° held constant to within ±0.5°. The cell suspension so obtained is the *Inoculum*.

Analysis

Samples: *Standard solution* and *Sample solution* To similar separate test tubes add, in duplicate, 1.0 and/or 1.5, 2.0, 3.0, 4.0, and 5.0 mL of the *Standard solution*. To each tube and to four similar empty tubes add 5.0 mL of *Basal medium stock solution* and sufficient water to make 10 mL.

To similar test tubes add, in duplicate, volumes of the *Sample solution* corresponding to three or more of the levels specified for the *Standard solution*, including the levels of 2.0, 3.0, and 4.0 mL. To each tube add 5.0 mL of the *Basal medium stock solution* and sufficient water to make 10 mL. Place one complete set of *Standard* and *sample* tubes together in one tube rack and the duplicate set in a second rack or section of a rack, preferably in random order.

Cover the tubes of both series to prevent contamination, and sterilize in an autoclave at 121° for 5 min. Cool. Add 1 drop of *Inoculum* to each tube, except two of the four tubes containing no *Standard solution* (the uninoculated blanks). Incubate the tubes at a temperature between 30° and 37° held constant to

within ±0.5° until, following 16–24 h of incubation, there has been no substantial increase in turbidity in the tubes containing the highest level of *Standard* during a 2-h period.

Determine the transmittance of the tubes in the following manner. Mix the contents of each tube, and transfer to a spectrophotometer cell. Place the cell in a spectrophotometer that has been set at a specific wavelength of 540–660 nm, and read the transmittance when a steady state is reached. This steady state is observed a few seconds after agitation when the galvanometer reading remains constant for 30 s or more. Allow approximately the same time interval for the reading on each tube.

With the transmittance set at 1.00 for the uninoculated blank, read the transmittance of the inoculated blank. With the transmittance set at 1.00 for the inoculated blank, read the transmittance for each of the remaining tubes. If there is evidence of contamination with a foreign microorganism, disregard the result of the assay.

Calculation: Prepare a standard concentration-response curve as follows. For each level of the *Standard*, calculate the response from the sum of the duplicate values of the transmittance (Σ_s) as the difference, $y = 2.00 - \Sigma_s$. Plot this response on the ordinate of cross-section paper against the logarithm of the mL of *Standard solution* per tube on the abscissa, using for the ordinate either an arithmetic or a logarithmic scale, whichever gives the better approximation to a straight line. Draw the straight line or smooth curve that best fits the plotted points.

Calculate the response, $y = 2.00 - \Sigma_u$, adding together the two transmittances (Σ_u) for each level of the *Sample solution*. Read from the standard curve the logarithm of the volume of the *Standard solution* corresponding to each of those values of y that fall within the range of lowest and highest points plotted for the *Standard*. Subtract from each logarithm so obtained the logarithm of the volume, in mL, of the *Sample solution* to obtain the difference, X , for each dosage level. Average the values of X for each of three or more dosage levels to obtain \bar{X} , which equals the log-relative potency, M' , of the *Sample solution*. Determine the quantity, in μg , of biotin ($\text{C}_{10}\text{H}_{16}\text{N}_2\text{O}_3\text{S}$) in the portion of Capsules taken:

$$\text{antilog } M = \text{antilog } (M' + \log R)$$

R = number of μg of biotin that was assumed to be present in the portion of Capsules taken
Calculate the percentage of the labeled amount of biotin in the portion of Capsules taken:

$$\text{Result} = [(\text{antilog } M)/N] \times 100$$

N = nominal amount of biotin ($\text{C}_{10}\text{H}_{16}\text{N}_2\text{O}_3\text{S}$) in the portion of Capsules taken (μg)

Replication: Repeat the entire determination at least once, using separately prepared *Sample solutions*. If the difference between the two log-potencies M is NMT 0.08, their mean, \bar{M} , is the assayed log-potency of the test material (see *Design and Analysis of Biological Assays* (111), *The Confidence Interval and Limits of Potency*). If the two determinations differ by more than 0.08, conduct one or more additional determinations. From the mean of two or more values of M that do not differ by more than 0.15, compute the mean potency of the preparation under assay.

Acceptance criteria: 90.0%–150.0% of the labeled amount of biotin ($\text{C}_{10}\text{H}_{16}\text{N}_2\text{O}_3\text{S}$)

• **CYANOCOBALAMIN, Method 1**

[NOTE—Use low-actinic glassware throughout this procedure.]

¹ ATCC No. 8014 is suitable. This strain was formerly known as *Lactobacillus arabinosus* 17-5.

Mobile phase: Methanol and water (7:13)

Standard stock solution: 10 µg/mL of USP Cyanocobalamin RS in water. [NOTE—Store this stock solution in a dark place, and discard after 1 week.]

Standard solution: 1 µg/mL of USP Cyanocobalamin RS from *Standard stock solution* diluted with water

Sample solution: Weigh NLT 30 Capsules in a tared weighing bottle. Open the Capsules, without the loss of shell material, and transfer the contents to a 100-mL beaker. Remove any contents adhering to the empty shells by washing, if necessary, with several portions of ether. Discard the washings, and dry the Capsule shells with the aid of a current of dry air until the odor of ether is no longer perceptible. Weigh the empty Capsule shells in the tared weighing bottle, and calculate the average net weight per Capsule. Transfer a portion of the Capsule contents, equivalent to 100 µg of cyanocobalamin, to a 250-mL flask. Add 100.0 mL of water, and carefully extract for 2 min. Filter 10 mL of the extract, and use the clear filtrate.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: 550 nm

Column: 4.6-mm × 15-cm; 5-µm packing L1

Flow rate: 0.5 mL/min

Injection size: 200 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak responses for cyanocobalamin.

Calculate the percentage of the labeled amount of cyanocobalamin (C₆₃H₈₈CoN₁₄O₁₄P) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Cyanocobalamin RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of cyanocobalamin in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–150.0% of the labeled amount of cyanocobalamin (C₆₃H₈₈CoN₁₄O₁₄P)

• CYANOCOBALAMIN, Method 2

[NOTE—Use low-actinic glassware throughout this procedure.]

Standard stock solution: 1.0 µg/mL of USP Cyanocobalamin RS in 25% alcohol. Store in a refrigerator.

Standard solution: Dilute a suitable volume of *Standard stock solution* with water to a measured volume such that after the incubation period as described in the *Analysis*, the difference in transmittance between the inoculated blank and the 5.0-mL level of the *Standard solution* is NLT that which corresponds to a difference of 1.25 mg in dried cell weight. This concentration usually falls between 0.01 and 0.04 ng/mL of the *Standard solution*. Prepare this solution fresh for each assay.

Sample solution: Proceed as directed in *Ascorbic Acid, Method 1*, through “calculate the average net weight per Capsule.” Transfer a portion of the Capsule contents, equivalent to 1.0 µg of cyanocobalamin, to an appropriate vessel containing, for each g of Capsule contents taken, 25 mL of an aqueous extracting solution prepared just before use to contain 12.9 mg/mL of dibasic sodium phosphate, 11.0 mg/mL of anhydrous citric acid, and 10 mg/mL of sodium metabisulfite. Autoclave the mixture at 121° for 10 min. Allow any undissolved particles of the extract to settle, and filter or centrifuge, if necessary. Dilute an aliquot of

the clear solution with water to obtain a final solution containing vitamin B₁₂ activity approximately equivalent to that of the *Standard solution*.

Acid-hydrolyzed casein solution: Prepare as directed in *Calcium Pantothenate, Method 2*.

Asparagine solution: Dissolve 2.0 g of L-asparagine in water to make 200 mL. Store under toluene in a refrigerator.

Adenine–guanine–uracil solution: Prepare as directed in *Calcium Pantothenate, Method 2*.

Xanthine solution: Suspend 0.20 g of xanthine in 30–40 mL of water, heat to 70°, add 6.0 mL of 6 N ammonium hydroxide, and stir until the solid is dissolved. Cool, and add water to make 200 mL. Store under toluene in a refrigerator.

Salt solution A: Dissolve 10 g of monobasic potassium phosphate and 10 g of dibasic potassium phosphate in water to make 200 mL, and add 2 drops of hydrochloric acid. Store this solution under toluene.

Salt solution B: Dissolve 4.0 g of magnesium sulfate, 0.20 g of sodium chloride, 0.20 g of ferrous sulfate, and 0.20 g of manganese sulfate in water to make 200 mL. Add 2 drops of hydrochloric acid. Store this solution under toluene.

Polysorbate 80 solution: Dissolve 20 g of polysorbate 80 in alcohol to make 200 mL. Store in a refrigerator.

Vitamin solution A: Dissolve 10 mg of riboflavin, 10 mg of thiamine hydrochloride, 100 µg of biotin, and 20 mg of niacin in 0.02 N acetic acid to make 400 mL. Store under toluene, protected from light, in a refrigerator.

Vitamin solution B: Dissolve 20 mg of *p*-aminobenzoic acid, 10 mg of calcium pantothenate, 40 mg of pyridoxine hydrochloride, 40 mg of pyridoxal hydrochloride, 8 mg of pyridoxamine dihydrochloride, and 2 mg of folic acid in a mixture of water and neutralized alcohol (3:1) to make 400 mL. Store, protected from light, in a refrigerator.

Basal medium stock solution: Prepare the medium according to the following formula and directions. A dehydrated mixture containing the same ingredients may be used provided that, when constituted as directed in the labeling, it yields a medium comparable to that obtained from the formula given herein.

Add the ingredients in the order listed, carefully dissolving cystine and tryptophan in the hydrochloric acid before adding the next eight solutions to the resulting solution. Add 100 mL of water, and dissolve the dextrose, sodium acetate, and ascorbic acid. Filter, if necessary. Add the *Polysorbate 80 solution*, adjust with 1 N sodium hydroxide to a pH of between 5.5 and 6.0, and add Purified Water to make 250 mL.

L-Cystine	0.1 g
L-Tryptophan	0.05 g
1 N Hydrochloric acid	10 mL
Adenine–guanine–uracil solution	5 mL
Xanthine solution	5 mL
Vitamin solution A	10 mL
Vitamin solution B	10 mL
Salt solution A	5 mL
Salt solution B	5 mL
Asparagine solution	5 mL
Acid-hydrolyzed casein solution	25 mL
Dextrose, anhydrous	10 g
Sodium acetate, anhydrous	5 g
Ascorbic acid	1 g
Polysorbate 80 solution	5 mL

Tomato juice preparation: Centrifuge commercially canned tomato juice so that most of the pulp is

removed. Suspend 5 g/L of analytical filter aid in the supernatant, and pass, with the aid of reduced pressure, through a layer of the filter aid. Repeat, if necessary, until a clear, straw-colored filtrate is obtained. Store under toluene in a refrigerator.

Culture medium: [NOTE—A dehydrated mixture containing the same ingredients may be used provided that, when constituted as directed in the labeling, it yields a medium equivalent to that obtained from the formula given herein.] Dissolve 0.75 g of yeast extract, 0.75 g of dried peptone, 1.0 g of anhydrous dextrose, and 0.20 g of monobasic potassium phosphate in 60–70 mL of water. Add 10 mL of *Tomato juice preparation* and 1 mL of *Polysorbate 80 solution*. Adjust with 1 N sodium hydroxide to a pH of 6.8, and add water to make 100 mL. Place 10-mL portions of the solution in test tubes, and plug with cotton. Sterilize the tubes and contents in an autoclave at 121° for 15 min. Cool as rapidly as possible to avoid color formation resulting from overheating the medium.

Suspension medium: Dilute a measured volume of *Basal medium stock solution* with an equal volume of water. Place 10-mL portions of the diluted medium in test tubes. Sterilize, and cool as directed for *Culture medium*.

Stock culture of *Lactobacillus leichmannii*: To 100 mL of *Culture medium* add 1.0–1.5 g of agar, and heat the mixture on a steam bath, with stirring, until the agar dissolves. Place 10-mL portions of the hot solution in test tubes, cover the tubes, sterilize at 121° for 15 min in an autoclave, and allow the tubes to cool in an upright position. Inoculate three or more of the tubes by stab transfer of a pure culture of *Lactobacillus leichmannii*.² [NOTE—Before first using a fresh culture in this assay, make NLT 10 successive transfers of the culture in a 2-week period.]

Incubate for 16–24 h at a temperature between 30° and 40° held constant to within $\pm 0.5^\circ$. Store in a refrigerator.

Prepare fresh stab cultures at least three times each week, and do not use them for preparing the *Inoculum* if more than 4 days old. The activity of the microorganism can be increased by daily or twice-daily transfer of the stab culture, to the point where definite turbidity in the liquid *Inoculum* can be observed 2–4 h after inoculation. A slow-growing culture seldom gives a suitable response curve and may lead to erratic results.

Inoculum: [NOTE—A frozen suspension of *Lactobacillus leichmannii* may be used as the stock culture, provided it yields an *Inoculum* comparable to a fresh culture.] Make a transfer of cells from the *Stock culture of Lactobacillus leichmannii* to two sterile tubes containing 10 mL of the *Culture medium* each. Incubate these cultures for 16–24 h at a temperature between 30° and 40° held constant to within $\pm 0.5^\circ$. Under aseptic conditions centrifuge the cultures, and decant the supernatant. Suspend the cells from the culture in 5 mL of sterile *Suspension medium*, and combine. Using sterile *Suspension medium*, adjust the volume so that a 1-in-20 dilution in saline TS produces 70% transmittance when read on a suitable spectrophotometer that has been set at a wavelength of 530 nm, equipped with a 10-mm cell, and read against saline TS set at 100% transmittance. Prepare a 1-in-400 dilution of the adjusted suspension using sterile *Basal medium stock solution*. [NOTE—This dilution may be altered, when necessary, to obtain the desired test response.] The cell suspension so obtained is the *Inoculum*.

Calibration of spectrophotometer: Check the wavelength of the spectrophotometer periodically, using a standard wavelength cell or other suitable device. Before reading any tests, calibrate the

spectrophotometer for 0% and 100% transmittance, using water and with the wavelength set at 530 nm.

Analysis

Samples: *Standard solution* and *Sample solution*

Because of the high sensitivity of the test organism to minute amounts of vitamin B₁₂ activity and to traces of many cleansing agents, cleanse meticulously by suitable means, followed preferably by heating at 250° for 2 h, using hard-glass 20-mm \times 150-mm test tubes, and other necessary glassware.

To separate test tubes add, in duplicate, 1.0, 1.5, 2.0, 3.0, 4.0, and 5.0 mL of the *Standard solution*. To each of these tubes and to four similar empty tubes add 5.0 mL of *Basal medium stock solution* and sufficient water to make 10 mL.

To similar separate test tubes add, in duplicate, 1.0, 1.5, 2.0, 3.0, and 4.0 mL of the *Sample solution*. To each tube add 5.0 mL of *Basal medium stock solution* and sufficient water to make 10 mL. Place one complete set of Standard and sample tubes together in one tube rack and the duplicate set in a second rack or section of a rack, preferably in random order.

Cover the tubes to prevent bacterial contamination, and sterilize in an autoclave at 121° for 5 min, arranging to reach this temperature in NMT 10 min by preheating the autoclave if necessary. Cool as rapidly as possible to avoid color formation resulting from overheating the medium. Take precautions to maintain uniformity of sterilizing and cooling conditions throughout the assay, because packing the tubes too closely in the autoclave or overloading it may cause variation in the heating rate.

Aseptically add 0.5 mL of *Inoculum* to each tube so prepared, except two of the four containing no *Standard solution* (the uninoculated blanks). Incubate the tubes at a temperature between 30° and 40°, held constant to within $\pm 0.5^\circ$, for 16–24 h.

Terminate growth by heating to a temperature NLT 80° for 5 min. Cool to room temperature. After agitating its contents, read the transmittance at 530 nm when a steady state is reached. This steady state is observed a few seconds after agitation when the reading remains constant for 30 s or more. Allow approximately the same time interval for the reading on each tube.

With the transmittance set at 100% for the uninoculated blank, read the transmittance of the inoculated blank. If the difference is greater than 5%, or if there is evidence of contamination with a foreign microorganism, disregard the results of the assay.

With the transmittance set at 100% for the uninoculated blank, read the transmittance of each of the remaining tubes. Disregard the results of the assay if the slope of the standard curve indicates a problem with sensitivity.

Calculation: Prepare a standard concentration-response curve by the following procedure. Test for and replace any aberrant individual transmittances. For each level of the Standard, calculate the response from the sum of the duplicate values of the transmittances (Σ_s) as the difference, $y = 2.00 - \Sigma_s$. Plot this response on the ordinate of cross-section paper against the logarithm of the mL of *Standard solution* per tube on the abscissa, using for the ordinate either an arithmetic or a logarithmic scale, whichever gives the better approximation to a straight line. Draw the straight line or smooth curve that best fits the plotted points.

Calculate the response, $y = 2.00 - \Sigma_u$, adding together the two transmittances (Σ_u) for each level of the *Sample solution*. Read from the standard curve the logarithm of the volume of the *Standard solution* corresponding to each of those values of y that falls within the range of the lowest and highest points plotted for the Standard. Subtract from each logarithm so obtained the logarithm of the volume, in mL, of the *Sample solution* to obtain the difference, X , for each dosage level. Average the values of X for each of three or more dosage levels to

²Pure cultures of *Lactobacillus leichmannii* may be obtained as No. 7830 from ATCC, 10801 University Blvd., Manassas, VA 20110-2209.

obtain \bar{X} , which equals the log-relative potency, M' , of the *Sample solution*. Determine the quantity, in μg , of cyanocobalamin in the portion of Capsules taken:

$$\text{antilog } M = \text{antilog } (M' + \log R)$$

R = number of μg of cyanocobalamin that was assumed to be present in the portion of Capsules taken

Calculate the percentage of the labeled amount of cyanocobalamin in the portion of Capsules taken:

$$\text{Result} = [(\text{antilog } M)/N] \times 100$$

N = nominal amount of cyanocobalamin in the portion of Capsules taken (μg)

Replication: Repeat the entire determination at least once, using separately prepared *Sample solutions*. If the difference between the two log-potencies M is NMT 0.08, their mean, \bar{M} , is the assayed log-potency of the test material (see *Vitamin B₁₂ Activity in Design and Analysis of Biological Assays* (111), *The Confidence Interval and Limits of Potency*). If the two determinations differ by more than 0.08, conduct one or more additional determinations. From the mean of two or more values of M that do not differ by more than 0.15, compute the mean potency of the preparation under assay.

Acceptance criteria: 90.0%–150.0% of the labeled amount of cyanocobalamin ($\text{C}_{63}\text{H}_{88}\text{CoN}_{14}\text{O}_{14}\text{P}$)

• **FOLIC ACID, Method 1**

[NOTE—Use low-actinic glassware throughout this procedure.]

Reagent A: 25% solution of tetrabutylammonium hydroxide in methanol

Reagent B: Transfer 5.0 g of pentetic acid to a 50-mL volumetric flask. Using sonication if necessary, dissolve in and dilute with 1 N sodium hydroxide to volume.

Mobile phase: 2 g of monobasic potassium phosphate in 650 mL of water. Add 12.0 mL of *Reagent A*, 7.0 mL of 3 N phosphoric acid, and 240 mL of methanol. Cool to room temperature, adjust with phosphoric acid or ammonia TS to a pH of 7.0, dilute with water to 1000 mL, and filter. Recheck the pH before use by adding water or methanol to the prepared *Mobile phase* to obtain baseline separation of folic acid and the internal standard. The pH may be increased up to 7.15 to obtain better separation. [NOTE—The methanol and water content may be varied (between 1% and 3%).]

Internal standard solution: Transfer 40 mg of methylparaben to a 1000-mL volumetric flask and add 220 mL of methanol to dissolve. Dissolve 2.0 g of monobasic potassium phosphate in 300 mL of water in a separate beaker, quantitatively transfer this solution to the flask containing the methylparaben solution, and add an additional 300 mL of water. Add 19 mL of *Reagent A*, 7 mL of 3 N phosphoric acid, and 30 mL of *Reagent B*. Adjust with ammonia TS to a pH of 9.8, bubble nitrogen through the solution for 30 min, dilute with water to volume, and mix.

Standard solution: 0.016 mg/mL of USP Folic Acid RS in *Internal standard solution*

Sample solution: Proceed as directed in *Ascorbic Acid, Method 1*, through “calculate the average net weight per Capsule.” Transfer an amount of Capsule contents to a suitable centrifuge tube, and add a volume of *Internal standard solution* to obtain a concentration of 0.016 mg/mL of folic acid. Shake by mechanical means for 10 min, and centrifuge. Filter a portion of the clear supernatant, and use the filtrate.

[NOTE—The relative retention times for folic acid and methylparaben are about 0.8 and 1.0, respectively.]

Suitability requirements

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas for folic acid and methylparaben. Calculate the percentage of the labeled amount of folic acid ($\text{C}_{19}\text{H}_{19}\text{N}_7\text{O}_6$) in the portion of Capsules taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = peak area ratio of folic acid to methylparaben from the *Sample solution*

R_S = peak area ratio of folic acid to methylparaben from the *Standard solution*

C_S = concentration of USP Folic Acid RS in the *Standard solution* ($\mu\text{g/mL}$)

C_U = nominal concentration of folic acid in the *Sample solution* ($\mu\text{g/mL}$)

Acceptance criteria: 90.0%–150.0% of the labeled amount of folic acid ($\text{C}_{19}\text{H}_{19}\text{N}_7\text{O}_6$)

• **FOLIC ACID, Method 2**

[NOTE—Use low-actinic glassware throughout this procedure.]

Diluent: 60 $\mu\text{g/mL}$ of ammonium hydroxide

Mobile phase: Transfer 0.4 mL of triethylamine, 15.0 mL of glacial acetic acid, and 350 mL of methanol to a 2000-mL volumetric flask, and dilute with 0.008 M sodium 1-hexanesulfonate to volume.

Standard stock solution: 60 $\mu\text{g/mL}$ of USP Folic Acid RS in *Diluent*. Prepare this solution fresh daily.

Standard solution: Mix 5.0 mL of *Standard stock solution* with 10.0 mL of a mixture of methanol and glacial acetic acid (9:1) and 30.0 mL of a mixture of methanol and ethylene glycol (1:1). Shake for 15 min in a water bath maintained at 60°, and cool. Filter, discarding the first few mL of the filtrate.

Sample solution: Proceed as directed for the *Sample solution* in *Ascorbic Acid, Method 1*, through “calculate the average net weight per Capsule.” Transfer a portion of the Capsule contents, equivalent to 0.3 mg of folic acid, to a 125-mL stoppered flask. Add 10.0 mL of a mixture of methanol and glacial acetic acid (9:1) and 30.0 mL of a mixture of methanol and ethylene glycol (1:1). Shake for 15 min in a water bath maintained at 60°, and cool. Filter, discarding the first few mL of the filtrate.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 270 nm

Column: 4.6-mm \times 25-cm; packing L7

Column temperature: 50°

Flow rate: 2 mL/min

Injection size: 5 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the areas of the major peaks. Calculate the percentage of the labeled amount of folic acid ($\text{C}_{19}\text{H}_{19}\text{N}_7\text{O}_6$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- r_U = peak area of folic acid from the *Sample solution*
 r_S = peak area of folic acid from the *Standard solution*
 C_S = concentration of USP Folic Acid RS in the *Standard solution* ($\mu\text{g/mL}$)
 C_U = nominal concentration of folic acid in the *Sample solution* ($\mu\text{g/mL}$)

Acceptance criteria: 90.0%–150.0% of the labeled amount of folic acid ($\text{C}_{19}\text{H}_{19}\text{N}_7\text{O}_6$)

• DEXPANTHENOL OR PANTHENOL

[NOTE—The following procedure is applicable also to the determination of the dextrorotatory component of racemic panthenol in preparations containing panthenol.]

Dehydrated mixtures yielding formulations similar to the media described herein may be used provided that, when constituted as directed, they have growth-promoting properties equal to or superior to those obtained with the media prepared as described herein.

Standard stock solution: 800 $\mu\text{g/mL}$ of USP Dexpantenol RS, or 1600 $\mu\text{g/mL}$ of USP Racemic Panthenol RS in water. Store in a refrigerator, protected from light, and use within 30 days.

Standard solution: On the day of the assay, prepare a dilution of 1.2 $\mu\text{g/mL}$ of dexpantenol or 2.4 $\mu\text{g/mL}$ of panthenol from *Standard stock solution* diluted with water.

Sample solution: Weigh NLT 30 Capsules in a tared weighing bottle. Open the Capsules, without loss of shell material, and transfer the contents as completely as possible to a beaker. Remove any contents adhering to the empty Capsule shells by washing with several portions of ether. Discard the washings, and dry the Capsule shells with the aid of a current of dry air until the odor of ether is no longer perceptible. Weigh the empty Capsule shells in the tared weighing bottle, and calculate the average net weight per Capsule. Dissolve a portion of the Capsule contents, equivalent to 1.2 mg of dexpantenol or 2.4 mg of panthenol, in 100.0 mL of water. Quantitatively dilute a portion of this solution with water to obtain a concentration of 1.2 $\mu\text{g/mL}$ of dexpantenol or 2.4 $\mu\text{g/mL}$ of panthenol.

Acid-hydrolyzed casein solution: Mix 100 g of vitamin-free casein with 500 mL of 6 N hydrochloric acid, and reflux the mixture for 8–12 h. Remove the hydrochloric acid from the mixture by distillation under reduced pressure until a thick paste remains. Redissolve the resulting paste in about 500 mL of water, adjust the solution with 1 N sodium hydroxide to a pH of 3.5 ± 0.1 , and add water to make 1000 mL. Add 20 g of activated charcoal, stir for 1 h, and filter. Repeat the treatment with activated charcoal. Store under toluene in a cool place at a temperature not below 10° . Filter the solution if a precipitate forms during storage.

Cystine–tryptophan solution: Suspend 4.0 g of L-cystine in a solution of 1.0 g of L-tryptophan (or 2.0 g of D,L-tryptophan) in 700–800 mL of water, heat to $75 \pm 5^\circ$, and add hydrochloric acid solution (1 in 2) dropwise, with stirring, until the solids are dissolved. Cool, and add water to make 1000 mL. Store under toluene in a cool place at a temperature not below 10° .

Adenine–guanine–uracil solution: Dissolve 200 mg each of adenine sulfate, guanine hydrochloride, and uracil, with the aid of heat, in 10 mL of 4 N hydrochloric acid. Cool. Add water to make 200 mL. Store under toluene in a refrigerator.

Polysorbate 80 solution: 100 mg/mL of polysorbate 80 in alcohol

Riboflavin–thiamine hydrochloride–biotin solution: 20 $\mu\text{g/mL}$ of riboflavin, 10 $\mu\text{g/mL}$ of thiamine hydrochloride, and 0.04 $\mu\text{g/mL}$ of biotin in 0.02 N acetic acid. Store under toluene, protected from light, in a refrigerator.

p-Aminobenzoic acid–niacin–pyridoxine hydrochloride solution: 10 $\mu\text{g/mL}$ of p-aminobenzoic acid, 50 $\mu\text{g/mL}$ of niacin, and 40 $\mu\text{g/mL}$ of pyridoxine hydrochloride in neutral 25% alcohol. Store in a refrigerator.

Salt solution A: 50 mg/mL of monobasic potassium phosphate and 50 mg/mL of dibasic potassium phosphate in water. Add 10 drops of hydrochloric acid per L of solution. Store under toluene.

Salt solution B: 20 mg/mL of magnesium sulfate, 1 mg/mL of sodium chloride, 1 mg/mL of ferrous sulfate, and 1 mg/mL of manganese sulfate in water. Add 10 drops of hydrochloric acid per L of the solution. Store under toluene.

Pyridoxal–calcium pantothenate solution: 200 $\mu\text{g/mL}$ of pyridoxal hydrochloride and 1.875 $\mu\text{g/mL}$ of calcium pantothenate in 10% alcohol. Store in a refrigerator, and use within 30 days.

Polysorbate 40–oleic acid solution: 50 mg/mL of polysorbate 40 and 0.5 mg/mL of oleic acid in 20% alcohol. Store in a refrigerator, and use within 30 days.

Modified pantothenate medium

Acid-hydrolyzed casein solution	25 mL
Cystine–tryptophan solution	25 mL
Polysorbate 80 solution	0.25 mL
Dextrose, anhydrous	10 g
Sodium acetate, anhydrous	5 g
Adenine–guanine–uracil solution	5 mL
Riboflavin–thiamine hydrochloride–biotin solution	5 mL
p-Aminobenzoic acid–niacin–pyridoxine hydrochloride solution	5 mL
Salt solution A	5 mL
Salt solution B	5 mL
Pyridoxal–calcium pantothenate solution	5 mL
Polysorbate 40–oleic acid solution	5 mL

Dissolve anhydrous dextrose and sodium acetate in the solutions previously mixed, and adjust with 1 N sodium hydroxide to a pH of 6.8. Finally, dilute with water to 250 mL.

Double-strength modified pantothenate medium:

Prepare as directed in *Modified pantothenate medium*, but make the final dilution to 125 mL instead of 250 mL. Prepare fresh.

Stock culture of *Pediococcus acidilactici*: Dissolve in 800 mL of water, with the aid of heat, 6.0 g of peptone, 4.0 g of pancreatic digest of casein, 3.0 g of yeast extract, 1.5 g of beef extract, 1.0 g of dextrose, and 15.0 g of agar. Adjust with 0.1 N sodium hydroxide or 0.1 N hydrochloric acid to a pH of 6.5–6.6, and dilute with water to 1000 mL. Add 10-mL portions of the solution to culture tubes, place caps on the tubes, and sterilize in an autoclave at 121° for 15 min. Cool on a slant, and store in a refrigerator. Prepare a stock culture of *Pediococcus acidilactici*³ on a slant of this medium. Incubate at 35° for 20–24 h, and store in a refrigerator. Maintain the stock culture by monthly transfer onto fresh slants.

Inoculum: Inoculate three 250-mL portions of sterile *Modified pantothenate medium* from a stock culture slant, and incubate at 35° for 20–24 h. Centrifuge the suspension from the combined portions, and wash the cells with sterile *Modified pantothenate medium*. Resuspend the cells in sufficient sterile *Modified pantothenate medium* so that a 1-in-50 dilution, when tested in a 13-mm diameter test tube, gives 80% light transmission at 530 nm. Transfer 1.2-mL portions of this stock suspension to sterile glass ampuls, seal, freeze in liquid nitrogen, and store in a freezer. On the day of the assay, allow the ampuls to reach room temperature,

³ ATCC No. 8042 is suitable.

mix the contents, and dilute 1 mL of thawed culture with sterile saline TS to 150 mL. [NOTE—This dilution may be altered when necessary to obtain the desired test response.]

Analysis: Prepare in triplicate a series of eight culture tubes by adding the following quantities of water to the tubes within a set: 5.0, 4.5, 4.0, 3.5, 3.0, 2.0, 1.0, and 0.0 mL. To these same tubes and in the same order add 0.0, 0.5, 1.0, 1.5, 2.0, 3.0, 4.0, and 5.0 mL of the *Standard solution*.

Prepare in duplicate a series of five culture tubes by adding the following quantities of water to the tubes within a set: 4.0, 3.5, 3.0, 2.0, and 1.0 mL. To these same tubes, and in the same order, add 1.0, 1.5, 2.0, 3.0, and 4.0 mL of the *Sample solution*.

Add 5.0 mL of *Double-strength modified pantothenate medium* to each tube. Cover the tubes with metal caps, and sterilize in an autoclave at 121° for 5 min. Cool to room temperature in a chilled water bath, and inoculate each tube with 0.5 mL of the *Inoculum*. Allow to incubate at 37° for 16 h. Terminate growth by heating to a temperature NLT 80°, such as by steaming at atmospheric pressure in a sterilizer for 5–10 min. Cool, and determine the percentage transmittance of the suspensions, in cells of equal pathlength, on a suitable spectrophotometer, at a wavelength of 530 nm.

Calculation: Draw a dose-response curve on arithmetic graph paper by plotting the average response, in percentage of transmittance, for each set of tubes of the standard curve against the standard level concentrations. The curve is drawn by connecting each adjacent pair of points with a straight line. From this standard curve, determine by interpolation the potency of each tube containing portions of the *Sample solution*. Divide the potency of each tube by the amount of the *Sample solution* added to it, to obtain the individual responses. Calculate the mean response by averaging the individual responses that vary from their mean by NMT 15%, using NLT half the total number of tubes. Calculate the potency of the portion of the material taken for assay, by multiplying the mean response by the appropriate dilution factor. Calculate the percentage of the labeled amount of dexpantenol or panthenol in the portion of Capsules taken:

$$\text{Result} = (P/N) \times 100$$

P = potency of dexpantenol or panthenol in the portion taken (mg)

N = nominal amount of dexpantenol or panthenol in the portion taken (mg)

Acceptance criteria: 90.0%–150.0% of the labeled amount of dexpantenol or panthenol ($\text{C}_9\text{H}_{19}\text{NO}_4$)

• **CALCIUM PANTOTHENATE, Method 1**

Mobile phase: Phosphoric acid and water (1:1000)

Internal standard solution: 80 mg of *p*-hydroxybenzoic acid in 3 mL of alcohol. Add 50 mL of water and 7.1 g of dibasic sodium phosphate, and dilute with water to 1000 mL. Adjust with phosphoric acid to a pH of 6.7.

Standard solution: 0.6 mg/mL of USP Calcium Pantothenate RS in *Internal standard solution*

Sample solution: Proceed as directed in *Ascorbic Acid, Method 1*, through “calculate the average net weight per Capsule.” To a centrifuge tube, transfer an amount of mixed Capsule contents and a volume of *Internal standard solution* to obtain a concentration of 0.6 mg/mL in the *Sample solution*.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 210 nm

Column: 3.9-mm × 15-cm; packing L1

Flow rate: 1.5 mL/min

Injection size: 10 µL

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for calcium pantothenate and *p*-hydroxybenzoic acid are about 0.5 and 1.0, respectively.]

Suitability requirements

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak responses for calcium pantothenate and the internal standard. Calculate the percentage of the labeled amount of calcium pantothenate ($\text{C}_{18}\text{H}_{32}\text{CaN}_2\text{O}_{10}$) in the portion of Capsules taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = peak response ratio of calcium pantothenate to *p*-hydroxybenzoic acid from the *Sample solution*

R_S = peak response ratio of calcium pantothenate to *p*-hydroxybenzoic acid from the *Standard solution*

C_S = concentration of USP Calcium Pantothenate RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of calcium pantothenate in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–150.0% of the labeled amount of calcium pantothenate ($\text{C}_{18}\text{H}_{32}\text{CaN}_2\text{O}_{10}$)

• **CALCIUM PANTOTHENATE, Method 2**

Standard stock solution: Dissolve 50 mg of USP Calcium Pantothenate RS, previously dried and stored in the dark over phosphorus pentoxide and protected from absorption of moisture while weighing, in 500 mL of water in a 1000-mL volumetric flask. Add 10 mL of 0.2 N acetic acid and 100 mL of sodium acetate solution (1 in 60), and dilute with water to volume, to obtain a concentration of 50 µg/mL of USP Calcium Pantothenate RS. Store under toluene in a refrigerator.

Standard solution: On the day of the assay, dilute a volume of *Standard stock solution* with water to obtain a concentration of 0.01–0.04 µg/mL of calcium pantothenate, the exact concentration being such that the responses obtained as directed in the *Analysis*, 2.0 and 4.0 mL of the *Standard solution* being used, are within the linear portion of the log-concentration response curve.

Sample solution: Proceed as directed in *Ascorbic Acid, Method 1*, through “calculate the average net weight per Capsule.” Transfer a portion of the Capsule contents, equivalent to 50 mg of calcium pantothenate, to a 1000-mL volumetric flask containing 500 mL of water. Add 10 mL of 0.2 N acetic acid and 100 mL of sodium acetate solution (16.66 mg/mL), dilute with water to volume, and filter. Dilute a volume of this solution to obtain a solution having approximately the same concentration as that of the *Standard solution*.

Acid-hydrolyzed casein solution: Mix 100 g of vitamin-free casein with 500 mL of 6 N hydrochloric acid, and reflux the mixture for 8–12 h. Remove the hydrochloric acid from the mixture by distillation under reduced pressure until a thick paste remains. Redissolve the resulting paste in water, adjust the solution with 1 N sodium hydroxide to a pH of 3.5 ± 0.1 , and add water to make 1000 mL. Add 20 g of activated charcoal, stir for 1 h, and filter. Repeat the treatment with activated charcoal. Store under toluene in a cool place at a temperature not below 10°.

Cystine-tryptophan solution: Suspend 4.0 g of L-cystine in a solution of 1.0 g of L-tryptophan (or 2.0 g

of D,L-tryptophan) in 700–800 mL of water, heat to 70°–80°, and add dilute hydrochloric acid (1 in 2) dropwise, with stirring, until the solids are dissolved. Cool, and add water to make 1000 mL. Store under toluene in a cool place at a temperature not below 10°.

Adenine–guanine–uracil solution: Dissolve 200 mg each of adenine sulfate, guanine hydrochloride, and uracil, with the aid of heat, in 10 mL of 4 N hydrochloric acid. Cool, and add water to make 200 mL. Store under toluene in a refrigerator.

Polysorbate 80 solution: 100 mg/mL of polysorbate 80 in alcohol

Riboflavin–thiamine hydrochloride–biotin solution: 20 µg/mL of riboflavin, 10 µg/mL of thiamine hydrochloride, and 0.04 µg/mL of biotin in 0.02 N acetic acid. Store under toluene, protected from light, in a refrigerator.

p-Aminobenzoic acid–niacin–pyridoxine hydrochloride solution: 10 µg/mL of p-aminobenzoic acid, 50 µg/mL of niacin, and 40 µg/mL of pyridoxine hydrochloride in a mixture of neutralized alcohol and water (1:3). Store in a refrigerator.

Salt solution A: Dissolve 25 g of monobasic potassium phosphate and 25 g of dibasic potassium phosphate in water to make 500 mL. Add 5 drops of hydrochloric acid. Store under toluene.

Salt solution B: Dissolve 10 g of magnesium sulfate, 0.5 g of sodium chloride, 0.5 g of ferrous sulfate, and 0.5 g of manganese sulfate in water to make 500 mL. Add 5 drops of hydrochloric acid. Store under toluene.

Basal medium stock solution

Acid-hydrolyzed casein solution	25 mL
Cystine–tryptophan solution	25 mL
Polysorbate 80 solution	0.25 mL
Dextrose, anhydrous	10 g
Sodium acetate, anhydrous	5 g
Adenine–guanine–uracil solution	5 mL
Riboflavin–thiamine hydrochloride–biotin solution	5 mL
p-Aminobenzoic acid–niacin–pyridoxine hydrochloride solution	5 mL
Salt solution A	5 mL
Salt solution B	5 mL

Dissolve the anhydrous dextrose and anhydrous sodium acetate in the solutions previously mixed, and adjust with 1 N sodium hydroxide to a pH of 6.8. Dilute with water to 250 mL.

Stock culture of *Lactobacillus plantarum*: Dissolve 2.0 g of yeast extract in 100 mL of water. Add 500 mg of anhydrous dextrose, 500 mg of anhydrous sodium acetate, and 1.5 g of agar, and heat the mixture on a steam bath, with stirring, until the agar dissolves. Add 10-mL portions of the hot solution to the test tubes, close or cover the tubes, sterilize in an autoclave at 121° for 15 min, and allow the tubes to cool in an upright position. Prepare stab cultures in three or more of the tubes, using a pure culture of *Lactobacillus plantarum*¹ incubating for 16–24 h at a temperature between 30° and 37° held constant to within ±0.5°. Store in a refrigerator. Prepare a fresh stab of the stock culture every week, and do not use for *Inoculum* if the culture is more than 1 week old.

Culture medium: Add 5.0 mL of water containing 0.2 µg of calcium pantothenate to each of a series of test tubes containing 5.0 mL of *Basal medium stock solution*. Plug the tubes with cotton, sterilize in an autoclave at 121° for 15 min, and cool.

Inoculum: [NOTE—A frozen suspension of *Lactobacillus plantarum* may be used as the stock culture, provided it yields an *Inoculum* comparable to a fresh culture.] Make a transfer of cells from the *Stock culture of Lactobacillus*

plantarum to a sterile tube containing 10 mL of *Culture medium*. Incubate this culture for 16–24 h at a temperature between 30° and 37° held constant to within ±0.5°. The cell suspension so obtained is the *Inoculum*.

Analysis

Samples: *Standard solution* and *Sample solution*

To similar separate test tubes add, in duplicate, 1.0 and/or 1.5, 2.0, 3.0, 4.0, and 5.0 mL of the *Standard solution*. To each tube and to four similar empty tubes add 5.0 mL of *Basal medium stock solution* and sufficient water to make 10 mL.

To similar separate test tubes add, in duplicate, volumes of the *Sample solution* corresponding to three or more of the levels specified for the *Standard solution*, including the levels of 2.0, 3.0, and 4.0 mL. To each tube add 5.0 mL of the *Basal medium stock solution* and sufficient water to make 10 mL. Place one complete set of Standard and sample tubes together in one tube rack and the duplicate set in a second rack or section of a rack, preferably in random order.

Cover the tubes of both series to prevent contamination, and sterilize in an autoclave at 121° for 5 min. Cool, and add 1 drop of *Inoculum* to each tube, except two of the four tubes containing no *Standard solution* (the uninoculated blanks). Incubate the tubes at a temperature between 30° and 37°, held constant to within ±0.5° until, following 16–24 h of incubation, there has been no substantial increase in turbidity in the tubes containing the highest level of Standard during a 2-h period.

Determine the transmittance of the tubes in the following manner. Mix the contents of each tube, and transfer to an optical container if necessary. Read the transmittance between 540 and 660 nm when a steady state is reached. This steady state is observed a few seconds after agitation when the galvanometer reading remains constant for 30 s or more. Allow approximately the same time interval for the reading on each tube.

With the transmittance set at 1.00 for the uninoculated blank, read the transmittance of the inoculated blank. With the transmittance set at 1.00 for the inoculated blank, read the transmittance for each of the remaining tubes. If there is evidence of contamination with a foreign microorganism, disregard the result of the assay.

Calculation: Prepare a standard concentration-response curve as follows. For each level of the Standard, calculate the response from the sum of the duplicate values of the transmittance (Σ_s) as the difference, $y = 2.00 - \Sigma_s$. Plot this response on the ordinate of cross-section paper against the logarithm of the mL of *Standard solution* per tube on the abscissa, using for the ordinate either an arithmetic or a logarithmic scale, whichever gives the better approximation to a straight line. Draw the straight line or smooth curve that best fits the plotted points.

Calculate the response, $y = 2.00 - \Sigma_u$, adding together the two transmittances for each level of the *Sample solution* (Σ_u). Read from the standard curve the logarithm of the volume of the *Standard solution* corresponding to each of those values of y that fall within the range of the lowest and highest points plotted for the Standard. Subtract from each logarithm so obtained the logarithm of the volume, in mL, of the *Sample solution* to obtain the difference, X , for each dosage level. Average the values of X for each of three or more dosage levels to obtain \bar{X} , which equals the log-relative potency, M' , of the *Sample solution*. Determine the quantity, in mg, of calcium pantothenate in the portion of Capsules taken:

$$\text{antilog } M = \text{antilog } (M' + \log R)$$

R = number of mg of calcium pantothenate that was assumed to be present in the portion of Capsules taken
Calculate the percentage of calcium pantothenate in the portion of Capsules taken:

$$\text{Result} = [(\text{antilog } M)/N] \times 100$$

N = nominal amount of calcium pantothenate in the portion of Capsules taken (mg)

Replication: Repeat the entire determination at least once, using separately prepared *Sample solutions*. If the difference between the two log-potencies *M* is NMT 0.08, their mean, *M*, is the assayed log-potency of the test material (see *Design and Analysis of Biological Assays* (111), *The Confidence Interval and Limits of Potency*). If the two determinations differ by more than 0.08, conduct one or more additional determinations. From the mean of two or more values of *M* that do not differ by more than 0.15, compute the mean potency of the preparation under assay.

Acceptance criteria: 90.0%–150.0% of the labeled amount of calcium pantothenate ($\text{C}_{18}\text{H}_{32}\text{CaN}_2\text{O}_{10}$)

• CALCIUM PANTOTHENATE, Method 3

Buffer solution: Dissolve 10.0 g of monobasic potassium phosphate in 2000 mL of water, and adjust with phosphoric acid to a pH of 3.5.

Mobile phase: Methanol and *Buffer solution* (1:9)

Standard stock solution: 0.25 mg/mL of USP Calcium Pantothenate RS in water. Prepare fresh every 4 weeks. Store in a refrigerator.

Standard solution: 40 µg/mL of USP Calcium Pantothenate RS from *Standard stock solution* diluted with water

Sample solution: Proceed as directed for the *Sample solution* in *Ascorbic Acid, Method 1*, through “calculate the net weight of the Capsule contents.” Transfer a portion of the Capsule contents, equivalent to 10 mg of calcium pantothenate, to a 250-mL volumetric flask. Add 10 mL of methanol, and swirl the flask to disperse the Capsules contents. Dilute with water to volume, mix, and filter.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 205 nm

Column: 3.9-mm × 30-cm; 5-µm packing L1

Column temperature: 50°

Flow rate: 2 mL/min

Injection size: 25 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas for calcium pantothenate.

Calculate the percentage of the labeled amount of calcium pantothenate ($\text{C}_{18}\text{H}_{32}\text{CaN}_2\text{O}_{10}$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area from the *Sample solution*

r_S = peak area from the *Standard solution*

C_S = concentration of USP Calcium Pantothenate RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of calcium pantothenate in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–150.0% of the labeled amount of calcium pantothenate ($\text{C}_{18}\text{H}_{32}\text{CaN}_2\text{O}_{10}$)

• NIACIN OR NIACINAMIDE, PYRIDOXINE HYDROCHLORIDE, RIBOFLAVIN, and THIAMINE, Method 1

[NOTE—Use low-actinic glassware throughout this procedure.]

Diluent: Acetonitrile, glacial acetic acid, and water (5:1:94)

Mobile phase: A mixture of methanol, glacial acetic acid, and water (27:1:73) containing 140 mg of sodium 1-hexanesulfonate per 100 mL

Standard solution: [NOTE—Use USP Niacin RS in place of USP Niacinamide RS for formulations containing niacin.] Transfer 80 mg of USP Niacinamide RS, 20 mg of USP Pyridoxine Hydrochloride RS, 20 mg of USP Riboflavin RS, and 20 mg of USP Thiamine Hydrochloride RS to a 200-mL volumetric flask, and add 180 mL of *Diluent*. Immerse the flask in a hot water bath maintained at 65°–70° for 10 min with regular shaking or using a vortex mixer, until all the solid materials are dissolved. Chill rapidly in a cold water bath for 10 min to room temperature, and dilute with *Diluent* to volume.

Sample solution: Proceed as directed in *Ascorbic Acid, Method 1*, through “calculate the average net weight per Capsule.” Transfer a portion of the Capsule contents, equivalent to 10 mg of niacinamide and 2.5 mg each of pyridoxine hydrochloride, riboflavin, and thiamine hydrochloride, to a 50-mL centrifuge tube. Add 25.0 mL of *Diluent*, and mix using a vortex mixer for 30 s to completely suspend the powder. Immerse the centrifuge tube in a hot water bath maintained at 65°–70°, heat for 5 min, and mix on a vortex mixer for 30 s. Return the tube to the hot water bath, heat for another 5 min, and mix on a vortex mixer for 30 s. Filter a portion of the solution, cool to room temperature, and use the clear filtrate. [NOTE—Use the filtrate within 3 h of filtration.]

Chromatographic system

Mode: LC

Detector: UV 280 nm

Column: 3.9-mm × 30-cm; packing L1

Flow rate: 1 mL/min

Injection size: 10 µL

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for niacinamide, pyridoxine, riboflavin, and thiamine are about 0.3, 0.5, 0.8, and 1.0, respectively.]

Suitability requirements

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas for niacin or niacinamide, pyridoxine, riboflavin, and thiamine. Calculate the percentage of the labeled amount of niacinamide ($\text{C}_6\text{H}_6\text{N}_2\text{O}$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of niacinamide from the *Sample solution*

r_S = peak area of niacinamide from the *Standard solution*

C_S = concentration of USP Niacinamide RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of niacinamide in the *Sample solution* (mg/mL)

For formulations containing niacin:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of niacin from the *Sample solution*

r_S = peak area of niacin from the *Standard solution*

C_S = concentration of USP Niacin RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of niacin in the *Sample solution* (mg/mL)

Separately calculate the percentage of the labeled amount of pyridoxine hydrochloride ($C_8H_{11}NO_3 \cdot HCl$), riboflavin ($C_{17}H_{20}N_4O_6$), and thiamine hydrochloride ($C_{12}H_{17}ClN_4OS \cdot HCl$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of the corresponding vitamin from the *Sample solution*

r_S = peak area of the corresponding vitamin from the *Standard solution*

C_S = concentration of the relevant USP Reference Standard in the *Standard solution* (mg/mL)

C_U = nominal concentration of the corresponding vitamin in the *Sample solution* (mg/mL)

For products containing thiamine mononitrate, calculate the percentage of the labeled amount of thiamine mononitrate ($C_{12}H_{17}N_5O_4S$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak area of thiamine from the *Sample solution*

r_S = peak area of thiamine from the *Standard solution*

C_S = concentration of USP Thiamine Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of thiamine mononitrate in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of thiamine mononitrate, 327.36

M_{r2} = molecular weight of thiamine hydrochloride, 337.27

Acceptance criteria: 90.0%–150.0% of the labeled amount of niacin ($C_6H_5NO_2$) or niacinamide ($C_6H_6N_2O$), pyridoxine hydrochloride ($C_8H_{11}NO_3 \cdot HCl$), riboflavin ($C_{17}H_{20}N_4O_6$), and thiamine as thiamine hydrochloride ($C_{12}H_{17}ClN_4OS \cdot HCl$) or thiamine mononitrate ($C_{12}H_{17}N_5O_4S$)

• **NIACIN, Method 2**

[NOTE—Use low-actinic glassware throughout this procedure.]

Solution A: Transfer 1 mL of glacial acetic acid and 2.5 g of edetate disodium to a 100-mL volumetric flask. Dissolve in and dilute with water to volume.

Extraction solvent: *Solution A* and methanol (3:1)

Mobile phase: 0.1 M Sodium acetate solution (13.6 mg/mL of sodium acetate in water). Adjust with acetic acid to a pH of 5.4. [NOTE—A small amount of methanol (up to 1%) may be added to the *Mobile phase* to improve resolution.]

Standard stock solution: 1 mg/mL of USP Niacin RS in *Extraction solvent*

Standard solution: Transfer 5.0 mL of *Standard stock solution* to a 25-mL volumetric flask. Dilute with *Extraction solvent* to volume.

Sample solution: [NOTE—This preparation is suitable for the determination of niacin or niacinamide, pyridoxine, and riboflavin, when present in the formulation.] Weigh NLT 20 Capsules in a tared weighing bottle. Open the Capsules, without loss of shell material, and transfer the contents to a beaker. Remove any contents adhering to the shells by washing with several portions of ether. Discard the washings, and dry the Capsule shells with the aid of a current of dry air. Weigh the empty Capsule shells in the tared weighing bottle, and calculate the net weight of the Capsule contents. Transfer a portion of the Capsule contents, equivalent to 2 mg of riboflavin, to a 200-mL volumetric flask. If riboflavin is not present in the formulation, use a

portion, equivalent to 2 mg of pyridoxine. If pyridoxine is not present in the formulation, use a portion, equivalent to 20 mg of niacin or niacinamide. Add 100.0 mL of *Extraction solvent*, and mix for 20 min, using a wrist-action shaker. Immerse the flask in a water bath maintained at 70°–75°, and heat for 20 min. Mix on a vortex mixer for 30 s, cool to room temperature, and filter. Use the clear filtrate.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm × 25-cm; packing L1

Flow rate: 1 mL/min

Injection size: 20 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 3.0%

[NOTE—If necessary, flush the column with methanol between injections.]

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas for niacin. Calculate the percentage of the labeled amount of niacin ($C_6H_5NO_2$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area from the *Sample solution*

r_S = peak area from the *Standard solution*

C_S = concentration of USP Niacin RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of niacin in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–150.0% of the labeled amount of niacin ($C_6H_5NO_2$)

• **NIACINAMIDE, Method 2**

[NOTE—Use low-actinic glassware throughout this procedure.]

Extraction solvent, Mobile phase, Standard stock solution, Standard solution, Sample solution, and

Chromatographic system: Using USP Niacinamide RS in place of USP Niacin RS, proceed as directed in *Niacin, Method 2*.

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas for niacinamide. Calculate the percentage of the labeled amount of niacinamide ($C_6H_6N_2O$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area from the *Sample solution*

r_S = peak area from the *Standard solution*

C_S = concentration of USP Niacinamide RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of niacinamide in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–150.0% of the labeled amount of niacinamide ($C_6H_6N_2O$)

• **PYRIDOXINE HYDROCHLORIDE, Method 2**

[NOTE—Use low-actinic glassware throughout this procedure.]

Extraction solvent, Mobile phase, and Sample

solution: Prepare as directed in *Niacin, Method 2*.

Standard stock solution: 0.1 mg/mL of USP Pyridoxine Hydrochloride RS in *Extraction solvent*

Standard solution: 20 µg/mL of USP Pyridoxine Hydrochloride RS from *Standard stock solution* diluted with *Extraction solvent*

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Column: 4.6-mm × 25-cm; packing L1

Flow rate: 1 mL/min

Injection size: 20 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas for pyridoxine. Calculate the percentage of the labeled amount of pyridoxine hydrochloride ($C_8H_{11}NO_3 \cdot HCl$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area from the *Sample solution*

r_S = peak area from the *Standard solution*

C_S = concentration of USP Pyridoxine Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of pyridoxine hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–150.0% of the labeled amount of pyridoxine hydrochloride ($C_8H_{11}NO_3 \cdot HCl$)

• **RIBOFLAVIN, Method 2**

[NOTE—Use low-actinic glassware throughout this procedure.]

Extraction solvent and Sample solution: Prepare as directed in *Niacin, Method 2*.

Solution A: 6.8 g/L of sodium acetate in water

Mobile phase: Prepare a mixture of *Solution A* and methanol (13:7). Add 2 mL of triethylamine per L of the mixture, and adjust with glacial acetic acid to a pH of 5.2.

Standard stock solution: Transfer 20 mg of USP Riboflavin RS to a 200-mL volumetric flask, and add 180 mL of *Extraction solvent*. Immerse the flask for 5 min in a water bath maintained at 65°–75°. Mix well, and repeat if necessary until dissolved. Chill rapidly in a cold water bath to room temperature, and dilute with *Extraction solvent* to volume.

Standard solution: Dilute 5.0 mL of *Standard stock solution* with *Extraction solvent* to 25.0 mL.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm × 25-cm; packing L1

Flow rate: 1 mL/min

Injection size: 20 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas for riboflavin. Calculate the percentage of the labeled amount of riboflavin ($C_{17}H_{20}N_4O_6$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area from the *Sample solution*

r_S = peak area from the *Standard solution*

C_S = concentration of USP Riboflavin RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of riboflavin in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–150.0% of the labeled amount of riboflavin ($C_{17}H_{20}N_4O_6$)

• **THIAMINE, Method 2**

[NOTE—Use low-actinic glassware throughout this procedure.]

Solution A: 1.88 g/L of sodium 1-hexanesulfonate in 0.1% phosphoric acid

Mobile phase: *Solution A* and acetonitrile (46:9)

Standard stock solution: 0.1 mg/mL of USP Thiamine Hydrochloride RS in 0.2 N hydrochloric acid

Standard solution: 0.02 mg/mL of USP Thiamine Hydrochloride RS from *Standard stock solution* diluted with 0.2 N hydrochloric acid

Sample solution: Proceed as directed for the *Sample solution* in *Ascorbic Acid, Method 1*, through “calculate the net weight of the Capsule contents.” Mix a portion of the Capsule contents with a volume of 0.2 N hydrochloric acid to obtain a concentration of 0.02 mg/mL of thiamine. Shake for 15 min with a wrist-action shaker, and heat to boiling for 30 min. Cool to room temperature, and filter. Use the clear filtrate.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the areas for the major peaks. For products containing thiamine hydrochloride, calculate the percentage of the labeled amount of thiamine hydrochloride ($C_{12}H_{17}ClN_4OS \cdot HCl$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of thiamine from the *Sample solution*

r_S = peak area of thiamine from the *Standard solution*

C_S = concentration of USP Thiamine Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of thiamine hydrochloride in the *Sample solution* (mg/mL)

For products containing thiamine mononitrate, calculate the percentage of the labeled amount of thiamine mononitrate ($C_{12}H_{17}N_5O_4S$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak area of thiamine from the *Sample solution*

r_S = peak area of thiamine from the *Standard solution*

C_S = concentration of USP Thiamine Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of thiamine mononitrate in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of thiamine mononitrate, 327.36

M_{r2} = molecular weight of thiamine hydrochloride, 337.27

Acceptance criteria: 90.0%–150.0% of the labeled amount of thiamine as thiamine hydrochloride ($C_{12}H_{17}ClN_4OS \cdot HCl$) or thiamine mononitrate ($C_{12}H_{17}N_5O_4S$)

• **NIACIN OR NIACINAMIDE, PYRIDOXINE HYDROCHLORIDE, RIBOFLAVIN, and THIAMINE, Method 3**

[NOTE—Use low-actinic glassware throughout this procedure.]

Reagent: 25 mg/mL of edetate disodium in water

Mobile phase: Transfer 0.4 mL of triethylamine, 15.0 mL of glacial acetic acid, and 350 mL of methanol to a 2000-mL volumetric flask. Dilute with 0.008 M sodium 1-hexanesulfonate to volume.

Standard stock solution: 1.5 mg/mL of USP Niacin RS or USP Niacinamide RS, 0.24 mg/mL of USP Pyridoxine Hydrochloride RS, 0.08 mg/mL of USP Riboflavin RS, and 0.24 mg/mL of USP Thiamine Hydrochloride RS in the *Reagent*, with heating if necessary

Standard solution: Transfer 5.0 mL of *Standard stock solution* to a stoppered 125-mL flask. Add 10.0 mL of a mixture of methanol and glacial acetic acid (9:1) and 30.0 mL of a mixture of methanol and ethylene glycol (1:1). Insert the stopper, shake for 15 min in a water bath maintained at 60°, and cool. Filter, discarding the first few mL of the filtrate.

Sample solution: Proceed as directed for the *Sample solution* in *Ascorbic Acid, Method 1*, through “calculate the average net weight per Capsule.” Transfer a portion of the Capsule contents, equivalent to 7.5 mg of niacin or niacinamide, 1.2 mg of pyridoxine hydrochloride, 0.4 mg of riboflavin, and 1.2 mg of thiamine hydrochloride, to a stoppered 125-mL flask. Add 10.0 mL of a mixture of methanol and glacial acetic acid (9:1), and 30.0 mL of a mixture of methanol and ethylene glycol (1:1). Insert the stopper, shake for 15 min in a water bath maintained at 60°, and cool. Filter, discarding the first few mL of the filtrate.

Chromatographic system

Column: 4.6-mm × 25-cm; packing L7

Column temperature: 50°

Flow rate: 2 mL/min

Injection size: 5 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the areas of the peaks. Calculate the percentage of the labeled amount of niacin (C₆H₅NO₂) or niacinamide (C₆H₆N₂O) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of niacin or niacinamide from the *Sample solution*

r_S = peak area of niacin or niacinamide from the *Standard solution*

C_S = concentration of USP Niacin RS or USP Niacinamide RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of niacin or niacinamide in the *Sample solution* (mg/mL)

Separately calculate the percentage of the labeled amount of pyridoxine hydrochloride (C₈H₁₁NO₃ · HCl), riboflavin (C₁₇H₂₀N₄O₆), and thiamine hydrochloride (C₁₂H₁₇ClN₄OS · HCl) (for products containing thiamine hydrochloride) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of the corresponding vitamin from the *Sample solution*

r_S = peak area of the corresponding vitamin from the *Standard solution*

C_S = concentration of the relevant USP Reference Standard in the *Standard solution* (mg/mL)

C_U = nominal concentration of the corresponding vitamin in the *Sample solution* (mg/mL)

For products containing thiamine mononitrate, calculate the percentage of the labeled amount of thiamine mononitrate (C₁₂H₁₇N₅O₄S) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak area of thiamine from the *Sample solution*

r_S = peak area of thiamine from the *Standard solution*

C_S = concentration of USP Thiamine Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of thiamine mononitrate in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of thiamine mononitrate, 327.36

M_{r2} = molecular weight of thiamine hydrochloride, 337.27

Acceptance criteria: 90.0%–150.0% of the labeled amount of niacin (C₆H₅NO₂) or niacinamide (C₆H₆N₂O), pyridoxine hydrochloride (C₈H₁₁NO₃ · HCl), riboflavin (C₁₇H₂₀N₄O₆), and thiamine as thiamine hydrochloride (C₁₂H₁₇ClN₄OS · HCl) or thiamine mononitrate (C₁₂H₁₇N₅O₄S)

PERFORMANCE TESTS

• **DISINTEGRATION AND DISSOLUTION OF DIETARY SUPPLEMENTS**

<2040>: Meet the requirements

• **WEIGHT VARIATION OF DIETARY SUPPLEMENTS** <2091>: Meet the requirements

CONTAMINANTS

• **MICROBIAL ENUMERATION TESTS** <2021>: The total aerobic microbial count does not exceed 3000 cfu/g and the combined molds and yeasts count does not exceed 300 cfu/g.

• **ABSENCE OF SPECIFIED MICROORGANISMS** <2022>: Meet the requirements of the tests for absence of *Salmonella* species, *Escherichia coli*, and *Staphylococcus aureus*

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.

• **LABELING:**⁴ The label states that the product is Oil- and Water-Soluble Vitamins Capsules. The label also states the quantity of each vitamin per dosage unit and, where necessary, the chemical form in which it is present. Where the product contains vitamin E, the label indicates whether it is the *d*- or *dl*- form. Where more than one assay method is given for a particular vitamin, the labeling states with which assay method the product complies only if *Method 1* is not used.

⁴ USP Units of activity for vitamins, where such exist or formerly existed, are equivalent to the corresponding international units, where such formerly existed. The USP Unit for Vitamin E has been discontinued. International units (IU) for vitamins also have been discontinued; however, the use of IU on the labels of vitamin products continues. Where articles are labeled in terms of Units in addition to the required labeling, the relationship of the USP Units or IU to mass is as follows. One USP Vitamin A Unit = 0.3 µg of all-*trans*-retinol (vitamin A alcohol) or 0.344 µg of all-*trans*-retinyl acetate (vitamin A acetate) or 0.55 µg of all-*trans*-retinyl palmitate (vitamin A palmitate), and 1 µg of retinol (3.3 USP Vitamin A Units) = 1 retinol equivalent (RE); 1 IU of beta carotene = 0.6 µg of all-*trans*-beta carotene; 1 USP Vitamin D Unit = 0.025 µg of ergocalciferol or cholecalciferol; and 1 mg of *d*-alpha tocopherol = 1.1 former USP Vitamin E Units, 1 mg of *d*-alpha tocopheryl acetate = 1 former USP Vitamin E Unit, 1 mg of *d*-alpha tocopheryl acid succinate = 0.89 former USP Vitamin E Unit, 1 mg of *d*-alpha tocopherol = 1.49 former USP Vitamin E Units, and 1 mg of *d*-alpha tocopheryl acetate = 1.36 former USP Vitamin E Units, 1 mg of *d*-alpha tocopheryl acid succinate = 1.21 former USP Vitamin E Units. In terms of *d*-alpha tocopherol equivalents, 1 mg of *d*-alpha tocopheryl acetate = 0.91, 1 mg of *d*-alpha tocopheryl acid succinate = 0.81, 1 mg of *d*-alpha tocopherol = 0.74, 1 mg of *dl*-alpha tocopheryl acetate = 0.67, and 1 mg of *dl*-alpha tocopheryl acid succinate = 0.60.

Oil- and Water-Soluble Vitamins Oral Solution

DEFINITION

Oil- and Water-Soluble Vitamins Oral Solution contains one or more of the following oil-soluble vitamins: Vitamin A, Vitamin D as Ergocalciferol (Vitamin D₂) or Cholecalciferol (Vitamin D₃), and Vitamin E; one or more of the following water-soluble vitamins: Ascorbic Acid or its equivalent as Calcium Ascorbate or Sodium Ascorbate, Cyanocobalamin, Niacin or Niacinamide, Dexpanthenol or Panthenol, Pantothenic Acid (as Calcium Pantothenate or Racemic Calcium Pantothenate), Pyridoxine Hydrochloride, Riboflavin or Riboflavin-5'-Phosphate Sodium, and Thiamine Hydrochloride or Thiamine Mononitrate. It contains NLT 90.0% and NMT 250.0% of the labeled amounts of vitamin A ($C_{20}H_{30}O$) as retinol or esters of retinol in the form of retinyl acetate ($C_{27}H_{32}O_2$) or retinyl palmitate ($C_{36}H_{60}O_2$), vitamin D as ergocalciferol ($C_{28}H_{44}O$) or cholecalciferol ($C_{27}H_{44}O$), vitamin E as alpha tocopherol ($C_{29}H_{50}O_2$) or alpha tocopheryl acetate ($C_{31}H_{52}O_3$) or alpha tocopheryl acid succinate ($C_{33}H_{54}O_5$), ascorbic acid ($C_6H_8O_6$) or its salts as calcium ascorbate ($C_{12}H_{14}CaO_{12} \cdot 2H_2O$) or sodium ascorbate ($C_6H_7NaO_6$), and thiamine ($C_{12}H_{17}ClN_4OS$) as thiamine hydrochloride or thiamine mononitrate; NLT 90.0% and NMT 150.0% of the labeled amounts of calcium pantothenate ($C_{18}H_{32}CaN_2O_{10}$), dexpanthenol ($C_9H_{19}NO_4$) or panthenol ($C_9H_{19}NO_4$), niacin ($C_6H_5NO_2$) or niacinamide ($C_6H_6N_2O$), pyridoxine hydrochloride ($C_8H_{11}NO_3 \cdot HCl$), and riboflavin ($C_{17}H_{20}N_4O_6$) or riboflavin-5'-phosphate sodium ($C_{17}H_{20}N_4NaO_9P$); and NLT 90.0% and NMT 450.0% of the labeled amount of cyanocobalamin ($C_{63}H_{88}CoN_{14}O_{14}P$).

STRENGTH

[NOTE—In the following assays, where more than one assay method is given for an individual ingredient, the requirements may be met by following any one of the specified methods, the method used being stated in the labeling only if *Method 1* is not used.]

• **VITAMIN A**

[NOTE—Use low-actinic glassware throughout this procedure.]

Diluent: Tetrahydrofuran and acetonitrile (1:1)

Mobile phase: Methanol, acetonitrile, and *n*-hexane (46.5:46.5:7.0)

Standard solution: 0.33 mg/mL of retinol ($C_{20}H_{30}O$) from USP Vitamin A RS in *Diluent*. [NOTE—USP Vitamin A RS is retinyl acetate. Use it to analyze Oral Solution that contains vitamin A as retinol, retinyl acetate, or retinyl palmitate.]

Sample solution: Transfer an accurately measured volume of Oral Solution, equivalent to 3.3 mg of retinol, to a 500-mL separatory funnel containing 10 mL of water and 20 mL of dehydrated alcohol. Add 150 mL of solvent hexane, insert the stopper, and shake for 1 min. Add another 150 mL of solvent hexane, insert the stopper, shake, and allow the layers to separate. Discard the aqueous layer, and filter the solvent hexane extract through anhydrous sodium sulfate into a 500-mL, round-bottom flask. Evaporate the solution to dryness with the aid of a rotary evaporator over a water bath maintained at about 65°. Immediately add 10.0 mL of *Diluent*, swirl to dissolve the residue, and filter.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 265 nm

Column: 4.6-mm × 50-cm (prepared from two concatenated 4.6-mm × 25-cm columns); packing L1

Column temperature: 40°

Flow rate: 1.5 mL/min

Injection size: 20 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 5.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of vitamin A as retinol ($C_{20}H_{30}O$) in the portion of Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times F \times 100$$

r_U = peak area of retinol or retinyl ester from the *Sample solution*

r_S = peak area of retinyl acetate from the *Standard solution*

C_S = concentration of retinyl acetate ($C_{22}H_{32}O_2$) in the *Standard solution* (µg/mL)

C_U = nominal concentration of vitamin A, as retinol ($C_{20}H_{30}O$), in the *Sample solution* (µg/mL)

F = factor used to convert retinyl acetate, the ester form present in USP Vitamin A RS, to retinol, 0.872

Acceptance criteria: 90.0%–250.0% of the labeled amount of vitamin A as retinol ($C_{20}H_{30}O$)

• CHOLECALCIFEROL OR ERGOCALCIFEROL (VITAMIN D)

[NOTE—Where vitamin D (cholecalciferol or ergocalciferol) is specified in the following procedure, use the chemical form present in the formulation and the relevant USP Reference Standard. Use low-actinic glassware throughout this procedure.]

Diluent and Mobile phase: Prepare as directed for *Vitamin A*.

Standard solution: 5 µg/mL of USP Cholecalciferol RS or USP Ergocalciferol RS in *Diluent*

Sample solution: Transfer an accurately measured volume of Oral Solution, equivalent to 50 µg of cholecalciferol or ergocalciferol, to a 500-mL separatory funnel containing 10 mL of water and 20 mL of dehydrated alcohol. Add 150 mL of solvent hexane, insert the stopper, and shake for 1 min. Add another 150 mL of solvent hexane, insert the stopper, shake, and allow the layers to separate. Discard the aqueous layer. Drain the solvent hexane extract through anhydrous sodium sulfate into a 500-mL, round-bottom flask. Evaporate the solution to dryness with the aid of a rotary evaporator over a water bath maintained at about 65°. Immediately add 10.0 mL of *Diluent*, swirl to dissolve the residue, and filter.

Chromatographic system: Prepare as directed in *Vitamin A*.

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 5.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas for vitamin D. Calculate the percentage of the labeled amount of cholecalciferol ($C_{27}H_{44}O$) or ergocalciferol ($C_{28}H_{44}O$) in the portion of Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times F \times 100$$

r_U = peak areas of cholecalciferol or ergocalciferol from the *Sample solution*

r_S = peak areas of cholecalciferol or ergocalciferol from the *Standard solution*

C_S = concentration of USP Cholecalciferol RS or USP Ergocalciferol RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of cholecalciferol or ergocalciferol in the *Sample solution* (µg/mL)

F = correction factor to account for the average amount of previtamin D present in the formulation, 1.09

Acceptance criteria: 90.0%–250.0% of the labeled amount of vitamin D as cholecalciferol ($C_{27}H_{44}O$) or ergocalciferol ($C_{28}H_{44}O$)

• VITAMIN E

[NOTE—Use low-actinic glassware throughout this procedure.]

Diluent: Acetonitrile and ethyl acetate (1:1)

Potassium hydroxide solution: Transfer 90 g of potassium hydroxide pellets to a 100-mL volumetric flask containing 60 mL of water. Mix to dissolve, cool, and dilute with water to volume.

Mobile phase: Methanol, acetonitrile, and *n*-hexane (46.5:46.5:7.0)

Standard solution: 0.3 mg/mL of USP Alpha Tocopherol RS in *Diluent*

Sample solution: Transfer an amount of Oral Solution equivalent to 1.5 mg of alpha tocopherol to a 125-mL conical flask fitted with a ground-glass joint, and add 25.0 mL of dehydrated alcohol. Attach a reflux condenser, and reflux in a boiling water bath for 1 min. Cautiously add 3 mL of *Potassium hydroxide solution* through the condenser, and continue to reflux for 30 min. Remove the flask from the bath, and rinse the condenser with about 15 mL of water. Cool, and transfer with a minimum volume of water to a 250-mL separatory funnel. Rinse the flask with 50 mL of *n*-hexane, and add the rinsings to the separatory funnel. Insert the stopper, shake vigorously for 1 min, and allow the layers to separate. Drain the aqueous layer into a second 250-mL separatory funnel, and repeat the extraction with 50 mL of *n*-hexane. Discard the aqueous layer, and combine the hexane extracts. Wash the combined extracts with 25 mL of water, allow the layers to separate, and discard the aqueous layer. Add 3 drops of glacial acetic acid, and repeat the washing procedure two more times. Filter the washed hexane layer through anhydrous sodium sulfate into a 250-mL round-bottom flask. Rinse the funnel and sodium sulfate with *n*-hexane, and add the rinsing to the hexane solution in the flask. Evaporate the hexane solution to dryness with the aid of a rotary evaporator over a water bath maintained at about 50°. Immediately add 5.0 mL of *Diluent*, and swirl to dissolve the residue.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 291 nm

Column: 4.6-mm × 25-cm; packing L1

Column temperature: 40°

Flow rate: 3.0 mL/min

Injection size: 20 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 5.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas. Calculate the percentage of the labeled amount of vitamin E as alpha tocopherol ($C_{29}H_{50}O_2$) in the portion of Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of alpha tocopherol from the *Sample solution*

r_S = peak area of alpha tocopherol from the *Standard solution*

C_S = concentration of alpha tocopherol in the *Standard solution* (mg/mL)

C_U = nominal concentration of vitamin E, as alpha tocopherol, in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–250.0% of the labeled amount of vitamin E.

- **ASCORBIC ACID, Method 1:** Proceed as directed for *Automated Methods of Analysis* (16), *Assay for Ascorbic Acid*.

Acceptance criteria: 90.0%–250.0% of the labeled amount of ascorbic acid ($C_6H_8O_6$)

- **ASCORBIC ACID, Method 2**

Sample solution: Transfer an accurately measured volume of Oral Solution, equivalent to 80 mg of ascorbic acid, to a conical flask. Add 50 mL of water, 100 mL of 0.1 N sulfuric acid VS, and 15.0 mL of 0.1 N iodine VS. Stir the contents for 30 s, and add 5 mL of starch TS. Immediately titrate with 0.1 N sodium thiosulfate VS to the disappearance of the color. Each mL of 0.1 N iodine is equivalent to 8.806 mg of ascorbic acid ($C_6H_8O_6$).

Acceptance criteria: 90.0%–250.0% of the labeled amount of ascorbic acid ($C_6H_8O_6$)

- **CALCIUM ASCORBATE, Method 1:** Proceed as directed in *Automated Methods of Analysis* (16), *Assay for Ascorbic Acid*.

Acceptance criteria: 90.0%–250.0% of the labeled amount of calcium ascorbate ($C_{12}H_{14}CaO_{12} \cdot 2H_2O$)

- **CALCIUM ASCORBATE, Method 2:** Proceed as directed for *Ascorbic Acid, Method 2*. Each mL of 0.1 N iodine is equivalent to 10.66 mg of $C_{12}H_{14}CaO_{12} \cdot 2H_2O$.

Acceptance criteria: 90.0%–250.0% of the labeled amount of calcium ascorbate ($C_{12}H_{14}CaO_{12} \cdot 2H_2O$)

- **SODIUM ASCORBATE, Method 1:** Proceed as directed for *Automated Methods of Analysis* (16), *Assay for Ascorbic Acid*.

Acceptance criteria: 90.0%–250.0% of the labeled amount of sodium ascorbate ($C_6H_7NaO_6$)

- **SODIUM ASCORBATE, Method 2:** Proceed as directed for *Ascorbic Acid, Method 2*. Each mL of 0.1 N iodine is equivalent to 9.905 mg of $C_6H_7NaO_6$.

Acceptance criteria: 90.0%–250.0% of the labeled amount of sodium ascorbate ($C_6H_7NaO_6$)

- **CYANOCOBALAMIN**

[NOTE—Use low-actinic glassware throughout this procedure.]

Standard stock solution: 1.0 µg/mL of cyanocobalamin from USP Cyanocobalamin RS in 25% alcohol. Store in a refrigerator.

Standard solution: Dilute a suitable volume of *Standard stock solution* with water to a measured volume such that after the incubation period as described for *Analysis*, the difference in transmittance between the inoculated blank and the 5.0-mL level of the *Standard solution* is NLT that which corresponds to a difference of 1.25 mg in dried cell weight. This concentration usually falls between 0.01 and 0.04 ng/mL of *Standard solution*. Prepare this solution fresh for each assay.

Sample solution: Transfer an accurately measured volume of Oral Solution, assumed to contain 1.0 µg of cyanocobalamin, to an appropriate vessel containing, for each mL of the Oral Solution taken, 25 mL of an aqueous extracting solution prepared just before use to contain, in each 100 mL, 1.29 g of dibasic sodium phosphate, 1.1 g of anhydrous citric acid, and 1.0 g of sodium metabisulfite. Autoclave the mixture at 121° for 10 min. Allow any undissolved particles of the extract to settle, and filter or centrifuge if necessary. Dilute an aliquot of the clear solution with water to obtain a final solution containing vitamin B12 activity approximately equivalent to that of the *Standard solution*.

Acid-hydrolyzed casein solution: Mix 100 g of vitamin-free casein with 500 mL of 6 N hydrochloric acid, and reflux the mixture for 8–12 h. Remove the hydrochloric acid from the mixture by distillation under reduced pressure until a thick paste remains. Redissolve

the resulting paste in water, adjust the solution with 1 N sodium hydroxide to a pH of 3.5 ± 0.1 , and add water to make 1000 mL. Add 20 g of activated charcoal, stir for 1 h, and filter. Repeat the treatment with activated charcoal. Store under toluene in a cool place at a temperature not below 10°. Filter the solution if a precipitate forms during storage.

Asparagine solution: Dissolve 2.0 g of L-asparagine in water to make 200 mL. Store under toluene in a refrigerator.

Adenine–guanine–uracil solution: Dissolve 200 mg each of adenine sulfate, guanine hydrochloride, and uracil, with the aid of heat, in 10 mL of 4 N hydrochloric acid. Cool, and add water to make 200 mL. Store under toluene in a refrigerator.

Xanthine solution: Suspend 0.20 g of xanthine in 30–40 mL of water, heat to 70°, add 6.0 mL of 6 N ammonium hydroxide, and stir until the solid is dissolved. Cool, and add water to make 200 mL. Store under toluene in a refrigerator.

Salt solution A: Dissolve 10 g of monobasic potassium phosphate and 10 g of dibasic potassium phosphate in water to make 200 mL, and add 2 drops of hydrochloric acid. Store this solution under toluene.

Salt solution B: Dissolve 4.0 g of magnesium sulfate, 0.20 g of sodium chloride, 0.20 g of ferrous sulfate, and 0.20 g of manganese sulfate in water to make 200 mL, and add 2 drops of hydrochloric acid. Store this solution under toluene.

Polysorbate 80 solution: 100 mg/mL of polysorbate 80 in alcohol. Store in a refrigerator.

Vitamin solution A: 10 mg of riboflavin, 10 mg of thiamine hydrochloride, 100 µg of biotin, and 20 mg of niacin in 0.02 N acetic acid to make 400 mL. Store under toluene, protected from light, in a refrigerator.

Vitamin solution B: 20 mg of *p*-aminobenzoic acid, 10 mg of calcium pantothenate, 40 mg of pyridoxine hydrochloride, 40 mg of pyridoxal hydrochloride, 8 mg of pyridoxamine dihydrochloride, and 2 mg of folic acid in a mixture of water and neutralized alcohol (3:1) to make 400 mL. Store, protected from light, in a refrigerator.

Basal medium stock solution: Prepare the medium according to the following formula and directions. A dehydrated mixture containing the same ingredients may be used provided that, when constituted as directed in the labeling, it yields a medium comparable to that obtained from the formula given herein.

Add the ingredients in the order listed in *Table 1*, carefully dissolving cystine and tryptophan in the hydrochloric acid before adding the next eight solutions in the resulting solution. Add 100 mL of water, and dissolve dextrose, sodium acetate, and ascorbic acid. Filter, if necessary, add the *Polysorbate 80 solution*, adjust with 1 N sodium hydroxide to a pH of 5.5–6.0, and add Purified Water to make 250 mL.

Table 1

L-Cystine	0.1 g
L-Tryptophan	0.05 g
1 N Hydrochloric acid	10 mL
Adenine–guanine–uracil solution	5 mL
Xanthine solution	5 mL
Vitamin solution A	10 mL
Vitamin solution B	10 mL
Salt solution A	5 mL
Salt solution B	5 mL
Asparagine solution	5 mL
Acid-hydrolyzed casein solution	25 mL
Dextrose, anhydrous	10 g
Sodium acetate, anhydrous	5 g

Table 1 (Continued)

Ascorbic acid	1 g
Polysorbate 80 solution	5 mL

Tomato juice preparation: Centrifuge commercially canned tomato juice so that most of the pulp is removed. Suspend 5 g/L of analytical filter-aid in the supernatant, and filter, with the aid of reduced pressure, through a layer of the filter-aid. Repeat, if necessary, until a clear, straw-colored filtrate is obtained. Store under toluene in a refrigerator.

Culture medium

[NOTE—A dehydrated mixture containing the same ingredients may be used provided that, when constituted as directed in the labeling, it yields a medium equivalent to that obtained from the formula given herein.]

Dissolve 0.75 g of yeast extract, 0.75 g of dried peptone, 1.0 g of anhydrous dextrose, and 0.20 g of monobasic potassium phosphate in 60–70 mL of water. Add 10 mL of *Tomato juice preparation* and 1 mL of *Polysorbate 80 solution*. Adjust with 1 N sodium hydroxide to a pH of 6.8, and add water to make 100 mL. Place 10-mL portions of the solution in test tubes, and plug with cotton. Sterilize the tubes and contents in an autoclave at 121° for 15 min. Cool as rapidly as possible to avoid color formation resulting from overheating the medium.

Suspension medium: Dilute a measured volume of *Basal medium stock solution* with an equal volume of water. Place 10-mL portions of the diluted medium in test tubes. Sterilize, and cool as directed for *Culture medium*.

Stock culture of *Lactobacillus leichmannii*: To 100 mL of *Culture medium* add 1.0–1.5 g of agar, and heat the mixture on a steam bath, with stirring, until the agar dissolves. Place 10-mL portions of the hot solution in test tubes, cover the tubes, sterilize at 121° for 15 min in an autoclave, and allow the tubes to cool in an upright position. Inoculate three or more of the tubes by stab transfer of a pure culture of *Lactobacillus leichmannii*. [NOTE—Before first using a fresh culture in this assay, make NLT 10 successive transfers of the culture in a 2-week period.]

Incubate for 16–24 h at a temperature between 30° and 40° held constant to within $\pm 0.5^\circ$. Store in a refrigerator.

Prepare fresh stab cultures at least three times each week, and do not use them for preparing the *Inoculum* if more than 4 days old. The activity of the microorganism can be increased by daily or twice-daily transfer of the stab culture to the point where definite turbidity in the liquid *Inoculum* can be observed 2–4 h after inoculation. A slow-growing culture seldom gives a suitable response curve and may lead to erratic results.

Inoculum: [NOTE—A frozen suspension of *Lactobacillus leichmannii* may be used as the stock culture, provided it yields an *Inoculum* comparable to a fresh culture.]

Transfer cells from the *Stock culture of Lactobacillus leichmannii* to two sterile tubes containing 10 mL of the *Culture medium* each. Incubate these cultures for 16–24 h at a temperature between 30° and 40° held constant to within $\pm 0.5^\circ$. Under aseptic conditions centrifuge the cultures, and decant the supernatant. Suspend the cells from the culture in 5 mL of sterile *Suspension medium*, and combine. Using sterile *Suspension medium*, adjust the volume so that a 1-in-20 dilution in saline TS produces 70% transmittance when read on a suitable spectrophotometer that has been set at a wavelength of 530 nm, equipped with a 10-mm cell, and read against saline TS set at 100% transmittance. Prepare a 1-in-400 dilution of the adjusted suspension using sterile *Basal medium stock solution*. The cell suspension

so obtained is the *Inoculum*. [NOTE—This dilution may be altered, when necessary, to obtain the desired test response.]

Calibration of spectrophotometer: Check the wavelength of the spectrophotometer periodically, using a standard wavelength cell or other suitable device. Before reading any tests, calibrate the spectrophotometer for 0% and 100% transmittance, using water and with the wavelength set at 530 nm.

Analysis: Because of the high sensitivity of the test organism to minimum amounts of vitamin B₁₂ activity and to traces of many cleansing agents, cleanse meticulously by suitable means, followed preferably by heating at 250° for 2 h, using hard-glass 20-mm × 150-mm test tubes, and other necessary glassware.

To separate test tubes add, in duplicate, 1.0, 1.5, 2.0, 3.0, 4.0, and 5.0 mL of the *Standard solution*. To each of these tubes and to four similar empty tubes, add 5.0 mL of *Basal medium stock solution* and sufficient water to make 10 mL.

To similar separate test tubes add, in duplicate, 1.0, 1.5, 2.0, 3.0, and 4.0 mL of the *Sample solution*. To each tube add 5.0 mL of *Basal medium stock solution* and sufficient water to make 10 mL. Place one complete set of standard and sample tubes together in one tube rack and the duplicate set in a second rack or section of a rack, preferably in random order.

Cover the tubes to prevent bacterial contamination, and sterilize in an autoclave at 121° for 5 min, arranging to reach this temperature in NMT 10 min by preheating the autoclave if necessary. Cool as rapidly as possible to avoid color formation resulting from overheating the medium. Take precautions to maintain uniformity of sterilizing and cooling conditions throughout the assay, because packing the tubes too closely in the autoclave or overloading it may cause variation in the heating rate.

Aseptically add 0.5 mL of *Inoculum* to each tube so prepared, except two of the four containing no *Standard solution* (the uninoculated blanks). Incubate the tubes at a temperature between 30° and 40°, held constant to within $\pm 0.5^\circ$, for 16–24 h.

Terminate growth by heating to a temperature NLT 80° for 5 min. Cool to room temperature. After agitating the contents, read the transmittance at 530 nm when a steady state is reached. This steady state is observed a few seconds after agitation when the reading remains constant for 30 s or more. Allow approximately the same time interval for the reading on each tube.

With the transmittance set at 100% for the uninoculated blank, read the transmittance of the inoculated blank. If the difference is greater than 5% or if there is evidence of contamination with a foreign microorganism, disregard the results of the assay.

With the transmittance set at 100% for the uninoculated blank, read the transmittance of each of the remaining tubes. Disregard the results of the assay if the slope of the standard curve indicates a problem with sensitivity.

Calculation: Prepare a standard concentration-response curve by the following procedure. Test for and replace any aberrant individual transmittances. For each level of the Standard, calculate the response from the sum of the duplicate values of the transmittances (Σ_s) as the difference, $y = 2.00 - \Sigma_s$. Plot this response on the ordinate of cross-section paper against the logarithm of the mL of *Standard solution* per tube on the abscissa, using for the ordinate either an arithmetic or a logarithmic scale, whichever gives the better approximation to a straight line. Draw the straight line or smooth curve that best fits the plotted points. Calculate the response, $y = 2.00 - \Sigma_u$, adding together the two transmittances (Σ_u) for each level of the *Sample solution*. Read from the standard curve the logarithm of the volume of the *Standard solution* corresponding to each of those values of y that falls

within the range of the lowest and highest points plotted for the standard. Subtract from each logarithm so obtained the logarithm of the volume, in mL, of the *Sample solution* to obtain the difference, x , for each dosage level. Average the values of x for each of three or more dosage levels to obtain \bar{x} , which equals the log-relative potency, M' , of the *Sample solution*. Determine the quantity, in μg , of cyanocobalamin ($\text{C}_{63}\text{H}_{88}\text{CoN}_{14}\text{O}_{14}\text{P}$), in the portion of Oral Solution taken:

$$\text{antilog } M = \text{antilog } (M' + \log R)$$

R = number of μg of cyanocobalamin assumed to be present in the portion of Oral Solution taken

Calculate the percentage of the labeled amount of cyanocobalamin in the portion of the Oral Solution taken:

$$\text{Result} = [(\text{antilog } M)/N] \times 100$$

N = nominal amount of cyanocobalamin in the portion of Oral Solution taken

Replication: Repeat the entire determination at least once, using separately prepared *Sample solutions*. If the difference between the two log-potencies M is NMT 0.08, their mean, \bar{M} , is the assayed log-potency of the test material (see *Design and Analysis of Biological Assays* (111), *Vitamin B₁₂ Activity*). If the two determinations differ by more than 0.08, conduct one or more additional determinations. From the mean of two or more values of M that do not differ by more than 0.15, compute the mean potency of the preparation under assay.

Acceptance criteria: 90.0%–450.0% of the labeled amount of cyanocobalamin ($\text{C}_{63}\text{H}_{88}\text{CoN}_{14}\text{O}_{14}\text{P}$)

• **CALCIUM PANTOTHENATE, Method 1**

Mobile phase: 0.2 M monobasic sodium phosphate and methanol (97:3). Adjust with 1.7 M phosphoric acid to a pH of 3.2 ± 0.1 .

Standard solution: 80 $\mu\text{g}/\text{mL}$ of USP Calcium Pantothenate RS in *Mobile phase*

System suitability solution: 80 $\mu\text{g}/\text{mL}$ of USP Racemic Panthenol RS in *Mobile phase*. Mix the resulting solution and *Standard solution* (1:1).

Sample solution: Equivalent to 80 $\mu\text{g}/\text{mL}$ of calcium pantothenate from Oral Solution, in *Mobile phase*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 210 nm

Column: 4.0-mm \times 10-cm; packing L1

Flow rate: 1 mL/min

Injection size: 20 μL

System suitability

Samples: *Standard solution* and *System suitability solution*

Suitability requirements

Resolution: NLT 1.5 between panthenol and calcium pantothenate, *System suitability solution*

Tailing factor: NMT 2.0 for both the calcium pantothenate and the panthenol peaks, *Standard solution*

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*
Measure the peak areas for calcium pantothenate. Calculate the percentage of the labeled amount of calcium pantothenate ($\text{C}_{18}\text{H}_{32}\text{CaN}_2\text{O}_{10}$) in the portion of the Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of calcium pantothenate from the *Sample solution*

r_S = peak area of calcium pantothenate from the *Standard solution*

C_S = concentration of USP Calcium Pantothenate RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of calcium pantothenate in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–150.0% of the labeled amount of calcium pantothenate ($\text{C}_{18}\text{H}_{32}\text{CaN}_2\text{O}_{10}$)

• **CALCIUM PANTOTHENATE, Method 2**

Standard stock solution: Dissolve 50 mg of USP Calcium Pantothenate RS, previously dried and stored in the dark over phosphorus pentoxide and protected from absorption of moisture while weighing, in 500 mL of water in a 1000-mL volumetric flask. Add 10 mL of 0.2 N acetic acid and 100 mL of sodium acetate solution (1 in 60), and dilute with water to volume to obtain a concentration of 50 $\mu\text{g}/\text{mL}$ of USP Calcium Pantothenate RS. Store under toluene in a refrigerator.

Standard solution: On the day of the assay, dilute a volume of *Standard stock solution* with water to obtain a concentration of 0.01–0.04 $\mu\text{g}/\text{mL}$ of calcium pantothenate, the exact concentration being such that the responses obtained as directed for *Analysis*, 2.0 and 4.0 mL of the *Standard solution* being used, are within the linear portion of the log-concentration response curve.

Sample solution: Transfer an accurately measured volume of Oral Solution, equivalent to 50 mg of calcium pantothenate, to a 1000-mL volumetric flask containing 500 mL of water. Add 10 mL of 0.2 N acetic acid and 100 mL of sodium acetate solution (1 in 60), dilute with water to volume, and filter. Dilute a measured volume of this solution quantitatively, and stepwise if necessary, with water to obtain a solution having about the same concentration as that of the *Standard solution*.

Acid-hydrolyzed casein solution: Mix 100 g of vitamin-free casein with 500 mL of 6 N hydrochloric acid, and reflux the mixture for 8–12 h. Remove the hydrochloric acid from the mixture by distillation under reduced pressure until a thick paste remains. Redissolve the resulting paste in water, adjust the solution with 1 N sodium hydroxide to a pH of 3.5 ± 0.1 , and add water to make 1000 mL. Add 20 g of activated charcoal, stir for 1 h, and filter. Repeat the treatment with activated charcoal. Store under toluene in a cool place at a temperature not below 10°. Filter the solution if a precipitate forms during storage.

Cystine-tryptophan solution: Suspend 4.0 g of L-cystine in a solution of 1.0 g of L-tryptophan (or 2.0 g of D,L-tryptophan) in 700–800 mL of water, heat to 70°–80°, and add dilute hydrochloric acid (1 in 2) dropwise, with stirring, until the solids are dissolved. Cool, and add water to make 1000 mL. Store under toluene in a cool place at a temperature not below 10°.

Adenine-guanine-uracil solution: Dissolve 200 mg each of adenine sulfate, guanine hydrochloride, and uracil, with the aid of heat, in 10 mL of 4 N hydrochloric acid. Cool, and add water to make 200 mL. Store under toluene in a refrigerator.

Polysorbate 80 solution: 100 mg/mL of polysorbate 80 in alcohol

Riboflavin-thiamine hydrochloride-biotin solution: 20 $\mu\text{g}/\text{mL}$ of riboflavin, 10 $\mu\text{g}/\text{mL}$ of thiamine hydrochloride, and 0.04 $\mu\text{g}/\text{mL}$ of biotin in 0.02 N acetic acid. Store under toluene, protected from light, in a refrigerator.

p-Aminobenzoic acid-niacin-pyridoxine hydrochloride solution: 10 $\mu\text{g}/\text{mL}$ of p-aminobenzoic acid, 50 $\mu\text{g}/\text{mL}$ of niacin, and 40 $\mu\text{g}/\text{mL}$ of pyridoxine hydrochloride in a mixture of neutralized alcohol and water (1:3). Store in a refrigerator.

Salt solution A: Dissolve 25 g of monobasic potassium phosphate and 25 g of dibasic potassium phosphate in water to make 500 mL. Add 5 drops of hydrochloric acid. Store under toluene.

Salt solution B: Dissolve 10 g of magnesium sulfate, 0.5 g of sodium chloride, 0.5 g of ferrous sulfate, and 0.5 g of manganese sulfate in water to make 500 mL. Add 5 drops of hydrochloric acid. Store under toluene.

Basal medium stock solution: Dissolve the anhydrous dextrose and anhydrous sodium acetate in the solutions previously mixed according to Table 2, and adjust with 1 N sodium hydroxide to a pH of 6.8. Dilute with water to 250 mL.

Table 2

Acid-hydrolyzed casein solution	25 mL
Cystine-tryptophan solution	25 mL
Polysorbate 80 solution	0.25 mL
Dextrose, anhydrous	10 g
Sodium acetate, anhydrous	5 g
Adenine-guanine-uracil solution	5 mL
Riboflavin-thiamine hydrochloride-biotin solution	5 mL
p-Aminobenzoic acid-niacin-pyridoxine hydrochloride solution	5 mL
Salt solution A	5 mL
Salt solution B	5 mL

Stock culture of *Lactobacillus plantarum*: Dissolve 2.0 g of yeast extract in 100 mL of water; add 500 mg of anhydrous dextrose, 500 mg of anhydrous sodium acetate, and 1.5 g of agar; and heat the mixture on a steam bath, with stirring, until the agar dissolves. Add 10-mL portions of the hot solution to the test tubes, close or cover the tubes, sterilize in an autoclave at 121° for 15 min, and allow the tubes to cool in an upright position. Prepare stab cultures in three or more of the tubes, using a pure culture of *Lactobacillus plantarum*, incubating for 16–24 h at a temperature between 30° and 37° held constant to within ±0.5°. Store in a refrigerator. Prepare a fresh stab of the stock culture every week, and do not use for *Inoculum* if the culture is more than 1 week old.

Culture medium: To each of a series of test tubes containing 5.0 mL of *Basal medium stock solution*, add 5.0 mL of water containing 0.2 µg of calcium pantothenate. Plug the tubes with cotton, sterilize in an autoclave at 121° for 15 min, and cool.

Inoculum: [NOTE—A frozen suspension of *Lactobacillus plantarum* may be used as the stock culture, provided it yields an *Inoculum* comparable to a fresh culture.]

Transfer cells from the *Stock culture of Lactobacillus plantarum* to a sterile tube containing 10 mL of *Culture medium*. Incubate this culture for 16–24 h at a temperature between 30° and 37° held constant to within ±0.5°. The cell suspension so obtained is the *Inoculum*.

Analysis: To similar separate test tubes add, in duplicate, 1.0 and/or 1.5, 2.0, 3.0, 4.0, and 5.0 mL of the *Standard solution*. To each tube and to four similar empty tubes, add 5.0 mL of *Basal medium stock solution* and sufficient water to make 10 mL.

To similar separate test tubes add, in duplicate, volumes of the *Sample solution* corresponding to three or more of the levels specified for the *Standard solution*, including the levels of 2.0, 3.0, and 4.0 mL. To each tube add 5.0 mL of the *Basal medium stock solution* and sufficient water to make 10 mL. Place one complete set of Standard and sample tubes together in one tube rack and the duplicate set in a second rack or section of a rack, preferably in random order.

Cover the tubes of both series to prevent contamination, and sterilize in an autoclave at 121° for 5 min. Cool,

add 1 drop of *Inoculum* to each tube, except two of the four tubes containing no *Standard solution* (the uninoculated blanks). Incubate the tubes at a temperature between 30° and 37°, held constant to within ±0.5° until, following 16–24 h of incubation, there has been no substantial increase in turbidity in the tubes containing the highest level of Standard during a 2-h period.

Determine the transmittance of the tubes in the following manner. Mix the contents of each tube, and transfer to an optical container if necessary. Read the transmittance between 540 and 660 nm when a steady state is reached. This steady state is observed a few seconds after agitation when the galvanometer reading remains constant for 30 s or more. Allow approximately the same time interval for the reading on each tube. With the transmittance set at 1.00 for the uninoculated blank, read the transmittance of the inoculated blank. With the transmittance set at 1.00 for the inoculated blank, read the transmittance for each of the remaining tubes. If there is evidence of contamination with a foreign microorganism, disregard the result of the assay.

Calculation: Prepare a standard concentration-response curve as follows. For each level of the Standard, calculate the response from the sum of the duplicate values of the transmittance (Σ_s) as the difference, $y = 2.00 - \Sigma_s$. Plot this response on the ordinate of cross-section paper against the logarithm of the mL of *Standard solution* per tube on the abscissa, using for the ordinate either an arithmetic or a logarithmic scale, whichever gives the better approximation to a straight line. Draw the straight line or smooth curve that best fits the plotted points. Calculate the response, $y = 2.00 - \Sigma_u$, adding together the two transmittances (Σ_u) for each level of the *Sample solution*. Read from the standard curve the logarithm of the volume of the *Standard solution* corresponding to each of those values of y that fall within the range of the lowest and highest points plotted for the Standard. Subtract from each logarithm so obtained the logarithm of the volume, in mL, of the *Sample solution* to obtain the difference, x , for each dosage level. Average the values of x for each of three or more dosage levels to obtain \bar{x} , which equals the log-relative potency, M' , of the *Sample solution*. Determine the quantity, in mg, of USP Calcium Pantothenate RS corresponding to the calcium pantothenate ($C_{18}H_{32}CaN_2O_{10}$) in the portion of Oral Solution taken:

$$\text{antilog } M = \text{antilog } (M' + \log R)$$

R = number of mg of calcium pantothenate assumed to be present in the portion of Oral Solution taken

Calculate the percentage of the labeled amount of calcium pantothenate ($C_{18}H_{32}CaN_2O_{10}$) in the portion of Oral Solution taken:

$$\text{Result} = [(\text{antilog } M)/N] \times 100$$

N = nominal amount of calcium pantothenate in the portion of Oral Solution (mg)

Replication: Repeat the entire determination at least once, using separately prepared *Sample solutions*. If the difference between the two log-potencies M is NMT 0.08, their mean, \bar{M} , is the assayed log-potency of the test material (see *Design and Analysis of Biological Assays* (111), *Confidence Interval and Limits of Potency*). If the two determinations differ by more than 0.08, conduct one or more additional determinations. From the mean of two or more values of M that do not differ by more than 0.15, compute the mean potency of the preparation under assay.

Acceptance criteria: 90.0%–150.0% of the labeled amount of calcium pantothenate ($C_{18}H_{32}CaN_2O_{10}$)

• **DEXPANTHENOL OR PANTHENOL, Method 1**

Mobile phase and Chromatographic system: Proceed as directed in *Calcium Pantothenate, Method 1*.

Standard solution: 80 µg/mL of USP Dexpantenol RS or USP Racemic Panthenol RS in *Mobile phase*. [NOTE—Use USP Dexpantenol RS to analyze Oral Solution that contains dexpantenol and USP Racemic Panthenol RS to analyze Oral Solution that contains panthenol.]

System suitability solution: 80 µg/mL of USP Calcium Pantothenate RS in *Mobile phase*. Mix the resulting solution and *Standard solution* (1:1).

Sample solution: Equivalent to 80 µg/mL of dexpantenol or panthenol from the Oral Solution in *Mobile phase*

Analysis

Samples: *Standard solution* and *Sample solution*
Measure the areas for panthenol. Calculate the percentage of the labeled amount of dexpantenol or panthenol ($C_9H_{19}NO_4$) in the portion of the Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of dexpantenol or panthenol from the *Sample solution*

r_S = peak area of dexpantenol or panthenol from the *Standard solution*

C_S = concentration of USP Dexpantenol RS or USP Racemic Panthenol RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of dexpantenol or panthenol in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–150.0% of the labeled amount of dexpantenol or panthenol ($C_9H_{19}NO_4$)

• **DEXPANTHENOL OR PANTHENOL, Method 2**

[NOTE—The following procedure is applicable also to the determination of the dextrorotatory component of racemic panthenol in preparations containing panthenol.]

Dehydrated mixtures yielding formulations similar to the media described herein may be used provided that, when constituted as directed, they have growth-promoting properties equal to or superior to those obtained with the media prepared as described herein.

Standard stock solution: 800 µg/mL of USP Dexpantenol RS or 1600 µg/mL of USP Racemic Panthenol RS in water. Store in a refrigerator, protected from light, and use within 30 days. [NOTE—Use USP Dexpantenol RS to analyze Oral Solution that contains dexpantenol and USP Racemic Panthenol RS to analyze Oral Solution that contains panthenol.]

Standard solution: On the day of the assay, prepare 1.2 µg/mL of dexpantenol or 2.4 µg/mL of racemic panthenol from the *Standard stock solution* with water.

Sample solution: 1.2 µg/mL of dexpantenol or 2.4 µg/mL of panthenol from the Oral Solution in water

Acid-hydrolyzed casein solution: Mix 100 g of vitamin-free casein with 500 mL of 6 N hydrochloric acid, and reflux the mixture for 8–12 h. Remove the hydrochloric acid from the mixture by distillation under reduced pressure until a thick paste remains. Redissolve the resulting paste in about 500 mL of water, adjust the solution with 1 N sodium hydroxide to a pH of 3.5 ± 0.1 , and add water to make 1000 mL. Add 20 g of activated charcoal, stir for 1 h, and filter. Repeat the treatment with activated charcoal. Store under toluene in a cool place at a temperature not below 10°. Filter the solution if a precipitate forms during storage.

Cystine-tryptophan solution: Suspend 4.0 g of L-cystine in a solution of 1.0 g of L-tryptophan (or 2.0 g of D,L-tryptophan) in 700 to 800 mL of water, heat to $75 \pm 5^\circ$, and add 6 M hydrochloric acid solution dropwise, with stirring, until the solids are dissolved.

Cool, add water to make 1000 mL, and mix. Store under toluene in a cool place at a temperature not below 10°.

Adenine-guanine-uracil solution: Dissolve 200 mg each of adenine sulfate, guanine hydrochloride, and uracil, with the aid of heat, in 10 mL of 4 N hydrochloric acid. Cool, add water to make 200 mL, and mix. Store under toluene in a refrigerator.

Polysorbate 80 solution: 100 mg/mL of polysorbate 80 in alcohol

Riboflavin-thiamine hydrochloride-biotin solution: Prepare a solution of riboflavin, thiamine hydrochloride, and biotin in 0.02 N acetic acid containing 20 µg/mL of riboflavin, 10 µg/mL of thiamine hydrochloride, and 0.04 µg/mL of biotin. Store under toluene, protected from light, in a refrigerator.

p-Aminobenzoic acid-niacin-pyridoxine hydrochloride solution: Prepare a solution in neutral 25% alcohol containing 10 µg/mL of p-aminobenzoic acid, 50 µg/mL of niacin, and 40 µg/mL of pyridoxine hydrochloride. Store in a refrigerator.

Salt solution A: Dissolve 25 g of monobasic potassium phosphate and 25 g of dibasic potassium phosphate in water to make 500 mL. Add 5 drops of hydrochloric acid, and mix. Store under toluene.

Salt solution B: Dissolve 10 g of magnesium sulfate, 0.5 g of sodium chloride, 0.5 g of ferrous sulfate, and 0.5 g of manganese sulfate in water to make 500 mL. Add 5 drops of hydrochloric acid, and mix. Store under toluene.

Pyridoxal-calcium pantothenate solution: Dissolve 40 mg of pyridoxal hydrochloride and 375 µg of calcium pantothenate in 10% alcohol to make 200 mL, and mix. Store in a refrigerator, and use within 30 days.

Polysorbate 40-oleic acid solution: Dissolve 25 g of polysorbate 40 and 0.25 g of oleic acid in 20% alcohol to make 500 mL, and mix. Store in a refrigerator, and use within 30 days.

Modified pantothenate medium: Dissolve anhydrous dextrose and sodium acetate in the solutions previously mixed according to *Table 3*, adjust with 1 N sodium hydroxide to a pH of 6.8, dilute with water to 250 mL, and mix.

Table 3

Acid-hydrolyzed casein solution	25 mL
Cystine-tryptophan solution	25 mL
Polysorbate 80 solution	0.25 mL
Dextrose, anhydrous	10 g
Sodium acetate, anhydrous	5 g
Adenine-guanine-uracil solution	5 mL
Riboflavin-thiamine hydrochloride-biotin solution	5 mL
p-Aminobenzoic acid-niacin-pyridoxine hydrochloride solution	5 mL
Salt solution A	5 mL
Salt solution B	5 mL
Pyridoxal-calcium pantothenate solution	5 mL
Polysorbate 40-oleic acid solution	5 mL

Double-strength modified pantothenate medium:

Prepare as directed under *Modified pantothenate medium*, but make the final dilution to 125 mL instead of 250 mL. Prepare fresh.

Stock culture of *Pediococcus acidilactici*: Dissolve 6.0 g of peptone, 4.0 g of pancreatic digest of casein, 3.0 g of yeast extract, 1.5 g of beef extract, 1.0 g of dextrose, and 15.0 g of agar in 800 mL of water, with the aid of heat. Adjust with 0.1 N sodium hydroxide or 0.1 N hydrochloric acid to a pH between 6.5 and 6.6, dilute with water to 1000 mL, and mix. Add 10-mL portions of the solution to culture tubes, place caps on the

tubes, and sterilize in an autoclave at 121° for 15 min. Cool on a slant, and store in a refrigerator. Prepare a stock culture of *Pediococcus acidilactici*¹ on a slant of this medium. Incubate at 35° for 20–24 h, and store in a refrigerator. Maintain the stock culture by monthly transfer onto fresh slants.

Inoculum: Inoculate three 250-mL portions of *Modified pantothenate medium* from a stock culture slant, and incubate at 35° for 20–24 h. Centrifuge the suspension from the combined portions, and wash the cells with *Modified pantothenate medium*. Resuspend the cells in sufficient *Modified pantothenate medium* so that a 1-in-50 dilution, when tested in a 13-mm diameter test tube, gives 80% light transmission at 530 nm. Transfer 1.2-mL portions of this stock suspension to glass ampuls, seal, freeze in liquid nitrogen, and store in a freezer. On the day of the assay, allow the ampuls to reach room temperature, mix the contents, and dilute 1 mL of thawed culture with sterile saline TS to 150 mL. [NOTE—This dilution may be altered when necessary to obtain the desired test response.]

Analysis: Prepare in triplicate a series of eight culture tubes by adding the following quantities of water to the tubes within a set: 5.0, 4.5, 4.0, 3.5, 3.0, 2.0, 1.0, and 0.0 mL. To these same tubes, and in the same order, add 0.0, 0.5, 1.0, 1.5, 2.0, 3.0, 4.0, and 5.0 mL of the *Standard solution*.

Prepare in duplicate a series of five culture tubes by adding the following quantities of water to the tubes within a set: 4.0, 3.5, 3.0, 2.0, and 1.0 mL. To these same tubes, and in the same order, add 1.0, 1.5, 2.0, 3.0, and 4.0 mL of the *Sample solution*.

Add 5.0 mL of *Double-strength modified pantothenate medium* to each tube, and mix. Cover the tubes with metal caps, and sterilize in an autoclave at 121° for 5 min. Cool to room temperature in a chilled water bath, and inoculate each tube with 0.5 mL of the *Inoculum*. Allow to incubate at 37° for 16 h. Terminate growth by heating to a temperature not below 80°, such as by steaming at atmospheric pressure in a sterilizer for 5 to 10 min. Cool, and concomitantly determine the percentage transmittance of the suspensions, in cells of equal pathlength, on a suitable spectrophotometer, at a wavelength of 530 nm.

Calculation: Draw a dose-response curve on arithmetic graph paper by plotting the average response, in percent transmittance, for each set of tubes of the standard curve against the standard level concentrations. The curve is drawn by connecting each adjacent pair of points with a straight line. From this standard curve, determine by interpolation the potency of each tube containing portions of the *Sample solution*. Divide the potency of each tube by the amount of the *Sample solution* added to it, to obtain the individual responses. Calculate the mean response by averaging the individual responses that vary from their mean by NMT 15%, using NLT half the total number of tubes. Calculate the potency of the portion of the material taken for assay, by multiplying the mean response by the appropriate dilution factor. Calculate the percentage of the labeled amount of dexpanthenol or panthenol in the portion of Oral Solution taken:

$$\text{Result} = (P/N) \times 100$$

P = calculated potency of dexpanthenol or panthenol in the portion of Oral Solution taken (mg)
N = nominal amount of dexpanthenol or panthenol in the portion of Oral Solution taken (mg)

¹ ATCC No. 8042 is suitable.

Acceptance criteria: 90.0%–150.0% of the labeled amount of dexpanthenol or panthenol ($\text{C}_9\text{H}_{19}\text{NO}_4$)

• NIACIN or NIACINAMIDE

[NOTE—Use low-actinic glassware throughout this procedure.]

Diluent: 25 mg/mL of edetate disodium in water

Mobile phase: Mix 0.4 mL of triethylamine, 15.0 mL of glacial acetic acid, and 350 mL of methanol, and dilute with 0.008 M sodium 1-hexanesulfonate to 2000 mL.

Standard solution: 0.10 mg/mL of USP Niacin RS or USP Niacinamide RS in *Diluent*. [NOTE—Use USP Niacin RS for Oral Solution that contains niacin and USP Niacinamide RS for Oral Solution that contains niacinamide.]

Sample solution: Dilute an accurately measured volume of Oral Solution with *Diluent* to obtain a solution with a concentration of 0.1 mg/mL of niacin or niacinamide.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 270 nm

Column: 4.6-mm × 25-cm; packing L7

Flow rate: 2 mL/min

Injection size: 5 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of niacin ($\text{C}_6\text{H}_5\text{NO}_2$) or niacinamide ($\text{C}_6\text{H}_6\text{N}_2\text{O}$) in the portion of Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of niacin or niacinamide from the *Sample solution*

r_S = peak area of niacin or niacinamide from the *Standard solution*

C_S = concentration of USP Niacin RS or USP Niacinamide RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of niacin or niacinamide in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–150.0% the labeled amount of niacin ($\text{C}_6\text{H}_5\text{NO}_2$) or niacinamide ($\text{C}_6\text{H}_6\text{N}_2\text{O}$)

• PYRIDOXINE HYDROCHLORIDE

Diluent, Mobile phase, and Chromatographic system: Proceed as directed in the assay for *Niacin* or *Niacinamide*.

Standard solution: Equivalent to 24 µg/mL of USP Pyridoxine Hydrochloride RS in *Diluent*

Sample solution: Equivalent to 24 µg/mL of Pyridoxine Hydrochloride from Oral Solution in *Diluent*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of pyridoxine hydrochloride ($\text{C}_8\text{H}_{11}\text{NO}_3 \cdot \text{HCl}$) in the portion of Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of pyridoxine hydrochloride from the *Sample solution*

r_S = peak area of pyridoxine hydrochloride from the *Standard solution*

C_S = concentration of USP Pyridoxine Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of pyridoxine hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–150.0% of the labeled amount of pyridoxine hydrochloride ($\text{C}_8\text{H}_{11}\text{NO}_3 \cdot \text{HCl}$)

• **RIBOFLAVIN-5'-PHOSPHATE SODIUM, Method 1**

[NOTE—Riboflavin-5'-phosphate sodium is quantitated against USP Riboflavin RS in this procedure. In the chromatogram of the *Sample solution*, the riboflavin-5'-phosphate peak is the only peak measured for calculation.]

Diluent, Mobile phase, and Chromatographic system: Proceed as directed in the assay for *Niacin* or *Niacinamide*.

Standard solution: 8 µg/mL of USP Riboflavin RS in *Diluent*, by heating if necessary.

Sample solution: Equivalent to 8 µg/mL of riboflavin from Oral Solution in *Diluent*

Analysis

Samples: *Standard solution* and *Sample solution*

[NOTE—The relative retention times for riboflavin-5'-phosphate and riboflavin are about 0.18 and 1.0, respectively.]

Calculate the percentage of the labeled amount of riboflavin ($C_{17}H_{20}N_4O_6$) in the portion of Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times F \times 100$$

r_U = peak area of riboflavin-5'-phosphate from the *Sample solution*

r_S = peak area of riboflavin from the *Standard solution*

C_S = concentration of USP Riboflavin RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of riboflavin in the *Sample solution* (mg/mL)

F = factor for converting the response obtained for riboflavin-5'-phosphate to riboflavin, 1.493. [NOTE—Riboflavin phosphate sodium is a mixture of isomeric monophosphates and diphosphates containing an average amount of 67% of riboflavin-5'-monophosphate, which separates in this chromatographic system. The factor 1.493 assumes 67% of riboflavin-5'-monophosphate.]

Acceptance criteria: 90.0%–150.0% of the labeled amount of riboflavin ($C_{17}H_{20}N_4O_6$)

• **RIBOFLAVIN OR RIBOFLAVIN-5'-PHOSPHATE SODIUM, Method 2**
[NOTE—Use low-actinic glassware throughout this procedure.]

Solvent blank: 1 N hydrochloric acid, 2.5 M sodium acetate, and water (1:2:97)

Standard stock solution: Transfer 16 mg of USP Riboflavin RS to a 100-mL volumetric flask, dissolve in 1.0 mL of 1 N hydrochloric acid and 2.0 mL of 2.5 M sodium acetate, and dilute with water to volume. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, and dilute with water to volume.

Standard solution: Transfer 5.0 mL of the *Standard stock solution* to a 500-mL volumetric flask, add 5.0 mL of 1 N hydrochloric acid, 10.0 mL of 2.5 M sodium acetate, and dilute with water to volume.

Sample solution: Transfer an accurately measured volume of Oral Solution, equivalent to 0.8 mg of riboflavin to a 100-mL volumetric flask, and dilute with water to volume. Transfer 10.0 mL of the resulting solution to a 500-mL volumetric flask, add 5.0 mL of 1 N hydrochloric acid, 10.0 mL of 2.5 M sodium acetate, and dilute with water to volume.

Spectrometric conditions

Mode: Fluorescence

Analytical wavelength

Excitation: 440 nm

Emission: 530 nm

Blank: *Solvent blank*

Analysis

Samples: *Standard solution* and *Sample solution*
Determine the maximum fluorescence intensities, I_S and I_U , of the *Standard solution* and the *Sample solution*, respectively. Calculate the percentage of the labeled amount of riboflavin ($C_{17}H_{20}N_4O_6$) in the portion of Oral Solution taken:

$$\text{Result} = (I_U/I_S) \times (C_S/C_U) \times 100$$

I_U = fluorescence intensity from the *Sample solution*

I_S = fluorescence intensity from the *Standard solution*

C_S = concentration of USP Riboflavin RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of riboflavin in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–150.0% of the labeled amount of riboflavin ($C_{17}H_{20}N_4O_6$)

• **THIAMINE**

Diluent, Mobile phase, and Chromatographic system: Proceed as directed for *Niacin* or *Niacinamide*.

Standard solution: 24 µg/mL of USP Thiamine Hydrochloride RS in *Diluent*

Sample solution: Equivalent to 24 µg/mL of thiamine hydrochloride from Oral Solution in *Diluent*

Analysis

Samples: *Standard solution* and *Sample solution*
Measure the areas for the major peaks. Calculate the percentage of the labeled amount of thiamine hydrochloride ($C_{12}H_{17}ClN_4OS \cdot HCl$) or thiamine mononitrate ($C_{12}H_{17}N_5O_4S$) in the portion of Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times F \times 100$$

r_U = peak area of thiamine from the *Sample solution*

r_S = peak area of thiamine from the *Standard solution*

C_S = concentration of USP Thiamine Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of thiamine hydrochloride or thiamine mononitrate in the *Sample solution* (mg/mL)

F = 1 (for products containing thiamine hydrochloride) and 0.97 (for products containing thiamine mononitrate)

Acceptance criteria: 90.0%–250.0% of the labeled amount of thiamine hydrochloride ($C_{12}H_{17}ClN_4OS \cdot HCl$) or thiamine mononitrate ($C_{12}H_{17}N_5O_4S$)

OTHER COMPONENTS

- **ALCOHOL DETERMINATION, Method I <611>** (if present): 90.0%–120.0% of the labeled amount of C_2H_5OH

CONTAMINANTS

- **MICROBIAL ENUMERATION TESTS <2021>**: The total aerobic microbial count does not exceed 3000 cfu/mL, and the combined molds and yeasts count does not exceed 300 cfu/mL.
- **MICROBIOLOGICAL PROCEDURES FOR ABSENCE OF SPECIFIED MICROORGANISMS <2022>**: Meet the requirements of the tests for absence of *Salmonella* species, *Escherichia coli*, and *Staphylococcus aureus*.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, under an inert gas or with a minimum of headspace.

- **LABELING:**² The label states that the product is Oil- and Water-Soluble Vitamins Oral Solution. The label states the quantity of each vitamin present in a given volume of Oral Solution and, where necessary, the chemical form in which a vitamin is present. Where the product contains vitamin E, the label indicates whether it is the *d*- or *dl*-form. Where the product is labeled to contain panthenol, the label states the equivalent content of dexpanthenol. Where more than one assay method is given for a particular vitamin, the labeling states with which assay method the product complies only if *Method 1* is not used.

 - 3,7-Dimethyl-9-(2,6,6-trimethyl-1-cyclohexen-1-yl) 2,4,6,8-nonatetraen-1-ol acetate (vitamin A acetate).

² USP Units of activity for vitamins, where such exist or formerly existed, are equivalent to the corresponding international units, where such formerly existed. The USP Unit for Vitamin E has been discontinued. International units (IU) for vitamins also have been discontinued; however, the use of IU on the labels of vitamin products continues. Where articles are labeled in terms of Units in addition to the required labeling, the relationship of the USP Units or IU to mass is as follows. One USP Vitamin A Unit = 0.3 μ g of all-*trans*-retinol (vitamin A alcohol) or 0.344 μ g of all-*trans*-retinyl acetate (vitamin A acetate) or 0.55 μ g of all-*trans*-retinyl palmitate (vitamin A palmitate), and 1 μ g of retinol (3.3 USP Vitamin A Units) = 1 retinol equivalent (RE); 1 IU of beta carotene = 0.6 μ g of all-*trans*-beta carotene; 1 USP Vitamin D Unit = 0.025 μ g of ergocalciferol or cholecalciferol; and 1 mg of *dl*-alpha tocopherol = 1.1 former USP Vitamin E Units, 1 mg of *dl*-alpha tocopheryl acetate = 1 former USP Vitamin E Unit, 1 mg of *dl*-alpha tocopheryl acid succinate = 0.89 former USP Vitamin E Unit, 1 mg of *d*-alpha tocopherol = 1.49 former USP Vitamin E Units, 1 mg of *d*-alpha tocopheryl acetate = 1.36 former USP Vitamin E Units, and 1 mg of *d*-alpha tocopheryl acid succinate = 1.21 former USP Vitamin E Units. In terms of *d*-alpha tocopherol equivalents, 1 mg of *d*-alpha tocopheryl acetate = 0.91, 1 mg of *d*-alpha tocopheryl acid succinate = 0.81, 1 mg of *dl*-alpha tocopherol = 0.74, 1 mg of *dl*-alpha tocopheryl acetate = 0.67, and 1 mg of *dl*-alpha tocopheryl acid succinate = 0.60.

Oil- and Water-Soluble Vitamins Tablets

DEFINITION

Oil- and Water-Soluble Vitamins Tablets contain one or more of the following oil-soluble vitamins: Vitamin A, Vitamin D as Ergocalciferol (Vitamin D₂) or Cholecalciferol (Vitamin D₃), Vitamin E, Phytonadione (Vitamin K₁), and Beta Carotene, and one or more of the following water-soluble vitamins: Ascorbic Acid or its equivalent as Calcium Ascorbate or Sodium Ascorbate, Biotin, Cyanocobalamin, Folic Acid, Niacin or Niacinamide, Pantothenic Acid (as Calcium Pantothenate or Racemic Calcium Pantothenate), Pyridoxine Hydrochloride, Riboflavin, and Thiamine Hydrochloride or Thiamine Mononitrate. Tablets contain NLT 90.0% and NMT 165.0% of the labeled amounts of vitamin A ($C_{20}H_{30}O$) as retinol or esters of retinol in the form of retinyl acetate ($C_{22}H_{32}O_2$) or retinyl palmitate ($C_{36}H_{60}O_2$), vitamin D as ergocalciferol ($C_{28}H_{44}O$) or cholecalciferol ($C_{27}H_{44}O$); vitamin E as alpha tocopherol ($C_{29}H_{50}O_2$), alpha tocopheryl acetate ($C_{31}H_{52}O_3$), or alpha tocopheryl acid succinate ($C_{33}H_{54}O_5$); phytonadione ($C_{31}H_{46}O_2$); and beta carotene ($C_{40}H_{56}$); and NLT 90.0% and NMT 150.0% of the labeled amounts of ascorbic acid ($C_6H_8O_6$) or its salts, as calcium ascorbate ($C_{12}H_{14}CaO_{12} \cdot 2H_2O$) or sodium ascorbate ($C_6H_7NaO_6$); biotin ($C_{10}H_{16}N_2O_3S$); cyanocobalamin ($C_{63}H_{88}CoN_{14}O_{14}P$); folic acid ($C_{19}H_{19}N_7O_6$); niacin ($C_6H_5NO_2$) or niacinamide ($C_6H_6N_2O$); calcium pantothenate ($C_{18}H_{32}CaN_2O_{10}$); pyridoxine hydrochloride ($C_8H_{11}NO_3 \cdot HCl$); riboflavin ($C_{17}H_{20}N_4O_6$); and thiamine ($C_{12}H_{17}ClN_4OS$) as thiamine hydrochloride or thiamine mononitrate.

They do not contain any minerals. They may contain other labeled added substances that are generally recognized as safe, in amounts that are unobjectionable.

STRENGTH

[NOTE—Where more than one assay method is given for an individual ingredient, the requirements may be met by following any one of the specified methods, the method used being stated in the labeling only if *Method 1* is not used.]

• VITAMIN A, *Method 1*

[NOTE—Where the use of a vitamin A ester (retinyl acetate or retinyl palmitate) is specified in the following procedure, use the chemical form present in the formulation. USP Vitamin A RS is retinyl acetate. It is to be used where USP Vitamin A RS is specified. Use low-acid glassware throughout this procedure.]

Mobile phase: *n*-Hexane

Standard solution: 15 μ g/mL of retinyl acetate from USP Vitamin A RS in *n*-hexane

System suitability stock solution: 15 μ g/mL of retinyl palmitate in *n*-hexane

System suitability solution: Mix equal volumes of *System suitability stock solution* and the *Standard solution* to obtain concentrations of 7.5 μ g/mL each of retinyl acetate and retinyl palmitate.

Sample solution: Finely powder NLT 20 Tablets. Transfer a portion of the powder, equivalent to 5 Tablets, to a container having a polytetrafluoroethylene-lined screw cap. Add 10 mL of dimethyl sulfoxide and 15 mL of *n*-hexane, and shake for 45 min on a wrist-action shaker in a water bath maintained at 60°. [NOTE—Set up the wrist-action shaker to ensure that the contents of the container are mixed vigorously and thoroughly.] Centrifuge at 3000 rpm for 10 min, and transfer the hexane layer by means of a pipet to a 100-mL volumetric flask. Add 15 mL of *n*-hexane to the dimethyl sulfoxide layer, shake thoroughly for 5 min, and transfer the hexane layer by means of a pipet to the 100-mL volumetric flask. Repeat this extraction with three additional 15-mL portions of *n*-hexane. Dilute the extracts in the volumetric flask with *n*-hexane to volume. Dilute a 10-mL volume of this solution with *n*-hexane to obtain a solu-

tion with a concentration of 15 µg/mL of vitamin A as retinol (C₂₀H₃₀O).

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 325 nm

Column: 4.6-mm × 15-cm; 3-µm packing L8

Flow rate: 1 mL/min

Injection size: 40 µL

System suitability

Sample: *System suitability solution*

Suitability requirements

Resolution: NLT 10 between all-*trans*-retinyl acetate and all-*trans*-retinyl palmitate

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak area for all-*trans*-retinyl acetate from the *Standard solution* and the peak area for all-*trans*-retinyl acetate or all-*trans*-retinyl palmitate from the *Sample solution*. For products containing vitamin A acetate or vitamin A palmitate, calculate the percentage of the labeled amount of vitamin A, as retinol (C₂₀H₃₀O) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times F \times 100$$

r_U = peak area of the all-*trans*-retinyl ester from the *Sample solution*

r_S = peak area of the all-*trans*-retinyl ester from the *Standard solution*

C_S = concentration of retinyl acetate (C₂₂H₃₂O₂) from USP Vitamin A RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of vitamin A as retinol (C₂₀H₃₀O) in the *Sample solution* (µg/mL)

F = factor used to convert retinyl acetate, the ester form present in USP Vitamin A RS, to retinol, 0.872

[NOTE—The molar responses of retinyl acetate and retinyl palmitate are equivalent.]

Acceptance criteria: 90.0%–165.0% of the labeled amount of vitamin A, as retinol (C₂₀H₃₀O)

• VITAMIN A, Method 2

[NOTE—Where a vitamin A ester (retinyl acetate or retinyl palmitate) is indicated in the following procedure, use the chemical form present in the formulation. USP Vitamin A RS is retinyl acetate. It is to be used where USP Vitamin A RS is specified. Use low-actinic glassware throughout this procedure.]

3 N methanolic sulfuric acid solution: Cautiously add 9 mL of sulfuric acid to 80 mL of methanol in a 100-mL volumetric flask. Cool, and dilute with methanol to volume.

Sodium ascorbate–pyrogallol solution: Transfer 10 g of sodium ascorbate and 5 g of pyrogallol to a 100-mL volumetric flask, and add sufficient water to dissolve. Add 1.7 mL of sulfuric acid, and dilute with water to volume.

Lecithin solution: 5 mg/mL of lecithin in 2,2,4-trimethylpentane

Mobile phase: *n*-Hexane and ethyl acetate (99.7:0.3)

Standard solution: 15 µg/mL of retinyl acetate from USP Vitamin A RS in 2,2,4-trimethylpentane

System suitability stock solution: 15 µg/mL of retinyl palmitate in 2,2,4-trimethylpentane

System suitability solution: Mix equal volumes of the *System suitability stock solution* and the *Standard solution* to obtain concentrations of 7.5 µg/mL each of retinyl acetate and retinyl palmitate.

Sample solution: [NOTE—This preparation is suitable for the determination of vitamin A, vitamin D, and vitamin E, when present in the formulation.] Finely powder NLT 20 Tablets. If vitamin D is present in the formulation, transfer a portion of the powder, equivalent to 30 µg of

the labeled amount of cholecalciferol or ergocalciferol, to a container having a polytetrafluoroethylene-lined screw cap. If vitamin D is not present in the formulation, use a portion of the powder, equivalent to 90 mg of the labeled amount of vitamin E (as alpha tocopherol, alpha tocopheryl acetate, or alpha tocopheryl hemisuccinate). If vitamin E is not present in the formulation, use a portion of the powder, equivalent to 2.5 mg of the labeled amount of retinyl acetate or retinyl palmitate. Add 0.5 g of sodium bicarbonate, 1.5 mL of *Lecithin solution*, and 12.5 mL of 2,2,4-trimethylpentane, and disperse on a vortex mixer. Add 6 mL of *Sodium ascorbate–pyrogallol solution*, shake slowly, and allow the solution to degas. Continue shaking until the evolution of gas has ceased, and then shake for an additional 12 min. Add 6 mL of dimethyl sulfoxide, mix on a vortex mixer to form a suspension, and shake for 12 min. Add 6 mL of 3 N methanolic sulfuric acid solution, mix on a vortex mixer to form a suspension, and shake for 12 min. Add 12.5 mL of 2,2,4-trimethylpentane, mix on a vortex mixer to form a suspension, and shake for 10 min. Centrifuge for 10 min to break up the emulsion and to clarify the supernatant. [NOTE—The supernatant is used for the determination of vitamin A, and also vitamin D and vitamin E, if present in the formulation.] If necessary, quantitatively dilute a volume of the supernatant with 2,2,4-trimethylpentane to obtain a concentration close to that of the *Standard solution*.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 325 nm

Column: 4.6-mm × 25-cm; 5-µm packing L24

Flow rate: 1.5 mL/min

Injection size: 40 µL

System suitability

Sample: *System suitability solution*

Suitability requirements

Resolution: NLT 8.0 between all-*trans*-retinyl acetate and all-*trans*-retinyl palmitate

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak area for all-*trans*-retinyl acetate from the *Standard solution* and the peak area of all-*trans*-retinyl acetate or all-*trans*-retinyl palmitate from the *Sample solution*.

Calculate the percentage of the labeled amount of vitamin A, as retinol (C₂₀H₃₀O), in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times F \times 100$$

r_U = peak area of the all-*trans*-retinyl ester from the *Sample solution*

r_S = peak area of the all-*trans*-retinyl ester from the *Standard solution*

C_S = concentration of retinyl acetate (C₂₂H₃₂O₂) from USP Vitamin A RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of vitamin A, as retinol (C₂₀H₃₀O) in the *Sample solution* (µg/mL)

F = factor used to convert retinyl acetate, the ester form present in the USP Vitamin A RS, to retinol, 0.872

[NOTE—Account for the initial extraction volume of 26.5 mL of 2,2,4-trimethylpentane to calculate the nominal concentration. The molar responses of retinyl acetate and retinyl palmitate are equivalent.]

Acceptance criteria: 90.0%–165.0% of the labeled amount of vitamin A, as retinol (C₂₀H₃₀O)

• VITAMIN A, Method 3

[NOTE—Where a vitamin A ester (retinyl acetate or retinyl palmitate) is indicated in the following procedure, use the chemical form present in the formulation. USP

Vitamin A RS is retinyl acetate. It is to be used where USP Vitamin A RS is specified. Use low-actinic glassware throughout this procedure.]

Extraction solvent: *n*-Hexane and methylene chloride (3:1)

Potassium hydroxide solution: 800 mg/mL of potassium hydroxide in water. [NOTE—Cautiously add the potassium hydroxide to the water. Mix, and cool.]

Diluent: 10 mg/mL of pyrogallol in alcohol

Mobile phase: *n*-Hexane and isopropyl alcohol (92:8)

Standard stock solution: 30 µg/mL of retinyl acetate from USP Vitamin A RS in *Diluent*. [NOTE—This solution may be stored in a refrigerator for 1 week.]

Standard solution: Dilute a volume of *Standard stock solution* with *Diluent* to obtain a concentration of 1 µg/mL of USP Vitamin A RS. Transfer 10.0 mL of this solution to a stoppered 125-mL flask, and add 5 mL of water, 5 mL of *Diluent*, and 3 mL of *Potassium hydroxide solution*. Insert the stopper tightly, shake for 15 min over a water bath maintained at $60 \pm 5^\circ$, and cool to room temperature. Add 7 mL of water and 25.0 mL of *Extraction solvent*. Insert the stopper tightly, and shake vigorously for 60 s. Rinse the sides of the flask with 60 mL of water, and allow to stand for 10 min until the layers separate. Withdraw a portion of the organic layer for injection into the chromatograph. This *Standard solution* contains 0.34 µg/mL of retinol.

Sample solution: Finely powder a counted number of Tablets. Transfer a portion of the powder, equivalent to 1.5 mg of retinyl acetate, to a stoppered 125-mL flask. Add 5 mL of water, 15 mL of *Diluent*, and 3 mL of *Potassium hydroxide solution*. Insert the stopper tightly, shake for 15 min over a water bath maintained at $60 \pm 5^\circ$, and cool to room temperature. Add 7 mL of water and 25.0 mL of *Extraction solvent*. Insert the stopper tightly, and shake vigorously for 60 s or longer, if necessary, for complete extraction. Rinse the sides of the flask with 60 mL of water, and allow to stand for 10 min until the layers separate. [NOTE—Do not shake, because an emulsion may form.] Withdraw a portion of the organic layer, and dilute with *Extraction solvent* to obtain a concentration of 0.34 µg/mL of retinol.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*).

Mode: LC

Detector: UV 335 nm

Column: 6.2-mm \times 8-cm; packing L3

Column temperature: 40°

Flow rate: 4 mL/min

Injection size: 50 µL

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for 13-*cis*-retinol and all-*trans*-retinol are 0.92 and 1.0, respectively.]

Suitability requirements

Relative standard deviation: NMT 5.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas for all-*trans*-retinol and 13-*cis*-retinol. Calculate the percentage of the labeled amount of vitamin A, as retinol ($C_{20}H_{30}O$), in the portion of Tablets taken:

$$\text{Result} = (r_{T1}/r_{T2}) \times (C_S/C_U) \times F \times 100$$

r_{T1} = sum of the areas of the all-*trans*-retinol and 13-*cis*-retinol peaks from the *Sample solution*

r_{T2} = sum of the areas of the all-*trans*-retinol and 13-*cis*-retinol peaks from the *Standard solution*

C_S = concentration of retinyl acetate ($C_{23}H_{32}O_2$) from USP Vitamin A RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of vitamin A, as retinol ($C_{20}H_{30}O$) in the *Sample solution* (µg/mL)

F = factor used to convert retinyl acetate, the ester form present in USP Vitamin A RS, to retinol, 0.872

Acceptance criteria: 90.0%–165.0% of the labeled amount of vitamin A, as retinol ($C_{20}H_{30}O$)

• CHOLECALCIFEROL or ERGOCALCIFEROL (VITAMIN D),

Method 1

[NOTE—Where vitamin D (cholecalciferol or ergocalciferol) is specified in the following procedure, use the chemical form present in the formulation and the relevant USP Reference Standard. Use low-actinic glassware throughout this procedure.]

Mobile phase: *n*-Hexane and isopropyl alcohol (99:1)

Standard solution: 2 µg/mL of USP Cholecalciferol RS or USP Ergocalciferol RS in *n*-hexane

System suitability solution: Heat a volume of the *Standard solution* at 60° for 1 h to partially isomerize vitamin D (cholecalciferol or ergocalciferol) to its corresponding precursor.

Sample solution: Proceed as directed for the *Sample solution* in *Vitamin A, Method 1*. Transfer NLT 20 mL of this solution to a suitable container, and evaporate, if necessary, in vacuum at room temperature to obtain a concentration of 2 µg/mL of cholecalciferol or ergocalciferol.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*).

Mode: LC

Detector: UV 265 nm

Column: 4.6-mm \times 15-cm; 3-µm packing L8

Flow rate: 1 mL/min

Injection size: 100 µL

System suitability

Samples: *Standard solution* and *System suitability solution*

Suitability requirements

Resolution: NLT 10 between the vitamin D form present and its corresponding precursor, *System suitability solution*

Relative standard deviation: NMT 3.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas for vitamin D. Calculate the percentage of the labeled amount of cholecalciferol ($C_{27}H_{44}O$) or ergocalciferol ($C_{28}H_{44}O$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times F \times 100$$

r_U = peak area of cholecalciferol or ergocalciferol from the *Sample solution*

r_S = peak area of cholecalciferol or ergocalciferol from the *Standard solution*

C_S = concentration of USP Cholecalciferol RS or USP Ergocalciferol RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of cholecalciferol or ergocalciferol in the *Sample solution* (µg/mL)

F = correction factor to account for the average amount of previtamin D present in the *Sample solution*, 1.09

Acceptance criteria: 90.0%–165.0% of the labeled amount of vitamin D as cholecalciferol ($C_{27}H_{44}O$) or ergocalciferol ($C_{28}H_{44}O$)

• CHOLECALCIFEROL or ERGOCALCIFEROL (VITAMIN D),

Method 2

[NOTE—Where vitamin D (cholecalciferol or ergocalciferol) is specified in the following procedure, use the chemical form present in the formulation and the relevant USP Reference Standard. Use low-actinic glassware throughout this procedure.]

3 N methanolic sulfuric acid solution, Sodium ascorbate-pyrogallol solution, Lecithin solution, and

Sample solution: Proceed as directed in *Vitamin A, Method 2*.

Mobile phase: *n*-Hexane and tertiary butyl alcohol (98.75:1.25)

Standard solution: 1 µg/mL of USP Cholecalciferol RS or USP Ergocalciferol RS in 2,2,4-trimethylpentane

System suitability solution: Heat a volume of the *Standard solution* at 60° for 1 h to partially isomerize vitamin D (cholecalciferol or ergocalciferol) to its corresponding precursor.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 265 nm

Column: 4.6-mm × 25-cm; 5-µm packing L24

Flow rate: 1 mL/min

Injection size: 40 µL

System suitability

Samples: *Standard solution* and *System suitability solution*

Suitability requirements

Resolution: NLT 4.0 between the vitamin D form present and its corresponding precursor, *System suitability solution*

Relative standard deviation: NMT 3.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas for vitamin D. Calculate the percentage of the labeled amount of cholecalciferol (C₂₇H₄₄O) or ergocalciferol (C₂₈H₄₄O) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of cholecalciferol or ergocalciferol from the *Sample solution*

r_S = peak area of cholecalciferol or ergocalciferol from the *Standard solution*

C_S = concentration of USP Cholecalciferol RS or USP Ergocalciferol RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of cholecalciferol or ergocalciferol in the *Sample solution* (µg/mL)

[NOTE—Account for the initial extraction volume of 26.5 mL of 2,2,4-trimethylpentane to calculate the nominal concentration.]

Acceptance criteria: 90.0%–165.0% of the labeled amount of vitamin D as cholecalciferol (C₂₇H₄₄O) or ergocalciferol (C₂₈H₄₄O)

• CHOLECALCIFEROL or ERGOCALCIFEROL (VITAMIN D), Method 3

[NOTE—Where vitamin D (cholecalciferol or ergocalciferol) is specified in the following procedure, use the chemical form present in the formulation and the relevant USP Reference Standard. Use low-actinic glassware throughout this procedure.]

Diluted acetic acid: Glacial acetic acid solution (1 in 10) in water

Phenolphthalein solution: 10 mg/mL of phenolphthalein in alcohol

Potassium hydroxide solution: Slowly dissolve 14 g of potassium hydroxide in a mixture of 31 mL of dehydrated alcohol and 5 mL of water. Prepare fresh daily.

Extraction solvent: Methylene chloride and isopropyl alcohol (99.8:0.2)

Mobile phase: Acetonitrile and methanol (91:9)

Standard stock solution: 0.2 mg/mL of USP Cholecalciferol RS or USP Ergocalciferol RS in dehydrated alcohol. [NOTE—Prepare fresh every 4 weeks. Store in a freezer.]

Standard solution: [NOTE—Condition the solid-phase extraction column specified for use in the *Standard solution* and the *Sample solution* by initially washing the

column with 4.0 mL of a mixture of methylene chloride and isopropyl alcohol (4:1), followed by 5.0 mL of *Extraction solvent*. Do not allow the column to dry.]

Dilute a volume of *Standard stock solution* with dehydrated alcohol to obtain a concentration of 5 µg/mL of USP Cholecalciferol RS or USP Ergocalciferol RS. Prepare this solution fresh daily. Transfer 2.0 mL of this solution to a stoppered 125-mL flask. Add 15.0 mL of water and 15.0 mL of *Potassium hydroxide solution*, insert the stopper, and shake for 30 min in a water bath maintained at 60°. Allow to cool to room temperature, and transfer the contents of the flask to a 250-mL separatory funnel. Add 15.0 mL of water to the flask, insert the stopper, shake vigorously, and transfer this solution to the separatory funnel. Rinse the flask with 60 mL of *n*-hexane, and transfer the rinsing to the separatory funnel. Insert the stopper, shake vigorously for 90 s, and allow to stand for 15 min until the layers separate. Drain and discard the aqueous layer. Add 15.0 mL of water to the hexane layer in the separatory funnel, insert the stopper, and shake vigorously. Allow to stand for 10 min until the layers separate, and discard the aqueous layer. Add 1 drop of *Phenolphthalein solution* and 15.0 mL of water to the separatory funnel. Add *Diluted acetic acid* dropwise, with shaking, until the washing is neutral. Allow to stand for 10 min until the layers separate. Drain and discard the aqueous layer. Filter the hexane layer through anhydrous sodium sulfate supported by a small pledget of cotton into a 100-mL, round-bottom flask. Rinse the funnel and sodium sulfate with a few mL of *n*-hexane, and collect the rinsings in the same flask. Evaporate the hexane in the flask on a rotary evaporator at 50° to dryness. Immediately add 2.0 mL of *Extraction solvent* to dissolve the residue. Transfer this solution to a freshly conditioned solid-phase extraction column containing silica packing with a sorbent mass to column volume ratio of 500 mg to 2.8 mL or equivalent, rinse the round-bottom flask with 1.0 mL of *Extraction solvent*, and transfer to the column. Elute the column with 2.0 mL of *Extraction solvent*, and discard this fraction. Elute the column with 7.0 mL of *Extraction solvent*, and collect the eluate in a suitable flask. Place the flask in a warm water bath maintained at 42°, and evaporate the solvent with the aid of a stream of nitrogen. Immediately add 2.0 mL of acetonitrile to the residue, and use the solution for injection into the chromatograph.

Sample solution: Finely powder NLT 20 Tablets. Transfer a portion of the powder, equivalent to 10 µg of cholecalciferol or ergocalciferol, to the stoppered 125-mL flask, and proceed as directed for the *Standard solution*, beginning with "Add 15.0 mL of water and 15.0 mL of *Potassium hydroxide solution*".

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 265 nm

Column temperature: 27°

Flow rate: 0.7 mL/min

Injection size: 15 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 4.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas for vitamin D. Calculate the percentage of the labeled amount of cholecalciferol (C₂₇H₄₄O) or ergocalciferol (C₂₈H₄₄O) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- r_U = peak area of cholecalciferol or ergocalciferol from the *Sample solution*
 r_S = peak area of cholecalciferol or ergocalciferol from the *Standard solution*
 C_S = concentration of USP Cholecalciferol RS or USP Ergocalciferol RS in the *Standard solution* ($\mu\text{g/mL}$)
 C_U = nominal concentration of cholecalciferol or ergocalciferol in the *Sample solution* ($\mu\text{g/mL}$)

Acceptance criteria: 90.0%–165.0% of the labeled amount of vitamin D as cholecalciferol ($\text{C}_{27}\text{H}_{44}\text{O}$) or ergocalciferol ($\text{C}_{28}\text{H}_{44}\text{O}$)

• VITAMIN E, Method 1

[NOTE—Where vitamin E (alpha tocopherol, alpha tocopheryl acetate, or alpha tocopheryl acid succinate) is specified in the following procedure, use the chemical form present in the formulation and the relevant USP Reference Standard. Use low-actinic glassware throughout this procedure.]

Solution A: Phosphoric acid solution (1 in 100) in water

Mobile phase: Methanol and *Solution A* (19:1)

Standard solution: 2 mg/mL of USP Alpha Tocopherol RS, USP Alpha Tocopheryl Acetate RS, or USP Alpha Tocopheryl Acid Succinate RS in methanol

System suitability solution: Prepare a 0.65-mg/mL solution of USP Ergocalciferol RS in methanol. Transfer 1.0 mL of this solution to a 100-mL volumetric flask containing 100 mg of USP Alpha Tocopheryl Acetate RS. Dissolve in 30 mL of methanol, with the aid of sonication if necessary, and dilute with methanol to volume. Store this solution in a refrigerator.

Sample solution: Proceed as directed for the *Sample solution* in *Vitamin A, Method 1*. Transfer NLT 20 mL of this solution to a suitable container, and evaporate in vacuum at room temperature to dryness. Transfer the residue with the aid of methanol to a suitable volumetric flask, and dilute with methanol to volume to obtain a concentration of 2 mg/mL of alpha tocopherol, alpha tocopheryl acetate, or alpha tocopheryl acid succinate.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 8-mm \times 10-cm; 5- μm packing L1

Flow rate: 2 mL/min

Injection size: 100 μL

System suitability

Samples: *Standard solution* and *System suitability solution*

[NOTE—The relative retention times for ergocalciferol and alpha tocopheryl acetate are about 0.5 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 12 between ergocalciferol and alpha tocopheryl acetate, *System suitability solution*

Tailing factor: Between 0.8 and 1.2, *System suitability solution*

Relative standard deviation: NMT 3.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas. Calculate the percentage of the labeled amount of alpha tocopherol ($\text{C}_{29}\text{H}_{50}\text{O}_2$), alpha tocopheryl acetate ($\text{C}_{31}\text{H}_{52}\text{O}_3$), or alpha tocopheryl acid succinate ($\text{C}_{33}\text{H}_{54}\text{O}_5$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- r_U = peak area of the relevant vitamin E form from the *Sample solution*
 r_S = peak area of the relevant vitamin E form from the *Standard solution*

- C_S = concentration of the corresponding USP Reference Standard in the *Standard solution* (mg/mL)
 C_U = nominal concentration of the corresponding form of vitamin E in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–165.0% of the labeled amount of vitamin E as alpha tocopherol ($\text{C}_{29}\text{H}_{50}\text{O}_2$), alpha tocopheryl acetate ($\text{C}_{31}\text{H}_{52}\text{O}_3$), or alpha tocopheryl acid succinate ($\text{C}_{33}\text{H}_{54}\text{O}_5$)

• VITAMIN E, Method 2

[NOTE—Where vitamin E (alpha tocopherol, alpha tocopheryl acetate, or alpha tocopheryl acid succinate) is specified in the following procedure, use the chemical form present in the formulation and the relevant USP Reference Standard. Use low-actinic glassware throughout this procedure.]

Mobile phase: Mix 240 mL of methanol with 10 mL of water followed by 0.5 mL of 50% phosphoric acid, and dilute with acetonitrile to 1000 mL.

System suitability solution: 2 mg/mL each of USP Alpha Tocopherol RS, USP Alpha Tocopheryl Acetate RS, and USP Alpha Tocopheryl Acid Succinate RS in methanol

Standard solution: 2 mg/mL of USP Alpha Tocopherol RS, USP Alpha Tocopheryl Acetate RS, or USP Alpha Tocopheryl Acid Succinate RS in methanol

Sample solution: Proceed as directed for *Sample solution* in *Vitamin A, Method 2*. Transfer a volume of the supernatant 2,2,4-trimethylpentane to a suitable volumetric flask, the volume of the specimen withdrawn from the 2,2,4-trimethylpentane and the size of the volumetric flask being such that the final concentration of the *Sample solution* is equivalent to that of the *Standard solution*. Evaporate nearly to dryness, add several mL of methanol, and evaporate the remaining 2,2,4-trimethylpentane. Dilute with methanol to volume.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 4.6-mm \times 25-cm; 5- μm packing L1

Flow rate: 1.5 mL/min

Injection size: 25 μL

System suitability

Samples: *Standard solution* and *System suitability solution*

[NOTE—The relative retention times for alpha tocopheryl acid succinate, alpha tocopherol, and alpha tocopheryl acetate are about 0.6, 0.8, and 1.0, respectively.]

Suitability requirements

Resolution: NLT 4.0 between alpha tocopheryl acid succinate and alpha tocopherol; NLT 3.0 between alpha tocopherol and alpha tocopheryl acetate, *System suitability solution*

Relative standard deviation: NMT 3.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas. Calculate the percentage of the labeled amount of alpha tocopherol ($\text{C}_{29}\text{H}_{50}\text{O}_2$), alpha tocopheryl acetate ($\text{C}_{31}\text{H}_{52}\text{O}_3$), or alpha tocopheryl acid succinate ($\text{C}_{33}\text{H}_{54}\text{O}_5$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- r_U = peak area of the relevant vitamin E form from the *Sample solution*
 r_S = peak area of the relevant vitamin E form from the *Standard solution*

C_s = concentration of the corresponding USP Reference Standard in the *Standard solution* (mg/mL)

C_U = nominal concentration of the corresponding form of vitamin E in the *Sample solution* (mg/mL)

[NOTE—Account for the initial extraction volume of 26.5 mL of 2,2,4-trimethylpentane and the dilution factor to exchange the solvent from 2,2,4-trimethylpentane to methanol to calculate the nominal concentration.]

Acceptance criteria: 90.0%–165.0% of the labeled amount of vitamin E as alpha tocopherol ($C_{29}H_{50}O_2$), alpha tocopheryl acetate ($C_{31}H_{52}O_3$), or alpha tocopheryl acid succinate ($C_{33}H_{54}O_5$)

• **VITAMIN E, Method 3**

Diluent: Acetonitrile and ethyl acetate (1:1)

Mobile phase: Methanol, acetonitrile, and *n*-hexane (46.5:46.5:7.0)

Standard solution: 0.3 mg/mL of USP Alpha Tocopherol RS in methanol

Sample solution: Finely powder NLT 20 Tablets.

Transfer a portion of the powder, equivalent to 8 mg of alpha tocopherol, to a 125-mL flask fitted with a ground-glass joint. Add 25.0 mL of water, 25.0 mL of dehydrated alcohol, and 3.5 g of potassium hydroxide pellets. Shake for 1 h in a water bath maintained at 55°. Cool, and transfer with the aid of a minimum volume of water to a 125-mL separatory funnel. Rinse the flask with 50 mL of *n*-hexane, and add the rinsing to the separatory funnel. Insert the stopper, shake vigorously for 60 s, and allow the layers to separate. Drain the aqueous layer into a second 250-mL separatory funnel, and repeat the extraction with 50 mL of *n*-hexane. Discard the aqueous layer, and combine the hexane extracts. Wash the combined extracts with 25 mL of water, allow the layers to separate, and discard the aqueous layer. Add 3 drops of glacial acetic acid, and repeat the washing procedure two more times. Filter the washed hexane layer through anhydrous sodium sulfate into a 250-mL round-bottom flask. Rinse the funnel and sodium sulfate with a few mL of *n*-hexane, and add the rinsing to the hexane solution in the flask. Place the flask in a water bath maintained at 50°, and evaporate the hexane solution with the aid of a rotary evaporator to dryness. Immediately add 25.0 mL of *Diluent*, and swirl to dissolve the residue.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 291 nm

Column: 4.6-mm × 25-cm; packing L1

Column temperature: 40°

Flow rate: 3 mL/min

Injection size: 20 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 5.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas. Calculate the percentage of the labeled amount of vitamin E as alpha tocopherol ($C_{29}H_{50}O_2$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of alpha tocopherol from the *Sample solution*

r_S = peak area of alpha tocopherol from the *Standard solution*

C_S = concentration of alpha tocopherol in the *Standard solution* (mg/mL)

C_U = nominal concentration of vitamin E as alpha tocopherol in the *Sample solution* (mg/mL)

[NOTE—Calculate the content of alpha tocopheryl acetate ($C_{31}H_{52}O_3$) or alpha tocopheryl acid succinate ($C_{33}H_{54}O_5$) by dividing the content, in mg/Tablet of vitamin E as alpha tocopherol ($C_{29}H_{50}O_2$), by the factor 0.91 or 0.81, respectively.]

Acceptance criteria: 90.0%–165.0% of the labeled amount of vitamin E as alpha tocopherol ($C_{29}H_{50}O_2$), alpha tocopheryl acetate ($C_{31}H_{52}O_3$), or alpha tocopheryl acid succinate ($C_{33}H_{54}O_5$)

• **PHYTONADIONE, Method 1**

[NOTE—Use low-actinic glassware throughout this procedure.]

Mobile phase: Methanol and water (19:1)

Standard stock solution: 200 µg/mL of USP

Phytonadione RS in methanol. Dissolve with the aid of sonication if necessary.

Standard solution: 20 µg/mL of USP Phytonadione RS

from the *Standard stock solution* diluted with methanol

System suitability solution: 0.65 mg/mL of USP Alpha

Tocopheryl Acetate RS and 20 µg/mL of USP

Phytonadione RS from the *Standard stock solution*

diluted with methanol. [NOTE—Dissolve USP Alpha

Tocopheryl Acetate RS in a portion of methanol, add

the *Standard stock solution*, and then dilute with

methanol to volume.]

Sample solution: Transfer NLT 20 mL of the solution retained as specified in the directions for *Sample solution* in *Vitamin A, Method 1* to a suitable container, and evaporate in vacuum at room temperature to dryness. Transfer the residue with the aid of methanol to a suitable volumetric flask, and dilute with methanol to volume to obtain a concentration of 20 µg/mL of phytonadione.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 8-mm × 10-cm; 5-µm packing L1

Flow rate: 2 mL/min

Injection size: 100 µL

System suitability

Samples: *Standard solution* and *System suitability solution*

[NOTE—The relative retention times for alpha tocopheryl acetate and phytonadione are 0.68 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 5 between alpha tocopheryl acetate and phytonadione, *System suitability solution*

Relative standard deviation: NMT 3.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas. Calculate the percentage of the labeled amount of phytonadione ($C_{31}H_{46}O_2$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of phytonadione from the *Sample solution*

r_S = peak area of phytonadione from the *Standard solution*

C_S = concentration of USP Phytonadione RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of phytonadione in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–165.0% of the labeled amount of phytonadione ($C_{31}H_{46}O_2$)

• **PHYTONADIONE, Method 2**

[NOTE—Use low-actinic glassware throughout this procedure.]

Solvent: Methanol and isopropyl alcohol (19:1)

Mobile phase: Mix 800 mL of methanol, 200 mL of methylene chloride, 0.1 mL of glacial acetic acid, 1.36 g of zinc chloride, and 0.41 g of sodium acetate.

Internal standard solution: 5 µg/mL of menaquinone 4 (vitamin K₂) in *Solvent*. [NOTE—A concentrated stock solution of menaquinone 4 (100 µg/mL) can be stored for 2 months in a refrigerator.]

Standard stock solution: 5 µg/mL of USP Phytonadione RS, prepared by dissolving in methylene chloride with the aid of sonication, and diluting with *Solvent* to final volume.

Standard solution: Transfer 1.0 mL of the *Standard stock solution* and 1.0 mL of the *Internal standard solution* to a suitable flask, and dilute with *Solvent* to 5 mL. Pass through a membrane filter of 0.45-µm or finer pore size.

Sample solution: Finely powder NLT 20 Tablets. To a centrifuge tube fitted with a cap transfer an amount of powder, not exceeding 800 mg and equivalent to an amount of phytonadione not exceeding 50 µg. Add 4 mL of water. Insert the stopper, and mix using a vortex mixer until the sample is dispersed. Place the tube in a water bath at 60° for 5 min. Remove from the bath, and again shake or mix using a vortex mixer for 1 min while the preparation is still hot. Add 8 mL of alcohol, and swirl the contents to mix. Place the tube in a water bath at 60° for 5 min. Remove from the bath, and again shake or mix using a vortex mixer for 2 min while the preparation is still hot. Cool to room temperature. Add a volume of *Internal standard solution*, equivalent to 1.0 mL for each 5 µg of the expected amount of phytonadione in the aliquot taken. Add 20.0 mL of petroleum ether, and cap the tube tightly. Shake or mix using a vortex mixer for 15 min to thoroughly mix the contents. Centrifuge to separate the two layers. Transfer a volume of the top layer of petroleum ether, equivalent to 5–50 µg of the nominal amount of phytonadione, to an appropriate flask. Place the flask in a water bath at 35°–45°, and evaporate the solvent under a stream of nitrogen until an oily residue is left. Dissolve the residue in a volume of *Solvent* to obtain a concentration of 1 µg/mL of phytonadione.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: Fluorometric detector set at 320 nm for excitation and 420 nm for emission

Column: 4.6-mm × 25-cm; 5-µm, end-capped packing L1, and a postcolumn reactor constituted with a 4.6-mm × 3-cm PEEK column tightly packed with zinc powder. [NOTE—Prepare the postcolumn reactor daily, or as necessary, to meet the system suitability requirements.]

Flow rate: 1 mL/min

Injection size: 25 µL

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for the internal standard and phytonadione are 1.0 and 1.4, respectively.]

Suitability requirements

Column efficiency: NLT 2500 theoretical plates for the phytonadione peak

Tailing factor: NMT 1.5 for the phytonadione peak

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of phytonadione (C₃₁H₄₆O₂) in the portion of Tablets taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = peak response ratio of phytonadione to that of the internal standard from the *Sample solution*

R_S = peak response ratio of phytonadione to that of the internal standard from the *Standard solution*

C_S = concentration of USP Phytonadione RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of phytonadione in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–165.0% of labeled amount of phytonadione (C₃₁H₄₆O₂)

• BETA CAROTENE

[NOTE—Use low-actinic glassware throughout this procedure.]

Potassium hydroxide solution: Dissolve 58.8 g of potassium hydroxide in 50 mL of water.

Iodine solution: 0.01 mg/mL of iodine in cyclohexane. [NOTE—Prepare this solution fresh daily.]

Sample solution: Weigh NLT 20 Tablets. Grind the Tablets to a fine powder, and transfer a quantity of the powder, equivalent to 2 mg of beta carotene, to a 500-mL saponification flask. Add 100 mL of alcohol, 6 mL of *Potassium hydroxide solution*, and a magnetic stirring bar. Attach an air condenser to the flask, and heat under reflux for 45 min with constant stirring. Cool to room temperature, add 170 mL of solvent hexane, and stir for 30 min. Quantitatively transfer the contents of the flask to a 500-mL separatory funnel with portions of solvent hexane. Allow the layers to separate for 5–10 min, and transfer the upper organic layer to a 500-mL volumetric flask. Transfer the lower aqueous layer into the saponification flask, add 170 mL of solvent hexane, and stir for an additional 20 min. Quantitatively transfer the contents of the saponification flask to the separatory funnel with the aid of portions of solvent hexane. Allow the layers to separate for 10 min. Drain the lower aqueous layer, and discard. Transfer the organic layer to the volumetric flask containing the previously collected organic layer. Rinse the separatory funnel with small portions of solvent hexane, and transfer the washings to the volumetric flask. Dilute the hexane extracts with solvent hexane to volume, add 3 g of anhydrous sodium sulfate, shake, and allow to settle. Quantitatively transfer a volume of this solution, equivalent to 100 µg of beta carotene, to a 50-mL volumetric flask. Evaporate under a stream of nitrogen to dryness, and immediately add cyclohexane. Add 2 mL of *Iodine solution*, and heat for 15 min in a water bath maintained at 65°. Cool rapidly, and dilute with cyclohexane to volume.

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* <851>.)

Mode: Vis

Analytical wavelength: 452 nm

Blank: Cyclohexane

Analysis

Sample: *Sample solution*

Determine the absorbance against the *Blank*. Calculate the percentage of the labeled amount of beta carotene (C₄₀H₅₆) in the portion of Tablets taken:

$$\text{Result} = (A_U/F) \times (100/C_U)$$

A_U = absorbance of the *Sample solution*

F = absorptivity of beta carotene at 452 nm, 223

C_U = nominal concentration of beta carotene in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–165.0% of the labeled amount of beta carotene (C₄₀H₅₆)

• ASCORBIC ACID, Method 1

Sample solution: Finely powder NLT 20 Tablets. Transfer a portion of the powder, equivalent of 100 mg of ascorbic acid, to a 200-mL volumetric flask, and add 75 mL of metaphosphoric-acetic acids TS. Insert a

stopper into the flask, and shake by mechanical means for 30 min. Dilute with water to volume. Transfer a portion of the solution to a centrifuge tube, and centrifuge until a clear supernatant is obtained. Pipet 4.0 mL of this solution into a 50-mL conical flask, and add 5 mL of metaphosphoric-acetic acids TS.

Analysis: Titrate with standard dichlorophenol-indophenol solution VS to a rose-pink color that persists for at least 5 s. Correct for the volume of dichlorophenol-indophenol solution consumed by a mixture of 5.5 mL of metaphosphoric-acetic acids TS and 15 mL of water. From the ascorbic acid equivalent of the standard dichlorophenol-indophenol solution, calculate the content of ascorbic acid in each Tablet.

Acceptance criteria: 90.0%–150.0% of the labeled amount of ascorbic acid ($C_6H_8O_6$)

- **ASCORBIC ACID, Method 2:** Proceed as directed in *Automated Methods of Analysis* (16), Assay for Ascorbic Acid.

Acceptance criteria: 90.0%–150.0% of the labeled amount of ascorbic acid ($C_6H_8O_6$)

- **CALCIUM ASCORBATE, Method 1:** Proceed as directed in *Ascorbic Acid, Method 1*.

Acceptance criteria: 90.0%–150.0% of the labeled amount of calcium ascorbate ($C_{12}H_{14}CaO_{12} \cdot 2H_2O$)

- **CALCIUM ASCORBATE, Method 2:** Proceed as directed in *Automated Methods of Analysis* (16), Assay for Ascorbic Acid.

Acceptance criteria: 90.0%–150.0% of the labeled amount of calcium ascorbate ($C_{12}H_{14}CaO_{12} \cdot 2H_2O$)

- **SODIUM ASCORBATE, Method 1:** Proceed as directed in *Ascorbic Acid, Method 1*.

Acceptance criteria: 90.0%–150.0% of the labeled amount of sodium ascorbate ($C_6H_7NaO_6$)

- **SODIUM ASCORBATE, Method 2:** Proceed as directed in *Automated Methods of Analysis* (16), Assay for Ascorbic Acid.

Acceptance criteria: 90.0%–150.0% of the labeled amount of sodium ascorbate ($C_6H_7NaO_6$)

- **BIOTIN, Method 1**

[NOTE—Use low-actinic glassware throughout this procedure.]

Mobile phase: Mix 85 mL of acetonitrile, 1 g of sodium perchlorate, 1 mL of phosphoric acid, and dilute with water to 1000 mL.

Standard stock solution: 0.333 mg/mL of USP Biotin RS in dimethyl sulfoxide

Standard solution: 5 µg/mL of USP Biotin RS prepared by diluting the *Standard stock solution* in water

Sample solution: Finely powder NLT 20 Tablets.

Transfer a portion of the powder, equivalent to 1 mg of biotin, to a 200-mL volumetric flask, add 3 mL of dimethyl sulfoxide, and swirl to wet. Place the flask in a water bath at 60°–70° for 5 min. Sonicate for 5 min, dilute with water to volume, and filter.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 200 nm

Column: 4.6-mm × 15-cm; 3-µm packing L7

Flow rate: 1.2 mL/min

Injection size: 100 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas of biotin. Calculate the percentage of the labeled amount of biotin ($C_{10}H_{16}N_2O_3S$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of biotin from the *Sample solution*

r_S = peak area of biotin from the *Standard solution*

C_S = concentration of USP Biotin RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of biotin in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–150.0% of the labeled amount of biotin ($C_{10}H_{16}N_2O_3S$)

• Biotin, Method 2

[NOTE—Use low-actinic glassware throughout this procedure.]

Dehydrated mixtures yielding formulations similar to the media described herein may be used provided that, when constituted as directed, they have growth-promoting properties equal to or superior to those obtained with the media prepared as described herein.

Standard stock solution: 50 µg/mL of USP Biotin RS in 50% alcohol. Store this solution in a refrigerator.

Standard solution: 0.1 ng/mL of USP Biotin RS in water, prepared by dilution of the *Standard stock solution* with water on the day of the assay

Sample solution: Finely powder NLT 30 Tablets.

Transfer a portion of the powder, equivalent to 100 µg of biotin, to a 200-mL volumetric flask. Add 3 mL of 50% alcohol, and swirl to wet the contents. Heat the flask in a water bath at 60°–70° for 5 min. Sonicate for 5 min, dilute with 50% alcohol to volume, and filter. Dilute a volume of the filtrate, quantitatively and stepwise if necessary, with water to obtain a solution with a concentration of 0.1 ng/mL.

Acid-hydrolyzed casein solution: Mix 100 g of vitamin-free casein with 500 mL of 6 N hydrochloric acid, and reflux the mixture for 8–12 h. Remove the hydrochloric acid from the mixture by distillation under reduced pressure until a thick paste remains. Redissolve the resulting paste in water, adjust the solution with 1 N sodium hydroxide to a pH of 3.5 ± 0.1 , and add water to make 1000 mL. Add 20 g of activated charcoal, stir for 1 h, and filter. Repeat the treatment with activated charcoal. Store under toluene in a cool place at a temperature not below 10°. Filter the solution if a precipitate forms during storage.

Cystine-tryptophan solution: Suspend 4.0 g of L-cystine in a solution of 1.0 g of L-tryptophan (or 2.0 g of D,L-tryptophan) in 700–800 mL of water, heat to 70°–80°, and add dilute hydrochloric acid (1 in 2) dropwise, with stirring, until the solids are dissolved. Cool, and add water to make 1000 mL. Store under toluene in a cool place at a temperature not below 10°.

Adenine-guanine-uracil solution: Dissolve 200 mg each of adenine sulfate, guanine hydrochloride, and uracil, with the aid of heat, in 10 mL of 4 N hydrochloric acid. Cool, and add water to make 200 mL. Store under toluene in a refrigerator.

Polysorbate 80 solution: 100 mg/mL of polysorbate 80 in alcohol

Calcium pantothenate solution: 10 µg/mL of calcium pantothenate in 50% alcohol. Store in a refrigerator.

Riboflavin-thiamine hydrochloride solution:

20 µg/mL of riboflavin and 10 µg/mL of thiamine hydrochloride in 0.02 N acetic acid. Store under toluene, protected from light, in a refrigerator.

p-Aminobenzoic acid-niacin-pyridoxine hydrochloride solution: 10 µg/mL of p-aminobenzoic acid, 50 µg/mL of niacin, and 40 µg/mL of pyridoxine hydrochloride in a mixture of neutralized alcohol and water (1:3). Store in a refrigerator.

Salt solution A: 25 g of monobasic potassium phosphate and 25 g of dibasic potassium phosphate in water to make 500 mL. Add 5 drops of hydrochloric acid. Store under toluene.

Salt solution B: 10 g of magnesium sulfate, 0.5 g of sodium chloride, 0.5 g of ferrous sulfate, and 0.5 g of manganese sulfate in water to make 500 mL. Add

5 drops of hydrochloric acid, and mix. Store under toluene.

Basal medium stock solution: Dissolve the anhydrous dextrose and anhydrous sodium acetate in the solutions previously mixed according to Table 1, and adjust with 1 N sodium hydroxide to a pH of 6.8. Dilute with water to 250 mL.

Table 1

Acid-hydrolyzed casein solution	25 mL
Cystine-tryptophan solution	25 mL
Polysorbate 80 solution	0.25 mL
Dextrose, anhydrous	10 g
Sodium acetate, anhydrous	5 g
Adenine-guanine-uracil solution	5 mL
Calcium pantothenate solution	5 mL
Riboflavin-thiamine hydrochloride solution	5 mL
p-Aminobenzoic acid-niacin-pyridoxine hydrochloride solution	5 mL
Salt solution A	5 mL
Salt solution B	5 mL

Stock culture of *Lactobacillus plantarum*: Dissolve 2.0 g of yeast extract in 100 mL of water. Add 500 mg of anhydrous dextrose, 500 mg of anhydrous sodium acetate, and 1.5 g of agar, and heat the mixture on a steam bath, with stirring, until the agar dissolves. Add 10-mL portions of the hot solution to test tubes, close or cover the tubes, sterilize in an autoclave at 121° for 15 min, and allow the tubes to cool in an upright position. Prepare stab cultures in three or more of the tubes, using a pure culture of *Lactobacillus plantarum*,¹ incubating for 16–24 h at a temperature between 30° and 37° held constant to within ±0.5°. Store in a refrigerator. Prepare a fresh stab of the stock culture every week, and do not use for *Inoculum* if the culture is more than 1 week old.

Culture medium: To each of a series of test tubes containing 5.0 mL of *Basal medium stock solution* add 5.0 mL of water containing 0.5 ng of biotin. Plug the tubes with cotton, sterilize in an autoclave at 121° for 15 min, and cool.

Inoculum: [NOTE—A frozen suspension of *Lactobacillus plantarum* may be used as the stock culture, provided it yields an inoculum comparable to a fresh culture.]

Transfer cells from the *Stock culture of Lactobacillus plantarum* to a sterile tube containing 10 mL of culture medium. Incubate this culture for 16–24 h at a temperature between 30° and 37° held constant to within ±0.5°. The cell suspension so obtained is the *Inoculum*.

Analysis

Samples: *Standard solution* and *Sample solution*
To similar separate test tubes add, in duplicate, 1.0 and/or 1.5, 2.0, 3.0, 4.0, and 5.0 mL of the *Standard solution*. To each tube and to four similar empty tubes add 5.0 mL of *Basal medium stock solution* and sufficient water to make 10 mL.

To similar test tubes add, in duplicate, volumes of the *Sample solution* corresponding to three or more of the levels specified for the *Standard solution*, including the levels of 2.0, 3.0, and 4.0 mL. To each tube add 5.0 mL of the *Basal medium stock solution* and sufficient water to make 10 mL. Place one complete set of Standard and sample tubes together in one tube rack and the duplicate set in a second rack or section of a rack, preferably in random order.

Cover the tubes of both series to prevent contamination, and sterilize in an autoclave at 121° for 5 min. Cool,

and add 1 drop of *Inoculum* to each tube, except two of the four tubes containing no *Standard solution* (the uninoculated blanks). Incubate the tubes at a temperature between 30° and 37° held constant to within ±0.5° until, following 16–24 h of incubation, there has been no substantial increase in turbidity in the tubes containing the highest level of Standard during a 2-h period.

Determine the transmittance of the tubes in the following manner. Mix the contents of each tube, and transfer to a spectrophotometer cell. Place the cell in a spectrophotometer that has been set at a specific wavelength from 540 to 660 nm, and read the transmittance when a steady state is reached. This steady state is observed a few seconds after agitation when the galvanometer reading remains constant for 30 s or more. Allow approximately the same time interval for the reading on each tube.

With the transmittance set at 1.00 for the uninoculated blank, read the transmittance of the inoculated blank. With the transmittance set at 1.00 for the inoculated blank, read the transmittance for each of the remaining tubes. If there is evidence of contamination with a foreign microorganism, disregard the result of the assay.

Calculation: Prepare a standard concentration-response curve as follows. For each level of the Standard, calculate the response from the sum of the duplicate values of the transmittance (Σ_s) as the difference, $y = 2.00 - \Sigma_s$. Plot this response on the ordinate of cross-section paper against the logarithm of the mL of *Standard solution* per tube on the abscissa, using for the ordinate either an arithmetic or a logarithmic scale, whichever gives the better approximation to a straight line. Draw the straight line or smooth curve that best fits the plotted points.

Calculate the response, $y = 2.00 - \Sigma_u$, adding together the two transmittances for each level of the *Sample solution* (Σ_u). Read from the standard curve the logarithm of the volume of the *Standard solution* corresponding to each of those values of y that fall within the range of lowest and highest points plotted for the Standard. Subtract from each logarithm so obtained the logarithm of the volume, in mL, of the *Sample solution* to obtain the difference, X , for each dosage level. Average the values of X for each of three or more dosage levels to obtain \bar{X} , which equals the log-relative potency, M' , of the *Sample solution*. Determine the quantity, in μg , of biotin in the portion of Tablets taken:

$$\text{antilog } M = \text{antilog } (M' + \log R)$$

R = number of μg of biotin that was assumed to be present in the portion of Tablets taken
Calculate the percentage of the labeled amount of biotin ($\text{C}_{10}\text{H}_{16}\text{N}_2\text{O}_3\text{S}$) in the portion of the Tablets taken:

$$\text{Result} = [(\text{antilog } M)/N] \times 100$$

N = nominal amount of biotin in the portion of the Tablets taken (μg)

Replication: Repeat the entire determination at least once, using separately prepared *Sample solutions*. If the difference between the two log-potencies M is NMT 0.08, their mean, \bar{M} , is the assayed log-potency of the test material (see *Design and Analysis of Biological Assays* (11), *The Confidence Interval and Limits of Potency*). If the two determinations differ by more than 0.08, conduct one or more additional determinations. From the mean of two or more values of M that do not differ by more than 0.15, compute the mean potency of the preparation under assay.

Acceptance criteria: 90.0%–150.0% of the labeled amount of biotin ($\text{C}_{10}\text{H}_{16}\text{N}_2\text{O}_3\text{S}$)

¹ ATCC No. 8014 is suitable. This strain was formerly known as *Lactobacillus arabinosus* 17-5.

• **BIOTIN, Method 3**

[NOTE—Use low-actinic glassware throughout this procedure.]

Solution A: Transfer 800 mL of water and 100 mL of triethylamine to a 1000-mL volumetric flask. Add 80 mL of 85% phosphoric acid, and dilute with water to volume.

Mobile phase: Transfer 80 mL of acetonitrile and 10 mL of *Solution A* to a 1000-mL volumetric flask. Dilute with water to volume.

Standard solution: 0.6 µg/mL of USP Biotin RS in water. [NOTE—A portion of the *Standard solution* will be used to determine the percent recovery of biotin from the *Solid-phase extraction* procedure.]

Sample solution: Finely powder NLT 20 Tablets. Transfer an amount of powdered Tablets to a volumetric flask to obtain a concentration of 0.6 µg/mL of biotin. Add water up to 80% of the flask capacity, sonicate for 30–40 min, with occasional mixing, to dissolve. Dilute with water to volume, and filter. Adjust the pH of the solution with either dilute acetic acid or 0.1 N sodium hydroxide to 6.0–7.0.

Solid-phase extraction: [NOTE—Condition the extraction column specified in this procedure in the following manner. Wash the column with a 2-mL portion of methanol. Equilibrate with a 2-mL portion of water.] Separately pipet 5.0 mL of the *Sample solution* and *Standard solution* into freshly conditioned solid-phase extraction columns consisting of a mixed-mode packing with a sorbent-mass of 60 mg. [NOTE—The mixed-mode packing consists of anion-exchange and reversed-phase sorbents. The reverse-phase component is a copolymer of *N*-vinylpyrrolidone and divinylbenzene. The anion exchange moiety is a trialkylamino group.²] Wash the column with 10 mL of 30% (v/v) methanol in water. Apply an appropriate volume (4.9 mL) of 30% (v/v) methanol in 0.1 N hydrochloric acid to the column. Collect the eluate in a 5-mL volumetric flask containing 100 µL of 40% (w/v) sodium acetate in water, and dilute with 30% (v/v) methanol in 0.1 N hydrochloric acid to volume.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 200 nm

Column: 4.6-mm × 25-cm; packing L1

Flow rate: 2 mL/min

Injection size: 100 µL

System suitability

Samples: *Standard solution* and a portion of the *Standard solution* that has undergone *Solid-phase extraction*

Suitability requirements

Tailing factor: NMT 1.5, *Standard solution*

Relative standard deviation: NMT 2.0%, *Standard solution* and the *Standard solution* that has undergone *Solid-phase extraction*

Recovery: 95%–100%, *Standard solution* that has undergone *Solid-phase extraction*

Analysis

Samples: *Standard solution* and *Sample solution* that have both undergone *Solid-phase extraction*. Measure the peak area of biotin. Calculate the percentage of the labeled amount of biotin ($C_{10}H_{16}N_2O_3S$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of biotin from the *Sample solution*

r_S = peak area of biotin from the *Standard solution*

C_S = concentration of USP Biotin RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of biotin in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–150.0% of the labeled amount of biotin ($C_{10}H_{16}N_2O_3S$)

• **CYANOCOBALAMIN, Method 1**

[NOTE—Use low-actinic glassware throughout this procedure.]

Mobile phase: Methanol and water (7:13)

Standard stock solution: 10 µg/mL of USP

Cyanocobalamin RS in water. [NOTE—Store this stock solution in a dark place, and discard after 1 week.]

Standard solution: 1 µg/mL of USP Cyanocobalamin RS from the *Standard stock solution* diluted with water

Sample solution: Finely powder NLT 30 Tablets.

Transfer a portion of the powder, equivalent to 100 µg of cyanocobalamin, to a 250-mL flask. Quantitatively add 100.0 mL of water, and carefully extract for 2 min. Filter 10 mL of the extract, and use the filtrate.

Chromatographic system

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak area of cyanocobalamin. Calculate the percentage of the labeled amount of cyanocobalamin ($C_{63}H_{88}CoN_{14}O_{14}P$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of cyanocobalamin from the *Sample solution*

r_S = peak area of cyanocobalamin from the *Standard solution*

C_S = concentration of USP Cyanocobalamin RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of cyanocobalamin in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–150.0% of the labeled amount of cyanocobalamin ($C_{63}H_{88}CoN_{14}O_{14}P$)

• **CYANOCOBALAMIN, Method 2**

[NOTE—Use low-actinic glassware throughout this procedure.]

Standard stock solution: 1.0 µg/mL of USP

Cyanocobalamin RS in 25% alcohol. Store in a refrigerator.

Standard solution: Dilute a suitable volume of *Standard stock solution* with water to a measured volume such that after the incubation period as described in the *Analysis*, the difference in transmittance between the inoculated blank and the 5.0-mL level of the *Standard solution* is NLT that which corresponds to a difference of 1.25 mg in dried cell weight. This concentration usually falls between 0.01 and 0.04 ng/mL of *Standard solution*. Prepare this solution fresh for each assay.

Sample solution: Finely powder NLT 20 Tablets.

Transfer a portion of the powdered Tablets, equivalent to 1.0 µg of cyanocobalamin, to an appropriate vessel containing, for each g of powdered Tablets taken, 25 mL of an aqueous extracting solution prepared just before use to contain, in each 100 mL, 1.29 g of dibasic sodium phosphate, 1.1 g of anhydrous citric acid, and 1.0 g of sodium metabisulfite. Autoclave the mixture at 121° for 10 min. Allow any undissolved particles of the extract to settle, and filter or centrifuge if necessary. Dilute an aliquot of the clear solution with water to obtain a final solution containing vitamin B₁₂ activity

² A suitable cartridge is the Waters, Oasis MAX Vac RC cartridge, particle size 30 µm, part 186000371.

equivalent to the nominal activity of the *Standard solution*.

Acid-hydrolyzed casein solution: Prepare as directed in *Biotin, Method 2*.

Asparagine solution: Dissolve 2.0 g of L-asparagine in water to make 200 mL. Store under toluene in a refrigerator.

Adenine–guanine–uracil solution: Prepare as directed in *Biotin, Method 2*.

Xanthine solution: Suspend 0.20 g of xanthine in 30–40 mL of water, heat to 70°, add 6.0 mL of 6 N ammonium hydroxide, and stir until the solid is dissolved. Cool, and add water to make 200 mL. Store under toluene in a refrigerator.

Salt solution A: Dissolve 10 g of monobasic potassium phosphate and 10 g of dibasic potassium phosphate in water to make 200 mL, and add 2 drops of hydrochloric acid. Store this solution under toluene.

Salt solution B: Dissolve 4.0 g of magnesium sulfate, 0.20 g of sodium chloride, 0.20 g of ferrous sulfate, and 0.20 g of manganese sulfate in water to make 200 mL, and add 2 drops of hydrochloric acid. Store this solution under toluene.

Polysorbate 80 solution: 20 g of polysorbate 80 in alcohol to make 200 mL. Store in a refrigerator.

Vitamin solution A: 10 mg of riboflavin, 10 mg of thiamine hydrochloride, 100 µg of biotin, and 20 mg of niacin in 0.02 N acetic acid to make 400 mL. Store under toluene, protected from light, in a refrigerator.

Vitamin solution B: 20 mg of *p*-aminobenzoic acid, 10 mg of calcium pantothenate, 40 mg of pyridoxine hydrochloride, 40 mg of pyridoxal hydrochloride, 8 mg of pyridoxamine dihydrochloride, and 2 mg of folic acid in a mixture of water and neutralized alcohol (3:1) to make 400 mL. Store, protected from light, in a refrigerator.

Basal medium stock solution: Prepare the medium according to the following formula and directions. A dehydrated mixture containing the same ingredients may be used provided that, when constituted as directed in the labeling, it yields a medium comparable to that obtained from the formula given herein.

Add the ingredients in the order listed in *Table 2*, carefully dissolving cystine and tryptophan in the hydrochloric acid before adding the next eight solutions to the resulting solution. Add 100 mL of water, and dissolve the dextrose, sodium acetate, and ascorbic acid. Filter, if necessary. Add the *Polysorbate 80 solution*, adjust with 1 N sodium hydroxide to a pH between 5.5 and 6.0, and add *Purified Water* to make 250 mL.

Table 2

L-Cystine	0.1 g
L-Tryptophan	0.05 g
1 N hydrochloric acid	10 mL
Adenine–guanine–uracil solution	5 mL
Xanthine solution	5 mL
Vitamin solution A	10 mL
Vitamin solution B	10 mL
Salt solution A	5 mL
Salt solution B	5 mL
Asparagine solution	5 mL
Acid-hydrolyzed casein solution	25 mL
Dextrose, anhydrous	10 g
Sodium acetate, anhydrous	5 g
Ascorbic acid	1 g
Polysorbate 80 solution	5 mL

Tomato juice preparation: Centrifuge commercially canned tomato juice so that most of the pulp is removed. Suspend 5 g/L of analytical filter-aid in the

supernatant, and pass, with the aid of reduced pressure, through a layer of the filter-aid. Repeat, if necessary, until a clear, straw-colored filtrate is obtained. Store under toluene in a refrigerator.

Culture medium: [NOTE—A dehydrated mixture containing the same ingredients may be used provided that, when constituted as directed in the labeling, it yields a medium equivalent to that obtained from the formula given herein.] Dissolve 0.75 g of yeast extract, 0.75 g of dried peptone, 1.0 g of anhydrous dextrose, and 0.20 g of monobasic potassium phosphate in 60–70 mL of water. Add 10 mL of *Tomato juice preparation* and 1 mL of *Polysorbate 80 solution*. Adjust with 1 N sodium hydroxide to a pH of 6.8, and add water to make 100 mL. Place 10-mL portions of the solution in test tubes, and plug with cotton. Sterilize the tubes and contents in an autoclave at 121° for 15 min. Cool as rapidly as possible to avoid color formation resulting from overheating the medium.

Suspension medium: Dilute a measured volume of *Basal medium stock solution* with an equal volume of water. Place 10-mL portions of the diluted medium in test tubes. Sterilize, and cool as directed for *Culture medium*.

Stock culture of *Lactobacillus leichmannii*: To 100 mL of *Culture medium* add 1.0–1.5 g of agar, and heat the mixture on a steam bath, with stirring, until the agar dissolves. Place 10-mL portions of the hot solution in test tubes, cover the tubes, sterilize at 121° for 15 min in an autoclave, and allow the tubes to cool in an upright position. Inoculate three or more of the tubes by stab transfer of a pure culture of *Lactobacillus leichmannii*.³ [NOTE—Before first using a fresh culture in this assay, make NLT 10 successive transfers of the culture in a 2-week period.]

Incubate for 16–24 h at a temperature between 30° and 40° held constant to within ±0.5°. Store in a refrigerator.

Prepare fresh stab cultures at least three times each week, and do not use them for preparing the *Inoculum* if more than 4 days old. The activity of the micro-organism can be increased by daily or twice-daily transfer of the stab culture, to the point where definite turbidity in the liquid *Inoculum* can be observed 2–4 h after inoculation. A slow-growing culture seldom gives a suitable response curve and may lead to erratic results.

Inoculum: [NOTE—A frozen suspension of *Lactobacillus leichmannii* may be used as the stock culture, provided it yields an *Inoculum* comparable to a fresh culture.]

Transfer cells from the *Stock culture of Lactobacillus leichmannii* to two sterile tubes containing 10 mL of the *Culture medium* each. Incubate these cultures for 16–24 h at a temperature between 30° and 40° held constant to within ±0.5°. Under aseptic conditions centrifuge the cultures, and decant the supernatant. Suspend the cells from the culture in 5 mL of sterile *Suspension medium*, and combine. Using sterile *Suspension medium*, adjust the volume so that a 1-in-20 dilution in saline TS produces 70% transmittance when read on a suitable spectrophotometer that has been set at a wavelength of 530 nm, equipped with a 10-mm cell, and read against saline TS set at 100% transmittance. Prepare a 1-in-400 dilution of the adjusted suspension using sterile *Basal medium stock solution*. The cell suspension so obtained is the *Inoculum*. [NOTE—This dilution may be altered, when necessary, to obtain the desired test response.]

Calibration of spectrophotometer: Check the wavelength of the spectrophotometer periodically, using a standard wavelength cell or other suitable device. Before reading any tests, calibrate the

³ Pure cultures of *Lactobacillus leichmannii* may be obtained as No. 7830 from ATCC, 10801 University Blvd., Manassas, VA 20110-2209.

spectrophotometer for 0% and 100% transmittance, using water and with the wavelength set at 530 nm.

Analysis

Samples: *Standard solution* and *Sample solution*

Because of the high sensitivity of the test organism to minute amounts of vitamin B₁₂ activity and to traces of many cleansing agents, cleanse meticulously by suitable means, followed preferably by heating at 250° for 2 h, using hard-glass 20-mm × 150-mm test tubes, and other necessary glassware.

To separate test tubes add, in duplicate, 1.0, 1.5, 2.0, 3.0, 4.0, and 5.0 mL of the *Standard solution*. To each of these tubes and to four similar empty tubes add 5.0 mL of *Basal medium stock solution* and sufficient water to make 10 mL.

To similar separate test tubes add, in duplicate, 1.0, 1.5, 2.0, 3.0, and 4.0 mL of the *Sample solution*. To each tube add 5.0 mL of *Basal medium stock solution* and sufficient water to make 10 mL. Place one complete set of Standard and sample tubes together in one tube rack and the duplicate set in a second rack or section of a rack, preferably in random order.

Cover the tubes to prevent bacterial contamination, and sterilize in an autoclave at 121° for 5 min, arranging to reach this temperature in NMT 10 min by preheating the autoclave if necessary. Cool as rapidly as possible to avoid color formation resulting from overheating the medium. Take precautions to maintain uniformity of sterilizing and cooling conditions throughout the assay, because packing the tubes too closely in the autoclave or overloading it may cause variation in the heating rate.

Aseptically add 0.5 mL of *Inoculum* to each tube so prepared, except two of the four containing no *Standard solution* (the uninoculated blanks). Incubate the tubes at a temperature between 30° and 40°, held constant to within ±0.5° for 16–24 h.

Terminate growth by heating to a temperature NLT 80° for 5 min. Cool to room temperature. After agitating its contents, read the transmittance at 530 nm when a steady state is reached. This steady state is observed a few seconds after agitation when the reading remains constant for 30 s or more. Allow approximately the same time interval for the reading on each tube.

With the transmittance set at 100% for the uninoculated blank, read the transmittance of the inoculated blank. If the difference is greater than 5% or if there is evidence of contamination with a foreign microorganism, disregard the results of the assay.

With the transmittance set at 100% for the uninoculated blank, read the transmittance of each of the remaining tubes. Disregard the results of the assay if the slope of the standard curve indicates a problem with sensitivity.

Calculation: Prepare a standard concentration-response curve by the following procedure. Test for and replace any aberrant individual transmittances. For each level of the Standard, calculate the response from the sum of the duplicate values of the transmittances (Σ_s) as the difference, $y = 2.00 - \Sigma_s$. Plot this response on the ordinate of cross-section paper against the logarithm of the mL of *Standard solution* per tube on the abscissa, using for the ordinate either an arithmetic or a logarithmic scale, whichever gives the better approximation to a straight line. Draw the straight line or smooth curve that best fits the plotted points.

Calculate the response, $y = 2.00 - \Sigma_u$, adding together the two transmittances for each level of the *Sample solution* (Σ_u). Read from the standard curve the logarithm of the volume of the *Standard solution* corresponding to each of those values of y that falls within the range of the lowest and highest points plotted for the Standard. Subtract from each logarithm so obtained the logarithm of the volume, in mL, of the

Sample solution to obtain the difference, X , for each dosage level. Average the values of X for each of three or more dosage levels to obtain \bar{X} , which equals the log-relative potency, M' , of the *Sample solution*. Determine the quantity, in μg , of cyanocobalamin in the portion of Tablets taken:

$$\text{antilog } M = \text{antilog } (M' + \log R)$$

R = number of μg of cyanocobalamin that was assumed to be present in the portion of Tablets taken

Calculate the percentage of the labeled amount of cyanocobalamin in the portion of Tablets taken:

$$\text{Result} = [(\text{antilog } M)/N] \times 100$$

N = nominal amount of cyanocobalamin in the portion of the Tablets taken (μg)

Replication: Repeat the entire determination at least once, using separately prepared *Sample solutions*. If the difference between the two log-potencies M is NMT 0.08, their mean, \bar{M} , is the assayed log-potency of the test material (see *Vitamin B₁₂ Activity in Design and Analysis of Biological Assays* (111), *The Confidence Interval and Limits of Potency*). If the two determinations differ by more than 0.08, conduct one or more additional determinations. From the mean of two or more values of M that do not differ by more than 0.15, compute the mean potency of the preparation under assay.

Acceptance criteria: 90.0%–150.0% of the labeled amount of cyanocobalamin ($\text{C}_{63}\text{H}_{88}\text{CoN}_{14}\text{O}_{14}\text{P}$)

• Folic Acid, Method 1

[NOTE—Use low-actinic glassware throughout this procedure.]

Reagent A: 25% solution of tetrabutylammonium hydroxide in methanol

Reagent B: Transfer 5.0 g of pentetic acid to a 50-mL volumetric flask. Using sonication if necessary, dissolve in and dilute with 1 N sodium hydroxide to volume.

Mobile phase: 2 g of monobasic potassium phosphate in 650 mL of water. Add 12.0 mL of *Reagent A*, 7.0 mL of 3 N phosphoric acid, and 240 mL of methanol. Cool to room temperature, adjust with phosphoric acid or ammonia TS to a pH of 7.0, dilute with water to 1000 mL, and filter. Recheck the pH before use.

[NOTE—The methanol and water content may be varied (between 1% and 3%) by adding water or methanol to the prepared *Mobile phase* to obtain baseline separation of folic acid and the internal standard. The pH may be increased up to 7.15 to obtain better separation.]

Internal standard solution: Transfer 40 mg of methylparaben to a 1000-mL volumetric flask, and add 220 mL of methanol to dissolve. Dissolve 2.0 g of monobasic potassium phosphate in 300 mL of water in a separate beaker, quantitatively transfer this solution to the flask containing the methylparaben solution, and add an additional 300 mL of water. Add 19 mL of *Reagent A*, 7 mL of 3 N phosphoric acid, and 30 mL of *Reagent B*. Adjust with ammonia TS to a pH of 9.8, bubble nitrogen through the solution for 30 min, dilute with water to volume, and mix.

Standard solution: 0.016 mg/mL of USP Folic Acid RS in *Internal standard solution*

Sample solution: Finely powder NLT 30 Tablets. Transfer a portion of powder, equivalent to 0.4 mg of folic acid, to a 50-mL amber-colored centrifuge tube. Add 25.0 mL of *Internal standard solution*, shake by mechanical means for 10 min, and centrifuge. Filter a portion of the clear supernatant, and use the filtrate.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 3.9-mm × 30-cm; packing L1

Flow rate: 1 mL/min

Injection size: 15 µL

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for folic acid and methylparaben are about 0.8 and 1.0, respectively.]

Suitability requirements

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas for folic acid and methylparaben. Calculate the percentage of the labeled amount of folic acid ($C_{19}H_{19}N_7O_6$) in the portion of Tablets taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = peak area ratio of folic acid to methylparaben from the *Sample solution*

R_S = peak area ratio of folic acid to methylparaben from the *Standard solution*

C_S = concentration of USP Folic Acid RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of folic acid in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–150.0% of the labeled amount of folic acid ($C_{19}H_{19}N_7O_6$)

• **FOLIC ACID, Method 2**

[NOTE—Use low-actinic glassware throughout this procedure.]

Reagent: Dissolve 7.5 g of edetate disodium, with stirring, in 500 mL of water containing 10 mL of ammonium hydroxide.

Diluent: 60 µg/mL of ammonium hydroxide

Mobile phase: Transfer 0.4 mL of triethylamine, 15 mL of glacial acetic acid, and 350 mL of methanol to a 2000-mL volumetric flask, and dilute with 0.008 M sodium 1-hexanesulfonate to volume.

Standard stock solution: 60 µg/mL of USP Folic Acid RS in *Diluent*. Prepare this solution fresh daily.

Standard solution: Mix 5.0 mL of *Standard stock solution* with 10.0 mL of methanol and 35.0 mL of *Reagent*, shake for 15 min in a water bath maintained at 60°, and cool. Filter, discarding the first few mL of the filtrate.

Sample solution: Transfer a portion of finely powdered Tablets, equivalent to 0.3 mg of folic acid, to a 125-mL stoppered flask. Add 10.0 mL of methanol and 35.0 mL of *Reagent*. Shake for 15 min in a water bath maintained at 60°, and cool. Filter, discarding the first few mL of the filtrate.

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas of calcium pantothenate and the internal standard. Calculate the percentage of the labeled amount of calcium pantothenate ($C_{18}H_{32}CaN_2O_{10}$) in the portion of Tablets taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = peak area ratio of calcium pantothenate to *p*-hydroxybenzoic acid from the *Sample solution*

R_S = peak area ratio of calcium pantothenate to *p*-hydroxybenzoic acid from the *Standard solution*

C_S = concentration of USP Calcium Pantothenate RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of calcium pantothenate in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–150.0% of the labeled amount of calcium pantothenate ($C_{18}H_{32}CaN_2O_{10}$)

• **CALCIUM PANTOTHENATE, Method 2**

Standard stock solution: Dissolve 50 mg of USP Calcium Pantothenate RS, previously dried and stored in the dark over phosphorus pentoxide and protected from absorption of moisture while weighing, in 500 mL of water in a 1000-mL volumetric flask. Add 10 mL of 0.2 N acetic acid and 100 mL of sodium acetate solution (1 in 60), and dilute with water to volume, to obtain a concentration of 50 µg/mL of USP Calcium Pantothenate RS. Store under toluene in a refrigerator.

Standard solution: On the day of the assay, dilute a volume of *Standard stock solution* with water to obtain a concentration of 0.01–0.04 µg/mL of calcium pantothenate, the exact concentration being such that the responses obtained as directed in the *Analysis*, 2.0 and 4.0 mL of the *Standard solution* being used, are within

the linear portion of the log-concentration response curve.

Sample solution: Finely powder NLT 30 Tablets.

Transfer a portion of the powder, equivalent to 50 mg of calcium pantothenate, to a 1000-mL volumetric flask containing 500 mL of water. Add 10 mL of 0.2 N acetic acid and 100 mL of sodium acetate solution (1 in 60), dilute with water to volume, and filter. Dilute a volume of this solution to obtain a solution having approximately the same concentration as that of the *Standard solution*.

Acid-hydrolyzed casein solution: Mix 100 g of vitamin-free casein with 500 mL of 6 N hydrochloric acid, and reflux the mixture for 8–12 h. Remove the hydrochloric acid from the mixture by distillation under reduced pressure until a thick paste remains. Redissolve the resulting paste in water, adjust the solution with 1 N sodium hydroxide to a pH of 3.5 ± 0.1 , and add water to make 1000 mL. Add 20 g of activated charcoal, stir for 1 h, and filter. Repeat the treatment with activated charcoal. Store under toluene in a cool place at a temperature not below 10°. Filter the solution if a precipitate forms during storage.

Cystine-tryptophan solution: Suspend 4.0 g of L-cystine in a solution of 1.0 g of L-tryptophan (or 2.0 g of D,L-tryptophan) in 700–800 mL of water, heat to 70°–80°, and add dilute hydrochloric acid (1 in 2) dropwise, with stirring, until the solids are dissolved. Cool, and add water to make 1000 mL. Store under toluene in a cool place at a temperature not below 10°.

Adenine-guanine-uracil solution: Dissolve 200 mg each of adenine sulfate, guanine hydrochloride, and uracil, with the aid of heat, in 10 mL of 4 N hydrochloric acid. Cool, and add water to make 200 mL. Store under toluene in a refrigerator.

Polysorbate 80 solution: 100 mg/mL of polysorbate 80 in alcohol

Riboflavin-thiamine hydrochloride-biotin solution: 20 µg/mL of riboflavin, 10 µg/mL of thiamine hydrochloride, and 0.04 µg/mL of biotin in 0.02 N acetic acid. Store under toluene, protected from light, in a refrigerator.

p-Aminobenzoic acid-niacin-pyridoxine hydrochloride solution: 10 µg/mL of p-aminobenzoic acid, 50 µg/mL of niacin, and 40 µg/mL of pyridoxine hydrochloride in a mixture of neutralized alcohol and water (1:3). Store in a refrigerator.

Salt solution A: Dissolve 25 g of monobasic potassium phosphate and 25 g of dibasic potassium phosphate in water to make 500 mL. Add 5 drops of hydrochloric acid. Store under toluene.

Salt solution B: Dissolve 10 g of magnesium sulfate, 0.5 g of sodium chloride, 0.5 g of ferrous sulfate, and 0.5 g of manganese sulfate in water to make 500 mL. Add 5 drops of hydrochloric acid. Store under toluene.

Basal medium stock solution: Dissolve the anhydrous dextrose and anhydrous sodium acetate in the solutions previously mixed according to *Table 3*, and adjust with 1 N sodium hydroxide to a pH of 6.8. Dilute with water to 250 mL.

Table 3

Acid-hydrolyzed casein solution	25 mL
Cystine-tryptophan solution	25 mL
Polysorbate 80 solution	0.25 mL
Dextrose, anhydrous	10 g
Sodium acetate, anhydrous	5 g
Adenine-guanine-uracil solution	5 mL
Riboflavin-thiamine hydrochloride-biotin solution	5 mL
p-Aminobenzoic acid-niacin-pyridoxine hydrochloride solution	5 mL

Table 3 (Continued)

Salt solution A	5 mL
Salt solution B	5 mL

Stock culture of *Lactobacillus plantarum*: Dissolve 2.0 g of yeast extract in 100 mL of water; add 500 mg of anhydrous dextrose, 500 mg of anhydrous sodium acetate, and 1.5 g of agar; and heat the mixture on a steam bath, with stirring, until the agar dissolves. Add 10-mL portions of the hot solution to the test tubes, close or cover the tubes, sterilize in an autoclave at 121° for 15 min, and allow the tubes to cool in an upright position. Prepare stab cultures in three or more of the tubes, using a pure culture of *Lactobacillus plantarum*⁴, incubating for 16–24 h at a temperature between 30° and 37° held constant to within $\pm 0.5^\circ$. Store in a refrigerator. Prepare a fresh stab of the stock culture every week, and do not use for *Inoculum* if the culture is more than 1 week old.

Culture medium: To each of a series of test tubes containing 5.0 mL of *Basal medium stock solution* add 5.0 mL of water containing 0.2 µg of calcium pantothenate. Plug the tubes with cotton, sterilize in an autoclave at 121° for 15 min, and cool.

Inoculum: [NOTE—A frozen suspension of *Lactobacillus plantarum* may be used as the stock culture, provided it yields an *Inoculum* comparable to a fresh culture.] Transfer cells from the *Stock culture of Lactobacillus plantarum* to a sterile tube containing 10 mL of *Culture medium*. Incubate this culture for 16–24 h at a temperature between 30° and 37° held constant to within $\pm 0.5^\circ$. The cell suspension so obtained is the *Inoculum*.

Analysis

Samples: *Standard solution* and *Sample solution*
To similar separate test tubes add, in duplicate, 1.0 and/or 1.5, 2.0, 3.0, 4.0, and 5.0 mL of the *Standard solution*. To each tube and to four similar empty tubes add 5.0 mL of *Basal medium stock solution* and sufficient water to make 10 mL.

To similar separate test tubes add, in duplicate, volumes of the *Sample solution* corresponding to three or more of the levels specified for the *Standard solution*, including the levels of 2.0, 3.0, and 4.0 mL. To each tube add 5.0 mL of the *Basal medium stock solution* and sufficient water to make 10 mL. Place one complete set of Standard and sample tubes together in one tube rack and the duplicate set in a second rack or section of a rack, preferably in random order.

Cover the tubes of both series to prevent contamination, and sterilize in an autoclave at 121° for 5 min. Cool, and add 1 drop of *Inoculum* to each tube, except two of the four tubes containing no *Standard solution* (the uninoculated blanks). Incubate the tubes at a temperature between 30° and 37°, held constant to within $\pm 0.5^\circ$ until, following 16–24 h of incubation, there has been no substantial increase in turbidity in the tubes containing the highest level of Standard during a 2-h period.

Determine the transmittance of the tubes in the following manner. Mix the contents of each tube, and transfer to an optical container if necessary. Read the transmittance between 540 and 660 nm when a steady state is reached. This steady state is observed a few seconds after agitation when the galvanometer reading remains constant for 30 s or more. Allow approximately the same time interval for the reading on each tube. With the transmittance set at 1.00 for the uninoculated blank, read the transmittance of the inoculated blank. With the transmittance set at 1.00 for the inoculated blank, read the transmittance for each of the remaining

⁴ ATCC No. 8014 is suitable. This strain was formerly known as *Lactobacillus arabinosus* 17-5.

tubes. If there is evidence of contamination with a foreign microorganism, disregard the result of the assay.

Calculation: Prepare a standard concentration-response curve as follows. For each level of the Standard, calculate the response from the sum of the duplicate values of the transmittance (Σ_s) as the difference, $y = 2.00 - \Sigma_s$. Plot this response on the ordinate of cross-section paper against the logarithm of the mL of *Standard solution* per tube on the abscissa, using for the ordinate either an arithmetic or a logarithmic scale, whichever gives the better approximation to a straight line. Draw the straight line or smooth curve that best fits the plotted points. Calculate the response, $y = 2.00 - \Sigma_u$, adding together the two transmittances for each level of the *Sample solution* (Σ_u). Read from the standard curve the logarithm of the volume of the *Standard solution* corresponding to each of those values of y that fall within the range of the lowest and highest points plotted for the Standard. Subtract from each logarithm so obtained the logarithm of the volume, in mL, of the *Sample solution* to obtain the difference, X , for each dosage level. Average the values of X for each of three or more dosage levels to obtain \bar{X} , which equals the log-relative potency, M' , of the *Sample solution*. Determine the quantity, in mg, of calcium pantothenate ($C_{18}H_{32}CaN_2O_{10}$) in the portion of Tablets taken:

$$\text{antilog } M = \text{antilog } (M' + \log R)$$

R = number of mg of calcium pantothenate that was assumed to be present in the portion of the Tablets taken

Calculate the percentage of the labeled amount of calcium pantothenate in the portion of Tablets taken:

$$\text{Result} = [(\text{antilog } M)/N] \times 100$$

N = nominal amount of calcium pantothenate in the portion of Tablets taken (mg)

Replication: Repeat the entire determination at least once, using separately prepared *Sample solutions*. If the difference between the two log-potencies M is NMT 0.08, their mean, \bar{M} , is the assayed log-potency of the test material (see *Design and Analysis of Biological Assays* (111), *The Confidence Interval and Limits of Potency*). If the two determinations differ by more than 0.08, conduct one or more additional determinations. From the mean of two or more values of M that do not differ by more than 0.15, compute the mean potency of the preparation under assay.

Acceptance criteria: 90.0%–150.0% of the labeled amount of calcium pantothenate ($C_{18}H_{32}CaN_2O_{10}$)

• **CALCIUM PANTOTHENATE, Method 3**

Buffer solution: Dissolve 10.0 g of monobasic potassium phosphate in 2000 mL of water, and adjust with phosphoric acid to a pH of 3.5.

Mobile phase: Methanol and *Buffer solution* (1:9)

Standard stock solution: 0.25 mg/mL of USP Calcium Pantothenate RS in water. Prepare fresh every 4 weeks. Store in a refrigerator.

Standard solution: 40 μ g/mL of USP Calcium Pantothenate RS from the *Standard stock solution* diluted with water

Sample solution: Finely powder NLT 20 Tablets. Transfer a portion of the powder, equivalent to 10 mg of calcium pantothenate, to a 250-mL volumetric flask. Add 10 mL of methanol, and swirl the flask to disperse. Dilute with water to volume, mix, and filter.

Suitability requirements

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas of calcium pantothenate.

Calculate the percentage of the labeled amount of calcium pantothenate ($C_{18}H_{32}CaN_2O_{10}$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of calcium pantothenate from the *Sample solution*

r_S = peak area of calcium pantothenate from the *Standard solution*

C_S = concentration of USP Calcium Pantothenate RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of calcium pantothenate in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–150.0% of the labeled amount of calcium pantothenate ($C_{18}H_{32}CaN_2O_{10}$)

• **NIACIN or NIACINAMIDE, PYRIDOXINE HYDROCHLORIDE, RIBOFLAVIN, and THIAMINE, Method 1**

[NOTE—Use low-actinic glassware throughout this procedure.]

Diluent: Acetonitrile, glacial acetic acid, and water (5:1:94)

Mobile phase: A mixture of methanol, glacial acetic acid, and water (27:1:73) containing 140 mg of sodium 1-hexanesulfonate per 100 mL

Standard solution: [NOTE—Use USP Niacin RS in place of USP Niacinamide RS for formulations containing niacin.] Transfer 80 mg of USP Niacinamide RS, 20 mg of USP Pyridoxine Hydrochloride RS, 20 mg of USP Riboflavin RS, and 20 mg of USP Thiamine Hydrochloride RS, to a 200-mL volumetric flask, and add 180 mL of *Diluent*. Immerse the flask in a hot water bath maintained at 65°–70° for 10 min with regular shaking or using a vortex mixer, until all the solid materials are dissolved. Chill rapidly in a cold water bath for 10 min to room temperature, and dilute with *Diluent* to volume.

Sample solution: Finely powder NLT 30 Tablets.

Transfer a portion of the powder, equivalent to 10 mg of niacinamide and 2.5 mg each of pyridoxine hydrochloride, riboflavin, and thiamine hydrochloride, to a 50-mL centrifuge tube. Add 25.0 mL of *Diluent*, and mix using a vortex mixer for 30 s to completely suspend the powder. Immerse the centrifuge tube in a hot water bath maintained at 65°–70°, heat for 5 min, and mix on a vortex mixer for 30 s. Return the tube to the hot water bath, heat for another 5 min, and mix on a vortex mixer for 30 s. Filter a portion of the solution, cool to room temperature, and use the clear filtrate.

[NOTE—Use the filtrate within 3 h of filtration.]

Analysis

Samples: *Standard solution* and *Sample solution*
Measure the areas for the major peaks. For products containing thiamine hydrochloride, calculate the percentage of the labeled amount of thiamine hydrochloride ($C_{12}H_{17}ClN_4OS \cdot HCl$) in the portion of Tablets taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

r_u = peak area of thiamine from the *Sample solution*

r_s = peak area of thiamine from the *Standard solution*

C_s = concentration of USP Thiamine Hydrochloride RS in the *Standard solution* (mg/mL)

C_u = nominal concentration of thiamine hydrochloride in the *Sample solution* (mg/mL)

For products containing thiamine mononitrate, calculate the percentage of the labeled amount of thiamine mononitrate ($C_{12}H_{17}N_5O_4S$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

- r_U = peak area of thiamine from the *Sample solution*
 r_S = peak area of thiamine from the *Standard solution*
 C_S = concentration of USP Thiamine Hydrochloride RS in the *Standard solution* (mg/mL)
 C_U = nominal concentration of thiamine mononitrate in the *Sample solution* (mg/mL)
 M_{r1} = molecular weight of thiamine mononitrate, 327.36
 M_{r2} = molecular weight of thiamine hydrochloride, 337.27

Acceptance criteria: 90.0%–150.0% of the labeled amount of thiamine as thiamine hydrochloride ($C_{12}H_{17}ClN_4OS \cdot HCl$) or thiamine mononitrate ($C_{12}H_{17}N_5O_4S$)

• **NIACIN or NIACINAMIDE, PYRIDOXINE HYDROCHLORIDE, RIBOFLAVIN, and THIAMINE, Method 3**

[NOTE—Use low-actinic glassware throughout this procedure.]

Reagent: 25 mg/mL of edetate disodium in water

Mobile phase: Transfer 0.4 mL of triethylamine, 15.0 mL of glacial acetic acid, and 350 mL of methanol to a 2000-mL volumetric flask. Dilute with 0.008 M sodium 1-hexanesulfonate to volume.

Standard stock solution: 1.5 mg/mL of USP Niacin RS or USP Niacinamide RS, 0.24 mg/mL of USP Pyridoxine Hydrochloride RS, 0.08 mg/mL of USP Riboflavin RS, and 0.24

mg/mL of USP Thiamine Hydrochloride RS in the *Reagent*, with heating if necessary

Standard solution: Transfer 5.0 mL of *Standard stock solution* to a stoppered 125-mL flask. Add 10.0 mL of a mixture of methanol and glacial acetic acid (9:1) and 30.0 mL of a mixture of methanol and ethylene glycol (1:1). Insert the stopper, shake for 15 min in a water bath maintained at 60°, and cool. Filter, discarding the first few mL of the filtrate.

Sample solution: Weigh and finely powder NLT 20 Tablets. Transfer a portion of the powder, equivalent to 7.5 mg of niacin or niacinamide, 1.2 mg of pyridoxine hydrochloride, 0.4 mg of riboflavin, and 1.2 mg of thiamine hydrochloride to a stoppered 125-mL flask. Add 10.0 mL of a mixture of methanol and glacial acetic acid (9:1) and 30.0 mL of a mixture of methanol and ethylene glycol (1:1). Insert the stopper, shake for 15 min in a water bath maintained at 60°, and cool. Filter, discarding the first few mL of the filtrate.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 270 nm

Column: 4.6-mm × 25-cm; packing L7

Column temperature: 50°

Flow rate: 2.0 mL/min

Injection size: 5 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas for niacin or niacinamide.

Calculate the percentage of the labeled amount of niacin ($C_6H_5NO_2$) or niacinamide ($C_6H_6N_2O$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of niacin or niacinamide from the *Sample solution*

r_S = peak area of niacin or niacinamide from the *Standard solution*

C_S = concentration of USP Niacin RS or USP Niacinamide RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of niacin or niacinamide in the *Sample solution* (mg/mL)

Separately calculate the percentage of the labeled amount of pyridoxine hydrochloride ($C_8H_{11}NO_3 \cdot HCl$), riboflavin ($C_{17}H_{20}N_4O_6$), and thiamine hydrochloride ($C_{12}H_{17}ClN_4OS \cdot HCl$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of the corresponding vitamin from the *Sample solution*

r_S = peak area of the corresponding vitamin from the *Standard solution*

C_S = concentration of the relevant USP Reference Standard in the *Standard solution* (mg/mL)

C_U = nominal concentration of the corresponding vitamin in the *Sample solution* (mg/mL)

For products containing thiamine mononitrate, calculate the percentage of the labeled amount of thiamine mononitrate ($C_{12}H_{17}N_5O_4S$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak area of thiamine from the *Sample solution*

r_S = peak area of thiamine from the *Standard solution*

C_S = concentration of USP Thiamine Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of thiamine mononitrate in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of thiamine mononitrate, 327.36

M_{r2} = molecular weight of thiamine hydrochloride, 337.27

Acceptance criteria: 90.0%–150.0% of the labeled amount of niacinamide ($C_6H_6N_2O$) or niacin ($C_6H_5NO_2$), pyridoxine hydrochloride ($C_8H_{11}NO_3 \cdot HCl$), riboflavin ($C_{17}H_{20}N_4O_6$), and thiamine as thiamine hydrochloride ($C_{12}H_{17}ClN_4OS \cdot HCl$) or thiamine mononitrate ($C_{12}H_{17}N_5O_4S$)

PERFORMANCE TESTS

• **DISINTEGRATION AND DISSOLUTION OF DIETARY SUPPLEMENTS**

<2040>: Meet the requirements for *Dissolution*.

• **WEIGHT VARIATION OF DIETARY SUPPLEMENTS** <2091>: Meet the requirements.

CONTAMINANTS

• **MICROBIAL ENUMERATION TESTS** <2021>: The total aerobic microbial count does not exceed 3000 cfu/g, and the combined molds and yeasts count does not exceed 300 cfu/g.

• **MICROBIOLOGICAL PROCEDURES FOR ABSENCE OF SPECIFIED MICROORGANISMS** <2022>: Meet the requirements of the tests for absence of *Salmonella* species, *Escherichia coli*, and *Staphylococcus aureus*

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.

- **LABELING:**⁵ The label states that the product is Oil- and Water-Soluble Vitamins Tablets. The label also states the quantity of each vitamin per dosage unit and, where necessary, the chemical form in which it is present. Where the product contains vitamin E, the label indicates whether it is the *d*- or *dl*- form. Where more than one assay method is given for a particular vitamin, the labeling states with which assay method the product complies only if *Method 1* is not used.

⁵ USP Units of activity for vitamins, where such exist or formerly existed, are equivalent to the corresponding international units, where such formerly existed. The USP Unit for Vitamin E has been discontinued. International units (IU) for vitamins also have been discontinued; however, the use of IU on the labels of vitamin products continues. Where articles are labeled in terms of Units in addition to the required labeling, the relationship of the USP Units or IU to mass is as follows. One USP Vitamin A Unit = 0.3 μg of all-*trans*-retinol (vitamin A alcohol) or 0.344 μg of all-*trans*-retinyl acetate (vitamin A acetate) or 0.55 μg of all-*trans*-retinyl palmitate (vitamin A palmitate), and 1 μg of retinol (3.3 USP Vitamin A Units) = 1 retinol equivalent (RE); 1 IU of beta carotene = 0.6 μg of all-*trans*-beta carotene; 1 USP Vitamin D Unit = 0.025 μg of ergocalciferol or cholecalciferol; and 1 mg of *d*-alpha tocopherol = 1.1 former USP Vitamin E Units, 1 mg of *d*-alpha tocopheryl acetate = 1 former USP Vitamin E Unit, 1 mg of *d*-alpha tocopheryl acid succinate = 0.89 former USP Vitamin E Unit, 1 mg of *d*-alpha tocopherol = 1.49 former USP Vitamin E Units, and 1 mg of *d*-alpha tocopheryl acetate = 1.36 former USP Vitamin E Units, 1 mg of *d*-alpha tocopheryl acid succinate = 1.21 former USP Vitamin E Units. In terms of *d*-alpha tocopherol equivalents, 1 mg of *d*-alpha tocopheryl acetate = 0.91, 1 mg of *d*-alpha tocopheryl acid succinate = 0.81, 1 mg of *d*-alpha tocopherol = 0.74, 1 mg of *d*-alpha tocopheryl acetate = 0.67, and 1 mg of *d*-alpha tocopheryl acid succinate = 0.60.

Oil- and Water-Soluble Vitamins with Minerals Capsules

DEFINITION

Oil- and Water-Soluble Vitamins with Minerals Capsules contain one or more of the following oil-soluble vitamins: Vitamin A, Vitamin D as Ergocalciferol (Vitamin D₂) or Cholecalciferol (Vitamin D₃), Vitamin E, Phytonadione (Vitamin K₁), and Beta Carotene; one or more of the following water-soluble vitamins: Ascorbic Acid or its equivalent as Calcium Ascorbate or Sodium Ascorbate, Biotin, Cyanocobalamin, Folic Acid, Niacin or Niacinamide, Dexpantenol or Panthenol, Pantothenic Acid (as Calcium Pantothenate or Racemic Calcium Pantothenate), Pyridoxine Hydrochloride, Riboflavin, and Thiamine Hydrochloride or Thiamine Mononitrate; and one mineral or more, furnishing one or more of the following elements in ionizable form: boron, calcium, chromium, copper, fluorine, iodine, iron, magnesium, manganese, molybdenum, nickel, phosphorus, potassium, selenium, tin, vanadium, and zinc, derived from substances generally recognized as safe. Capsules contain NLT 90.0% and NMT 165.0% of the labeled amounts of vitamin A (C₂₀H₃₀O) as retinol or esters of retinol in the form of retinyl acetate (C₂₂H₃₂O₂) or retinyl palmitate (C₃₆H₆₀O₂), vitamin D as cholecalciferol (C₂₇H₄₄O) or ergocalciferol (C₂₈H₄₄O), vitamin E as alpha tocopherol (C₂₉H₅₀O₂) or alpha tocopheryl acetate (C₃₁H₅₂O₃) or alpha tocopheryl acid succinate (C₃₃H₅₄O₅), phytonadione (C₃₁H₄₆O₂), and beta carotene (C₄₀H₅₆); NLT 90.0% and NMT 150.0% of the labeled amounts of ascorbic acid (C₆H₈O₆) or its salts as calcium ascorbate (C₁₂H₁₄CaO₁₂ · 2H₂O) or sodium ascorbate (C₆H₇NaO₆), biotin (C₁₀H₁₆N₂O₃S), cyanocobalamin (C₆₃H₈₈CoN₁₄O₁₄P), folic acid (C₁₉H₁₉N₇O₆), niacin (C₆H₅NO₂) or niacinamide (C₆H₆N₂O), dexpantenol (C₉H₁₉NO₄) or panthenol (C₉H₁₉NO₄), calcium pantothenate (C₁₈H₃₂CaN₂O₁₀), pyridoxine hydrochloride (C₈H₁₁NO₃ · HCl), riboflavin (C₁₇H₂₀N₄O₆), and thiamine (C₁₂H₁₇ClN₄OS) as thiamine hydrochloride or thiamine mononitrate; and NLT 90.0% and NMT 125.0% of the labeled amount of calcium (Ca), copper (Cu), iron (Fe), magnesium (Mg), manganese (Mn), phosphorus (P), potassium (K), and zinc (Zn); and NLT 90.0% and NMT 160.0% of the labeled amounts of boron (B), chromium (Cr), fluorine (F), iodine (I), molybdenum (Mo), nickel (Ni), selenium (Se), tin (Sn), and vanadium (V).

They may contain other labeled added substances that are generally recognized as safe, in amounts that are unobjectionable.

STRENGTH

[NOTE—In the following assays, where more than one assay method is given for an individual ingredient, compliance may be determined by following any one of the specified

methods, the method used being stated in the labeling only if *Method 1* is not used.]

• **VITAMIN A, Method 1**

[NOTE—Where the use of a vitamin A ester (retinyl acetate or retinyl palmitate) is specified in the following procedure, use the chemical form present in the formulation. USP Vitamin A RS is retinyl acetate. It is to be used where USP Vitamin A RS is specified. Use low-actinic glassware throughout this procedure.]

Mobile phase: *n*-Hexane

Standard solution: 15 µg/mL of retinyl acetate from USP Vitamin A RS in *n*-hexane

System suitability stock solution: 15 µg/mL of retinyl palmitate in *n*-hexane

System suitability solution: Mix equal volumes of *System suitability stock solution* and the *Standard solution* to obtain concentrations of 7.5 µg/mL each of retinyl acetate and retinyl palmitate.

Sample solution: Transfer the contents of NLT 20 Capsules to a suitable container, mix, and weigh. Transfer a portion of the mixture, equivalent to 5 Capsules, to a container having a polytetrafluoroethylene-lined screw cap. [NOTE—For hard gelatin Capsules, remove, as completely as possible, the contents of NLT 20 Capsules by cutting open the Capsule shells, transferring the shells and their contents to a suitable container, and triturating to a homogeneous mass. Transfer a portion of the mass, equivalent to 5 Capsules, to a container having a polytetrafluoroethylene-lined screw cap.] Add 10 mL of dimethyl sulfoxide and 15 mL of *n*-hexane, and shake for 45 min on a wrist-action shaker in a water bath maintained at 60°. [NOTE—Set up the wrist-action shaker to ensure that the contents of the container are mixed vigorously and thoroughly.] Centrifuge at 3000 rpm for 10 min, and transfer the hexane layer by means of a pipet to a 100-mL volumetric flask. Add 15 mL of *n*-hexane to the dimethyl sulfoxide layer, shake thoroughly for 5 min, and transfer the hexane layer by means of a pipet to the 100-mL volumetric flask. Repeat this extraction with three additional 15-mL portions of *n*-hexane. Dilute the extracts in the volumetric flask with *n*-hexane to volume. Dilute a volume of this solution with *n*-hexane to obtain a solution with a concentration of 15 µg/mL of vitamin A as retinol (C₂₀H₃₀O).

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 325 nm

Column: 4.6-mm × 15-cm; 3-µm packing L8

Flow rate: 1 mL/min

Injection size: 40 µL

System suitability

Sample: *System suitability solution*

Suitability requirements

Resolution: NLT 10 between all-*trans*-retinyl acetate and all-*trans*-retinyl palmitate

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak area for all-*trans*-retinyl acetate obtained from the *Standard solution* and the peak area for all-*trans*-retinyl acetate or all-*trans*-retinyl palmitate in the chromatogram of the *Sample solution*. For products containing vitamin A acetate or vitamin A palmitate, calculate the percentage of the labeled amount of vitamin A, as retinol (C₂₀H₃₀O), in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times F \times 100$$

r_U = peak area of the all-*trans*-retinyl ester from the *Sample solution*

r_S = peak area of the all-*trans*-retinyl ester from the *Standard solution*

C_S = concentration of retinyl acetate (C₂₂H₃₂O₂) from USP Vitamin A RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of vitamin A, as retinol (C₂₀H₃₀O) in the *Sample solution* (µg/mL)

F = factor used to convert retinyl acetate, the ester form present in USP Vitamin A RS, to retinol, 0.872

[NOTE—The molar responses of retinyl acetate and retinyl palmitate are equivalent.]

Acceptance criteria: 90.0%–165.0% of the labeled amount of vitamin A, as retinol (C₂₀H₃₀O)

• **VITAMIN A, Method 2**

[NOTE—Where a vitamin A ester (retinyl acetate or retinyl palmitate) is indicated in the following procedure, use the chemical form present in the formulation. USP Vitamin A RS is retinyl acetate. It is to be used where USP Vitamin A RS is specified. Use low-actinic glassware throughout this procedure.]

3 N methanolic sulfuric acid solution: Cautiously add 9 mL of sulfuric acid to 80 mL of methanol in a 100-mL volumetric flask. Cool, and dilute with methanol to volume.

Sodium ascorbate–pyrogallol solution: Transfer 10 g of sodium ascorbate and 5 g of pyrogallol to a 100-mL volumetric flask, and add sufficient water to dissolve. Add 1.7 mL of sulfuric acid, and dilute with water to volume.

Lecithin solution: 5 mg/mL of lecithin in 2,2,4-trimethylpentane

Mobile phase: *n*-Hexane and ethyl acetate (99.7:0.3)

Standard solution: 15 µg/mL of retinyl acetate from USP Vitamin A RS in 2,2,4-trimethylpentane

System suitability stock solution: 15 µg/mL of retinyl palmitate in 2,2,4-trimethylpentane

System suitability solution: Mix equal volumes of the *System suitability stock solution* and the *Standard solution* to obtain concentrations of 7.5 µg/mL each of retinyl acetate and retinyl palmitate.

Sample solution: [NOTE—This preparation is suitable for the determination of vitamin A, vitamin D, and vitamin E, when present in the formulation.] Weigh NLT 20 Capsules in a tared weighing bottle. Using a sharp blade if necessary, carefully open the Capsules, without loss of shell material, and transfer the contents to a 100-mL beaker. Remove any contents adhering to the empty shells by washing with several portions of ether. Discard the washings, and dry the Capsule shells with the aid of a current of dry air. Weigh the empty Capsule shells in the tared weighing bottle, and calculate the net weight of the Capsule contents. Transfer a portion of the Capsule contents, equivalent to 30 µg of the labeled amount of cholecalciferol or ergocalciferol (vitamin D), to a container with a polytetrafluoroethylene-lined screw cap. If vitamin D is not present in the formulation, use a portion, equivalent to 90 mg of the labeled amount of vitamin E. If vitamin E is not present in the formulation, use a portion, equivalent to 2.5 mg of the labeled amount of vitamin A, as retinol. Add 0.5 g of sodium bicarbonate, 1.5 mL of *Lecithin solution*, and 12.5 mL of 2,2,4-trimethylpentane, and disperse on a vortex mixer. Add 6 mL of *Sodium ascorbate–pyrogallol solution*, shake slowly, and allow the solution to degas. Continue shaking until the evolution of gas has ceased, and then shake for an additional 12 min. Add 6 mL of dimethyl sulfoxide, mix on a vortex mixer to form a suspension, and shake for 12 min. Add 6 mL of 3 N *methanolic sulfuric acid solution*, mix on a vortex mixer to form a suspension, and shake for 12 min. Add 12.5 mL of 2,2,4-trimethylpentane, mix on a vortex mixer to form a suspension, and shake for 10 min. Centrifuge for 10 min to break up the emulsion and to clarify the supernatant. [NOTE—The supernatant is used for the determination of vitamin A, and also vitamin D and vitamin E, if present in the formulation.] If

necessary, quantitatively dilute a volume of the supernatant with 2,2,4-trimethylpentane to obtain a concentration close to that of the *Standard solution*.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 325 nm

Column: 4.6-mm × 25-cm; 5-μm packing L24

Flow rate: 1.5 mL/min

Injection size: 40 μL

System suitability

Sample: *System suitability solution*

Suitability requirements

Resolution: NLT 8.0 between all-*trans*-retinyl acetate and all-*trans*-retinyl palmitate

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak area for all-*trans*-retinyl acetate from the *Standard solution* and the peak area of all-*trans*-retinyl acetate or all-*trans*-retinyl palmitate from the *Sample solution*.

Calculate the percentage of the labeled amount of vitamin A, as retinol (C₂₀H₃₀O), in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times F \times 100$$

r_U = peak area of the all-*trans*-retinyl ester from the *Sample solution*

r_S = peak area of the all-*trans*-retinyl ester from the *Standard solution*

C_S = concentration of retinyl acetate (C₂₂H₃₂O₂) from USP Vitamin A RS in the *Standard solution* (μg/mL)

C_U = nominal concentration of vitamin A, as retinol (C₂₀H₃₀O), in the *Sample solution* (μg/mL)

F = factor used to convert retinyl acetate, the ester form present in USP Vitamin A RS, to retinol, 0.872

[NOTE—Account for the initial extraction volume of 26.5 mL of 2,2,4-trimethylpentane to calculate the nominal concentration. The molar responses of retinyl acetate and retinyl palmitate are equivalent.]

Acceptance criteria: 90.0%–165.0% of the labeled amount of vitamin A, as retinol (C₂₀H₃₀O)

• VITAMIN A, Method 3

[NOTE—Where a vitamin A ester (retinyl acetate or retinyl palmitate) is indicated in the following procedure, use the chemical form present in the formulation. USP Vitamin A RS is retinyl acetate. It is to be used where USP Vitamin A RS is specified. Use low-actinic glassware throughout this procedure.]

Extraction solvent: *n*-Hexane and methylene chloride (3:1)

Potassium hydroxide solution: 800 mg/mL of potassium hydroxide in water. [NOTE—Cautiously add potassium hydroxide in water. Mix, and cool.]

Diluent: 10 mg/mL of pyrogallol in alcohol

Mobile phase: *n*-Hexane and isopropyl alcohol (92:8)

Standard stock solution: 30 μg/mL of retinyl acetate from USP Vitamin A RS in *Diluent*. [NOTE—This solution may be stored in a refrigerator for 1 week.]

Standard solution: Dilute a volume of *Standard stock solution* with *Diluent* to obtain a concentration of 1 μg/mL of retinyl acetate from USP Vitamin A RS. Transfer 10.0 mL of this solution to a stoppered 125-mL flask, and add 5 mL of water, 5 mL of *Diluent*, and 3 mL of *Potassium hydroxide solution*. Insert the stopper tightly, shake for 15 min over a water bath maintained at 60 ± 5°, and cool to room temperature. Add 7 mL of water and 25.0 mL of *Extraction solvent*. Insert the stopper tightly, and shake vigorously for 60 s. Rinse the sides of the flask with 60 mL of water, and allow to stand for 10 min until the layers separate. Withdraw a

portion of the organic layer for injection into the chromatograph. This *Standard solution* contains 0.34 μg/mL of retinol.

Sample solution: Weigh NLT 20 Capsules in a tared weighing bottle. Open the Capsules, without loss of shell material, and transfer the contents to a 100-mL beaker. Remove any contents adhering to the empty shells by washing with several portions of ether. Discard the washings, and dry the Capsule shells with the aid of a current of dry air. Weigh the empty Capsule shells in the tared weighing bottle, and calculate the net weight of the Capsule contents. Transfer a portion of the Capsule contents, equivalent to 1.5 mg of retinyl acetate, to a stoppered 125-mL flask. Add 5 mL of water, 15 mL of *Diluent*, and 3 mL of *Potassium hydroxide solution*. Insert the stopper tightly, shake for 15 min over a water bath maintained at 60 ± 5°, and cool to room temperature. Add 7 mL of water and 25.0 mL of *Extraction solvent*. Insert the stopper tightly, and shake vigorously for 60 s or longer, if necessary, for complete extraction. Rinse the sides of the flask with 60 mL of water, and allow to stand for 10 min until the layers separate. [NOTE—Do not shake, because an emulsion may form.] Withdraw a portion of the organic layer, and dilute quantitatively, and stepwise if necessary, with *Extraction solvent*, to obtain a concentration of 0.34 μg/mL of retinol.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 335 nm

Column: 6.2-mm × 8-cm; packing L3

Column temperature: 40°

Flow rate: 4 mL/min

Injection size: 50 μL

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for 13-*cis*-retinol and all-*trans*-retinol are about 0.92 and 1.0, respectively.]

Suitability requirements

Relative standard deviation: NMT 5.0%

Analysis

Samples: *Standard solution* and *Sample solution*
Measure the peak areas for all-*trans*-retinol and 13-*cis*-retinol. Calculate the percentage of the labeled amount of vitamin A, as retinol (C₂₀H₃₀O), in the portion of Capsules taken:

$$\text{Result} = (r_{T1}/r_{T2}) \times (C_S/C_U) \times F \times 100$$

r_{T1} = sum of the areas of the all-*trans*-retinol and 13-*cis*-retinol peaks from the *Sample solution*

r_{T2} = sum of the areas of all-*trans*-retinol and 13-*cis*-retinol peaks from the *Standard solution*

C_S = concentration of retinyl acetate (C₂₃H₃₂O₂) from USP Vitamin A RS in the *Standard solution* (μg/mL)

C_U = nominal concentration of vitamin A, as retinol (C₂₀H₃₀O), in the *Sample solution* (μg/mL)

F = factor used to convert retinyl acetate, the ester form present in USP Vitamin A RS, to retinol, 0.872

Acceptance criteria: 90.0%–165.0% of the labeled amount of vitamin A, as retinol (C₂₀H₃₀O)

• CHOLECALCIFEROL or ERGOCALCIFEROL (VITAMIN D),

Method 1

[NOTE—Where vitamin D (cholecalciferol or ergocalciferol) is specified in the following procedure, use the chemical form present in the formulation and the relevant USP Reference Standard. Use low-actinic glassware throughout this procedure.]

Mobile phase: *n*-Hexane and isopropyl alcohol (99:1)

Standard solution: 2 μg/mL of USP Cholecalciferol RS or USP Ergocalciferol RS in *n*-hexane

System suitability solution: Heat a volume of the *Standard solution* at 60° for 1 h to partially isomerize vitamin D (cholecalciferol or ergocalciferol) to its corresponding precursor.

Sample solution: Transfer NLT 20 mL of a solution prepared as directed for *Sample solution* in *Vitamin A, Method 1* to a suitable container, and concentrate, if necessary, in vacuum at room temperature to obtain a solution with an expected concentration of 2 µg/mL of cholecalciferol or ergocalciferol.

Analysis

Samples: *Standard solution* and *Sample solution*
Measure the peak areas for vitamin D. Calculate the percentage of the labeled amount of cholecalciferol (C₂₇H₄₄O) or ergocalciferol (C₂₈H₄₄O) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times F \times 100$$

r_U = peak area of cholecalciferol or ergocalciferol from the *Sample solution*

r_S = peak area of cholecalciferol or ergocalciferol from the *Standard solution*

C_S = concentration of USP Cholecalciferol RS or USP Ergocalciferol RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of cholecalciferol or ergocalciferol in the *Sample solution* (µg/mL)

F = correction factor to account for the average amount of previtamin D present in the *Sample solution*, 1.09

Acceptance criteria: 90.0%–165.0% of the labeled amount of vitamin D as cholecalciferol (C₂₇H₄₄O) or ergocalciferol (C₂₈H₄₄O)

• CHOLECALCIFEROL or ERGOCALCIFEROL (VITAMIN D), Method 2

[NOTE—Where vitamin D (cholecalciferol or ergocalciferol) is specified in the following procedure, use the chemical form present in the formulation and the relevant USP Reference Standard. Use low-actinic glassware throughout this procedure.]

3 N methanolic sulfuric acid solution, Sodium ascorbate–pyrogallol solution, Lecithin solution, and Sample solution: Proceed as directed for *Vitamin A, Method 2*.

Mobile phase: *n*-Hexane and tertiary butyl alcohol (98.75:1.25)

Standard solution: 1 µg/mL of USP Cholecalciferol RS or USP Ergocalciferol RS in 2,2,4-trimethylpentane

System suitability solution: Heat a volume of the *Standard solution* at 60° for 1 h to partially isomerize vitamin D (cholecalciferol or ergocalciferol) to its corresponding precursor.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 265 nm

Column: 4.6-mm × 25-cm; 5-µm packing L24

Flow rate: 1 mL/min

Injection size: 40 µL

System suitability

Sample: *Standard solution* and *System suitability solution*

Suitability requirements

Resolution: NLT 4.0 between the vitamin D form present and its corresponding precursor, *System suitability solution*

Relative standard deviation: NMT 3.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*
Measure the peak areas for vitamin D. Calculate the percentage of the labeled amount of cholecalciferol (C₂₇H₄₄O) or ergocalciferol (C₂₈H₄₄O) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of cholecalciferol or ergocalciferol from the *Sample solution*

r_S = peak area of cholecalciferol or ergocalciferol from the *Standard solution*

C_S = concentration of USP Cholecalciferol RS or USP Ergocalciferol RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of cholecalciferol or ergocalciferol in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–165.0% of the labeled amount of vitamin D as cholecalciferol (C₂₇H₄₄O) or ergocalciferol (C₂₈H₄₄O)

• CHOLECALCIFEROL or ERGOCALCIFEROL (VITAMIN D), Method 3

[NOTE—Where vitamin D (cholecalciferol or ergocalciferol) is specified in the following procedure, use the chemical form present in the formulation and the relevant USP Reference Standard. Use low-actinic glassware throughout this procedure.]

Diluted acetic acid: Glacial acetic acid solution (1 in 10), in water

Phenolphthalein solution: 10 mg/mL of phenolphthalein in alcohol

Potassium hydroxide solution: Slowly dissolve 14 g of potassium hydroxide in a mixture of 31 mL of dehydrated alcohol and 5 mL of water. Prepare fresh daily.

Extraction solvent: Methylene chloride and isopropyl alcohol (99.8:0.2)

Mobile phase: Acetonitrile and methanol (91:9)

Standard stock solution: 0.2 mg/mL of USP Cholecalciferol RS or USP Ergocalciferol RS in dehydrated alcohol. [NOTE—Prepare fresh every 4 weeks. Store in a freezer.]

Standard solution: [NOTE—Condition the solid-phase extraction column specified for use in the *Standard solution* and the *Sample solution* by initially washing the column with 4.0 mL of a mixture of methylene chloride and isopropyl alcohol (4:1), followed by 5.0 mL of *Extraction solvent*. Do not allow the column to dry.] Dilute a volume of *Standard stock solution* with dehydrated alcohol to obtain a concentration of 5 µg/mL of USP Cholecalciferol RS or USP Ergocalciferol RS. Prepare this solution fresh daily. Transfer 2.0 mL of this solution to a stoppered 125-mL flask. Add 15.0 mL of water and 15.0 mL of *Potassium hydroxide solution*, insert the stopper, and shake for 30 min in a water bath maintained at 60°. Allow to cool to room temperature, and transfer the contents of the flask to a 250-mL separatory funnel. Add 15.0 mL of water to the flask, insert the stopper, shake vigorously, and transfer this solution to the separatory funnel. Rinse the flask

with 60 mL of *n*-hexane, and transfer the rinsing to the separatory funnel. Insert the stopper, shake vigorously for 90 s, and allow to stand for 15 min until the layers separate. Drain and discard the aqueous layer. Add 15.0 mL of water to the hexane layer in the separatory funnel, insert the stopper, and shake vigorously. Allow to stand for 10 min until the layers separate, and discard the aqueous layer. Add 1 drop of *Phenolphthalein solution* and 15.0 mL of water to the separatory funnel. Add *Diluted acetic acid* dropwise, with shaking, until the washing is neutral. Allow to stand for 10 min until the layers separate. Drain and discard the aqueous layer. Filter the hexane layer through anhydrous sodium sulfate supported by a small pledget of cotton into a 100-mL round-bottom flask. Rinse the funnel and sodium sulfate with a few mL of *n*-hexane, and collect the rinsings in the same flask. Evaporate the hexane in the flask on a rotary evaporator at 50° to dryness. Immediately add 2.0 mL of *Extraction solvent* to dissolve the residue. Transfer this solution to a freshly conditioned solid-phase extraction column containing silica packing with a sorbent mass-to-column volume ratio of 500 mg to 2.8 mL or equivalent, rinse the round-bottom flask with 1.0 mL of *Extraction solvent*, and transfer to the column. Elute the column with 2.0 mL of *Extraction solvent*, and discard this fraction. Elute the column with 7.0 mL of *Extraction solvent*, and collect the eluate in a suitable flask. Place the flask in a warm water bath maintained at 42°, and evaporate the solvent with the aid of a stream of nitrogen. Immediately add 2.0 mL of acetonitrile to the residue, and use the solution for injection into the chromatograph.

Sample solution: Proceed as directed for the *Sample solution* for *Vitamin A, Method 3*, through "calculate the net weight of the Capsule contents." Transfer a portion of the Capsule contents, equivalent to 10 µg of ergocalciferol or cholecalciferol, to a stoppered 125-mL flask, and proceed as directed for the *Standard solution*, beginning with "Add 15.0 mL of water and 15.0 mL of *Potassium hydroxide solution*".

Injection size: 15 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 4.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas for vitamin D. Calculate the percentage of the labeled amount of cholecalciferol (C₂₇H₄₄O) or ergocalciferol (C₂₈H₄₄O) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of cholecalciferol or ergocalciferol from the *Sample solution*

r_S = peak area of cholecalciferol or ergocalciferol from the *Standard solution*

C_S = concentration of USP Cholecalciferol RS or USP Ergocalciferol RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of cholecalciferol or ergocalciferol in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–165.0% of the labeled amount of vitamin D as cholecalciferol (C₂₇H₄₄O) or ergocalciferol (C₂₈H₄₄O)

• VITAMIN E, Method 1

[NOTE—Where vitamin E (alpha tocopherol, alpha tocopheryl acetate, or alpha tocopheryl acid succinate) is specified in the following procedure, use the chemical form present in the formulation and the relevant USP Reference Standard. Use low-actinic glassware throughout this procedure.]

Solution A: Phosphoric acid solution (1 in 100) in water

Mobile phase: Methanol and *Solution A* (19:1)

System suitability solution: Prepare a 0.65-mg/mL solution of USP Ergocalciferol RS in methanol. Transfer 1.0 mL of this solution to a 100-mL volumetric flask containing 100 mg of USP Alpha Tocopheryl Acetate RS. Dissolve in 30 mL of methanol, with the aid of sonication if necessary, and dilute with methanol to volume. Store this solution in a refrigerator.

Standard solution: 2 mg/mL of USP Alpha Tocopherol RS, USP Alpha Tocopheryl Acetate RS, or USP Alpha Tocopheryl Acid Succinate RS in methanol

Sample solution: Transfer NLT 20 mL of the solution prepared as directed for the *Sample solution* in *Vitamin A, Method 1* to a suitable container, and evaporate, in vacuum at room temperature to dryness. Transfer the contents of the flask to a suitable volumetric flask with the aid of methanol, and dilute with methanol to volume, to obtain a solution with an expected concentration of 2 mg/mL of alpha tocopherol, alpha tocopheryl acetate, or alpha tocopheryl acid succinate.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 8-mm × 10-cm; 5-µm packing L1

Flow rate: 2 mL/min

Injection size: 100 µL

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for ergocalciferol and alpha tocopheryl acetate are about 0.5 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 12 between ergocalciferol and alpha tocopheryl acetate, *System suitability solution*

Tailing factor: Between 0.8 and 1.2, *System suitability solution*

Relative standard deviation: NMT 3.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas. Calculate the percentage of the labeled amount of alpha tocopherol (C₂₉H₅₀O₂), alpha tocopheryl acetate (C₃₁H₅₂O₃), or alpha tocopheryl acid succinate (C₃₃H₅₄O₅) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of the relevant vitamin E form from the *Sample solution*

r_S = peak area of the relevant vitamin E form from the *Standard solution*

C_S = concentration of the corresponding USP Reference Standard in the *Standard solution* (mg/mL)

C_U = nominal concentration of the corresponding form of vitamin E in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–165.0% of the labeled amount of vitamin E as alpha tocopherol (C₂₉H₅₀O₂), alpha tocopheryl acetate (C₃₁H₅₂O₃), or alpha tocopheryl acid succinate (C₃₃H₅₄O₅)

• **VITAMIN E, Method 2**

[NOTE—Where vitamin E (alpha tocopherol, alpha tocopheryl acetate, or alpha tocopheryl acid succinate) is specified in the following procedure, use the chemical form present in the formulation and the relevant USP Reference Standard. Use low-actinic glassware throughout this procedure.]

Mobile phase: Mix 240 mL of methanol with 10 mL of water, followed by 0.5 mL of 50% phosphoric acid, and dilute with acetonitrile to 1000 mL.

System suitability solution: 2 mg/mL each of USP Alpha Tocopherol RS, USP Alpha Tocopheryl Acetate RS, and USP Alpha Tocopheryl Acid Succinate RS in methanol

Standard solution: 2 mg/mL of USP Alpha Tocopherol RS, USP Alpha Tocopheryl Acetate RS, or USP Alpha Tocopheryl Acid Succinate RS in methanol

3 N methanolic sulfuric acid solution: Cautiously mix sulfuric acid and methanol (9 in 100) in a 100-mL volumetric flask. [NOTE—Dissolve in a portion of methanol, cool, and then dilute to final volume.]

Sodium ascorbate–pyrogallol solution: Transfer 10 g of sodium ascorbate and 5 g of pyrogallol to a 100-mL volumetric flask. Add sufficient water to dissolve. Add 1.7 mL of sulfuric acid, and dilute with water to volume.

Lecithin solution: 5 mg/mL of lecithin in 2,2,4-trimethylpentane

Sample solution: Proceed as directed for *Vitamin A, Method 2*, through “calculate the net weight of the Capsule contents.” Transfer a portion of the Capsule contents, equivalent to 55 mg of vitamin E, to a container having a polytetrafluoroethylene screw cap. Add 0.5 g of sodium bicarbonate, 1.5 mL of *Lecithin solution*, and 12.5 mL of 2,2,4-trimethylpentane, and disperse on a vortex mixer. Add 6 mL of *Sodium ascorbate–pyrogallol solution*, shake slowly, and allow the solution to degas. Continue shaking until the evolution of gas has ceased, and then shake for an additional 12 min. Add 6 mL of dimethyl sulfoxide, mix on a vortex mixer to form a suspension, and shake for 12 min. Add 6 mL of 3 N methanolic sulfuric acid solution, mix on a vortex mixer to form a suspension, and shake for 12 min. Add 12.5 mL of 2,2,4-trimethylpentane, mix on a vortex mixer to form a suspension, and shake for 10 min. Centrifuge for 10 min to break up the emulsion and to clarify the supernatant layer. Transfer a volume of the supernatant 2,2,4-trimethylpentane layer to a suitable volumetric flask, the volume of the specimen withdrawn from the 2,2,4-trimethylpentane layer and the size of the volumetric flask being such that the final concentration of the *Sample solution* is equivalent to that of the *Standard solution*. Evaporate nearly to dryness, add several mL of methanol, and evaporate the remaining 2,2,4-trimethylpentane. Dilute with methanol to volume.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 4.6-mm × 25-cm; 5-μm packing L1

Flow rate: 1.5 mL/min

Injection size: 25 μL

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for alpha tocopheryl acid succinate, alpha tocopherol, and alpha tocopheryl acetate are about 0.6, 0.8, and 1.0, respectively.]

Suitability requirements

Resolution: NLT 4.0 between alpha tocopheryl acid succinate and alpha tocopherol and NLT 3.0 between

alpha tocopherol and alpha tocopheryl acetate,
System suitability solution

Relative standard deviation: NMT 3.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas. Calculate the percentage of the labeled amount of alpha tocopherol ($C_{29}H_{50}O_2$), alpha tocopheryl acetate ($C_{31}H_{52}O_3$), or alpha tocopheryl acid succinate ($C_{33}H_{54}O_5$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of the relevant vitamin E form from the *Sample solution*

r_S = peak area of the relevant vitamin E form from the *Standard solution*

C_S = concentration of the corresponding USP Reference Standard in the *Standard solution* (mg/mL)

C_U = nominal concentration of the corresponding form of vitamin E in the *Sample solution* (mg/mL)

[NOTE—Account for the initial extraction volume of 26.5 mL of 2,2,4-trimethylpentane and the dilution factor to exchange the solvent from 2,2,4-trimethylpentane to methanol to calculate the nominal concentration.]

Acceptance criteria: 90.0%–165.0% of the labeled amount of vitamin E as alpha tocopherol ($C_{29}H_{50}O_2$), alpha tocopheryl acetate ($C_{31}H_{52}O_3$), or alpha tocopheryl acid succinate ($C_{33}H_{54}O_5$)

• **VITAMIN E, Method 3**

Diluent: Acetonitrile and ethyl acetate (1:1)

Mobile phase: Methanol, acetonitrile, and *n*-hexane (46.5:46.5:7.0)

Standard solution: 0.3 mg/mL of USP Alpha Tocopherol RS in methanol

Sample solution: Proceed as directed for *Vitamin A, Method 3*, through “calculate the net weight of the Capsule contents.” Transfer a portion of the Capsule contents, equivalent to an expected amount of 8.0 mg of alpha tocopherol, to a glass-stoppered conical flask. Add 25.0 mL of water, 25.0 mL of dehydrated alcohol, and 3.5 g of potassium hydroxide pellets. Shake for 1 h in a water bath maintained at 55°. Cool, and transfer with the aid of a minimum volume of water to a 125-mL separatory funnel. Rinse the flask with 50 mL of *n*-hexane, and add the rinsing to the separatory funnel. Insert the stopper, shake vigorously for 60 s, and allow the layers to separate. Drain the aqueous layer into a second 250-mL separatory funnel, and repeat the extraction with 50 mL of *n*-hexane. Discard the aqueous layer, and combine the hexane extracts. Wash the combined extracts with 25 mL of water, allow the layers to separate, and discard the aqueous layer. Add 3 drops of glacial acetic acid, and repeat the washing procedure two more times. Filter the washed hexane layer through anhydrous sodium sulfate into a 250-mL round-bottom flask. Rinse the funnel and sodium sulfate with a few mL of *n*-hexane, and add the rinsing to the hexane solution in the flask. Place the flask in a water bath maintained at 50°, and evaporate the hexane solution with the aid of a rotary evaporator to dryness. Immediately add 25.0 mL of *Diluent*, and swirl to dissolve the residue.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC
Detector: UV 291 nm
Column: 4.6-mm × 25-cm; packing L1

Injection size: 20 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 5.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas. Calculate the percentage of the labeled amount of vitamin E, as alpha tocopherol (C₂₉H₅₀O₂), in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of alpha tocopherol from the *Sample solution*

r_S = peak area of alpha tocopherol from the *Standard solution*

C_S = concentration of alpha tocopherol in the *Standard solution* (mg/mL)

C_U = nominal concentration of vitamin E, as alpha tocopherol in the *Sample solution* (mg/mL)

[NOTE—Calculate the alpha tocopherol equivalent (C₂₉H₅₀O₂) of alpha tocopheryl acetate (C₃₁H₅₂O₃) or alpha tocopheryl acid succinate (C₃₃H₅₄O₅) by multiplying their contents by the factors 0.91 or 0.81, respectively.]

Acceptance criteria: 90.0%–165.0% of the labeled amount of vitamin E

• **PHYTONADIONE**

[NOTE—Use low-actinic glassware throughout this procedure.]

Mobile phase: Methanol and water (19:1)

Standard stock solution: 200 µg/mL of USP

Phytonadione RS in methanol. Dissolve with the aid of sonication if necessary.

Standard solution: 20 µg/mL of USP Phytonadione RS from *Standard stock solution* diluted with methanol

System suitability solution: 0.65 mg/mL of USP Alpha Tocopheryl Acetate RS and 20 µg/mL of USP Phytonadione RS from *Standard stock solution* diluted with methanol. [NOTE—Dissolve USP Alpha Tocopheryl Acetate RS in a portion of methanol, add the *Standard stock solution*, and then dilute with methanol to volume.]

Sample solution: Transfer NLT 20 mL of the solution prepared as directed for the *Sample solution* in *Vitamin A, Method 1* to a suitable container, and evaporate, if necessary, in vacuum at room temperature to dryness. Transfer the contents of the flask to a suitable volumetric flask with the aid of methanol, and dilute with methanol to volume to obtain a solution with an expected concentration of 20 µg/mL of phytonadione.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 8-mm × 10-cm; 5-µm packing L1

Flow rate: 2.0 mL/min

Injection size: 100 µL

System suitability

Samples: *Standard solution* and *System suitability solution*

[NOTE—The relative retention times for alpha tocopheryl acetate and phytonadione are about 0.68 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 5 between alpha tocopheryl acetate and phytonadione, *System suitability solution*

Relative standard deviation: NMT 3.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas. Calculate the percentage of the labeled amount of phytonadione (C₃₁H₄₆O₂) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area from the *Sample solution*

r_S = peak area from the *Standard solution*

C_S = concentration of USP Phytonadione RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of phytonadione in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–165.0% of the labeled amount of phytonadione (C₃₁H₄₆O₂)

• **BETA CAROTENE**

[NOTE—Use low-actinic glassware throughout this procedure.]

Potassium hydroxide solution: Dissolve 58.8 g of potassium hydroxide in 50 mL of water.

Iodine solution: Transfer 10 mg of iodine to a 100-mL volumetric flask. Dissolve in cyclohexane, and dilute with cyclohexane to volume. Dilute 10 mL of this solution with cyclohexane to 100 mL. [NOTE—Prepare this solution fresh daily.]

Sample solution A (for preparations containing beta carotene in oil solutions): Proceed as directed for *Vitamin A, Method 1*, except use cyclohexane instead of *n*-hexane as the extraction solvent, and dilute the filtered extracts with cyclohexane, to obtain a concentration of 2 µg/mL of beta carotene.

Sample solution B (for preparations containing beta carotene in dry powder): Remove the contents of NLT 20 Capsules by cutting open the Capsules. Mix, and determine the weight of the contents. Transfer a quantity of the Capsule contents, equivalent to 2 mg of beta carotene, to a 500-mL saponification flask. Add 100 mL of alcohol, 6 mL of *Potassium hydroxide solution*, and a magnetic stirring bar. Attach an air condenser to the flask, and heat under reflux for 45 min with constant stirring. Cool to room temperature. Add 170 mL of solvent hexane, and stir for 30 min. Quantitatively transfer the contents of the flask to a 500-mL separatory funnel with portions of solvent hexane. Allow the layers to separate for 5–10 min, and transfer the upper organic layer to a 500-mL volumetric flask. Transfer the lower aqueous layer into the saponification flask. Add 170 mL of solvent hexane, and stir for an additional 20 min. Quantitatively transfer the contents of the saponification flask to the separatory funnel with the aid of portions of solvent hexane. Allow the layers to separate for 10 min. Drain the lower aqueous layer, and discard. Transfer the organic layer to the volumetric flask containing the previously collected organic layer. Rinse the separatory funnel with small portions of solvent hexane, and transfer the washings to the volumetric flask. Dilute the hexane extracts with solvent hexane to volume. Add 3 g of anhydrous sodium sulfate, shake, and allow to settle. Quantitatively transfer a volume of this solution, equivalent to 100 µg of beta carotene, to a 50-mL volumetric flask. Evaporate under a stream of nitrogen to dryness, and immediately add cyclohexane. Add 2 mL of *Iodine solution*, and heat for 15 min in a water bath maintained at 65°. Cool rapidly, and dilute with cyclohexane to volume.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* <851>.)

Mode: Vis

Analytical wavelength: 452 nm

Blank: Cyclohexane

Analysis

Sample: *Sample solution*

Determine the absorbance against the *Blank*. Calculate the percentage of the labeled amount of beta carotene ($C_{40}H_{56}$) in the portion of Capsules taken:

$$\text{Result} = (A_U/F) \times (100/C_U)$$

A_U = absorbance of the *Sample solution*

F = absorptivity of beta carotene at 452 nm, 223

C_U = nominal concentration of beta carotene in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–165.0% of the labeled amount of beta carotene ($C_{40}H_{56}$)

• **ASCORBIC ACID, Method 1**

Sample solution: Weigh NLT 20 Capsules in a tared weighing bottle. Open the Capsules, without the loss of shell material, and transfer the contents to a 100-mL beaker. Remove any contents adhering to the empty shells by washing, if necessary, with several portions of ether. Discard the washings, and dry the Capsule shells with the aid of a current of dry air until the odor of ether is no longer perceptible. Weigh the empty Capsule shells in the tared weighing bottle, and calculate the average net weight per Capsule. Transfer a portion of the Capsule contents, equivalent to 100 mg of ascorbic acid, to a 200-mL volumetric flask, and add 75 mL of metaphosphoric–acetic acids TS. Insert a stopper into the flask, and shake by mechanical means for 30 min. Dilute with water to volume. Transfer a portion of the solution to a centrifuge tube, and centrifuge until a clear supernatant is obtained. Pipet 4.0 mL of this solution into a 50-mL conical flask, and add 5 mL of metaphosphoric–acetic acids TS.

Analysis: Titrate with standard dichlorophenol–indophenol solution VS to a rose-pink color that persists for at least 5 s. Correct for the volume of dichlorophenol–indophenol solution consumed by a mixture of 5.5 mL of metaphosphoric–acetic acids TS and 15 mL of water. From the ascorbic acid equivalent of the standard dichlorophenol–indophenol solution, calculate the content of ascorbic acid in each Capsule.

Acceptance criteria: 90.0%–150.0% of the labeled amount of ascorbic acid ($C_6H_8O_6$)

• **ASCORBIC ACID, Method 2:** Proceed as directed in *Automated Methods of Analysis* (16), *Assay for Ascorbic Acid*.

Acceptance criteria: 90.0%–150.0% of the labeled amount of ascorbic acid ($C_6H_8O_6$)

• **CALCIUM ASCORBATE, Method 1:** Proceed as directed for *Ascorbic Acid, Method 1*.

Acceptance criteria: 90.0%–150.0% of the labeled amount of calcium ascorbate ($C_{12}H_{14}CaO_{12} \cdot 2H_2O$)

• **CALCIUM ASCORBATE, Method 2:** Proceed as directed in *Automated Methods of Analysis* (16), *Assay for Ascorbic Acid*.

Acceptance criteria: 90.0%–150.0% of the labeled amount of calcium ascorbate ($C_{12}H_{14}CaO_{12} \cdot 2H_2O$)

• **SODIUM ASCORBATE, Method 1:** Proceed as directed for *Ascorbic Acid, Method 1*.

Acceptance criteria: 90.0%–150.0% of the labeled amount of sodium ascorbate ($C_6H_7NaO_6$)

• **SODIUM ASCORBATE, Method 2:** Proceed as directed in *Automated Methods of Analysis* (16), *Assay for Ascorbic Acid*.

Acceptance criteria: 90.0%–150.0% of the labeled amount of sodium ascorbate ($C_6H_7NaO_6$)

• **BIOTIN, Method 1**

[NOTE—Use low-actinic glassware throughout this procedure.]

Mobile phase: Mix 85 mL of acetonitrile, 1 g of sodium perchlorate, and 1 mL of phosphoric acid, and dilute with water to 1000 mL.

Standard stock solution: 0.333 mg/mL of USP Biotin RS in dimethyl sulfoxide

Standard solution: 5 µg/mL of USP Biotin RS prepared by diluting the *Standard stock solution* in water

Sample solution: Proceed as directed in *Ascorbic Acid, Method 1*, through “calculate the average net weight per Capsule.” Transfer a portion of the Capsule contents, equivalent to 1 mg of biotin, to a 200-mL volumetric flask. Add 3 mL of dimethyl sulfoxide, and swirl to wet the contents. Place the flask in a water bath at 60°–70° for 5 min. Sonicate for 5 min, dilute with water to volume, and filter.

Analysis

Samples: *Standard solution* and *Sample solution*
Measure the responses for the biotin peaks. Calculate the percentage of the labeled amount of biotin ($C_{10}H_{16}N_2O_3S$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Biotin RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of biotin in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–150.0% of the labeled amount of biotin ($C_{10}H_{16}N_2O_3S$)

• **BIOTIN, Method 2**

[NOTE—Use low-actinic glassware throughout this procedure.]

Dehydrated mixtures yielding formulations similar to the media described herein may be used provided that, when constituted as directed, they have growth-promoting properties equal to or superior to those obtained with the media prepared as described herein.

Standard stock solution: 50 µg/mL of USP Biotin RS in 50% alcohol. Store this solution in a refrigerator.

Standard solution: 0.1 ng/mL of USP Biotin RS in water, prepared by dilution of the *Standard stock solution* with water on the day of the assay.

Sample solution: Proceed as directed for *Ascorbic Acid, Method 1*, through “calculate the average net weight per Capsule.” Transfer a portion of the Capsule contents, equivalent to 100 µg of biotin, to a 200-mL volumetric flask. Add 3 mL of 50% alcohol, and swirl to wet the contents. Heat the flask in a water bath at 60°–70° for 5 min. Sonicate for 5 min, dilute with 50% alcohol to volume, and filter. Dilute a volume of the filtrate quantitatively, and stepwise if necessary, with water to obtain a solution having a concentration of 0.1 ng/mL.

Acid-hydrolyzed casein solution: Mix 100 g of vitamin-free casein with 500 mL of 6 N hydrochloric acid, and reflux the mixture for 8–12 h. Remove the hydrochloric acid from the mixture by distillation under reduced pressure until a thick paste remains. Redissolve the resulting paste in water, adjust the solution with 1 N sodium hydroxide to a pH of 3.5 ± 0.1 , and add water to make 1000 mL. Add 20 g of activated charcoal, stir for 1 h, and filter. Repeat the treatment

with activated charcoal. Store under toluene in a cool place at a temperature not below 10°. Filter the solution if a precipitate forms during storage.

Cystine-tryptophan solution: Suspend 4.0 g of L-cystine in a solution of 1.0 g of L-tryptophan (or 2.0 g of D,L-tryptophan) in 700–800 mL of water. Heat to 70°–80°, and add dilute hydrochloric acid (1 in 2) dropwise, with stirring, until the solids are dissolved. Cool, and add water to make 1000 mL. Store under toluene in a cool place at a temperature not below 10°.

Adenine-guanine-uracil solution: Dissolve 200 mg each of adenine sulfate, guanine hydrochloride, and uracil, with the aid of heat, in 10 mL of 4 N hydrochloric acid. Cool, and add water to make 200 mL. Store under toluene in a refrigerator.

Polysorbate 80 solution: 100 mg/mL of polysorbate 80 in alcohol

Calcium pantothenate solution: 10 µg/mL of calcium pantothenate in 50% alcohol. Store in a refrigerator.

Riboflavin-thiamine hydrochloride solution: 20 µg/mL of riboflavin and 10 µg/mL of thiamine hydrochloride in 0.02 N acetic acid. Store under toluene, protected from light, in a refrigerator.

p-Aminobenzoic acid-niacin-pyridoxine hydrochloride solution: 10 µg/mL of p-aminobenzoic acid, 50 µg/mL of niacin, and 40 µg/mL of pyridoxine hydrochloride in a mixture of neutralized alcohol and water (1:3). Store in a refrigerator.

Salt solution A: 25 g of monobasic potassium phosphate and 25 g of dibasic potassium phosphate in water to make 500 mL. Add 5 drops of hydrochloric acid. Store under toluene.

Salt solution B: 10 g of magnesium sulfate, 0.5 g of sodium chloride, 0.5 g of ferrous sulfate, and 0.5 g of manganese sulfate in water to make 500 mL. Add 5 drops of hydrochloric acid, and mix. Store under toluene.

Basal medium stock solution: Dissolve the anhydrous dextrose and anhydrous sodium acetate in the solutions previously mixed according to Table 1, and adjust with 1 N sodium hydroxide to a pH of 6.8. Dilute with water to 250 mL.

Table 1

Acid-hydrolyzed casein solution	25 mL
Cystine-tryptophan solution	25 mL
Polysorbate 80 solution	0.25 mL
Dextrose, anhydrous	10 g
Sodium acetate, anhydrous	5 g
Adenine-guanine-uracil solution	5 mL
Calcium pantothenate solution	5 mL
Riboflavin-thiamine hydrochloride solution	5 mL
p-Aminobenzoic acid-niacin-pyridoxine hydrochloride solution	5 mL
Salt solution A	5 mL
Salt solution B	5 mL

Stock culture of *Lactobacillus plantarum*: Dissolve 2.0 g of yeast extract in 100 mL of water. Add 500 mg of anhydrous dextrose, 500 mg of anhydrous sodium acetate, and 1.5 g of agar, and heat the mixture on a steam bath, with stirring, until the agar dissolves. Add 10-mL portions of the hot solution to test tubes, close or cover the tubes, sterilize in an autoclave at 121° for 15 min, and allow the tubes to cool in an upright position. Prepare stab cultures in three or more of the tubes, using a pure culture of *Lactobacillus plantarum*,¹ incubating for 16–24 h at a temperature between 30° and 37° held constant to within ±0.5°. Store in a

refrigerator. Prepare a fresh stab of the stock culture every week, and do not use for *Inoculum* if the culture is more than 1 week old.

Culture medium: To each of a series of test tubes containing 5.0 mL of *Basal medium stock solution* add 5.0 mL of water containing 0.5 ng of biotin. Plug the tubes with cotton, sterilize in an autoclave at 121° for 15 min, and cool.

Inoculum: [NOTE—A frozen suspension of *Lactobacillus plantarum* may be used as the stock culture, provided it yields an *Inoculum* comparable to a fresh culture.] Make a transfer of cells from the *Stock culture* of *Lactobacillus plantarum* to a sterile tube containing 10 mL of *Culture medium*. Incubate this culture for 16–24 h at a temperature between 30° and 37° held constant to within ±0.5°. The cell suspension so obtained is the *Inoculum*.

Analysis

Samples: *Standard solution* and *Sample solution*
To similar separate test tubes add, in duplicate, 1.0 and/or 1.5, 2.0, 3.0, 4.0, and 5.0 mL of the *Standard solution*. To each tube and to four similar empty tubes add 5.0 mL of *Basal medium stock solution* and sufficient water to make 10 mL.

To similar test tubes add, in duplicate, volumes of the *Sample solution* corresponding to three or more of the levels specified for the *Standard solution*, including the levels of 2.0, 3.0, and 4.0 mL. To each tube add 5.0 mL of the *Basal medium stock solution* and sufficient water to make 10 mL. Place one complete set of *Standard* and *sample* tubes together in one tube rack and the duplicate set in a second rack or section of a rack, preferably in random order.

Cover the tubes of both series to prevent contamination, and sterilize in an autoclave at 121° for 5 min. Cool. Add 1 drop of *Inoculum* to each tube, except two of the four tubes containing no *Standard solution* (the uninoculated blanks). Incubate the tubes at a temperature between 30° and 37° held constant to within ±0.5° until, following 16–24 h of incubation, there has been no substantial increase in turbidity in the tubes containing the highest level of *Standard* during a 2-h period.

Determine the transmittance of the tubes in the following manner. Mix the contents of each tube, and transfer to a spectrophotometer cell. Place the cell in a spectrophotometer that has been set at a specific wavelength from 540 to 660 nm, and read the transmittance when a steady state is reached. This steady state is observed a few seconds after agitation when the galvanometer reading remains constant for 30 s or more. Allow approximately the same time interval for the reading on each tube.

With the transmittance set at 1.00 for the uninoculated blank, read the transmittance of the inoculated blank. With the transmittance set at 1.00 for the inoculated blank, read the transmittance for each of the remaining tubes. If there is evidence of contamination with a foreign microorganism, disregard the result of the assay.

Calculation: Prepare a standard concentration-response curve as follows. For each level of the *Standard*, calculate the response from the sum of the duplicate values of the transmittance (Σ_S) as the difference, $y = 2.00 - \Sigma_S$. Plot this response on the ordinate of cross-section paper against the logarithm of the mL of *Standard solution* per tube on the abscissa, using for the ordinate either an arithmetic or a logarithmic scale, whichever gives the better approximation to a straight line. Draw the straight line or smooth curve that best fits the plotted points.

Calculate the response, $y = 2.00 - \Sigma_U$, adding together the two transmittances for each level of the *Sample solution* (Σ_U). Read from the standard curve the logarithm of the volume of the *Standard solution*

¹ ATCC No. 8014 is suitable. This strain was formerly known as *Lactobacillus arabinosus* 17-5.

corresponding to each of those values of γ that fall within the range of lowest and highest points plotted for the Standard. Subtract from each logarithm so obtained the logarithm of the volume, in mL, of the *Sample solution* to obtain the difference, X , for each dosage level. Average the values of X for each of three or more dosage levels to obtain \bar{X} , which equals the log-relative potency, M' , of the *Sample solution*. Determine the quantity, in μg , of biotin ($\text{C}_{10}\text{H}_{16}\text{N}_2\text{O}_3\text{S}$) in the portion of Capsules taken:

$$\text{antilog } M = \text{antilog } (M' + \log R)$$

R = number of μg of biotin that was assumed to be present in the portion of the Capsules taken

Calculate the percentage of the labeled amount of biotin in the portion of the Capsules taken

$$\text{Result} = [(\text{antilog } M)/N] \times 100$$

N = nominal amount of biotin ($\text{C}_{10}\text{H}_{16}\text{N}_2\text{O}_3\text{S}$) in the portion of Capsules taken (μg)

Replication: Repeat the entire determination at least once, using separately prepared *Sample solutions*. If the difference between the two log-potencies M is NMT 0.08, their mean, \bar{M} , is the assayed log-potency of the test material (see *Design and Analysis of Biological Assays* (111), *The Confidence Interval and Limits of Potency*). If the two determinations differ by more than 0.08, conduct one or more additional determinations. From the mean of two or more values of M that do not differ by more than 0.15, compute the mean potency of the preparation under assay.

Acceptance criteria: 90.0%–150.0% of the labeled amount of biotin ($\text{C}_{10}\text{H}_{16}\text{N}_2\text{O}_3\text{S}$)

• **CYANOCOBALAMIN, Method 1**

[NOTE—Use low-actinic glassware throughout this procedure.]

Mobile phase: Methanol and water (7:13)

Standard stock solution: 10 $\mu\text{g}/\text{mL}$ of USP Cyanocobalamin RS in water. [NOTE—Store this stock solution in a dark place, and discard after 1 week.]

Standard solution: 1 $\mu\text{g}/\text{mL}$ of USP Cyanocobalamin RS from *Standard stock solution* diluted with water

Sample solution: Proceed as directed for *Ascorbic Acid, Method 1*, through “calculate the average net weight per Capsule.” Transfer a portion of the Capsule contents, equivalent to 100 μg of cyanocobalamin, to a 250-mL flask. Add 100.0 mL of water, and carefully extract for 2 min. Filter 10 mL of the extract, and use the clear filtrate.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: 550 nm

Column: 4.6-mm \times 15-cm; 5- μm packing L1

Flow rate: 0.5 mL/min

Injection size: 200 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak responses for cyanocobalamin.

Calculate the percentage of the labeled amount of cyanocobalamin ($\text{C}_{63}\text{H}_{88}\text{CoN}_{14}\text{O}_{14}\text{P}$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Cyanocobalamin RS in the *Standard solution* ($\mu\text{g}/\text{mL}$)

C_U = nominal concentration of cyanocobalamin in the *Sample solution* ($\mu\text{g}/\text{mL}$)

Acceptance criteria: 90.0%–150.0% of the labeled amount of cyanocobalamin ($\text{C}_{63}\text{H}_{88}\text{CoN}_{14}\text{O}_{14}\text{P}$)

• **CYANOCOBALAMIN, Method 2**

[NOTE—Use low-actinic glassware throughout this procedure.]

Standard stock solution: 1.0 $\mu\text{g}/\text{mL}$ of USP Cyanocobalamin RS in 25% alcohol. Store in a refrigerator.

Standard solution: Dilute a suitable volume of *Standard stock solution* with water to a measured volume such that after the incubation period as described in the *Analysis*, the difference in transmittance between the inoculated blank and the 5.0-mL level of the *Standard solution* is NLT that which corresponds to a difference of 1.25 mg in dried cell weight. This concentration usually falls between 0.01 and 0.04 ng/mL of the *Standard solution*. Prepare this solution fresh for each assay.

Sample solution: Proceed as directed for *Ascorbic Acid, Method 1*, through “calculate the average net weight per Capsule.” Transfer a portion of the Capsule contents, equivalent to 1.0 μg of cyanocobalamin, to an appropriate vessel containing, for each g of Capsule contents taken, 25 mL of an aqueous extracting solution prepared just before use to contain 12.9 mg/mL of dibasic sodium phosphate, 11.0 mg/mL of anhydrous citric acid, and 10 mg/mL of sodium metabisulfite. Autoclave the mixture at 121° for 10 min. Allow any undissolved particles of the extract to settle, and filter or centrifuge, if necessary. Dilute an aliquot of the clear solution with water to obtain a final solution containing vitamin B₁₂ activity approximately equivalent to that of the *Standard solution*.

Acid-hydrolyzed casein solution: Prepare as directed for *Calcium Pantothenate, Method 2*.

Asparagine solution: Dissolve 2.0 g of L-asparagine in water to make 200 mL. Store under toluene in a refrigerator.

Adenine–guanine–uracil solution: Prepare as directed for *Calcium Pantothenate, Method 2*.

Xanthine solution: Suspend 0.20 g of xanthine in 30–40 mL of water, heat to 70°, add 6.0 mL of 6 N ammonium hydroxide, and stir until the solid is dissolved. Cool, and add water to make 200 mL. Store under toluene in a refrigerator.

Salt solution A: Dissolve 10 g of monobasic potassium phosphate and 10 g of dibasic potassium phosphate in water to make 200 mL, and add 2 drops of hydrochloric acid. Store this solution under toluene.

Salt solution B: Dissolve 4.0 g of magnesium sulfate, 0.20 g of sodium chloride, 0.20 g of ferrous sulfate, and 0.20 g of manganese sulfate in water to make 200 mL. Add 2 drops of hydrochloric acid. Store this solution under toluene.

Polysorbate 80 solution: 20 g of polysorbate 80 in alcohol to make 200 mL. Store in a refrigerator.

Vitamin solution A: 10 mg of riboflavin, 10 mg of thiamine hydrochloride, 100 μg of biotin, and 20 mg of niacin in 0.02 N acetic acid to make 400 mL. Store under toluene, protected from light, in a refrigerator.

Vitamin solution B: 20 mg of *p*-aminobenzoic acid, 10 mg of calcium pantothenate, 40 mg of pyridoxine hydrochloride, 40 mg of pyridoxal hydrochloride, 8 mg of pyridoxamine dihydrochloride, and 2 mg of folic acid in a mixture of water and neutralized alcohol (3:1) to make 400 mL. Store, protected from light, in a refrigerator.

Basal medium stock solution: Prepare the medium according to the following formula and directions. A dehydrated mixture containing the same ingredients may be used provided that, when constituted as

directed in the labeling, it yields a medium comparable to that obtained from the formula given herein. Add the ingredients in the order listed in *Table 2*, carefully dissolving cystine and tryptophan in the hydrochloric acid before adding the next eight solutions to the resulting solution. Add 100 mL of water, and dissolve the dextrose, sodium acetate, and ascorbic acid. Filter, if necessary. Add the *Polysorbate 80 solution*, adjust with 1 N sodium hydroxide to a pH of between 5.5 and 6.0, and add Purified Water to make 250 mL.

Table 2

L-Cystine	0.1 g
L-Tryptophan	0.05 g
1 N Hydrochloric acid	10 mL
Adenine-guanine-uracil solution	5 mL
Xanthine solution	5 mL
Vitamin solution A	10 mL
Vitamin solution B	10 mL
Salt solution A	5 mL
Salt solution B	5 mL
Asparagine solution	5 mL
Acid-hydrolyzed casein solution	25 mL
Dextrose, anhydrous	10 g
Sodium acetate, anhydrous	5 g
Ascorbic acid	1 g
Polysorbate 80 solution	5 mL

Tomato juice preparation: Centrifuge commercially canned tomato juice so that most of the pulp is removed. Suspend 5 g/L of analytical filter aid in the supernatant, and pass, with the aid of reduced pressure, through a layer of the filter aid. Repeat, if necessary, until a clear, straw-colored filtrate is obtained. Store under toluene in a refrigerator.

Culture medium: [NOTE—A dehydrated mixture containing the same ingredients may be used provided that, when constituted as directed in the labeling, it yields a medium equivalent to that obtained from the formula given herein.] Dissolve 0.75 g of yeast extract, 0.75 g of dried peptone, 1.0 g of anhydrous dextrose, and 0.20 g of monobasic potassium phosphate in 60–70 mL of water. Add 10 mL of *Tomato juice preparation* and 1 mL of *Polysorbate 80 solution*. Adjust with 1 N sodium hydroxide to a pH of 6.8, and add water to make 100 mL. Place 10-mL portions of the solution in test tubes, and plug with cotton. Sterilize the tubes and contents in an autoclave at 121° for 15 min. Cool as rapidly as possible to avoid color formation resulting from overheating the medium.

Suspension medium: Dilute a measured volume of *Basal medium stock solution* with an equal volume of water. Place 10-mL portions of the diluted medium in test tubes. Sterilize, and cool as directed for *Culture medium*.

Stock culture of *Lactobacillus leichmannii*: To 100 mL of *Culture medium* add 1.0–1.5 g of agar, and heat the mixture on a steam bath, with stirring, until the agar dissolves. Place 10-mL portions of the hot solution in test tubes, cover the tubes, sterilize at 121° for 15 min in an autoclave, and allow the tubes to cool in an upright position. Inoculate three or more of the tubes by stab transfer of a pure culture of *Lactobacillus leichmannii*.² [NOTE—Before first using a fresh culture in this assay, make NLT 10 successive transfers of the culture in a 2-week period.]

Incubate for 16–24 h at a temperature between 30° and 40° held constant to within $\pm 0.5^\circ$. Store in a refrigerator.

Prepare fresh stab cultures at least three times each week, and do not use them for preparing the *Inoculum* if more than 4 days old. The activity of the microorganism can be increased by daily or twice-daily transfer of the stab culture, to the point where definite turbidity in the liquid *Inoculum* can be observed 2–4 h after inoculation. A slow-growing culture seldom gives a suitable response curve and may lead to erratic results.

Inoculum: [NOTE—A frozen suspension of *Lactobacillus leichmannii* may be used as the stock culture, provided it yields an *Inoculum* comparable to a fresh culture.] Make a transfer of cells from the *Stock culture of Lactobacillus leichmannii* to two sterile tubes containing 10 mL of the *Culture medium* each. Incubate these cultures for 16–24 h at a temperature between 30° and 40° held constant to within $\pm 0.5^\circ$. Under aseptic conditions centrifuge the cultures, and decant the supernatant. Suspend the cells from the culture in 5 mL of sterile *Suspension medium*, and combine. Using sterile *Suspension medium*, adjust the volume so that a 1-in-20 dilution in saline TS produces 70% transmittance when read on a suitable spectrophotometer that has been set at a wavelength of 530 nm, equipped with a 10-mm cell, and read against saline TS set at 100% transmittance. Prepare a 1-in-400 dilution of the adjusted suspension using sterile *Basal medium stock solution*. The cell suspension so obtained is the *Inoculum*. [NOTE—This dilution may be altered, when necessary, to obtain the desired test response.]

Calibration of spectrophotometer: Check the wavelength of the spectrophotometer periodically, using a standard wavelength cell or other suitable device. Before reading any tests, calibrate the spectrophotometer for 0% and 100% transmittance, using water and with the wavelength set at 530 nm.

Analysis

Samples: *Standard solution* and *Sample solution*

Because of the high sensitivity of the test organism to minute amounts of vitamin B₁₂ activity and to traces of many cleansing agents, cleanse meticulously by suitable means, followed preferably by heating at 250° for 2 h, using hard-glass 20-mm \times 150-mm test tubes, and other necessary glassware.

To separate test tubes add, in duplicate, 1.0, 1.5, 2.0, 3.0, 4.0, and 5.0 mL of the *Standard solution*. To each of these tubes and to four similar empty tubes add 5.0 mL of *Basal medium stock solution* and sufficient water to make 10 mL.

To similar separate test tubes add, in duplicate, 1.0, 1.5, 2.0, 3.0, and 4.0 mL of the *Sample solution*. To each tube add 5.0 mL of *Basal medium stock solution* and sufficient water to make 10 mL. Place one complete set of Standard and sample tubes together in one tube rack and the duplicate set in a second rack or section of a rack, preferably in random order.

Cover the tubes to prevent bacterial contamination, and sterilize in an autoclave at 121° for 5 min, arranging to reach this temperature in NMT 10 min by preheating the autoclave if necessary. Cool as rapidly as possible to avoid color formation resulting from overheating the medium. Take precautions to maintain uniformity of sterilizing and cooling conditions throughout the assay, because packing the tubes too closely in the autoclave or overloading it may cause variation in the heating rate.

Aseptically add 0.5 mL of *Inoculum* to each tube so prepared, except two of the four containing no *Standard solution* (the uninoculated blanks). Incubate the tubes at a temperature between 30° and 40°, held constant to within $\pm 0.5^\circ$, for 16–24 h.

Terminate growth by heating to a temperature NLT 80° for 5 min. Cool to room temperature. After agitating its

² Pure cultures of *Lactobacillus leichmannii* may be obtained as No. 7830 from ATCC, 10801 University Blvd., Manassas, VA 20110-2209.

contents, and read the transmittance at 530 nm when a steady state is reached. This steady state is observed a few seconds after agitation when the reading remains constant for 30 s or more. Allow approximately the same time interval for the reading on each tube.

With the transmittance set at 100% for the uninoculated blank, read the transmittance of the inoculated blank. If the difference is greater than 5% or if there is evidence of contamination with a foreign microorganism, disregard the results of the assay.

With the transmittance set at 100% for the uninoculated blank, read the transmittance of each of the remaining tubes. Disregard the results of the assay if the slope of the standard curve indicates a problem with sensitivity.

Calculation: Prepare a standard concentration-response curve by the following procedure. Test for and replace any aberrant individual transmittances. For each level of the Standard, calculate the response from the sum of the duplicate values of the transmittances (ΣS) as the difference, $y = 2.00 - \Sigma S$. Plot this response on the ordinate of cross-section paper against the logarithm of the mL of *Standard solution* per tube on the abscissa, using for the ordinate either an arithmetic or a logarithmic scale, whichever gives the better approximation to a straight line. Draw the straight line or smooth curve that best fits the plotted points. Calculate the response, $y = 2.00 - \Sigma U$, adding together the two transmittances for each level of the *Sample solution* (ΣU). Read from the standard curve the logarithm of the volume of the *Standard solution* corresponding to each of those values of y that falls within the range of the lowest and highest points plotted for the Standard. Subtract from each logarithm so obtained the logarithm of the volume, in mL, of the *Sample solution* to obtain the difference, X , for each dosage level. Average the values of X for each of three or more dosage levels to obtain \bar{X} , which equals the log-relative potency, M' , of the *Sample solution*. Determine the quantity, in μg , of cyanocobalamin in the portion of Capsules taken:

$$\text{antilog } M = \text{antilog } (M' + \log R)$$

R = number of μg of cyanocobalamin that was assumed to be present in each mg in the portion of Capsules taken

Calculate the percentage of the labeled amount of biotin in the portion of the Capsules taken:

$$\text{Result} = [(\text{antilog } M)/N] \times 100$$

N = nominal amount of cyanocobalamin ($\text{C}_{63}\text{H}_{88}\text{CoN}_{14}\text{O}_{14}\text{P}$) in the portion of Capsules taken (μg)

Replication: Repeat the entire determination at least once, using separately prepared *Sample solutions*. If the difference between the two log-potencies M is NMT 0.08, their mean, \bar{M} , is the assayed log-potency of the test material (see *Vitamin B₁₂ Activity in Design and Analysis of Biological Assays* (111), *The Confidence Interval and Limits of Potency*). If the two determinations differ by more than 0.08, conduct one or more additional determinations. From the mean of two or more values of M that do not differ by more than 0.15, compute the mean potency of the preparation under assay.

Acceptance criteria: 90.0%–150.0% of the labeled amount of cyanocobalamin ($\text{C}_{63}\text{H}_{88}\text{CoN}_{14}\text{O}_{14}\text{P}$)

• **Folic Acid, Method 1**

[NOTE—Use low-actinic glassware throughout this procedure.]

Reagent A: 25% solution of tetrabutylammonium hydroxide in methanol

Reagent B: Transfer 5.0 g of pentetic acid to a 50-mL volumetric flask. Using sonication if necessary, dissolve in and dilute with 1 N sodium hydroxide to volume.

Mobile phase: 2 g of monobasic potassium phosphate in 650 mL of water. Add 12.0 mL of *Reagent A*, 7.0 mL of 3 N phosphoric acid, and 240 mL of methanol. Cool to room temperature, adjust with phosphoric acid or ammonia TS to a pH of 7.0, dilute with water to 1200 mL, and filter. Recheck the pH before use by adding water or methanol to the prepared *Mobile phase* to obtain baseline separation of folic acid and the internal standard. The pH may be increased up to 7.15 to obtain better separation. [NOTE—The methanol and water content may be varied (between 1% and 3%).]

Internal standard solution: Transfer 40 mg of methylparaben to a 1000-mL volumetric flask and add 220 mL of methanol to dissolve. Dissolve 2.0 g of monobasic potassium phosphate in 300 mL of water in a separate beaker, quantitatively transfer this solution to the flask containing the methylparaben solution, and add an additional 300 mL of water. Add 19 mL of *Reagent A*, 7 mL of 3 N phosphoric acid, and 30 mL of *Reagent B*. Adjust with ammonia TS to a pH of 9.8, bubble nitrogen through the solution for 30 min, dilute with water to volume, and mix.

Standard solution: 0.016 mg/mL of USP Folic Acid RS in *Internal standard solution*

Sample solution: Proceed as directed for *Ascorbic Acid, Method 1*, through “calculate the average net weight per Capsule.” Transfer an amount of Capsule contents to a suitable centrifuge tube, and add a volume of *Internal standard solution* to obtain a concentration of 0.016 mg/mL of folic acid. Shake by mechanical means for 10 min, and centrifuge. Filter a portion of the clear supernatant, and use the filtrate.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 3.9-mm \times 30-cm; packing L1

Flow rate: 1 mL/min

Injection size: 15 μL

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for folic acid and methylparaben are about 0.8 and 1.0, respectively.]

Suitability requirements

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas for folic acid and methylparaben. Calculate the percentage of the labeled amount of folic acid ($\text{C}_{19}\text{H}_{19}\text{N}_7\text{O}_6$) in the portion of Capsules taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = peak area ratio of folic acid to methylparaben from the *Sample solution*

R_S = peak area ratio of folic acid to methylparaben from the *Standard solution*

C_S = concentration of USP Folic Acid RS in the *Standard solution* ($\mu\text{g/mL}$)

C_U = nominal concentration of folic acid in the *Sample solution* ($\mu\text{g/mL}$)

Acceptance criteria: 90.0%–150.0% of the labeled amount of folic acid ($\text{C}_{19}\text{H}_{19}\text{N}_7\text{O}_6$)

• **Folic Acid, Method 2**

[NOTE—Use low-actinic glassware throughout this procedure.]

Reagent: Dissolve 7.5 g of edetate disodium, with stirring, in 500 mL of water containing 10 mL of ammonium hydroxide.

Diluent: 60 µg/mL of ammonium hydroxide

Mobile phase: Transfer 0.4 mL of triethylamine, 15 mL of glacial acetic acid, and 350 mL of methanol to a 2000-mL volumetric flask, and dilute with 0.008 M sodium 1-hexanesulfonate to volume.

Standard stock solution: 60 µg/mL of USP Folic Acid RS in *Diluent*. Prepare this solution fresh daily.

Standard solution: Mix 5.0 mL of *Standard stock solution* with 10.0 mL of methanol and 35.0 mL of *Reagent*. Shake for 15 min in a water bath maintained at 60°, and cool. Filter, discarding the first few mL of the filtrate.

Sample solution: Proceed as directed for the *Sample solution* for *Ascorbic Acid, Method 1*, through "calculate the net weight of the Capsule contents." Transfer a portion of the Capsule contents, equivalent to 0.3 mg of folic acid to a 125-mL stoppered flask. Add 10.0 mL of methanol and 35.0 mL of *Reagent*. Shake for 15 min in a water bath maintained at 60°, and cool. Filter, discarding the first few mL of the filtrate.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 270 nm

Column: 4.6-mm × 25-cm; packing L7

Column temperature: 50°

Flow rate: 2 mL/min

Injection size: 5 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the areas of the major peaks. Calculate the percentage of the labeled amount of folic acid ($C_{19}H_{19}N_7O_6$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of folic acid from the *Sample solution*

r_S = peak area of folic acid from the *Standard solution*

C_S = concentration of USP Folic Acid RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of folic acid in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–150.0% of the labeled amount of folic acid ($C_{19}H_{19}N_7O_6$)

• DEXPANTHENOL or PANTHENOL

[NOTE—The following procedure is applicable also to the determination of the dextrorotatory component of racemic panthenol in preparations containing panthenol.]

Dehydrated mixtures yielding formulations similar to the media described herein may be used provided that, when constituted as directed, they have growth-promoting properties equal to or superior to those obtained with the media prepared as described herein.

Standard stock solution: 800 µg/mL of USP Dexpantenol RS or 1600 µg/mL of USP Racemic Panthenol RS in water. Store in a refrigerator, protected from light, and use within 30 days.

Standard solution: On the day of the assay, prepare a dilution of 1.2 µg/mL of dexpantenol or 2.4 µg/mL of panthenol from *Standard stock solution* diluted with water.

Sample solution: Weigh NLT 30 Capsules in a tared weighing bottle. Open the Capsules, without loss of shell material, and transfer the contents as completely as possible to a beaker. Remove any contents adhering to the empty Capsule shells by washing with several portions of ether. Discard the washings, and dry the Capsule shells with the aid of a current of dry air until

the odor of ether is no longer perceptible. Weigh the empty Capsule shells in the tared weighing bottle, and calculate the average net weight per Capsule. Dissolve a portion of the Capsule contents, equivalent to 1.2 mg of dexpantenol or 2.4 mg of panthenol, in 100.0 mL of water. Quantitatively dilute a portion of this solution with water to obtain a concentration of 1.2 µg/mL of dexpantenol or

2.4 µg/mL of panthenol.

Acid-hydrolyzed casein solution: Mix 100 g of vitamin-free casein with 500 mL of 6 N hydrochloric acid, and reflux the mixture for 8–12 h. Remove the hydrochloric acid from the mixture by distillation under reduced pressure until a thick paste remains. Redissolve the resulting paste in about 500 mL of water, adjust the solution with 1 N sodium hydroxide to a pH of 3.5 ± 0.1 , and add water to make 1000 mL. Add 20 g of activated charcoal, stir for 1 h, and filter. Repeat the treatment with activated charcoal. Store under toluene in a cool place at a temperature not below 10°. Filter the solution if a precipitate forms during storage.

Cystine–tryptophan solution: Suspend 4.0 g of L-cystine in a solution of 1.0 g of L-tryptophan (or 2.0 g of D,L-tryptophan) in 700–800 mL of water, heat to $75 \pm 5^\circ$, and add hydrochloric acid solution (1 in 2) dropwise, with stirring, until the solids are dissolved. Cool, and add water to make 1000 mL. Store under toluene in a cool place at a temperature not below 10°.

Adenine–guanine–uracil solution: Dissolve 200 mg each of adenine sulfate, guanine hydrochloride, and uracil, with the aid of heat, in 10 mL of 4 N hydrochloric acid. Cool. Add water to make 200 mL. Store under toluene in a refrigerator.

Polysorbate 80 solution: 100 mg/mL of polysorbate 80 in alcohol

Riboflavin–thiamine hydrochloride–biotin solution: 20 µg/mL of riboflavin, 10 µg/mL of thiamine hydrochloride, and 0.04 µg/mL of biotin in 0.02 N acetic acid. Store under toluene, protected from light, in a refrigerator.

p-Aminobenzoic acid–niacin–pyridoxine hydrochloride solution: 10 µg/mL of p-aminobenzoic acid, 50 µg/mL of niacin, and 40 µg/mL of pyridoxine hydrochloride in neutral 25% alcohol. Store in a refrigerator.

Salt solution A: 50 mg/mL of monobasic potassium phosphate and 50 mg/mL of dibasic potassium phosphate in water. Add 10 drops of hydrochloric acid/L of solution. Store under toluene.

Salt solution B: 20 mg/mL of magnesium sulfate, 1 mg/mL of sodium chloride, 1 mg/mL of ferrous sulfate, and 1 mg/mL of manganese sulfate in water. Add 10 drops of hydrochloric acid/L of the solution. Store under toluene.

Pyridoxal–calcium pantothenate solution: 200 µg/mL of pyridoxal hydrochloride and 1.875 µg/mL of calcium pantothenate in 10% alcohol. Store in a refrigerator, and use within 30 days.

Polysorbate 40–oleic acid solution: 50 mg/mL of polysorbate 40 and 0.5 mg/mL of oleic acid in 20% alcohol. Store in a refrigerator, and use within 30 days.

Modified pantothenate medium: Dissolve anhydrous dextrose and sodium acetate in the solutions previously mixed according to *Table 3*, and adjust with 1 N sodium hydroxide to a pH of 6.8. Finally, dilute with water to 250 mL.

Table 3

Acid-hydrolyzed casein solution	25 mL
Cystine–tryptophan solution	25 mL
Polysorbate 80 solution	0.25 mL
Dextrose, anhydrous	10 g

Table 3 (Continued)

Sodium acetate, anhydrous	5 g
Adenine–guanine–uracil solution	5 mL
Riboflavin–thiamine hydrochloride–biotin solution	5 mL
<i>p</i> -Aminobenzoic acid–niacin–pyridoxine hydrochloride solution	5 mL
Salt solution A	5 mL
Salt solution B	5 mL
Pyridoxal–calcium pantothenate solution	5 mL
Polysorbate 40–oleic acid solution	5 mL

Double-strength modified pantothenate medium:

Prepare as directed in *Modified pantothenate medium*, but make the final dilution to 125 mL instead of 250 mL. Prepare fresh.

Stock culture of *Pediococcus acidilactici*: Dissolve in 800 mL of water, with the aid of heat, 6.0 g of peptone, 4.0 g of pancreatic digest of casein, 3.0 g of yeast extract, 1.5 g of beef extract, 1.0 g of dextrose, and 15.0 g of agar. Adjust with 0.1 N sodium hydroxide or 0.1 N hydrochloric acid to a pH of 6.5–6.6, and dilute with water to 1000 mL. Add 10-mL portions of the solution to culture tubes, place caps on the tubes, and sterilize in an autoclave at 121° for 15 min. Cool on a slant, and store in a refrigerator. Prepare a stock culture of *Pediococcus acidilactici*³ on a slant of this medium. Incubate at 35° for 20–24 h, and store in a refrigerator. Maintain the stock culture by monthly transfer onto fresh slants.

Inoculum: Inoculate three 250-mL portions of *Modified pantothenate medium* from a stock culture slant, and incubate at 35° for 20–24 h. Centrifuge the suspension from the combined portions, and wash the cells with *Modified pantothenate medium*. Resuspend the cells in sufficient *Modified pantothenate medium* so that a 1-in-50 dilution, when tested in a 13-mm diameter test tube, gives 80% light transmission at 530 nm. Transfer 1.2-mL portions of this stock suspension to glass ampuls, seal, freeze in liquid nitrogen, and store in a freezer. On the day of the assay, allow the ampuls to reach room temperature, mix the contents, and dilute 1 mL of thawed culture with sterile saline TS to 150 mL. [NOTE—This dilution may be altered when necessary to obtain the desired test response.]

Analysis: Prepare in triplicate a series of eight culture tubes by adding the following quantities of water to the tubes within a set: 5.0, 4.5, 4.0, 3.5, 3.0, 2.0, 1.0, and 0.0 mL. To these same tubes and in the same order, add 0.0, 0.5, 1.0, 1.5, 2.0, 3.0, 4.0, and 5.0 mL of the *Standard solution*.

Prepare in duplicate a series of five culture tubes by adding the following quantities of water to the tubes within a set: 4.0, 3.5, 3.0, 2.0, and 1.0 mL. To these same tubes, and in the same order, add 1.0, 1.5, 2.0, 3.0, and 4.0 mL of the *Sample solution*.

Add 5.0 mL of *Double-strength modified pantothenate medium* to each tube. Cover the tubes with metal caps, and sterilize in an autoclave at 121° for 5 min. Cool to room temperature in a chilled water bath, and inoculate each tube with 0.5 mL of the *Inoculum*. Allow to incubate at 37° for 16 h. Terminate growth by heating to a temperature NLT 80°, such as by steaming at atmospheric pressure in a sterilizer for 5–10 min. Cool, and determine the percentage transmittance of the suspensions, in cells of equal pathlength, on a suitable spectrophotometer, at a wavelength of 530 nm.

Calculation: Draw a dose-response curve on arithmetic graph paper by plotting the average response, in percentage of transmittance, for each set of tubes of

the standard curve against the standard level concentrations. The curve is drawn by connecting each adjacent pair of points with a straight line. From this standard curve, determine by interpolation the potency, of each tube containing portions of the *Sample solution*. Divide the potency of each tube by the amount of the *Sample solution* added to it, to obtain the individual responses. Calculate the mean response by averaging the individual responses that vary from their mean by NMT 15%, using NLT half the total number of tubes. Calculate the potency of the portion of the material taken, by multiplying the mean response by the appropriate dilution factor. Calculate the percentage of the labeled amount of dexpanthenol or panthenol in the portion of Capsules taken:

$$\text{Result} = (P/N) \times 100$$

P = potency of dexpanthenol or panthenol in the portion of Capsules taken (mg)
N = nominal amount of dexpanthenol or panthenol in the portion of Capsules taken (mg)

Acceptance criteria: 90.0%–150.0% of the labeled amount of dexpanthenol or panthenol (C₉H₁₉NO₄)

• **CALCIUM PANTOTHENATE, Method 1**

Mobile phase: Phosphoric acid and water (1:1000)

Internal standard solution: 80 mg of *p*-hydroxybenzoic acid in 3 mL of alcohol. Add 50 mL of water and 7.1 g of dibasic sodium phosphate, and dilute with water to 1000 mL. Adjust with phosphoric acid to a pH of 6.7.

Standard solution: 0.6 mg/mL of USP Calcium Pantothenate RS in *Internal standard solution*

Sample solution: Proceed as directed for *Ascorbic Acid, Method 1*, through “calculate the average net weight per Capsule.” To a centrifuge tube, transfer an amount of mixed Capsule contents and a volume of *Internal standard solution* to obtain a concentration of 0.6 mg/mL in the *Sample solution*.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 210 nm

Column: 3.9-mm × 15-cm; packing L1

Flow rate: 1.5 mL/min

Injection size: 10 µL

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for calcium pantothenate and *p*-hydroxybenzoic acid are about 0.5 and 1.0, respectively.]

Suitability requirements

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak responses for calcium pantothenate and the internal standard. Calculate the percentage of the labeled amount of calcium pantothenate (C₁₈H₃₂CaN₂O₁₀) in the portion of Capsules taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = peak response ratio of calcium pantothenate to *p*-hydroxybenzoic acid from the *Sample solution*

R_S = peak response ratio of calcium pantothenate to *p*-hydroxybenzoic acid from the *Standard solution*

C_S = concentration of USP Calcium Pantothenate RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of calcium pantothenate in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–150.0% of the labeled amount of calcium pantothenate (C₁₈H₃₂CaN₂O₁₀)

³ ATCC No. 8042 is suitable.

• **CALCIUM PANTOTHENATE, Method 2**

Standard stock solution: Dissolve 50 mg of USP Calcium Pantothenate RS, previously dried and stored in the dark over phosphorus pentoxide and protected from absorption of moisture while weighing, in 500 mL of water in a 1000-mL volumetric flask. Add 10 mL of 0.2 N acetic acid and 100 mL of sodium acetate solution (1 in 60), and dilute with water to volume, to obtain a concentration of 50 µg/mL of USP Calcium Pantothenate RS. Store under toluene in a refrigerator.

Standard solution: On the day of the assay, dilute a volume of *Standard stock solution* with water to obtain a concentration of 0.01–0.04 µg/mL of calcium pantothenate, the exact concentration being such that the responses obtained as directed in the *Analysis*, 2.0 and 4.0 mL of the *Standard solution* being used, are within the linear portion of the log-concentration response curve.

Sample solution: Proceed as directed for *Ascorbic Acid, Method 1*, through “calculate the average net weight per Capsule.” Transfer a portion of the Capsule contents, equivalent to an amount of 50 mg of calcium pantothenate, to a 1000-mL volumetric flask containing 500 mL of water. Add 10 mL of 0.2 N acetic acid and 100 mL of sodium acetate solution (1 in 60), dilute with water to volume, and filter. Dilute a volume of this solution to obtain a solution having approximately the same concentration as that of the *Standard solution*.

Acid-hydrolyzed casein solution: Mix 100 g of vitamin-free casein with 500 mL of 6 N hydrochloric acid, and reflux the mixture for 8–12 h. Remove the hydrochloric acid from the mixture by distillation under reduced pressure until a thick paste remains. Redissolve the resulting paste in water, adjust the solution with 1 N sodium hydroxide to a pH of 3.5 ± 0.1 , and add water to make 1000 mL. Add 20 g of activated charcoal, stir for 1 h, and filter. Repeat the treatment with activated charcoal. Store under toluene in a cool place at a temperature not below 10°. Filter the solution if a precipitate forms during storage.

Cystine–tryptophan solution: Suspend 4.0 g of L-cystine in a solution of 1.0 g of L-tryptophan (or 2.0 g of D,L-tryptophan) in 700–800 mL of water, heat to 70°–80°, and add dilute hydrochloric acid (1 in 2) dropwise, with stirring, until the solids are dissolved. Cool, and add water to make 1000 mL. Store under toluene in a cool place at a temperature not below 10°.

Adenine–guanine–uracil solution: Dissolve 200 mg each of adenine sulfate, guanine hydrochloride, and uracil, with the aid of heat, in 10 mL of 4 N hydrochloric acid. Cool, and add water to make 200 mL. Store under toluene in a refrigerator.

Polysorbate 80 solution: 100 mg/mL of polysorbate 80 in alcohol

Riboflavin–thiamine hydrochloride–biotin solution: 20 µg/mL of riboflavin, 10 µg/mL of thiamine hydrochloride, and 0.04 µg/mL of biotin in 0.02 N acetic acid. Store under toluene, protected from light, in a refrigerator.

p-Aminobenzoic acid–niacin–pyridoxine hydrochloride solution: 10 µg/mL of p-aminobenzoic acid, 50 µg/mL of niacin, and 40 µg/mL of pyridoxine hydrochloride in a mixture of neutralized alcohol and water (1:3). Store in a refrigerator.

Salt solution A: Dissolve 25 g of monobasic potassium phosphate and 25 g of dibasic potassium phosphate in water to make 500 mL. Add 5 drops of hydrochloric acid. Store under toluene.

Salt solution B: Dissolve 10 g of magnesium sulfate, 0.5 g of sodium chloride, 0.5 g of ferrous sulfate, and 0.5 g of manganese sulfate in water to make 500 mL. Add 5 drops of hydrochloric acid. Store under toluene.

Basal medium stock solution: Dissolve the anhydrous dextrose and anhydrous sodium acetate in the solutions previously mixed according to *Table 4*, and adjust with

1 N sodium hydroxide to a pH of 6.8. Dilute with water to 250 mL.

Table 4

Acid-hydrolyzed casein solution	25 mL
Cystine–tryptophan solution	25 mL
Polysorbate 80 solution	0.25 mL
Dextrose, anhydrous	10 g
Sodium acetate, anhydrous	5 g
Adenine–guanine–uracil solution	5 mL
Riboflavin–thiamine hydrochloride–biotin solution	5 mL
p-Aminobenzoic acid–niacin–pyridoxine hydrochloride solution	5 mL
Salt solution A	5 mL
Salt solution B	5 mL

Stock culture of *Lactobacillus plantarum*: Dissolve 2.0 g of yeast extract in 100 mL of water. Add 500 mg of anhydrous dextrose, 500 mg of anhydrous sodium acetate, and 1.5 g of agar, and heat the mixture on a steam bath, with stirring, until the agar dissolves. Add 10-mL portions of the hot solution to the test tubes, close or cover the tubes, sterilize in an autoclave at 121° for 15 min, and allow the tubes to cool in an upright position. Prepare stab cultures in three or more of the tubes, using a pure culture of *Lactobacillus plantarum*¹ incubating for 16–24 h at a temperature between 30° and 37° held constant to within $\pm 0.5^\circ$. Store in a refrigerator. Prepare a fresh stab of the stock culture every week, and do not use for *Inoculum* if the culture is more than 1 week old.

Culture medium: Add 5.0 mL of water containing 0.2 µg of calcium pantothenate to each of a series of test tubes containing 5.0 mL of *Basal medium stock solution*. Plug the tubes with cotton, sterilize in an autoclave at 121° for 15 min, and cool.

Inoculum: [NOTE—A frozen suspension of *Lactobacillus plantarum* may be used as the stock culture, provided it yields an *Inoculum* comparable to a fresh culture.] Make a transfer of cells from the of *Stock culture of Lactobacillus plantarum* to a sterile tube containing 10 mL of culture medium. Incubate this culture for 16–24 h at a temperature between 30° and 37° held constant to within $\pm 0.5^\circ$. The cell suspension so obtained is the *Inoculum*.

Analysis

Samples: *Standard solution* and *Sample solution*
To similar separate test tubes add, in duplicate, 1.0 and/or 1.5, 2.0, 3.0, 4.0, and 5.0 mL of the *Standard solution*. To each tube and to four similar empty tubes add 5.0 mL of *Basal medium stock solution* and sufficient water to make 10 mL.

To similar separate test tubes add, in duplicate, volumes of the *Sample solution* corresponding to three or more of the levels specified for the *Standard solution*, including the levels of 2.0, 3.0, and 4.0 mL. To each tube add 5.0 mL of the *Basal medium stock solution* and sufficient water to make 10 mL. Place one complete set of Standard and sample tubes together in one tube rack and the duplicate set in a second rack or section of a rack, preferably in random order.

Cover the tubes of both series to prevent contamination, and sterilize in an autoclave at 121° for 5 min. Cool, and add 1 drop of *Inoculum* to each tube, except two of the four tubes containing no *Standard solution* (the uninoculated blanks). Incubate the tubes at a temperature between 30° and 37° held constant to within $\pm 0.5^\circ$ until, following 16–24 h of incubation, there has been no substantial increase in turbidity in the tubes containing the highest level of Standard during a 2-h period.

Determine the transmittance of the tubes in the following manner. Mix the contents of each tube, and transfer to an optical container if necessary. Read the transmittance from 540 to 660 nm when a steady state is reached. This steady state is observed a few seconds after agitation when the galvanometer reading remains constant for 30 s or more. Allow approximately the same time interval for the reading on each tube.

With the transmittance set at 1.00 for the uninoculated blank, read the transmittance of the inoculated blank. With the transmittance set at 1.00 for the inoculated blank, read the transmittance for each of the remaining tubes. If there is evidence of contamination with a foreign microorganism, disregard the result of the assay.

Calculation: Prepare a standard concentration-response curve as follows. For each level of the Standard, calculate the response from the sum of the duplicate values of the transmittance (Σ_s) as the difference, $y = 2.00 - \Sigma_s$. Plot this response on the ordinate of cross-section paper against the logarithm of the mL of *Standard solution* per tube on the abscissa, using for the ordinate either an arithmetic or a logarithmic scale, whichever gives the better approximation to a straight line. Draw the straight line or smooth curve that best fits the plotted points.

Calculate the response, $y = 2.00 - \Sigma_u$, adding together the two transmittances for each level of the *Sample solution* (Σ_u). Read from the standard curve the logarithm of the volume of the *Standard solution* corresponding to each of those values of y that fall within the range of the lowest and highest points plotted for the Standard. Subtract from each logarithm so obtained the logarithm of the volume, in mL, of the *Sample solution* to obtain the difference, X , for each dosage level. Average the values of X for each of three or more dosage levels to obtain \bar{X} , which equals the log-relative potency, M' , of the *Sample solution*. Determine the quantity, in mg, of calcium pantothenate ($C_{18}H_{32}CaN_2O_{10}$) in the portion of Capsules taken:

$$\text{antilog } M = \text{antilog } (M' + \log R)$$

R = number of mg of calcium pantothenate that was assumed to be present in the portion of the Capsules taken

Calculate the percentage of calcium pantothenate in the portion of Capsules taken:

$$\text{Result} = [(\text{antilog } M)/N] \times 100$$

N = nominal amount of calcium pantothenate in the portion of the Capsules taken (mg)

Replication: Repeat the entire determination at least once, using separately prepared *Sample solutions*. If the difference between the two log-potencies M is NMT 0.08, their mean, \bar{M} , is the assayed log-potency of the test material (see *Design and Analysis of Biological Assays* (11), *The Confidence Interval and Limits of Potency*). If the two determinations differ by more than 0.08, conduct one or more additional determinations. From the mean of two or more values of M that do not differ by more than 0.15, compute the mean potency of the preparation under assay.

Acceptance criteria: 90.0%–150.0% of the labeled amount of calcium pantothenate ($C_{18}H_{32}CaN_2O_{10}$)

• CALCIUM PANTOTHENATE, *Method 3*

Buffer solution: Dissolve 10.0 g of monobasic potassium phosphate in 2000 mL of water, and adjust with phosphoric acid to a pH of 3.5.

Mobile phase: Methanol and *Buffer solution* (1:9)

Standard stock solution: 0.25 mg/mL of USP Calcium Pantothenate RS in water. Prepare fresh every 4 weeks. Store in a refrigerator.

Standard solution: 40 µg/mL of USP Calcium Pantothenate RS from *Standard stock solution* diluted with water

Sample solution: Proceed as directed for the *Sample solution for Ascorbic Acid, Method 1*, through “calculate the net weight of the Capsule contents.” Transfer a portion of the Capsule contents, equivalent to 10 mg of calcium pantothenate, to a 250-mL volumetric flask. Add 10 mL of methanol, and swirl the flask to disperse the Capsule contents. Dilute with water to volume, mix, and filter.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 205 nm

Column: 3.9-mm × 30-cm; 5-µm packing L1

Column temperature: 50°

Flow rate: 2 mL/min

Injection size: 25 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas for calcium pantothenate.

Calculate the percentage of the labeled amount of calcium pantothenate ($C_{18}H_{32}CaN_2O_{10}$) in the portion of Capsules taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

r_u = peak area from the *Sample solution*

r_s = peak area from the *Standard solution*

C_s = concentration of USP Calcium Pantothenate RS in the *Standard solution* (mg/mL)

C_u = nominal concentration of calcium pantothenate in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–150.0% of the labeled amount of calcium pantothenate ($C_{18}H_{32}CaN_2O_{10}$)

• NIACIN OR NIACINAMIDE, PYRIDOXINE HYDROCHLORIDE, RIBOFLAVIN, and THIAMINE, *Method 1*

[NOTE—Use low-actinic glassware throughout this procedure.]

Diluent: Acetonitrile, glacial acetic acid, and water (5:1:94)

Mobile phase: A mixture of methanol, glacial acetic acid, and water (27:1:73) containing 140 mg of sodium 1-hexanesulfonate per 100 mL

Standard solution: [NOTE—Use USP Niacin RS in place of USP Niacinamide RS for formulations containing niacin.] Transfer 80 mg of USP Niacinamide RS, 20 mg of USP Pyridoxine Hydrochloride RS, 20 mg of USP Riboflavin RS, and 20 mg of USP Thiamine Hydrochloride RS, to a 200-mL volumetric flask, and add 180 mL of *Diluent*. Immerse the flask in a hot water bath maintained at 65°–70° for 10 min with regular shaking or using a vortex mixer, until all the solid materials are dissolved. Chill rapidly in a cold water bath for 10 min to room temperature, and dilute with *Diluent* to volume.

Sample solution: Proceed as directed for *Ascorbic Acid, Method 1*, through “calculate the average net weight per Capsule.” Transfer a portion of the Capsule contents, equivalent to 10 mg of niacinamide and 2.5 mg each of pyridoxine hydrochloride, riboflavin, and thiamine hydrochloride, to a 50-mL centrifuge tube. Add 25.0 mL of *Diluent*, and mix using a vortex mixer for 30 s to completely suspend the powder. Immerse the centrifuge tube in a hot water bath maintained at 65°–70°, heat for 5 min, and mix on a vortex mixer for 30 s. Return the tube to the hot water bath, heat for another 5 min, and mix on a vortex mixer for 30 s. Filter a portion of the solution, cool to

room temperature, and use the clear filtrate. [NOTE—Use the filtrate within 3 h of filtration.]

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas for niacin or niacinamide, pyridoxine, riboflavin, and thiamine. Calculate the percentage of the labeled amount of niacinamide ($C_6H_6N_2O$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of niacinamide from the *Sample solution*

r_S = peak area of niacinamide from the *Standard solution*

C_S = concentration of USP Niacinamide RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of niacinamide in the *Sample solution* (mg/mL)

For formulations containing niacin:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of niacin from the *Sample solution*

r_S = peak area of niacin from the *Standard solution*

C_S = concentration of USP Niacin RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of niacin in the *Sample solution* (mg/mL)

Separately calculate the percentage of the labeled amount of pyridoxine hydrochloride ($C_8H_{11}NO_3 \cdot HCl$), riboflavin ($C_{17}H_{20}N_4O_6$), and thiamine hydrochloride ($C_{12}H_{17}ClN_4OS \cdot HCl$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of the corresponding vitamin from the *Sample solution*

r_S = peak area of the corresponding vitamin from the *Standard solution*

C_S = concentration of the relevant USP Reference Standard in the *Standard solution* (mg/mL)

C_U = nominal concentration of the corresponding vitamin in the *Sample solution* (mg/mL)

For products containing thiamine mononitrate, calculate the percentage of the labeled amount of thiamine mononitrate ($C_{12}H_{17}N_5O_4S$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak area of thiamine from the *Sample solution*

r_S = peak area of thiamine from the *Standard solution*

C_S = concentration of USP Thiamine Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of thiamine mononitrate in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of thiamine mononitrate, 327.36

M_{r2} = molecular weight of thiamine hydrochloride, 337.27

Acceptance criteria: 90.0%–150.0% of the labeled amount of niacinamide ($C_6H_6N_2O$) or niacin ($C_6H_5NO_2$), pyridoxine hydrochloride ($C_8H_{11}NO_3 \cdot HCl$), riboflavin ($C_{17}H_{20}N_4O_6$), and thiamine as thiamine hydrochloride ($C_{12}H_{17}ClN_4OS \cdot HCl$) or thiamine mononitrate ($C_{12}H_{17}N_5O_4S$)

• NIACIN, Method 2

[NOTE—Use low-actinic glassware throughout this procedure.]

Solution A: Transfer 1 mL of glacial acetic acid and 2.5 g of edetate disodium to a 100-mL volumetric flask. Dissolve in and dilute with water to volume.

Extraction solvent: *Solution A* and methanol (3:1)

Mobile phase: 0.1 M sodium acetate solution (13.6 mg/mL of sodium acetate in water). Adjust with acetic acid to a pH of 5.4. [NOTE—A small amount of methanol (up to 1%) may be added to the *Mobile phase* to improve resolution.]

Standard stock solution: 1 mg/mL of USP Niacin RS in *Extraction solvent*

Standard solution: Transfer 5.0 mL of *Standard stock solution* to a 25-mL volumetric flask. Dilute with *Extraction solvent* to volume.

Sample solution: [NOTE—This preparation is suitable for the determination of niacin or niacinamide, pyridoxine, and riboflavin, when present in the formulation.] Weigh NLT 20 Capsules in a tared weighing bottle. Open the Capsules, without loss of shell material, and transfer the contents to a beaker. Remove any contents adhering to the shells by washing with several portions of ether. Discard the washings, and dry the Capsule shells with the aid of a current of dry air. Weigh the empty Capsule shells in the tared weighing bottle, and calculate the net weight of the Capsule contents. Transfer a portion of the Capsule contents, equivalent to 2 mg of riboflavin, to a 200-mL volumetric flask. If riboflavin is not present in the formulation, use a portion, equivalent to a nominal amount of 2 mg of pyridoxine. If pyridoxine is not present in the formulation, use a portion, equivalent to 20 mg of niacin or niacinamide. Add 100.0 mL of *Extraction solvent*, and mix for 20 min, using a wrist-action shaker. Immerse the flask in a water bath maintained at 70°–75°, and heat for 20 min. Mix on a vortex mixer for 30 s, cool to room temperature, and filter. Use the clear filtrate.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm × 25-cm; packing L1

Flow rate: 1 mL/min

Injection size: 20 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 3.0%

[NOTE—If necessary, flush the column with methanol between injections.]

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas for niacin. Calculate the percentage of the labeled amount of niacin ($C_6H_5NO_2$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area from the *Sample solution*

r_S = peak area from the *Standard solution*

C_S = concentration of USP Niacin RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of niacin in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–150.0% of the labeled amount of niacin ($C_6H_5NO_2$)

• **NIACINAMIDE, Method 2**

[NOTE—Use low-actinic glassware throughout this procedure.]

Solution A, Extraction solvent, Mobile phase, Standard stock solution, Standard solution, Sample solution, Chromatographic system, and System suitability solution: Using USP Niacinamide RS in place of USP Niacin RS, proceed as directed for *Niacin, Method 2*.

Analysis

Samples: *Standard solution* and *Sample solution*
Measure the peak areas for niacinamide. Calculate the percentage of the labeled amount of niacinamide ($C_6H_6N_2O$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area from the *Sample solution*

r_S = peak area from the *Standard solution*

C_S = concentration of USP Niacinamide RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of niacinamide in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–150.0% of the labeled amount of niacinamide ($C_6H_6N_2O$)

• **PYRIDOXINE HYDROCHLORIDE, Method 2**

[NOTE—Use low-actinic glassware throughout this procedure.]

Extraction solvent, Mobile phase, and Sample solution: Prepare as directed for *Niacin, Method 2*.

Standard stock solution: 0.1 mg/mL of USP Pyridoxine Hydrochloride RS in *Extraction solvent*

Standard solution: 20 µg/mL of USP Pyridoxine Hydrochloride RS from *Standard stock solution* diluted with *Extraction solvent*

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm × 25-cm; packing L1

Flow rate: 1 mL/min

Injection size: 20 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*
Measure the peak areas for pyridoxine. Calculate the percentage of the labeled amount of pyridoxine hydrochloride ($C_8H_{11}NO_3 \cdot HCl$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area from the *Sample solution*

r_S = peak area from the *Standard solution*

C_S = concentration of USP Pyridoxine Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of pyridoxine hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–150.0% of the labeled amount of pyridoxine hydrochloride ($C_8H_{11}NO_3 \cdot HCl$)

• **RIBOFLAVIN, Method 2**

[NOTE—Use low-actinic glassware throughout this procedure.]

Extraction solvent and Sample solution: Prepare as directed for *Niacin, Method 2*.

Solution A: 6.8 g/L of sodium acetate in water

Mobile phase: Prepare a mixture of *Solution A* and methanol (1:3:7). Add 2 mL of triethylamine per L of the

mixture, and adjust with glacial acetic acid to a pH of 5.2.

Standard stock solution: Transfer 20 mg of USP Riboflavin RS to a 200-mL volumetric flask, and add 180 mL of *Extraction solvent*. Immerse the flask for 5 min in a water bath maintained at 65°–75°. Mix well, and repeat if necessary until dissolved. Chill rapidly in a cold water bath to room temperature, and dilute with *Extraction solvent* to volume.

Standard solution: Dilute 5.0 mL of *Standard stock solution* with *Extraction solvent* to 25.0 mL.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm × 25-cm; packing L1

Flow rate: 1 mL/min

Injection size: 20 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*
Measure the peak areas for riboflavin. Calculate the percentage of the labeled amount of riboflavin ($C_{17}H_{20}N_4O_6$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area from the *Sample solution*

r_S = peak area from the *Standard solution*

C_S = concentration of USP Riboflavin RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of riboflavin in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–150.0% of the labeled amount of riboflavin ($C_{17}H_{20}N_4O_6$)

• **THIAMINE, Method 2**

[NOTE—Use low-actinic glassware throughout this procedure.]

Solution A: 1.88 g/L of sodium 1-hexanesulfonate in 0.1% phosphoric acid

Mobile phase: *Solution A* and acetonitrile (46:9)

Standard stock solution: 0.1 mg/mL of USP Thiamine Hydrochloride RS in 0.2 N hydrochloric acid

Standard solution: 0.02 mg/mL of USP Thiamine Hydrochloride RS from *Standard stock solution* diluted with 0.2 N hydrochloric acid

Sample solution: Proceed as directed for the *Sample solution* for *Ascorbic Acid, Method 1*, through “calculate the net weight of the Capsule contents.” Mix a portion of the Capsule contents with a volume of 0.2 N hydrochloric acid to obtain a concentration of 0.02 mg/mL of thiamine. Shake for 15 min with a wrist-action shaker, and heat to boiling for 30 min. Cool to room temperature, and filter. Use the clear filtrate.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm × 25-cm; packing L1

Flow rate: 2 mL/min

Injection size: 20 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*
Measure the areas for the major peaks. For products containing thiamine hydrochloride, calculate the percentage of the labeled amount of thiamine

hydrochloride ($C_{12}H_{17}ClN_4OS \cdot HCl$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of thiamine from the *Sample solution*

r_S = peak area of thiamine from the *Standard solution*

C_S = concentration of USP Thiamine Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of thiamine hydrochloride in the *Sample solution* (mg/mL)

For products containing thiamine mononitrate, calculate the percentage of the labeled amount of thiamine mononitrate ($C_{12}H_{17}N_5O_4S$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak area of thiamine from the *Sample solution*

r_S = peak area of thiamine from the *Standard solution*

C_S = concentration of USP Thiamine Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of thiamine mononitrate in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of thiamine mononitrate, 327.36

M_{r2} = molecular weight of thiamine hydrochloride, 337.27

Acceptance criteria: 90.0%–150.0% of the labeled amount of thiamine as thiamine hydrochloride ($C_{12}H_{17}ClN_4OS \cdot HCl$) or thiamine mononitrate ($C_{12}H_{17}N_5O_4S$)

• **NIACIN OR NIACINAMIDE, PYRIDOXINE HYDROCHLORIDE, RIBOFLAVIN, and THIAMINE, Method 3**

[NOTE—Use low-actinic glassware throughout this procedure.]

Reagent: 25 mg/mL of edetate disodium in water

Mobile phase: Transfer 0.4 mL triethylamine, 15.0 mL of glacial acetic acid, and 350 mL of methanol to a 2000-mL volumetric flask. Dilute with 0.008 M sodium 1-hexanesulfonate to volume.

Standard stock solution: 1.5 mg/mL of USP Niacin RS or USP Niacinamide RS, 0.24 mg/mL of USP Pyridoxine Hydrochloride RS, 0.08 mg/mL of USP Riboflavin RS, and 0.24 mg/mL of USP Thiamine Hydrochloride RS in the *Reagent*, with heating if necessary

Standard solution: Transfer 5.0 mL of *Standard stock solution* to a stoppered 125-mL flask. Add 10.0 mL of a mixture of methanol and glacial acetic acid (9:1) and 30.0 mL of a mixture of methanol and ethylene glycol (1:1). Insert the stopper, shake for 15 min in a water bath maintained at 60°, and cool. Filter, discarding the first few mL of the filtrate.

Sample solution: Proceed as directed for the *Sample solution for Ascorbic Acid, Method 1*, through “calculate the net weight of the Capsule contents.” Transfer a portion of the Capsule contents, equivalent to 7.5 mg of niacin or niacinamide, 1.2 mg of pyridoxine hydrochloride, 0.4 mg of riboflavin, and 1.2 mg of thiamine hydrochloride, to a stoppered 125-mL flask. Add 10.0 mL of a mixture of methanol and glacial acetic acid (9:1), and 30.0 mL of a mixture of methanol and ethylene glycol (1:1). Insert the stopper, shake for 15 min in a water bath maintained at 60°, and cool. Filter, discarding the first few mL of the filtrate.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 270 nm

Column: 4.6-mm × 25-cm; packing L7

Column temperature: 50°

Injection size: 5 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the areas of the peaks. Calculate the percentage of the labeled amount of niacin ($C_6H_5NO_2$) or niacinamide ($C_6H_6N_2O$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of niacin or niacinamide from the *Sample solution*

r_S = peak area of niacin or niacinamide from the *Standard solution*

C_S = concentration of USP Niacin RS or USP Niacinamide RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of niacin or niacinamide in the *Sample solution* (mg/mL)

Separately calculate the percentage of the labeled amount of pyridoxine hydrochloride ($C_8H_{11}NO_3 \cdot HCl$), riboflavin ($C_{17}H_{20}N_4O_6$) and thiamine ($C_{12}H_{17}ClN_4OS$) (for products containing thiamine hydrochloride) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of the corresponding vitamin from the *Sample solution*

r_S = peak area of the corresponding vitamin from the *Standard solution*

C_S = concentration of the relevant USP Reference Standard in the *Standard solution* (mg/mL)

C_U = nominal concentration of the corresponding vitamin in the *Sample solution* (mg/mL)

For products containing thiamine mononitrate, calculate the percentage of the labeled amount of thiamine mononitrate ($C_{12}H_{17}N_5O_4S$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak area of thiamine from the *Sample solution*

r_S = peak area of thiamine from the *Standard solution*

C_S = concentration of USP Thiamine Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of thiamine mononitrate in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of thiamine mononitrate, 327.36

M_{r2} = molecular weight of thiamine hydrochloride, 337.27

Acceptance criteria: 90.0%–150.0% of the labeled amount of niacinamide ($C_6H_6N_2O$) or niacin ($C_6H_5NO_2$), pyridoxine hydrochloride ($C_8H_{11}NO_3 \cdot HCl$), riboflavin ($C_{17}H_{20}N_4O_6$), and thiamine as thiamine hydrochloride ($C_{12}H_{17}ClN_4OS \cdot HCl$) or thiamine mononitrate ($C_{12}H_{17}N_5O_4S$)

[NOTE—Commercially available atomic absorption standard solutions for the minerals, where applicable, may be used where preparation of a *Standard stock solution* is described in the following assays. Use deionized water where water is specified. Where atomic absorption spectrophotometry is specified in the assay, the *Standard solutions* and the

Sample solution may be diluted quantitatively with the solvent specified, if necessary, to yield solutions of suitable concentrations adaptable to the linear or working range of the instrument.]

• **CALCIUM, Method 1**

Lanthanum chloride solution: 267 mg/mL of lanthanum chloride heptahydrate in 0.125 N hydrochloric acid

Calcium standard solution: 400 µg/mL of calcium. Dissolve 1.001 g of calcium carbonate, previously dried at 300° for 3 h and cooled in a desiccator for 2 h, in 25 mL of 1 N hydrochloric acid. Boil to expel carbon dioxide, and dilute with water to 1000 mL.

Standard stock solution: 100 µg/mL of calcium from *Calcium standard solution* diluted with 0.125 N hydrochloric acid

Standard solutions: Into separate 100-mL volumetric flasks pipet 1.0, 1.5, 2.0, 2.5, and 3.0 mL of the *Standard stock solution*. To each flask add 1.0 mL of *Lanthanum chloride solution*, and dilute with water to volume to obtain concentrations of 1.0, 1.5, 2.0, 2.5, and 3.0 µg/mL of calcium.

Polysorbate 80 solution: Polysorbate 80 and alcohol (1:10)

Sample solution: Transfer 5 Capsules to a 100-mL volumetric flask. [NOTE—For hard gelatin Capsules, weigh NLT 20 Capsules. Open the Capsules, without loss of shell material, and transfer the contents to a suitable container. Remove any contents adhering to the empty shells by washing with several portions of ether. Discard the washings, and allow the Capsule shells to dry. Weigh the empty Capsule shells, calculate the net weight of the Capsule contents, and transfer a portion of the Capsule contents, equivalent to 5 Capsules, to a 100-mL volumetric flask.] Add 15 mL of water, 10 mL of 6 N hydrochloric acid, and 1 mL of *Polysorbate 80 solution* to the flask. Heat on a hot plate or steam bath, with intermittent swirling, until the Capsules are completely disintegrated or the contents are dissolved. Boil gently for an additional 15 min. Cool, dilute with water to volume, and filter, discarding the first 5 mL of the filtrate. Dilute this solution with 0.125 N hydrochloric acid, to obtain a concentration of 2 µg/mL of calcium, adding 1 mL of *Lanthanum chloride solution* per 100 mL of the final volume.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry

Analytical wavelength: Calcium emission line at 422.7 nm

Lamp: Calcium hollow-cathode

Flame: Nitrous oxide-acetylene

Blank: 0.125 N hydrochloric acid containing 1 mL of *Lanthanum chloride solution* per 100 mL

Analysis

Samples: *Standard solutions* and *Sample solution*

Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in µg/mL, of calcium, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, *C*, in

mg/mL, of calcium in the *Sample solution*.

Calculate the percentage of the labeled amount of calcium (Ca) in the portion of Capsules taken:

$$\text{Result} = (C/C_u) \times 100$$

C = measured concentration of calcium in the *Sample solution* (µg/mL)

C_u = nominal concentration of calcium in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–125.0% of the labeled amount of calcium (Ca)

• **CHROMIUM, Method 1**

Chromium standard solution: 1000 µg/mL of chromium from potassium dichromate, previously dried at 120° for 4 h in water. Store in a polyethylene bottle.

Standard stock solution: 10 µg/mL of chromium from *Chromium standard solution* diluted with 6 N hydrochloric acid and water (1 in 20)

Standard solutions: Transfer 10.0 and 20.0 mL of the *Standard stock solution* to separate 100-mL volumetric flasks, and transfer 15.0 and 20.0 mL of the *Standard stock solution* to separate 50-mL volumetric flasks. Dilute the contents of each of the four flasks with 0.125 N hydrochloric acid to volume to obtain concentrations of 1.0, 2.0, 3.0, and 4.0 µg/mL of chromium.

Sample solution: Proceed as directed for *Calcium, Method 1*, except to prepare the *Sample solution* to contain 1 µg/mL of chromium and to omit the use of the *Lanthanum chloride solution*.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry

Analytical wavelength: Chromium emission line at 357.9 nm

Lamp: Chromium hollow-cathode

Flame: Air-acetylene

Blank: 0.125 N hydrochloric acid

Analysis

Samples: *Standard solutions* and *Sample solution*

Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in µg/mL, of chromium, and draw the straight line best fitting the four plotted points. From the graph so obtained, determine the concentration, *C*, in

µg/mL, of chromium in the *Sample solution*.

Calculate the percentage of the labeled amount of chromium (Cr) in the portion of Capsules taken:

$$\text{Result} = (C/C_u) \times 100$$

C = measured concentration of chromium in the *Sample solution* (µg/mL)

C_u = nominal concentration of chromium in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–160.0% of the labeled amount of chromium (Cr)

• **COPPER, Method 1**

Copper standard solution: Dissolve 1.00 g of copper foil in a minimum volume of a 50% solution of nitric acid, and dilute with a 1% solution of nitric acid to 1000 mL. This solution contains 1000 µg/mL of copper.

Standard stock solution: 100 µg/mL of copper from *Copper standard solution* diluted with 0.125 N hydrochloric acid

Standard solutions: To separate 200-mL volumetric flasks transfer 1.0, 2.0, 4.0, 6.0, and 8.0 mL of the *Standard stock solution*. Dilute with water to volume to obtain concentrations of 0.5, 1.0, 2.0, 3.0, and 4.0 µg/mL of copper.

Sample solution: Proceed as directed for *Calcium, Method 1*, except to prepare the *Sample solution* to contain 2 µg/mL of copper and to omit the use of the *Lanthanum chloride solution*.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry

Analytical wavelength: Copper emission line at 324.7 nm

Lamp: Copper hollow-cathode

Flame: Air-acetylene

Blank: 0.125 N hydrochloric acid

Analysis

Samples: *Standard solutions* and *Sample solution*

Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions*

versus the concentration, in $\mu\text{g/mL}$, of copper, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, C , in $\mu\text{g/mL}$, of copper in the *Sample solution*.

Calculate the percentage of the labeled amount of copper (Cu) in the portion of Capsules taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of copper in the *Sample solution* ($\mu\text{g/mL}$)

C_U = nominal concentration of copper in the *Sample solution* ($\mu\text{g/mL}$)

Acceptance criteria: 90.0%–125.0% of the labeled amount of copper (Cu)

• FLUORIDE, Method 1

[NOTE—Store all solutions in plastic containers.]

3 M sodium acetate solution: Dissolve 408 g of sodium acetate in 600 mL of water contained in a 1000-mL volumetric flask. Allow the solution to equilibrate to room temperature, and dilute with water to volume. Adjust with a few drops of acetic acid to a pH of 7.0.

Sodium citrate solution: Dissolve 222 g of sodium citrate in 250 mL of water in a 1000-mL volumetric flask. Add 28 mL of perchloric acid, and dilute with water to volume.

Fluoride standard stock solution: 500 $\mu\text{g/mL}$ of fluoride from a quantity of sodium fluoride, previously dried at 100° for 4 h and cooled in a desiccator, in water

Intermediate stock solution A: 100 $\mu\text{g/mL}$ of fluoride from *Fluoride standard stock solution* diluted with water

Intermediate stock solution B: 10 $\mu\text{g/mL}$ of fluoride from *Fluoride standard stock solution* diluted with water

Standard solutions: To five separate 100-mL volumetric flasks transfer 3.0, 5.0, and 10.0 mL of *Intermediate stock solution B* and 5.0 and 10.0 mL of *Intermediate stock solution A*. To each flask add 10.0 mL of 1 N hydrochloric acid, 25 mL of 3 M *sodium acetate solution*, and 25.0 mL of *Sodium citrate solution*. Dilute the contents of each flask with water to volume to obtain concentrations of 0.3, 0.5, 1.0, 5.0, and 10.0 $\mu\text{g/mL}$ of fluoride.

Sample solution: Remove the contents of Capsules by cutting open the Capsules. Mix, and determine the weight of the contents. Transfer a quantity of the mixed Capsule contents, equivalent to 200 μg of fluoride, to a 100-mL volumetric flask. Add 10.0 mL of 1 N hydrochloric acid, 25.0 mL of 3 M *sodium acetate solution*, and 25.0 mL of *Sodium citrate solution*. Dilute with water to volume.

Analysis

Samples: *Standard solutions* and *Sample solution*
To separate plastic beakers, each containing a plastic-coated stirring bar, transfer 50.0 mL each of the *Standard solutions* and the *Sample solution*. Measure the potentials (see pH <791>), in mV, of the *Standard solutions* and the *Sample solution*, with a pH meter capable of a minimum reproducibility of ± 0.2 mV and equipped with a fluoride-specific ion-indicating electrode and a calomel reference electrode. [NOTE—When taking measurements, immerse the electrodes in the solution, stir on a magnetic stirrer having an insulated top until equilibrium is attained (1–2 min), and record the potential. Rinse and dry the electrodes between measurements, taking care to avoid damaging the crystal of the specific-ion electrode.]

Plot the logarithms of fluoride concentrations, in $\mu\text{g/mL}$, of the *Standard solutions* versus potential, in

mV. From the standard response curve so obtained and the measured potential of the *Sample solution*, determine the concentration, C , in mg/mL , of fluoride in the *Sample solution*.

Calculate the percentage of the labeled amount of fluorine (F) in the portion of Capsules taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of fluoride in the *Sample solution* ($\mu\text{g/mL}$)

C_U = nominal concentration of fluorine in the *Sample solution* ($\mu\text{g/mL}$)

Acceptance criteria: 90.0%–160.0% of the labeled amount of fluorine (F)

• FLUORIDE, Method 2

[NOTE—Use plastic containers and deionized water throughout this procedure.]

pH 10.0 buffer: Add 214 mL of 0.1 N sodium hydroxide to 1000 mL of 0.05 M sodium bicarbonate.

Mobile phase: Alcohol, 0.1 N sulfuric acid, and water (20:5:175)

Standard stock solution: 220 $\mu\text{g/mL}$ of USP Sodium Fluoride RS in water. This solution contains 100 $\mu\text{g/mL}$ of fluoride.

Standard solution: [NOTE—Condition the solid-phase extraction column specified for use in the *Standard solution* and the *Sample solution* in the following manner. Using a vacuum at a pressure not exceeding 5 mm of mercury, wash the column with one column volume of methanol followed by one column volume of pH 10.0 buffer. Do not allow the column top to dry. If the top of the column becomes dry, recondition the column.] Transfer 10.0 mL of *Standard stock solution* to a 100-mL volumetric flask. Add 75 mL of water, and adjust with 0.1 N sodium hydroxide to a pH of 10.4 ± 0.1 . Dilute with water to volume. Filter, discarding the first 15 mL of the filtrate. Transfer 25.0 mL of the filtrate to a 50-mL volumetric flask, add 15.0 mL of water, and adjust with 0.1 N sodium hydroxide to a pH of 10.0. Dilute with pH 10.0 buffer to volume. Elute a portion of this solution through a 3-mL solid-phase extraction column containing L1 packing that is connected through an adaptor to a second solid-phase extraction column containing sulfonylpropyl strong cation-exchange packing. Discard the first 3 mL of the eluate, and collect the rest of the eluate in a suitable flask for injection into the chromatograph.

Sample solution: Weigh NLT 20 Capsules in a tared weighing bottle. Open the Capsules, without loss of shell material, and transfer the contents to a 100-mL container. If necessary, remove any contents adhering to the empty shells by washing with several portions of ether. Discard the washings, and dry the Capsule shells with the aid of a current of dry air. Weigh the empty Capsule shells in the tared weighing bottle, and calculate the net weight of the Capsule contents. Transfer a portion of the Capsule contents, equivalent to 1 mg of fluorine, to a 100-mL volumetric flask. Add 15 mL of water, and shake vigorously. Rinse the sides of the flask with 15 mL of water, and allow to stand for 10 min. Dilute with water to 85 mL, adjust with 1 N sodium hydroxide to a pH of 10.4 ± 0.1 , and dilute with water to 100 mL. Proceed as directed for the *Standard solution*, beginning with "Filter, discarding the first 15 mL of the filtrate."

Chromatographic system

(See Chromatography <621>, System Suitability.)

Mode: LC

Detector: Conductivity detector

Guard column: 4.6-mm × 3-cm; packing L17

Analytical column: 7.8-mm × 30-cm; packing L17

Flow rate: 0.5 mL/min

Injection size: 100 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Sample solution* and *Standard solution*

Measure the peak areas for fluoride. Calculate the percentage of the labeled amount of fluorine (F) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area from the *Sample solution*

r_S = peak area from the *Standard solution*

C_S = concentration of fluoride in the *Standard solution* (µg/mL)

C_U = nominal concentration of fluorine in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–160.0% of the labeled amount of fluorine (F)

• **IODIDE, Method 1**

Bromine water: To 20 mL of bromine in a glass-stoppered bottle add 100 mL of water. Insert the stopper into the bottle, and shake. Allow to stand for 30 min, and use the supernatant.

Analysis

Sample: Capsules

Remove the contents of Capsules by cutting open the Capsules. Mix, and determine the weight of the contents. Transfer a quantity of the contents, equivalent to 3 mg of iodine, to a nickel crucible. Add 5 g of sodium carbonate, 5 mL of 50% (w/v) sodium hydroxide solution, and 10 mL of alcohol, taking care that the entire specimen is moistened. Heat the crucible on a steam bath to evaporate the alcohol, then dry the crucible at 100° for 30 min to prevent spattering upon subsequent heating. Transfer the crucible with its contents to a furnace heated to 500°, and heat the crucible for 15 min. [NOTE—Heating at 500° is necessary to carbonize any organic matter present; a higher temperature may be used, if necessary, to ensure complete carbonization of all organic matter.]

Cool the crucible, add 25 mL of water, cover the crucible with a watchglass, and boil gently for 10 min. Filter the solution, and wash the crucible with boiling water, collecting the filtrate and washings in a beaker. Add phosphoric acid until the solution is neutral to methyl orange, then add 1 mL excess of phosphoric acid. Add excess of *Bromine water*, and boil the solution gently until colorless and then for 5 min longer. Add a few crystals of salicylic acid, and cool the solution to 20°. Add 1 mL of phosphoric acid and 0.5 g of potassium iodide, and titrate the liberated iodine with 0.005 N sodium thiosulfate VS, adding starch TS when the liberated iodine color has nearly disappeared. Calculate the percentage of the labeled amount of iodine (I) in the portion of Capsules taken:

$$\text{Result} = V \times N_A \times F \times \text{Ime} \times (Aw/W) \times (100/L)$$

V = volume of sodium thiosulfate consumed (mL)

N_A = actual normality of the sodium thiosulfate solution used

F = correction factor to convert mg to µg (1000 µg/mL)

Ime = milliequivalent of I (21.16 mg/meq)

Aw = average weight of the Capsules content

W = weight of the sample of Capsules content taken

L = labeled amount of iodine (µg/Capsule)

Acceptance criteria: 90.0%–160.0% of the labeled amount of iodine (I)

• **IODIDE, Method 2:** Proceed as directed in *Automated Methods of Analysis* (16), *Assay for Iodide*.

Acceptance criteria: 90.0%–160.0% of the labeled amount of iodine (I)

• **IRON, Method 1**

Iron standard stock solution: Transfer 100 mg of iron powder to a 1000-mL volumetric flask. Dissolve in 25 mL of 6 N hydrochloric acid, dilute with water to volume, and mix.

Standard solutions: To separate 100-mL volumetric flasks transfer 2.0, 4.0, 5.0, 6.0, and 8.0 mL of *Iron standard stock solution*. Dilute the contents of each flask with water to volume to obtain concentrations of 2.0, 4.0, 5.0, 6.0, and 8.0 µg/mL of iron.

Polysorbate 80 solution: Prepare as directed for *Calcium, Method 1*.

Sample solution: Proceed as directed for *Calcium, Method 1*, except to prepare the *Sample solution* to contain a concentration of 5 µg/mL of iron and to omit the use of the *Lanthanum chloride solution*.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry

Analytical wavelength: Iron emission line at 248.3 nm

Lamp: Iron hollow-cathode

Flame: Air–acetylene

Blank: 0.125 N hydrochloric acid

Analysis

Samples: *Standard solutions* and *Sample solution*
Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in µg/mL, of iron, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, C , in µg/mL, of iron in the *Sample solution*.

Calculate the percentage of the labeled amount of iron (Fe) in the portion of Capsules taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of iron in the *Sample solution* (µg/mL)

C_U = nominal concentration of iron in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–125.0% of the labeled amount of iron (Fe)

• **MAGNESIUM, Method 1**

Lanthanum chloride solution: Prepare as directed for *Calcium, Method 1*.

Magnesium standard solution: Transfer 1.0 g of magnesium ribbon to a 1000-mL volumetric flask, dissolve in 50 mL of 6 N hydrochloric acid, dilute with water to volume, and mix to obtain a solution with a known concentration of 1000 µg/mL of magnesium.

Standard stock solution: 20 µg/mL of magnesium from *Magnesium standard solution* diluted with 0.125 N hydrochloric acid

Standard solutions: To separate 100-mL volumetric flasks transfer 1.0, 1.5, 2.0, 2.5, and 3.0 mL of the *Standard stock solution*. To each flask add 1.0 mL of *Lanthanum chloride solution*, and dilute with 0.125 N hydrochloric acid to volume to obtain concentrations of 0.2, 0.3, 0.4, 0.5, and 0.6 µg/mL of magnesium.

Polysorbate 80 solution: Prepare as directed for *Calcium, Method 1*.

Sample solution: Proceed as directed for *Calcium, Method 1*, except prepare the *Sample solution* to contain 0.4 µg/mL of magnesium.

Instrumental conditions(See *Spectrophotometry and Light-Scattering* (851).)**Mode:** Atomic absorption spectrophotometry**Analytical wavelength:** Magnesium emission line at 285.2 nm**Lamp:** Magnesium hollow-cathode**Flame:** Air-acetylene**Blank:** 0.125 N hydrochloric acid containing 1 mL of *Lanthanum chloride solution* per 100 mL**Analysis****Samples:** *Standard solutions* and *Sample solution*

Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in $\mu\text{g/mL}$, of magnesium, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, C , in $\mu\text{g/mL}$, of magnesium in the *Sample solution*.

Calculate the percentage of the labeled amount of magnesium (Mg) in the portion of Capsules taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of magnesium in the *Sample solution* ($\mu\text{g/mL}$)

C_U = nominal concentration of magnesium in the *Sample solution* ($\mu\text{g/mL}$)

Acceptance criteria: 90.0%–125.0% of the labeled amount of magnesium (Mg)

- MANGANESE, Method 1**

Manganese standard stock solution: Transfer 1.00 g of manganese, to a 1000-mL volumetric flask. Dissolve in 20 mL of nitric acid, dilute with 6 N hydrochloric acid to volume, and mix to obtain a solution with a concentration of 1000 $\mu\text{g/mL}$ of manganese.

Standard stock solution: 50 $\mu\text{g/mL}$ of manganese from *Manganese standard stock solution* diluted with 0.125 N hydrochloric acid

Standard solutions: To separate 100-mL volumetric flasks transfer 1.0, 1.5, 2.0, 3.0, and 4.0 mL of *Standard stock solution*. Dilute the contents of each flask with 0.125 N hydrochloric acid to volume to obtain solutions with known concentrations of 0.5, 0.75, 1.0, 1.5, and 2.0 $\mu\text{g/mL}$ of manganese.

Polysorbate 80 solution: Prepare as directed for *Calcium, Method 1*.

Sample solution: Proceed as directed for *Calcium, Method 1*, except prepare the *Sample solution* to contain to 1 $\mu\text{g/mL}$ of manganese and to omit the use of the *Lanthanum chloride solution*.

Instrumental conditions(See *Spectrophotometry and Light-Scattering* (851).)**Mode:** Atomic absorption spectrophotometry**Analytical wavelength:** Manganese emission line at 279.5 nm**Lamp:** Manganese hollow-cathode**Flame:** Air-acetylene**Blank:** 0.125 N hydrochloric acid**Analysis**

Samples: *Standard solutions* and the *Sample solution*
Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in $\mu\text{g/mL}$, of manganese, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, C , in $\mu\text{g/mL}$, of manganese in the *Sample solution*.

Calculate the percentage of the labeled amount of manganese (Mn) in the portion of Capsules taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of manganese in the *Sample solution* ($\mu\text{g/mL}$)

C_U = nominal concentration of manganese in the *Sample solution* ($\mu\text{g/mL}$)

Acceptance criteria: 90.0%–125.0% of the labeled amount of manganese (Mn)

- MOLYBDENUM, Method 1**

Diluent: 20 mg/mL of ammonium chloride in water

Molybdenum standard solution: Transfer 1.0 g of molybdenum wire to a 1000-mL volumetric flask, and dissolve in 50 mL of nitric acid, warming if necessary. Dilute with water to volume, and mix to obtain a solution with a concentration of 1000 $\mu\text{g/mL}$ of molybdenum.

Standard stock solution: 100 $\mu\text{g/mL}$ of molybdenum from *Molybdenum standard solution* diluted with water

Standard solutions: To separate 100-mL volumetric flasks transfer 2.0, 10.0, and 25.0 mL of the *Standard stock solution*, and add 5.0 mL of perchloric acid to each flask. Gently boil the solution in each flask for 15 min. Cool to room temperature, and dilute each with *Diluent* to volume to obtain concentrations of 5.0, 10.0, and 25.0 $\mu\text{g/mL}$ of molybdenum.

Polysorbate 80 solution: Prepare as directed for *Calcium, Method 1*.

Sample solution: Proceed as directed for *Calcium, Method 1*, except take a number of Capsules or a portion of Capsule contents equivalent to 1000 μg of molybdenum and make appropriate dilutions to obtain a final concentration of 10 $\mu\text{g/mL}$ of molybdenum, omitting the addition of the *Lanthanum chloride solution*.

Instrumental conditions(See *Spectrophotometry and Light-Scattering* (851).)**Mode:** Atomic absorption spectrophotometry**Analytical wavelength:** Molybdenum emission line at 313.3 nm**Lamp:** Molybdenum hollow-cathode**Flame:** Nitrous oxide-acetylene**Blank:** *Diluent* and perchloric acid (20:1)**Analysis**

Samples: *Standard solutions* and the *Sample solution*
Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in $\mu\text{g/mL}$, of molybdenum, and draw the straight line best fitting the three plotted points. From the graph so obtained, determine the concentration, C , in $\mu\text{g/mL}$, of molybdenum in the *Sample solution*.

Calculate the percentage of the labeled amount of molybdenum (Mo) in the portion of Capsules taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of molybdenum in the *Sample solution* ($\mu\text{g/mL}$)

C_U = nominal concentration of molybdenum in the *Sample solution* ($\mu\text{g/mL}$)

Acceptance criteria: 90.0%–160.0% of the labeled amount of molybdenum (Mo)

- MOLYBDENUM, Method 2**

Sodium fluoride solution: Add 200 mL of water to 10 g of sodium fluoride, stir until the solution is saturated, and filter. Store in a polyethylene bottle.

Ferrous sulfate solution: 4.98 mg/mL of ferrous sulfate in water

Potassium thiocyanate solution: 200 mg/mL of potassium thiocyanate in water

20% Stannous chloride solution: Transfer 40 mg of stannous chloride to a beaker, add 20 mL of 6.5 N hydrochloric acid solution, and heat the solution until the stannous chloride is dissolved. Cool and dilute with water to 100 mL.

Diluted stannous chloride solution: 20% *stannous chloride solution* diluted with water (1 in 25). Prepare this solution fresh at the time of use.

Standard solution: 20 µg/mL of molybdenum in water
Sample: Remove the contents of a counted number of Capsules by cutting open the Capsules. Mix, and determine the weight of the contents. Use a quantity of the Capsule contents, equivalent to 40 µg of molybdenum.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: UV-Vis

Analytical wavelength: 465 nm

Cell: 1 cm

Blank: Amyl alcohol

Analysis

Samples: *Standard solution* and *Sample*

Transfer the *Sample* and 2.0 mL of the *Standard solution* to separate 200-mL beakers. Add 20 mL of nitric acid to each beaker. Cover each beaker with a watchglass, and boil slowly on a hot plate for 45 min. Cool to room temperature. Add 6 mL of perchloric acid, cover the beakers with a watchglass, and continue the heating until digestion is complete, as indicated when the liquid becomes colorless or pale yellow. Evaporate the solutions in the beakers to dryness. Rinse the sides of the beakers and the watchglasses with water, and add more water to complete 50 mL in each beaker. Gently boil the water solution for a few min. Cool to room temperature. Add 2 drops of methyl orange TS, and neutralize with ammonium hydroxide. Add 8.2 mL of hydrochloric acid. Quantitatively transfer the contents of the beakers to separate 100-mL volumetric flasks, rinse the beakers with water, transfer the rinsings to the corresponding volumetric flasks, and dilute with water to volume. Transfer 50.0 mL of each solution to separatory funnels. To each separatory funnel add 1.0 mL of *Sodium fluoride solution*, 0.5 mL of *Ferrous sulfate solution*, 4.0 mL of *Potassium thiocyanate solution*, 1.5 mL of 20% *Stannous chloride solution*, and 15.0 mL of amyl alcohol, and shake the separatory funnel for 1 min. Allow the layers to separate, and discard the aqueous layers. Add 25 mL of *Diluted stannous chloride solution* to each separatory funnel, and shake gently for 15 s. Allow the layers to separate, and discard the aqueous layers. Transfer the organic layer from each separatory funnel to a centrifuge tube, and centrifuge at 2000 rpm for 10 min. Determine the absorbances of the organic phases obtained from the *Standard solution* and the *Sample*, and correct with the *Blank*.

Calculate the percentage of the labeled amount of molybdenum (Mo) in the portion of Capsules taken:

$$\text{Result} = (A_U/A_S) \times [(V \times C_S)/M_U] \times 100$$

A_U = absorbance of the *Sample*

A_S = absorbance of the *Standard solution*

V = volume of the *Standard solution* analyzed, 2.0 mL

C_S = concentration of molybdenum in the *Standard solution* (µg/mL)

M_U = nominal amount of molybdenum in the *Sample* (µg)

Acceptance criteria: 90.0%–160.0% of the labeled amount of molybdenum (Mo)

• **PHOSPHORUS, Method 1**

Sulfuric acid solution: Cautiously add sulfuric acid to water (37.5:100), and mix.

Ammonium molybdate solution: 50 mg/mL of ammonium molybdate in *Sulfuric acid solution* and water (2:3). [NOTE—Dissolve in water first, and then dilute with *Sulfuric acid solution* to volume.]

Hydroquinone solution: 5 mg/mL of hydroquinone in water. Add one drop of sulfuric acid per 100 mL of solution.

Sodium bisulfite solution: 200 mg/mL of sodium bisulfite in water

Phosphorus standard stock solution: Weigh 4.395 g of monobasic potassium phosphate, previously dried at 105° for 2 h and stored in a desiccator, and transfer to a 1000-mL volumetric flask. Dissolve in water, add 6 mL of sulfuric acid as a preservative, dilute with water to volume, and mix to obtain a solution with a concentration of 1000 µg/mL of phosphorus.

Standard solution: 20 µg/mL of phosphorus from *Phosphorus standard stock solution* diluted with water

Sample solution: Remove the contents of Capsules by cutting open the Capsules. Mix, and determine the weight of the contents. Transfer a quantity of the Capsule contents, equivalent to 100 mg of phosphorus, to 25 mL of nitric acid, and digest on a hot plate for 30 min. Add 15 mL of hydrochloric acid, and continue the digestion to the cessation of brown fumes. Cool, and transfer the contents of the flask to a 500-mL volumetric flask with the aid of small portions of water. Dilute with water to volume. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, and dilute with water to volume.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Vis

Analytical wavelength: 650 nm

Cell: 1 cm

Analysis

Samples: *Standard solution* and *Sample solution*
 To three separate 25-mL volumetric flasks transfer 5.0 mL each of the *Standard solution*, the *Sample solution*, and water to provide the blank. To each of the three flasks add 1.0 mL each of *Ammonium molybdate solution*, *Hydroquinone solution*, and *Sodium bisulfite solution*, and swirl to mix. Dilute the contents of each flask with water to volume, and allow the flasks to stand for 30 min. Determine the absorbances of the solutions against the blank.

Calculate the percentage of the labeled amount of phosphorus (P) in the portion of Capsules taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

A_U = absorbance of the *Sample solution*

A_S = absorbance of the *Standard solution*

C_S = concentration of phosphorus in the *Standard solution* (µg/mL)

C_U = nominal concentration of phosphorus in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–125.0% of the labeled amount of phosphorus (P)

• **POTASSIUM**

Potassium standard solution: 100 µg/mL of potassium from potassium chloride, previously dried at 105° for 2 h, in water

Standard stock solution: 10 µg/mL of potassium from *Potassium standard solution* diluted with 0.125 N hydrochloric acid

Standard solutions: Transfer 5.0, 10.0, 15.0, 20.0, and 25.0 mL of the *Standard stock solution* to separate 100-mL volumetric flasks. Dilute the contents of each flask with 0.125 N hydrochloric acid to volume to obtain solutions containing 0.5, 1.0, 1.5, 2.0, and 2.5 µg/mL of potassium.

Polysorbate 80 solution: Prepare as directed for *Calcium, Method 1*.

Sample solution: Proceed as directed for *Calcium, Method 1*, except to prepare the *Sample solution* to contain 1 µg/mL of potassium and to omit the use of the *Lanthanum chloride solution*.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry

Analytical wavelength: Potassium emission line at 766.5 nm

Lamp: Potassium hollow-cathode

Flame: Air–acetylene

Blank: Water

Analysis

Samples: *Standard solutions* and the *Sample solution*
Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in $\mu\text{g/mL}$, of potassium, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, C , in $\mu\text{g/mL}$, of potassium in the *Sample solution*.

Calculate the percentage of the labeled amount of potassium (K) in the portion of Capsules taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of potassium in the *Sample solution* ($\mu\text{g/mL}$)

C_U = nominal concentration of potassium in the *Sample solution* ($\mu\text{g/mL}$)

Acceptance criteria: 90.0%–125.0% of the labeled amount of potassium (K)

• SELENIUM, Method 1

Diluent: Prepare as directed for *Molybdenum, Method 1*.

Selenium standard solution: [CAUTION—Selenium is toxic; handle it with care.] Dissolve 1 g of metallic selenium in a minimum volume of nitric acid. Evaporate to dryness, add 2 mL of water, and evaporate to dryness. Repeat the addition of water and the evaporation to dryness three times. Dissolve the residue in 3 N hydrochloric acid, transfer to a 1000-mL volumetric flask, and dilute with 3 N hydrochloric acid to volume to obtain a concentration of 1000 $\mu\text{g/mL}$ of selenium.

Standard stock solution: 100 $\mu\text{g/mL}$ of selenium from *Selenium standard solution* diluted with water

Standard solutions: To separate 100-mL volumetric flasks transfer 5.0, 10.0, and 25.0 mL of the *Standard stock solution*, and add 5.0 mL of perchloric acid to each flask. Gently boil the solutions for 15 min, cool to room temperature, and dilute each with *Diluent* to volume to obtain solutions with concentrations of 5.0, 10.0, and 25.0 $\mu\text{g/mL}$ of selenium.

Sample solution: Remove the contents of Capsules by cutting open the Capsules. Mix, and determine the weight of the contents. Transfer a quantity of the Capsule contents, equivalent to 1000 μg of selenium, to a suitable flask, and add 12 mL of nitric acid. [NOTE—The volume of nitric acid may be varied to ensure that the powder is uniformly dispersed.] Carefully swirl the flask to disperse the sample specimen. Sonicate for 10 min or until the sample specimen is completely dissolved. Gently boil the solution for 15 min, and cool to room temperature. Carefully add 8 mL of perchloric acid to the flask, heat the flask until perchloric acid fumes appear, and swirl the flask to dissipate the fumes. Repeat the heating and swirling until the fumes appear again. Cool to room temperature. Transfer the contents of the flask to a 50-mL volumetric flask with the aid of the *Diluent*, and dilute with *Diluent* to volume.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry

Analytical wavelength: Selenium emission line at 196.0 nm

Lamp: Selenium hollow-cathode

Flame: Air–acetylene

Blank: *Diluent* and perchloric acid (20:1)

Analysis

Samples: *Standard solutions* and the *Sample solution*
Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions*

versus the concentration, in $\mu\text{g/mL}$, of selenium, and draw the straight line best fitting the three plotted points. From the graph so obtained, determine the concentration, C , in $\mu\text{g/mL}$, of selenium in the *Sample solution*.

Calculate the percentage of the labeled amount of selenium (Se) in the portion of Capsules taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of selenium in the *Sample solution* ($\mu\text{g/mL}$)

C_U = nominal concentration of selenium in the *Sample solution* ($\mu\text{g/mL}$)

Acceptance criteria: 90.0%–160.0% of the labeled amount of selenium (Se)

• SELENIUM, Method 2

Hydrochloric acid solution: Hydrochloric acid diluted with water (1 in 10)

50% ammonium hydroxide solution: Ammonium hydroxide diluted with water (1 in 2)

Reagent A: 9 mg/mL of edetate disodium and 25 mg/mL of hydroxylamine hydrochloride in water. [NOTE—Dissolve edetate disodium in a portion of water first, then add hydroxylamine hydrochloride, and dilute with water to volume.]

Reagent B: Transfer 200 mg of 2,3-diaminonaphthalene to a 250-mL separatory funnel, and add 200 mL of 0.1 N hydrochloric acid. Wash the solution with three 40-mL portions of cyclohexane, and discard the cyclohexane layer. Filter the solution into a brown bottle, and cover the solution with a 1-cm layer of cyclohexane. This solution is stable for 1 week if stored in a refrigerator.

Standard stock solution: [CAUTION—Selenium is toxic; handle it with care.] Dissolve 1 g of metallic selenium in a minimum volume of nitric acid. Evaporate to dryness, add 2 mL of water, and evaporate to dryness. Repeat the addition of water and evaporation to dryness three times. Dissolve the residue in 3 N hydrochloric acid, transfer to a 1000-mL volumetric flask, and dilute with 3 N hydrochloric acid to volume to obtain a solution with a concentration of 1000 $\mu\text{g/mL}$ of selenium. Dilute a volume of the solution with 0.125 N hydrochloric acid to obtain a concentration of 2.0 $\mu\text{g/mL}$ of selenium.

Standard solution: Transfer 10 mL of the *Standard stock solution* to a glass-stoppered flask. Add 1 mL of perchloric acid and 1 mL of *Hydrochloric acid solution*, and dilute with water to 20 mL.

Sample solution: Remove the contents of Capsules by cutting open the Capsules. Mix, and determine the weight of the contents. Transfer a quantity of the Capsule contents, equivalent to 20 μg of selenium, to a suitable flask. Add 10 mL of nitric acid, and warm gently on a hot plate. Continue heating until the initial nitric acid reaction has subsided, then add 3 mL of perchloric acid.

[CAUTION—Exercise care at this stage, because perchloric acid reaction becomes vigorous.]

Continue heating on the hot plate until the appearance of white fumes of perchloric acid or until the digest begins to darken. Add 0.5 mL of nitric acid, and resume heating, adding additional amounts of nitric acid if further darkening occurs. Digest for 10 min after the first appearance of perchloric acid fumes or until the digest becomes colorless. Cool the flask. Add 2.5 mL of *Hydrochloric acid solution*, and return the flask to the hot plate to expel residual nitric acid. Heat the mixture for 3 min after it begins to boil. Cool the flask to room temperature, and dilute with water to 20 mL.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: UV

Analytical wavelength: 380 nm

Cell: 1 cm

Blank: 1 mL of perchloric acid and 1 mL of Hydrochloric acid solution diluted with water to 20 mL

Analysis

Samples: *Standard solution* and *Sample solution*

Treat the *Sample solution*, the *Standard solution*, and the *Blank* as follows. Add 5 mL of *Reagent A* to each flask, and swirl gently to mix. Adjust the solution in each flask with 50% *Ammonium hydroxide solution* to a pH of 1.1 ± 0.1 . Add 5 mL of *Reagent B* to each flask, and swirl gently to mix. Place the flasks in a water bath maintained at 50°, and equilibrate for 30 min, taking care that the flasks are covered to protect them from light. Cool to room temperature, and transfer the contents of each flask to separate separatory funnels. Transfer 10.0 mL of cyclohexane to each separatory funnel, and extract vigorously for 1 min. Discard the aqueous layer. Transfer the cyclohexane layer to a centrifuge tube, and centrifuge at 1000 rpm for 1 min to remove any remaining water. Determine the absorbances of the solutions obtained from the *Samples* against the solution obtained from the *Blank*. Calculate the percentage of the labeled amount of selenium (Se) in the portion of Capsules taken:

$$\text{Result} = (A_U/A_S) \times [(V \times C_S)/M_U] \times 100$$

A_U = absorbances of the cyclohexane layer from the *Sample solution*

A_S = absorbances of the cyclohexane layer from the *Standard solution*

V = volume of the *Standard stock solution* used to prepare the *Standard solution*, 10 mL

C_S = concentration of selenium in the *Standard stock solution* (µg/mL)

M_U = nominal amount of selenium in the *Sample solution* (µg)

Acceptance criteria: 90.0%–160.0% of the labeled amount of selenium (Se)

• ZINC, Method 1

Zinc standard solution: 1000 µg/mL of zinc from zinc oxide in 5 M hydrochloric acid (3.89 mg/mL) and diluted with water to final volume. [NOTE—Dissolve in 5 M hydrochloric acid by warming, if necessary, cool, and then dilute to final volume.]

Standard stock solutions: 50 µg/mL of zinc from *Zinc standard solution* diluted with 0.125 N hydrochloric acid

Standard solutions: Transfer 1.0, 2.0, 3.0, 4.0, and 5.0 mL of *Standard stock solution* to separate 100-mL volumetric flasks. Dilute the contents of each flask with 0.125 N hydrochloric acid to volume to obtain concentrations of 0.5, 1.0, 1.5, 2.0, and 2.5 µg/mL of zinc.

Polysorbate 80 solution: Prepare as directed for *Calcium*, Method 1.

Sample solution: Proceed as directed for *Calcium*, Method 1, except to prepare the *Sample solution* to contain 2 µg/mL of zinc and to omit the use of the *Lanthanum chloride solution*.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry

Analytical wavelength: Zinc emission line at 213.8 nm

Lamp: Zinc hollow-cathode

Flame: Air–acetylene

Blank: 0.125 N hydrochloric acid

Analysis

Samples: *Standard solutions* and the *Sample solution*
Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in µg/mL, of zinc, and draw the straight line best fitting the five plotted points.

From the graph so obtained, determine the concentration, C , in µg/mL, of zinc in the *Sample solution*.

Calculate the percentage of the labeled amount of zinc (Zn) in the portion of Capsules taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of zinc in the *Sample solution* (µg/mL)

C_U = nominal concentration of zinc in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–125.0% of the labeled amount of zinc (Zn)

• BORON, NICKEL, TIN, AND VANADIUM, Method 1; CALCIUM, CHROMIUM, COPPER, IRON, MAGNESIUM, MANGANESE, PHOSPHORUS, and ZINC, Method 2; MOLYBDENUM AND SELENIUM, Method 3

Stock aqua regia solution: Prepare a mixture of hydrochloric acid and nitric acid (3:1) by adding the nitric acid to the hydrochloric acid. [NOTE—Periodically vent the solution in an appropriate fume hood.]

Diluent: Prepare a mixture of *Stock aqua regia solution* and water (1:9) by adding one volume of *Stock aqua regia solution* to two volumes of water. Dilute with additional water to volume, and mix well.

System suitability solution: Prepare a mixture of 1000 mg/L of yttrium in 5% nitric acid solution, 1000 mg/L of scandium in 5% nitric acid solution, and *Diluent* (1:1:198), and mix.

Standard stock solution 1 (Ca, Cu, Fe, Mg, Mn, P, and Zn): [NOTE—It is only necessary to include the minerals of interest in the solution.] Using commercially available element standard (single- or multi-element) solutions in 5% nitric acid solution, pipet the appropriate amount of element standard solution into a volumetric flask, and dilute with 5% nitric acid solution to obtain a solution having final concentrations of about 1000 mg/L of calcium, 100 mg/L of copper, 250 mg/L of iron, 500 mg/L of magnesium, 100 mg/L of manganese, 800 mg/L of phosphorus, and 250 mg/L of zinc.

Standard stock solution 2 (B, Cr, Mo, Ni, Se, Sn, and V): [NOTE—It is only necessary to include the minerals of interest in the solution.] Using commercially available element standard (single- or multi-element) solutions in 20% hydrochloric acid solution, pipet the appropriate amount of element standard solution into a volumetric flask, and dilute with 20% hydrochloric acid solution to obtain a solution having final concentrations of about 200 mg/L of boron, and 100 mg/L each of chromium, molybdenum, nickel, selenium, tin, and vanadium.

Standard solutions: Prepare a mixture of *Standard stock solution 1* and *Standard stock solution 2*, as required, in *Diluent*, to prepare a six-point calibration curve to bracket the concentration range of each mineral of interest.

Sample solution: Weigh, then transfer 5 Capsules to a 250-mL volumetric flask, and heat gently on a hot plate until the contents begin to release. Cautiously add 25 mL of *Stock aqua regia solution* in 5-mL increments, and swirl. Heat, continue to swirl until the Capsules dissolve into the acid, immediately remove from the heat source, and add 150 mL of water. Cool, and dilute with water to volume. Filter about 30 mL into a centrifuge tube, using a 5-µm pore size nylon syringe filter. If necessary, make any further adjustments using the *Diluent*.

Instrumental conditions

(See *Plasma Spectrochemistry* (730).)

Mode: Inductively coupled plasma spectrometry, using a spectrometer set to measure the emission of each mineral of interest at about the corresponding wavelength. [NOTE—The operating conditions may be developed and optimized based on the manufacturer's recommendation. The wavelengths selected should be

demonstrated experimentally to provide sufficient specificity, sensitivity, linearity, accuracy, and precision.]

System suitability

[NOTE—Analyze the *System suitability solution*, and obtain the response as directed in the *Analysis*.]

Suitability requirements

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solutions* and *Sample solution*

Determine the emission of each mineral of interest in the *Standard solutions* and *Sample solution* with an inductively coupled plasma system using the *Diluent* as the blank. Plot the emission of the *Standard solutions* versus the concentration, in mg/L, of the minerals of interest, and draw the straight line best fitting the plotted points. From the graph so obtained, determine the concentration, *C*, in mg/L, for each mineral of interest in the *Sample solution*. Calculate the percentage of the labeled amount for each mineral taken:

$$\text{Result} = C \times (V/W) \times F \times (C_w/L) \times 100$$

C = measured concentration of the *Sample solution* (mg/L)

V = volume of the *Sample solution* (L)

W = sample weight (mg)

F = dilution factor of the *Sample solution*

C_w = average Capsule weight (mg)

L = labeled amount per Capsule (mg)

Acceptance criteria: 90.0%–125.0% of the labeled amount of calcium (Ca), copper (Cu), iron (Fe), magnesium (Mg), manganese (Mn), phosphorus (P), and zinc (Zn); and 90.0%–160.0% of the labeled amounts of boron (B), chromium (Cr), molybdenum (Mo), nickel (Ni), selenium (Se), tin (Sn), and vanadium (V)

PERFORMANCE TESTS

- **DISINTEGRATION AND DISSOLUTION OF DIETARY SUPPLEMENTS** <2040>: Meet the requirements for *Dissolution*
- **WEIGHT VARIATION OF DIETARY SUPPLEMENTS** <2091>: Meet the requirements

CONTAMINANTS

- **MICROBIAL ENUMERATION TESTS** <2021>: The total aerobic microbial count does not exceed 3000 cfu/g, and the combined molds and yeasts count does not exceed 300 cfu/g.
- **MICROBIOLOGICAL PROCEDURES FOR ABSENCE OF SPECIFIED MICROORGANISMS** <2022>: Meet the requirements of the tests for absence of *Salmonella* species, *Escherichia coli*, and *Staphylococcus aureus*

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.

- **LABELING:**⁴ The label states that the product is Oil- and Water-Soluble Vitamins with Minerals Capsules. The label also states the quantity of each vitamin and mineral per dosage unit and, where necessary, the chemical form in which a vitamin is present and also states the salt form of the mineral used as the source of each element. Where the product contains vitamin E, the label indicates whether it is the *d*- or *dl*- form. Where more than one assay method is given for a particular vitamin or mineral, the labeling states with which assay method the product complies only if *Method 1* is not used.

Oil- and Water-Soluble Vitamins with Minerals Oral Solution

DEFINITION

Oil- and Water-Soluble Vitamins with Minerals Oral Solution contains one or more of the following oil-soluble vitamins: Vitamin A, Vitamin D as Ergocalciferol (Vitamin D₂) or Cholecalciferol (Vitamin D₃), and Vitamin E; one or more of the following water-soluble vitamins: Ascorbic Acid or its equivalent as Calcium Ascorbate or Sodium Ascorbate, Biotin, Cyanocobalamin, Niacin or Niacinamide, Dexpanthenol or Panthenol, Pantothenic Acid (as Calcium Pantothenate or Racemic Calcium Pantothenate), Pyridoxine Hydrochloride, Riboflavin or Riboflavin-5'-Phosphate Sodium, and Thiamine Hydrochloride or Thiamine Mononitrate; and one or more minerals derived from substances generally recognized as safe, furnishing one or more of the following elements in ionizable form: chromium, fluorine, iodine, iron, magnesium, manganese, molybdenum, and zinc. It contains NLT 90.0% and NMT 200.0% of the labeled amounts of vitamin A (C₂₀H₃₀O) as retinol or esters of retinol in the form of retinyl acetate (C₂₂H₃₂O₂) or retinyl palmitate (C₃₆H₆₀O₂), vitamin D as

⁴ USP Units of activity for vitamins, where such exist or formerly existed, are equivalent to the corresponding international units, where such formerly existed. The USP Unit for Vitamin E has been discontinued. International units (IU) for vitamins also have been discontinued; however, the use of IU on the labels of vitamin products continues. Where articles are labeled in terms of Units in addition to the required labeling, the relationship of the USP Units or IU to mass is as follows. One USP Vitamin A Unit = 0.3 µg of all-*trans*-retinol (vitamin A alcohol) or 0.344 µg of all-*trans*-retinyl acetate (vitamin A acetate) or 0.55 µg of all-*trans*-retinyl palmitate (vitamin A palmitate), and 1 µg of retinol (3.3 USP Vitamin A Units) = 1 retinol equivalent (RE); 1 IU of beta carotene = 0.6 µg of all-*trans*-beta carotene; 1 USP Vitamin D Unit = 0.025 µg of ergocalciferol or cholecalciferol; and 1 mg of *dl*-alpha tocopherol = 1.1 former USP Vitamin E Units, 1 mg of *dl*-alpha tocopheryl acetate = 1 former USP Vitamin E Unit, 1 mg of *dl*-alpha tocopheryl acid succinate = 0.89 former USP Vitamin E Unit, 1 mg of *d*-alpha tocopherol = 1.49 former USP Vitamin E Units, and 1 mg of *d*-alpha tocopheryl acetate = 1.36 former USP Vitamin E Units, 1 mg of *d*-alpha tocopheryl acid succinate = 1.21 former USP Vitamin E Units. In terms of *d*-alpha tocopherol equivalents, 1 mg of *d*-alpha tocopheryl acetate = 0.91, 1 mg of *d*-alpha tocopheryl acid succinate = 0.81, 1 mg of *dl*-alpha tocopherol = 0.74, 1 mg of *dl*-alpha tocopheryl acetate = 0.67, and 1 mg of *dl*-alpha tocopheryl acid succinate = 0.60.

ergocalciferol ($C_{28}H_{44}O$) or cholecalciferol ($C_{27}H_{44}O$), vitamin E as alpha tocopherol ($C_{29}H_{50}O_2$) or alpha tocopheryl acetate ($C_{31}H_{52}O_3$) or alpha tocopheryl acid succinate ($C_{33}H_{54}O_5$), ascorbic acid ($C_6H_8O_6$) or its salts as calcium ascorbate ($C_{12}H_{14}CaO_{12} \cdot 2H_2O$) or sodium ascorbate ($C_6H_7NaO_6$), and thiamine ($C_{12}H_{17}ClN_4OS$) as thiamine hydrochloride or thiamine mononitrate; NLT 90.0% and NMT 150.0% of the labeled amounts of biotin ($C_{10}H_{16}N_2O_3S$), calcium pantothenate ($C_{18}H_{32}CaN_2O_{10}$), dexpantenol ($C_9H_{19}NO_4$) or panthenol ($C_9H_{19}NO_4$), niacin ($C_6H_5NO_2$) or niacinamide ($C_6H_6N_2O$), pyridoxine hydrochloride ($C_8H_{11}NO_3 \cdot HCl$), riboflavin ($C_{17}H_{20}N_4O_6$) or riboflavin-5'-phosphate sodium ($C_{17}H_{20}N_4NaO_9P$); NLT 90.0% and NMT 450.0% of the labeled amount of cyanocobalamin ($C_{63}H_{88}CoN_{14}O_{14}P$); NLT 90.0% and NMT 160.0% of the labeled amounts of chromium (Cr), fluorine (F), iodine (I), and molybdenum (Mo); and NLT 90.0% and NMT 125.0% of the labeled amounts of iron (Fe), magnesium (Mg), manganese (Mn), and zinc (Zn).

STRENGTH

[NOTE—In the following assays, where more than one assay method is given for an individual ingredient, the requirements may be met by following any one of the specified methods, the method used being stated in the labeling only if *Method 1* is not used.]

• VITAMIN A

[NOTE—Use low-actinic glassware throughout this procedure.]

Diluent: Tetrahydrofuran and acetonitrile (1:1)

Mobile phase: Methanol, acetonitrile, and *n*-hexane (46.5:46.5:7.0)

Standard solution: 0.33 mg/mL of retinol ($C_{20}H_{30}O$) from USP Vitamin A RS in *Diluent*. [NOTE—USP Vitamin A RS is retinyl acetate. Use it to analyze Oral Solution that contains vitamin A as retinol, retinyl acetate, or retinyl palmitate.]

Sample solution: Transfer an accurately measured volume of Oral Solution, equivalent to 3.3 mg of retinol, to a 500-mL separatory funnel containing 10 mL of water and 20 mL of dehydrated alcohol. Add 150 mL of solvent hexane, insert the stopper, and shake for 1 min. Add another 150 mL of solvent hexane, insert the stopper, shake, and allow the layers to separate. Discard the aqueous layer, and filter the solvent hexane extract through anhydrous sodium sulfate into a 500-mL, round-bottom flask. Evaporate the solution to dryness with the aid of a rotary evaporator over a water bath maintained at about 65°. Immediately add 10.0 mL of *Diluent*, swirl to dissolve the residue, and filter.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 265 nm

Column: 4.6-mm \times 50-cm (prepared from two concatenated 4.6-mm \times 25-cm columns); packing L1

Column temperature: 40°

Flow rate: 1.5 mL/min

Injection size: 20 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 5.0%

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of vitamin A as retinol ($C_{20}H_{30}O$) in the portion of Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times F \times 100$$

r_U = peak area of retinol or retinyl ester from the *Sample solution*

r_S = peak area of retinyl acetate from the *Standard solution*

C_S = concentration of retinyl acetate ($C_{22}H_{32}O_2$) in the *Standard solution* (μ g/mL)

C_U = nominal concentration of Vitamin A as retinol ($C_{20}H_{30}O$) in the *Sample solution* (μ g/mL)

F = factor used to convert retinyl acetate, the ester form present in USP Vitamin A RS, to retinol, 0.872

Acceptance criteria: 90.0%–200.0% of the labeled amount of vitamin A as retinol ($C_{20}H_{30}O$)

• CHOLECALCIFEROL OR ERGOCALCIFEROL (VITAMIN D)

[NOTE—Where vitamin D (cholecalciferol or ergocalciferol) is specified in the following procedure, use the chemical form present in the formulation and the relevant USP Reference Standard. Use low-actinic glassware throughout this procedure.]

Diluent and Mobile phase: Prepare as directed for *Vitamin A*.

Standard solution: 5 μ g/mL of USP Cholecalciferol RS or USP Ergocalciferol RS in *Diluent*

Sample solution: Transfer an accurately measured volume of Oral Solution, equivalent to 50 μ g of cholecalciferol or ergocalciferol, to a 500-mL separatory funnel containing 10 mL of water and 20 mL of dehydrated alcohol. Add 150.0 mL of solvent hexane, insert the stopper, and shake for 1 min. Add another 150 mL of solvent hexane, insert the stopper, shake, and allow the layers to separate. Discard the aqueous layer. Drain the solvent hexane extract through anhydrous sodium sulfate into a 500-mL, round-bottom flask. Evaporate the solution to dryness with the aid of a rotary evaporator over a water bath maintained at about 65°. Immediately add 10.0 mL of *Diluent*, swirl to dissolve the residue, and filter.

Chromatographic system: Prepare as directed for *Vitamin A*.

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 5.0%

Analysis

Samples: *Standard solution* and *Sample solution*
Measure the peak areas of vitamin D. Calculate the percentage of the labeled amount of cholecalciferol ($C_{27}H_{44}O$) or ergocalciferol ($C_{28}H_{44}O$) in the portion of Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times F \times 100$$

r_U = peak areas of cholecalciferol or ergocalciferol from the *Sample solution*

r_S = peak areas of cholecalciferol or ergocalciferol from the *Standard solution*

C_S = concentration of USP Cholecalciferol RS or USP Ergocalciferol RS in the *Standard solution* (μ g/mL)

C_U = nominal concentration of cholecalciferol or ergocalciferol in the *Sample solution* (μ g/mL)

F = correction factor to account for the average amount of previtamin D present in the formulation, 1.09

Acceptance criteria: 90.0%–200.0% of the labeled amount of vitamin D as cholecalciferol ($C_{27}H_{44}O$) or ergocalciferol ($C_{28}H_{44}O$)

• VITAMIN E

[NOTE—Use low-actinic glassware throughout this procedure.]

Diluent: Acetonitrile and ethyl acetate (1:1)

Potassium hydroxide solution: Transfer 90 g of potassium hydroxide pellets to a 100-mL volumetric flask containing 60 mL of water. Mix to dissolve, cool, and dilute with water to volume.

Mobile phase: Methanol, acetonitrile, and *n*-hexane (46.5:46.5:7.0)

Standard solution: 0.3 mg/mL of USP Alpha Tocopherol RS in *Diluent*

Sample solution: Transfer an amount of Oral Solution, equivalent to 1.5 mg of alpha tocopherol, to a 125-mL conical flask fitted with a ground-glass joint, and add 25.0 mL of dehydrated alcohol. Attach a reflux condenser, and reflux in a boiling water bath for 1 min. Cautiously add 3 mL of *Potassium hydroxide solution* through the condenser, and continue to reflux for 30 min. Remove the flask from the bath, and rinse the condenser with about 15 mL of water. Cool, and transfer with a minimum volume of water to a 250-mL separatory funnel. Rinse the flask with 50 mL of *n*-hexane, and add the rinsings to the separatory funnel. Insert the stopper, shake vigorously for 1 min, and allow the layers to separate. Drain the aqueous layer into a second 250-mL separatory funnel, and repeat the extraction with 50 mL of *n*-hexane. Discard the aqueous layer, and combine the hexane extracts. Wash the combined extracts with 25 mL of water, allow the layers to separate, and discard the aqueous layer. Add 3 drops of glacial acetic acid, and repeat the washing procedure two more times. Filter the washed hexane layer through anhydrous sodium sulfate into a 250-mL, round-bottom flask. Rinse the funnel and sodium sulfate with *n*-hexane, and add the rinsing to the hexane solution in the flask. Evaporate the hexane solution to dryness with the aid of a rotary evaporator over a water bath maintained at about 50°. Immediately add 5.0 mL of *Diluent*, and swirl to dissolve the residue.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 291 nm

Column: 4.6-mm × 25-cm; packing L1

Column temperature: 40°

Flow rate: 3.0 mL/min

Injection size: 20 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 5.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas. Calculate the percentage of the labeled amount of vitamin E as alpha tocopherol ($C_{29}H_{50}O_2$) in the portion of Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of alpha tocopherol from the *Sample solution*

r_S = peak area of alpha tocopherol from the *Standard solution*

C_S = concentration of alpha tocopherol in the *Standard solution* (mg/mL)

C_U = nominal concentration of Vitamin E as alpha tocopherol in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–200.0% of the labeled amount of vitamin E.

- **ASCORBIC ACID, Method 1:** Proceed as directed for *Automated Methods of Analysis* <16>, *Assay for Ascorbic Acid*.

Acceptance criteria: 90.0%–200.0% of the labeled amount of ascorbic acid ($C_6H_8O_6$)

- **ASCORBIC ACID, Method 2**

Sample solution: Transfer an accurately measured volume of Oral Solution, equivalent to 80 mg of ascorbic acid, to a conical flask. Add 50 mL of water, 100 mL of 0.1 N sulfuric acid VS, and 15.0 mL of 0.1 N iodine VS. Stir the contents for 30 s, and add 5 mL of starch TS.

Analysis: Immediately titrate with 0.1 N sodium thiosulfate VS to the disappearance of the color. Each mL of 0.1 N iodine is equivalent to 8.806 mg of ascorbic acid ($C_6H_8O_6$).

Acceptance criteria: 90.0%–200.0% of the labeled amount of ascorbic acid ($C_6H_8O_6$)

- **CALCIUM ASCORBATE, Method 1:** Proceed as directed for *Automated Methods of Analysis* <16>, *Assay for Ascorbic Acid*.

Acceptance criteria: 90.0%–200.0% of the labeled amount of calcium ascorbate ($C_{12}H_{14}CaO_{12} \cdot 2H_2O$)

- **CALCIUM ASCORBATE, Method 2:** Proceed as directed for *Ascorbic Acid, Method 2*. Each mL of 0.1 N iodine is equivalent to 10.66 mg of $C_{12}H_{14}CaO_{12} \cdot 2H_2O$.

Acceptance criteria: 90.0%–200.0% of the labeled amount of calcium ascorbate ($C_{12}H_{14}CaO_{12} \cdot 2H_2O$)

- **SODIUM ASCORBATE, Method 1:** Proceed as directed for *Automated Methods of Analysis* <16>, *Assay for Ascorbic Acid*.

Acceptance criteria: 90.0%–200.0% of the labeled amount of sodium ascorbate ($C_6H_7NaO_6$)

- **SODIUM ASCORBATE, Method 2:** Proceed as directed for *Ascorbic Acid, Method 2*. Each mL of 0.1 N iodine is equivalent to 9.905 mg of $C_6H_7NaO_6$.

Acceptance criteria: 90.0%–200.0% of the labeled amount of sodium ascorbate ($C_6H_7NaO_6$)

- **BIOTIN, Method 1**

[NOTE—Use low-actinic glassware throughout this procedure.]

Dehydrated mixtures yielding formulations similar to the media described herein may be used provided that, when constituted as directed, they have growth-promoting properties equal to or superior to those obtained with the media prepared as described herein.

Standard stock solution: 50 µg/mL of USP Biotin RS in 50% alcohol. Store this solution in a refrigerator.

Standard solution: On the day of the assay, prepare 0.1 ng/mL of biotin from the *Standard stock solution* in water.

Sample solution: Dilute an accurately measured portion of the Oral Solution with water to an assumed concentration of 0.1 ng/mL.

Acid-hydrolyzed casein solution: Mix 100 g of vitamin-free casein with 500 mL of 6 N hydrochloric acid, and reflux the mixture for 8–12 h. Remove the hydrochloric acid from the mixture by distillation under reduced pressure until a thick paste remains. Redissolve the resulting paste in water, adjust the solution with 1 N sodium hydroxide to a pH of 3.5 ± 0.1 , and add water to make 1000 mL. Add 20 g of activated charcoal, stir for 1 h, and filter. Repeat the treatment with activated charcoal. Store under toluene in a cool place at a temperature not below 10°. Filter the solution if a precipitate forms during storage.

Cystine-tryptophan solution: Suspend 4.0 g of L-cystine in a solution of 1.0 g of L-tryptophan (or 2.0 g of D,L-tryptophan) in 700–800 mL of water, heat to 70°–80°, and add dilute hydrochloric acid (1 in 2) dropwise, with stirring, until the solids are dissolved. Cool, and add water to make 1000 mL. Store under toluene in a cool place at a temperature not below 10°.

Adenine-guanine-uracil solution: Dissolve 200 mg each of adenine sulfate, guanine hydrochloride, and uracil, with the aid of heat, in 10 mL of 4 N hydrochloric acid, cool, and add water to make 200 mL. Store under toluene in a refrigerator.

Polysorbate 80 solution: 100 mg/mL of polysorbate 80 in alcohol

Calcium pantothenate solution: 10 µg/mL of calcium pantothenate in 50% alcohol. Store in a refrigerator.

Riboflavin-thiamine hydrochloride solution: 20 µg/mL of riboflavin and 10 µg/mL of thiamine hydrochloride in 0.02 N acetic acid. Store under toluene, protected from light, in a refrigerator.

p-Aminobenzoic acid-niacin-pyridoxine hydrochloride solution: 10 µg/mL of p-aminobenzoic acid, 50 µg/mL of niacin, and 40 µg/mL of pyridoxine hydrochloride in neutralized alcohol and water (1:3). Store in a refrigerator.

Salt solution A: 50 mg/mL of monobasic potassium phosphate and 50 mg/mL of dibasic potassium phosphate in water. Add 5 drops of hydrochloric acid. Store under toluene.

Salt solution B: 20 g of magnesium sulfate, 1 mg/mL of sodium chloride, 1 mg/mL of ferrous sulfate, and 1 mg/mL of manganese sulfate in water. Add 5 drops of hydrochloric acid, and mix. Store under toluene.

Basal medium stock solution: Dissolve the anhydrous dextrose and anhydrous sodium acetate in the solutions previously mixed according to *Table 1*, and adjust with 1 N sodium hydroxide to a pH of 6.8. Dilute with water to 250 mL.

Table 1

Acid-hydrolyzed casein solution	25 mL
Cystine-tryptophan solution	25 mL
Polysorbate 80 solution	0.25 mL
Dextrose, anhydrous	10 g
Sodium acetate, anhydrous	5 g
Adenine-guanine-uracil solution	5 mL
Calcium pantothenate solution	5 mL
Riboflavin-thiamine hydrochloride solution	5 mL
p-Aminobenzoic acid-niacin-pyridoxine hydrochloride solution	5 mL
Salt solution A	5 mL
Salt solution B	5 mL

Stock culture of *Lactobacillus plantarum*: Dissolve 2.0 g of yeast extract in 100 mL of water; add 500 mg of anhydrous dextrose, 500 mg of anhydrous sodium acetate, and 1.5 g of agar; and heat the mixture on a steam bath, with stirring, until the agar dissolves. Add 10-mL portions of the hot solution to test tubes, close or cover the tubes, sterilize in an autoclave at 121° for 15 min, and allow the tubes to cool in an upright position. Prepare stab cultures in three or more of the tubes, using a pure culture of *Lactobacillus plantarum*,¹ incubating for 16–24 h at a temperature between 30° and 37° held constant to within ± 0.5°. Store in a refrigerator. Prepare a fresh stab of the stock culture every week, and do not use for *Inoculum* if the culture is more than 1 week old.

Culture medium: To each of a series of test tubes containing 5.0 mL of *Basal medium stock solution*, add 5.0 mL of water containing 0.5 ng of biotin. Plug the tubes with cotton, sterilize in an autoclave at 121° for 15 min, and cool.

Inoculum: [NOTE—A frozen suspension of *Lactobacillus plantarum* may be used as the stock culture, provided it yields an *Inoculum* comparable to a fresh culture.]

Transfer cells from the *Stock culture of Lactobacillus plantarum* to a sterile tube containing 10 mL of *Culture medium*. Incubate this culture for 16–24 h at a temperature between 30° and 37° held constant to within ± 0.5°. The cell suspension so obtained is the *Inoculum*.

Analysis: To similar separate test tubes add, in duplicate, 1.0 and/or 1.5, 2.0, 3.0, 4.0, and 5.0 mL of the *Standard solution*. To each tube and to four similar empty tubes, add 5.0 mL of *Basal medium stock solution* and sufficient water to make 10 mL. To similar test tubes add, in duplicate, volumes of the *Sample solution* corresponding to three or more of the levels specified for the *Standard solution*, including the levels of 2.0, 3.0, and 4.0 mL. To each tube add 5.0 mL of the *Basal medium stock solution* and sufficient water to make 10 mL. Place one complete set of Standard and sample tubes together in one tube rack and the duplicate set in

a second rack or section of a rack, preferably in random order.

Cover the tubes of both series to prevent contamination, and sterilize in an autoclave at 121° for 5 min. Cool, add 1 drop of *Inoculum* to each tube, except two of the four tubes containing no *Standard solution* (the uninoculated blanks). Incubate the tubes at a temperature between 30° and 37° held constant to within ± 0.5° until, following 16–24 h of incubation, there has been no substantial increase in turbidity in the tubes containing the highest level of Standard during a 2-h period.

Determine the transmittance of the tubes in the following manner. Mix the contents of each tube, and transfer to a spectrophotometer cell. Place the cell in a spectrophotometer that has been set at a specific wavelength from 540 to 660 nm, and read the transmittance when a steady state is reached. This steady state is observed a few seconds after agitation when the reading remains constant for 30 s or more. Allow approximately the same time interval for the reading on each tube.

With the transmittance set at 1.00 for the uninoculated blank, read the transmittance of the inoculated blank. With the transmittance set at 1.00 for the inoculated blank, read the transmittance for each of the remaining tubes. If there is evidence of contamination with a foreign microorganism, disregard the result of the assay.

Calculation: Prepare a standard concentration-response curve as follows. For each level of the Standard, calculate the response from the sum of the duplicate values of the transmittance (Σ_s) as the difference, $y = 2.00 - \Sigma_s$. Plot this response on the ordinate of cross-section paper against the logarithm of the mL of *Standard solution* per tube on the abscissa, using for the ordinate either an arithmetic or a logarithmic scale, whichever gives the better approximation to a straight line. Draw the straight line or smooth curve that best fits the plotted points. Calculate the response, $y = 2.00 - \Sigma_u$, adding together the two transmittances (Σ_u) for each level of the *Sample solution*. Read from the standard curve the logarithm of the volume of the *Standard solution* corresponding to each of those values of y that fall within the range of lowest and highest points plotted for the standard. Subtract from each logarithm so obtained the logarithm of the volume, in mL, of the *Sample solution* to obtain the difference, x, for each dosage level. Average the values of x for each of three or more dosage levels to obtain x, which equals the log-relative potency, M', of the *Sample solution*. Determine the quantity, in ng, of biotin ($C_{10}H_{16}N_2O_3S$) in the portion of Oral Solution taken:

$$\text{antilog } M = \text{antilog } (M' + \log R)$$

R = number of ng of biotin assumed to be present in the portion of Oral solution taken

Calculate the percentage of the labeled amount of biotin in the portion of Oral Solution taken:

$$\text{Result} = [(\text{antilog } M)/N] \times 100$$

N = nominal amount of biotin, in ng, in the portion of Oral Solution taken

Replication: Repeat the entire determination at least once, using separately prepared *Sample solutions*. If the difference between the two log-potencies M is NMT 0.08, their mean, \bar{M} , is the assayed log-potency of the test material (see *Design and Analysis of Biological Assays* (111), *Confidence Interval and Limits of Potency*). If the two determinations differ by more than 0.08, conduct one or more additional determinations. From the mean of two or more values of M that do not

¹ ATCC No. 8014 is suitable. This strain was formerly known as *Lactobacillus arabinosus* 17-5.

differ by more than 0.15, compute the mean potency of the preparation under assay.

Acceptance criteria: 90.0%–150.0% of the labeled amount of biotin ($C_{10}H_{16}N_2O_3S$)

• **BIOTIN, Method 2**

[NOTE—Use low-actinic glassware throughout this procedure.]

Solution A: Transfer 800 mL of water and 100 mL of triethylamine to a 1000-mL volumetric flask. Add 80 mL of 85% phosphoric acid, and dilute with water to volume.

Mobile phase: Transfer 80 mL of acetonitrile and 10 mL of *Solution A* to a 1000-mL volumetric flask. Dilute with water to volume.

Standard solution: 0.6 µg/mL of USP Biotin RS in water. [NOTE—A portion of the *Standard solution* will be used to determine the percent recovery of biotin from the *Solid-phase extraction* procedure.]

Sample solution: 0.6 µg/mL of biotin, from the Oral Solution in water. Adjust the solution with either dilute acetic acid or 0.1 N sodium hydroxide to a pH between 6.0 and 7.0.

Solid-phase extraction: [NOTE—Condition the extraction column specified in this procedure in the following manner. Wash the column with a 2-mL portion of methanol. Equilibrate with a 2-mL portion of water.] Separately pipet 5.0 mL each of the *Sample solution* and *Standard solution* into freshly conditioned solid-phase extraction columns consisting of a mixed-mode packing with a sorbent-mass of 60 mg. [NOTE—The mixed-mode packing consists of anion-exchange and reversed-phase sorbents. The reverse-phase component is a copolymer of *N*-vinylpyrrolidone and divinylbenzene. The anion exchange moiety is a trialkylamino group.²] Wash the column with 10 mL of 30% (v/v) methanol in water. Apply an appropriate volume (4.9 mL) of 30% (v/v) methanol in 0.1 N hydrochloric acid to the column. Collect the eluate in a 5-mL volumetric flask, containing 100 µL of 40% (w/v) sodium acetate in water, and dilute with 30% (v/v) methanol in 0.1 N hydrochloric acid to volume.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 200 nm

Column: 4.6-mm × 25-cm; packing L1

Flow rate: 2 mL/min

Injection size: 100 µL

System suitability

Samples: *Standard solution* and a portion of the *Standard solution* that has undergone *Solid-phase extraction*

Suitability requirements

Tailing factor: NMT 1.5, *Standard solution*

Relative standard deviation: NMT 2.0%, *Standard solution* and the *Standard solution* that has undergone *Solid-phase extraction*

Recovery: 95%–100%, *Standard solution* that has undergone *Solid-phase extraction*

Analysis

Samples: *Standard solution* and *Sample solution* that have both undergone *Solid-phase extraction*
Measure the peak areas of biotin. Calculate the percentage of the labeled amount of biotin ($C_{10}H_{16}N_2O_3S$) in the portion of Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of biotin from the *Sample solution*

r_S = peak area of biotin from the *Standard solution*

C_S = concentration of USP Biotin RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of biotin in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–150.0% of the labeled amount of biotin ($C_{10}H_{16}N_2O_3S$)

• **CYANOCOBALAMIN**

[NOTE—Use low-actinic glassware throughout this procedure.]

Standard stock solution: 1.0 µg/mL of cyanocobalamin from USP Cyanocobalamin RS in 25% alcohol. Store in a refrigerator.

Standard solution: Dilute a suitable volume of *Standard stock solution* with water to a measured volume such that after the incubation period as described for *Analysis*, the difference in transmittance between the inoculated blank and the 5.0-mL level of the *Standard solution* is NLT that which corresponds to a difference of 1.25 mg in dried cell weight. This concentration usually falls between 0.01 and 0.04 ng/mL of *Standard solution*. Prepare this solution fresh for each assay.

Sample solution: Transfer an accurately measured volume of Oral Solution, assumed to contain 1.0 µg of cyanocobalamin, to an appropriate vessel containing, for each mL of the Oral Solution taken, 25 mL of an aqueous extracting solution prepared just before use to contain, in each 100 mL, 1.29 g of dibasic sodium phosphate, 1.1 g of anhydrous citric acid, and 1.0 g of sodium metabisulfite. Autoclave the mixture at 121° for 10 min. Allow any undissolved particles of the extract to settle, and filter or centrifuge if necessary. Dilute an aliquot of the clear solution with water to obtain a final solution containing vitamin B12 activity approximately equivalent to that of the *Standard solution*.

Acid-hydrolyzed casein solution: Prepare as directed in *Biotin, Method 1*.

Asparagine solution: Dissolve 2.0 g of L-asparagine in water to make 200 mL. Store under toluene in a refrigerator.

Adenine–guanine–uracil solution: Prepare as directed for *Biotin, Method 1*.

Xanthine solution: Suspend 0.20 g of xanthine in 30–40 mL of water, heat to 70°, add 6.0 mL of 6 N ammonium hydroxide, and stir until the solid is dissolved. Cool, and add water to make 200 mL. Store under toluene in a refrigerator.

Salt solution A: Dissolve 10 g of monobasic potassium phosphate and 10 g of dibasic potassium phosphate in water to make 200 mL, and add 2 drops of hydrochloric acid. Store this solution under toluene.

Salt solution B: Dissolve 4.0 g of magnesium sulfate, 0.20 g of sodium chloride, 0.20 g of ferrous sulfate, and 0.20 g of manganese sulfate in water to make 200 mL, and add 2 drops of hydrochloric acid. Store this solution under toluene.

Polysorbate 80 solution: 20 g of polysorbate 80 in alcohol to make 200 mL. Store in a refrigerator.

Vitamin solution A: 10 mg of riboflavin, 10 mg of thiamine hydrochloride, 100 µg of biotin, and 20 mg of niacin in 0.02 N acetic acid to make 400 mL. Store under toluene, protected from light, in a refrigerator.

Vitamin solution B: 20 mg of *p*-aminobenzoic acid, 10 mg of calcium pantothenate, 40 mg of pyridoxine hydrochloride, 40 mg of pyridoxal hydrochloride, 8 mg of pyridoxamine dihydrochloride, and 2 mg of folic acid in a mixture of water and neutralized alcohol (3:1) to make 400 mL. Store, protected from light, in a refrigerator.

Basal medium stock solution: Prepare the medium according to the following formula and directions. A dehydrated mixture containing the same ingredients may be used provided that, when constituted as directed in the labeling, it yields a medium comparable to that obtained from the formula given herein.

Add the ingredients in the order listed in *Table 2*, carefully dissolving cystine and tryptophan in the hydrochloric acid before adding the next eight solutions

² A suitable cartridge is the Waters, Oasis MAX Vac RC cartridge, particle size 30 µm, part 186000371.

in the resulting solution. Add 100 mL of water, and dissolve dextrose, sodium acetate, and ascorbic acid. Filter, if necessary, add the *Polysorbate 80 solution*, adjust with 1 N sodium hydroxide to a pH of 5.5–6.0, and add Purified Water to make 250 mL.

Table 2

L-Cystine	0.1 g
L-Tryptophan	0.05 g
1 N Hydrochloric acid	10 mL
Adenine–guanine–uracil solution	5 mL
Xanthine solution	5 mL
Vitamin solution A	10 mL
Vitamin solution B	10 mL
Salt solution A	5 mL
Salt solution B	5 mL
Asparagine solution	5 mL
Acid-hydrolyzed casein solution	25 mL
Dextrose, anhydrous	10 g
Sodium acetate, anhydrous	5 g
Ascorbic acid	1 g
Polysorbate 80 solution	5 mL

Tomato juice preparation: Centrifuge commercially canned tomato juice so that most of the pulp is removed. Suspend 5 g/L of analytical filter-aid in the supernatant, and filter, with the aid of reduced pressure, through a layer of the filter-aid. Repeat, if necessary, until a clear, straw-colored filtrate is obtained. Store under toluene in a refrigerator.

Culture medium

[NOTE—A dehydrated mixture containing the same ingredients may be used provided that, when constituted as directed in the labeling, it yields a medium equivalent to that obtained from the formula given herein.]

Dissolve 0.75 g of yeast extract, 0.75 g of dried peptone, 1.0 g of anhydrous dextrose, and 0.20 g of monobasic potassium phosphate in 60–70 mL of water. Add 10 mL of *Tomato juice preparation* and 1 mL of *Polysorbate 80 solution*. Adjust with 1 N sodium hydroxide to a pH of 6.8, and add water to make 100 mL. Place 10-mL portions of the solution in test tubes, and plug with cotton. Sterilize the tubes and contents in an autoclave at 121° for 15 min. Cool as rapidly as possible to avoid color formation resulting from overheating the medium.

Suspension medium: Dilute a measured volume of *Basal medium stock solution* with an equal volume of water. Place 10-mL portions of the diluted medium in test tubes. Sterilize, and cool as directed for *Culture medium*.

Stock culture of *Lactobacillus leichmannii*: To 100 mL of *Culture medium* add 1.0–1.5 g of agar, and heat the mixture on a steam bath, with stirring, until the agar dissolves. Place 10-mL portions of the hot solution in test tubes, cover the tubes, sterilize at 121° for 15 min in an autoclave, and allow the tubes to cool in an upright position. Inoculate three or more of the tubes by stab transfer of a pure culture of *Lactobacillus leichmannii*.³ [NOTE—Before first using a fresh culture in this assay, make NLT 10 successive transfers of the culture in a 2-week period.]

Incubate for 16–24 h at a temperature between 30° and 40° held constant to within ±0.5°. Store in a refrigerator.

Prepare fresh stab cultures at least three times each week, and do not use them for preparing the *Inoculum* if more than 4 days old. The activity of the

microorganism can be increased by daily or twice-daily transfer of the stab culture to the point where definite turbidity in the liquid *Inoculum* can be observed 2–4 h after inoculation. A slow-growing culture seldom gives a suitable response curve and may lead to erratic results.

Inoculum: [NOTE—A frozen suspension of *Lactobacillus leichmannii* may be used as the stock culture, provided it yields an *Inoculum* comparable to a fresh culture.]

Transfer cells from the *Stock culture of Lactobacillus leichmannii* to two sterile tubes containing 10 mL of the *Culture medium* each. Incubate these cultures for 16–24 h at a temperature between 30° and 40° held constant to within ± 0.5°. Under aseptic conditions centrifuge the cultures, and decant the supernatant. Suspend the cells from the culture in 5 mL of *Suspension medium*, and combine. Using *Suspension medium*, adjust the volume so that a 1-in-20 dilution in saline TS produces 70% transmittance when read on a suitable spectrophotometer that has been set at a wavelength of 530 nm, equipped with a 10-mm cell, and read against saline TS set at 100% transmittance. Prepare a 1-in-400 dilution of the adjusted suspension using sterile *Basal medium stock solution*. The cell suspension so obtained is the *Inoculum*. [NOTE—This dilution may be altered, when necessary, to obtain the desired test response.]

Calibration of spectrophotometer: Check the wavelength of the spectrophotometer periodically, using a standard wavelength cell or other suitable device. Before reading any tests, calibrate the spectrophotometer for 0% and 100% transmittance, using water and with the wavelength set at 530 nm.

Analysis: Because of the high sensitivity of the test organism to minimum amounts of vitamin B₁₂ activity and to traces of many cleansing agents, cleanse meticulously by suitable means, followed preferably by heating at 250° for 2 h, using hard-glass 20-mm × 150-mm test tubes, and other necessary glassware.

To separate test tubes add, in duplicate, 1.0, 1.5, 2.0, 3.0, 4.0, and 5.0 mL of the *Standard solution*. To each of these tubes and to four similar empty tubes, add 5.0 mL of *Basal medium stock solution* and sufficient water to make 10 mL.

To similar separate test tubes add, in duplicate, 1.0, 1.5, 2.0, 3.0, and 4.0 mL of the *Sample solution*. To each tube add 5.0 mL of *Basal medium stock solution* and sufficient water to make 10 mL. Place one complete set of Standard and sample tubes together in one tube rack and the duplicate set in a second rack or section of a rack, preferably in random order.

Cover the tubes to prevent bacterial contamination, and sterilize in an autoclave at 121° for 5 min, arranging to reach this temperature in NMT 10 min by preheating the autoclave if necessary. Cool as rapidly as possible to avoid color formation resulting from overheating the medium. Take precautions to maintain uniformity of sterilizing and cooling conditions throughout the assay, because packing the tubes too closely in the autoclave or overloading it may cause variation in the heating rate.

Aseptically add 0.5 mL of *Inoculum* to each tube so prepared, except two of the four containing no *Standard solution* (the uninoculated blanks). Incubate the tubes at a temperature between 30° and 40°, held constant to within ± 0.5° for 16–24 h.

Terminate growth by heating to NLT 80° for 5 min. Cool to room temperature. After agitating its contents, read the transmittance at 530 nm when a steady state is reached. This steady state is observed a few seconds after agitation when the reading remains constant for 30 s or more. Allow approximately the same time interval for the reading on each tube.

With the transmittance set at 100% for the uninoculated blank, read the transmittance of the inoculated blank. If the difference is greater than 5% or if there is evidence

³Pure culture of *Lactobacillus leichmannii* (listed as *Lactobacillus delbrueckii*) may be obtained as No. 7030 from ATCC, 10801 University Blvd., Manassas, VA 20110-2209 (www.atcc.org).

of contamination with a foreign microorganism, disregard the results of the assay.

With the transmittance set at 100% for the uninoculated blank, read the transmittance of each of the remaining tubes. Disregard the results of the assay if the slope of the standard curve indicates a problem with sensitivity.

Calculation: Prepare a standard concentration-response curve by the following procedure. Test for and replace any aberrant individual transmittances. For each level of the Standard, calculate the response from the sum of the duplicate values of the transmittances (Σ_s) as the difference, $y = 2.00 - \Sigma_s$. Plot this response on the ordinate of cross-section paper against the logarithm of the mL of *Standard solution* per tube on the abscissa, using for the ordinate either an arithmetic or a logarithmic scale, whichever gives the better approximation to a straight line. Draw the straight line or smooth curve that best fits the plotted points.

Calculate the response, $y = 2.00 - \Sigma_u$, adding together the two transmittances (Σ_u) for each level of the *Sample solution*. Read from the standard curve the logarithm of the volume of the Standard solution corresponding to each of those values of y that falls within the range of the lowest and highest points plotted for the standard. Subtract from each logarithm so obtained the logarithm of the volume, in mL, of the *Sample solution* to obtain the difference, x , for each dosage level. Average the values of x for each of three or more dosage levels to obtain \bar{x} , which equals the log-relative potency, M' , of the *Sample solution*. Determine the quantity, in μg , of cyanocobalamin ($\text{C}_{63}\text{H}_{88}\text{CoN}_{14}\text{O}_{14}\text{P}$), in the portion of Oral Solution taken:

$$\text{antilog } M = \text{antilog } (M' + \log R)$$

R = number of μg of cyanocobalamin assumed to be present in the portion of Oral Solution taken

Calculate the percentage of the labeled amount of cyanocobalamin in the portion of the Oral Solution taken:

$$\text{Result} = [(\text{antilog } M)/N] \times 100$$

N = nominal amount of cyanocobalamin in the portion of Oral Solution taken

Replication: Repeat the entire determination at least once, using separately prepared *Sample solutions*. If the difference between the two log-potencies M is NMT 0.08, their mean, \bar{M} , is the assayed log-potency of the test material (see *Design and Analysis of Biological Assays* (111), *Vitamin B₁₂ Activity*). If the two determinations differ by more than 0.08, conduct one or more additional determinations. From the mean of two or more values of M that do not differ by more than 0.15, compute the mean potency of the preparation under assay.

Acceptance criteria: 90.0%–450.0% of the labeled amount of cyanocobalamin ($\text{C}_{63}\text{H}_{88}\text{CoN}_{14}\text{O}_{14}\text{P}$)

• CALCIUM PANTOTHENATE, Method 1

Mobile phase: Methanol and 0.2 M monobasic sodium phosphate (3:97). Adjust with 1.7 M phosphoric acid to a pH of 3.2 ± 0.1 .

Standard solution: 80 $\mu\text{g}/\text{mL}$ of USP Calcium Pantothenate RS in *Mobile phase*

System suitability solution: 80 $\mu\text{g}/\text{mL}$ of USP Racemic Panthenol RS in *Mobile phase*. Mix the resulting solution and *Standard solution* (1:1).

Sample solution: Equivalent to 80 $\mu\text{g}/\text{mL}$ of calcium pantothenate from the Oral Solution in *Mobile phase*

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 210 nm

Column: 4.0-mm \times 10-cm; packing L1

Flow rate: 1 mL/min

Injection size: 20 μL

System suitability

Samples: *Standard solution* and *System suitability solution*

Suitability requirements

Resolution: NLT 1.5 between panthenol and calcium pantothenate, *System suitability solution*

Tailing factor: NMT 2.0 for both the calcium pantothenate and the panthenol peaks, *Standard solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas of calcium pantothenate.

Calculate the percentage of the labeled amount of calcium pantothenate ($\text{C}_{18}\text{H}_{32}\text{CaN}_2\text{O}_{10}$) in the portion of Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of calcium pantothenate from the *Sample solution*

r_S = peak area of calcium pantothenate from the *Standard solution*

C_S = concentration of USP Calcium Pantothenate RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of calcium pantothenate in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–150.0% of the labeled amount of calcium pantothenate ($\text{C}_{18}\text{H}_{32}\text{CaN}_2\text{O}_{10}$)

• CALCIUM PANTOTHENATE, Method 2

Standard stock solution: Dissolve 50 mg of USP Calcium Pantothenate RS, previously dried and stored in the dark over phosphorus pentoxide and protected from absorption of moisture while weighing, in 500 mL of water in a 1000-mL volumetric flask. Add 10 mL of 0.2 N acetic acid and 100 mL of sodium acetate solution (1 in 60), and dilute with water to volume to obtain a concentration of 50 $\mu\text{g}/\text{mL}$ of USP Calcium Pantothenate RS. Store under toluene in a refrigerator.

Standard solution: On the day of the assay, dilute a volume of *Standard stock solution* with water to obtain a concentration of 0.01–0.04 $\mu\text{g}/\text{mL}$ of calcium pantothenate, the exact concentration being such that the responses obtained as directed for *Analysis*, 2.0 and 4.0 mL of the *Standard solution* being used, are within the linear portion of the log-concentration response curve.

Sample solution: Transfer an accurately measured volume of Oral Solution equivalent to 50 mg of calcium pantothenate to a 1000-mL volumetric flask containing 500 mL of water. Add 10 mL of 0.2 N acetic acid and 100 mL of sodium acetate solution (1 in 60), dilute with water to volume, and filter. Dilute a measured volume of this solution quantitatively, and stepwise if necessary, with water to obtain a solution having about the same concentration as that of the *Standard solution*.

Acid-hydrolyzed casein solution: Mix 100 g of vitamin-free casein with 500 mL of 6 N hydrochloric acid, and reflux the mixture for 8–12 h. Remove the hydrochloric acid from the mixture by distillation under reduced pressure until a thick paste remains. Redissolve the resulting paste in water, adjust the solution with 1 N sodium hydroxide to a pH of 3.5 ± 0.1 , and add water to make 1000 mL. Add 20 g of activated charcoal, stir for 1 h, and filter. Repeat the treatment with activated charcoal. Store under toluene in a cool place at a temperature not below 10°. Filter the solution if a precipitate forms during storage.

Cystine-tryptophan solution: Suspend 4.0 g of L-cystine in a solution of 1.0 g of L-tryptophan (or 2.0 g of D,L-tryptophan) in 700–800 mL of water, heat to 70°–80°, and add dilute hydrochloric acid (1 in 2) dropwise, with stirring, until the solids are dissolved. Cool, and add water to make 1000 mL. Store under toluene in a cool place at a temperature not below 10°.

Adenine-guanine-uracil solution: Dissolve 200 mg each of adenine sulfate, guanine hydrochloride, and uracil, with the aid of heat, in 10 mL of 4 N hydrochloric acid. Cool, and add water to make 200 mL. Store under toluene in a refrigerator.

Polysorbate 80 solution: 100 mg/mL of polysorbate 80 in alcohol

Riboflavin-thiamine hydrochloride-biotin solution: 20 µg/mL of riboflavin, 10 µg/mL of thiamine hydrochloride, and 0.04 µg/mL of biotin in 0.02 N acetic acid. Store under toluene, protected from light, in a refrigerator.

p-Aminobenzoic acid-niacin-pyridoxine hydrochloride solution: 10 µg/mL of p-aminobenzoic acid, 50 µg/mL of niacin, and 40 µg/mL of pyridoxine hydrochloride in a mixture of neutralized alcohol and water (1:3). Store in a refrigerator.

Salt solution A: Dissolve 25 g of monobasic potassium phosphate and 25 g of dibasic potassium phosphate in water to make 500 mL. Add 5 drops of hydrochloric acid. Store under toluene.

Salt solution B: Dissolve 10 g of magnesium sulfate, 0.5 g of sodium chloride, 0.5 g of ferrous sulfate, and 0.5 g of manganese sulfate in water to make 500 mL. Add 5 drops of hydrochloric acid. Store under toluene.

Basal medium stock solution: Dissolve the anhydrous dextrose and anhydrous sodium acetate in the solutions previously mixed according to Table 3, and adjust with 1 N sodium hydroxide to a pH of 6.8. Dilute with water to 250 mL.

Table 3

Acid-hydrolyzed casein solution	25 mL
Cystine-tryptophan solution	25 mL
Polysorbate 80 solution	0.25 mL
Dextrose, anhydrous	10 g
Sodium acetate, anhydrous	5 g
Adenine-guanine-uracil solution	5 mL
Riboflavin-thiamine hydrochloride-biotin solution	5 mL
p-Aminobenzoic acid-niacin-pyridoxine hydrochloride solution	5 mL
Salt solution A	5 mL
Salt solution B	5 mL

Stock culture of *Lactobacillus plantarum*: Dissolve 2.0 g of yeast extract in 100 mL of water; add 500 mg of anhydrous dextrose, 500 mg of anhydrous sodium acetate, and 1.5 g of agar; and heat the mixture on a steam bath, with stirring, until the agar dissolves. Add 10-mL portions of the hot solution to the test tubes, close or cover the tubes, sterilize in an autoclave at 121° for 15 min, and allow the tubes to cool in an upright position. Prepare stab cultures in three or more of the tubes, using a pure culture of *Lactobacillus plantarum*¹, incubating for 16–24 h at a temperature between 30° and 37° held constant to within ± 0.5°. Store in a refrigerator. Prepare a fresh stab of the stock culture every week, and do not use for *Inoculum* if the culture is more than 1 week old.

Culture medium: To each of a series of test tubes containing 5.0 mL of *Basal medium stock solution*, add 5.0 mL of water containing 0.2 µg of calcium pantothenate. Plug the tubes with cotton, sterilize in an autoclave at 121° for 15 min, and cool.

Inoculum: [NOTE—A frozen suspension of *Lactobacillus plantarum* may be used as the stock culture, provided it yields an *Inoculum* comparable to a fresh culture.]

Transfer cells from the *Stock culture of Lactobacillus plantarum* to a sterile tube containing 10 mL of *Culture medium*. Incubate this culture for 16–24 h at a temperature between 30° and 37° held constant to within ± 0.5°. The cell suspension so obtained is the *Inoculum*.

Analysis: To similar separate test tubes add, in duplicate, 1.0 and/or 1.5, 2.0, 3.0, 4.0, and 5.0 mL of the *Standard solution*. To each tube and to four similar empty tubes, add 5.0 mL of *Basal medium stock solution* and sufficient water to make 10 mL.

To similar separate test tubes add, in duplicate, volumes of the *Sample solution* corresponding to three or more of the levels specified for the *Standard solution*, including the levels of 2.0, 3.0, and 4.0 mL. To each tube add 5.0 mL of the *Basal medium stock solution* and sufficient water to make 10 mL. Place one complete set of Standard and sample tubes together in one tube rack and the duplicate set in a second rack or section of a rack, preferably in random order.

Cover the tubes of both series to prevent contamination, and sterilize in an autoclave at 121° for 5 min. Cool, add 1 drop of *Inoculum* to each tube, except two of the four tubes containing no *Standard solution* (the uninoculated blanks). Incubate the tubes at a temperature between 30° and 37°, held constant to within ± 0.5° until, following 16–24 h of incubation, there has been no substantial increase in turbidity in the tubes containing the highest level of Standard during a 2-h period.

Determine the transmittance of the tubes in the following manner. Mix the contents of each tube, and transfer to an optical container if necessary. Read the transmittance between 540 and 660 nm when a steady state is reached. This steady state is observed a few seconds after agitation when the galvanometer reading remains constant for 30 s or more. Allow approximately the same time interval for the reading on each tube.

With the transmittance set at 1.00 for the uninoculated blank, read the transmittance of the inoculated blank. With the transmittance set at 1.00 for the inoculated blank, read the transmittance for each of the remaining tubes. If there is evidence of contamination with a foreign microorganism, disregard the result of the assay.

Calculation: Prepare a standard concentration-response curve as follows. For each level of the Standard, calculate the response from the sum of the duplicate values of the transmittance (Σ_s) as the difference, $y = 2.00 - \Sigma_s$. Plot this response on the ordinate of cross-section paper against the logarithm of the mL of *Standard solution* per tube on the abscissa, using for the ordinate either an arithmetic or a logarithmic scale, whichever gives the better approximation to a straight line. Draw the straight line or smooth curve that best fits the plotted points.

Calculate the response, $y = 2.00 - \Sigma_u$, adding together the two transmittances (Σ_u) for each level of the *Sample solution*. Read from the standard curve the logarithm of the volume of the *Standard solution* corresponding to each of those values of y that fall within the range of the lowest and highest points plotted for the Standard. Subtract from each logarithm so obtained the logarithm of the volume, in mL, of the *Sample solution* to obtain the difference, x , for each dosage level. Average the values of x for each of three or more dosage levels to obtain \bar{x} , which equals the log-relative potency, M' , of the *Sample solution*. Determine the quantity, in mg, of USP Calcium Pantothenate RS corresponding to the calcium

pantothenate ($C_{18}H_{32}CaN_2O_{10}$) in the portion of Oral Solution taken:

$$\text{antilog } M = \text{antilog } (M' + \log R)$$

R = number of mg of calcium pantothenate assumed to be present in the portion of Oral Solution taken

Calculate the percentage of the labeled amount of calcium pantothenate ($C_{18}H_{32}CaN_2O_{10}$) in the portion of Oral Solution taken:

$$\text{Result} = [(\text{antilog } M)/N] \times 100$$

N = nominal amount of calcium pantothenate in the portion of Oral Solution (mg)

Replication: Repeat the entire determination at least once, using separately prepared *Sample solutions*. If the difference between the two log-potencies M is NMT 0.08, their mean, \bar{M} , is the assayed log-potency of the test material (see *Design and Analysis of Biological Assays* (111), *Confidence Interval and Limits of Potency*). If the two determinations differ by more than 0.08, conduct one or more additional determinations. From the mean of two or more values of M that do not differ by more than 0.15, compute the mean potency of the preparation under assay.

Acceptance criteria: 90.0%–150.0% of the labeled amount of calcium pantothenate ($C_{18}H_{32}CaN_2O_{10}$)

• **DEXPANTHENOL OR PANTHENOL, Method 1**

Mobile phase and Chromatographic system: Proceed as directed in the assay for *Calcium Pantothenate, Method 1*.

Standard solution: 80 µg/mL of USP Dexpanthenol RS or USP Racemic Panthenol RS in *Mobile phase*. [NOTE—Use USP Dexpanthenol RS to analyze Oral Solution that contains dexpanthenol and USP Racemic Panthenol RS to analyze Oral Solution that contains panthenol.]

System suitability solution: 80 µg/mL of USP Calcium Pantothenate RS in *Mobile phase*. Mix the resulting solution and *Standard solution* (1:1).

Sample solution: Equivalent to 80 µg/mL of dexpanthenol or panthenol from the Oral Solution in *Mobile phase*

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas of panthenol. Calculate the percentage of the labeled amount of dexpanthenol or panthenol ($C_9H_{19}NO_4$) in the portion of Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of dexpanthenol or panthenol from the *Sample solution*

r_S = peak area of dexpanthenol or panthenol from the *Standard solution*

C_S = concentration of USP Dexpanthenol RS or USP Racemic Panthenol RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of panthenol or dexpanthenol in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–150.0% of the labeled amount of dexpanthenol or panthenol ($C_9H_{19}NO_4$)

• **DEXPANTHENOL OR PANTHENOL, Method 2**

[NOTE—The following procedure is applicable also to the determination of the dextrorotatory component of racemic panthenol in preparations containing panthenol.]

Dehydrated mixtures yielding formulations similar to the media described herein may be used provided that, when constituted as directed, they have growth-promoting properties equal to or superior to those obtained with the media prepared as described herein.

Standard stock solution: 800 µg/mL of USP

Dexpanthenol RS or 1600 µg/mL of USP Racemic Panthenol RS in water. Store in a refrigerator, protected from light, and use within 30 days. [NOTE—Use USP Dexpanthenol RS to analyze Oral Solution that contains dexpanthenol and USP Racemic Panthenol RS to analyze Oral Solution that contains panthenol.]

Standard solution: On the day of the assay, prepare 1.2 µg/mL of dexpanthenol or 2.4 µg/mL of racemic panthenol from the *Standard stock solution* with water.

Sample solution: 1.2 µg/mL of dexpanthenol or 2.4 µg/mL of panthenol from the Oral Solution in water

Acid-hydrolyzed casein solution: Mix 100 g of vitamin-free casein with 500 mL of dilute hydrochloric acid (1 in 2), and reflux the mixture for 8–12 h. Remove the hydrochloric acid from the mixture by distillation under reduced pressure until a thick paste remains. Redissolve the resulting paste in about 500 mL of water, adjust the solution with 1 N sodium hydroxide to a pH of 3.5 ± 0.1 , and add water to make 1000 mL. Add 20 g of activated charcoal, stir for 1 h, and filter. Repeat the treatment with activated charcoal. Store under toluene in a cool place at a temperature not below 10°. Filter the solution if a precipitate forms during storage.

Cystine–tryptophan solution: Suspend 4.0 g of L-cystine in a solution of 1.0 g of L-tryptophan (or 2.0 g of D,L-tryptophan) in 700–800 mL of water, heat to $75 \pm 5^\circ$, and add 6 M hydrochloric acid solution dropwise, with stirring, until the solids are dissolved. Cool, add water to make 1000 mL, and mix. Store under toluene in a cool place at a temperature not below 10°.

Adenine–guanine–uracil solution: Dissolve 200 mg each of adenine sulfate, guanine hydrochloride, and uracil, with the aid of heat, in 10 mL of 4 N hydrochloric acid. Cool, add water to make 200 mL, and mix. Store under toluene in a refrigerator.

Polysorbate 80 solution: 100 mg/mL of polysorbate 80 in alcohol

Riboflavin–thiamine hydrochloride–biotin solution: Prepare a solution of riboflavin, thiamine hydrochloride, and biotin in 0.02 N acetic acid containing 20 µg/mL of riboflavin, 10 µg/mL of thiamine hydrochloride, and 0.04 µg/mL of biotin. Store under toluene, protected from light, in a refrigerator.

p-Aminobenzoic acid–niacin–pyridoxine hydrochloride solution: Prepare a solution in neutral 25% alcohol containing 10 µg/mL of p-aminobenzoic acid, 50 µg/mL of niacin, and 40 µg/mL of pyridoxine hydrochloride. Store in a refrigerator.

Salt solution A: Dissolve 25 g of monobasic potassium phosphate and 25 g of dibasic potassium phosphate in water to make 500 mL. Add 5 drops of hydrochloric acid, and mix. Store under toluene.

Salt solution B: Dissolve 10 g of magnesium sulfate, 0.5 g of sodium chloride, 0.5 g of ferrous sulfate, and 0.5 g of manganese sulfate in water to make 500 mL. Add 5 drops of hydrochloric acid, and mix. Store under toluene.

Pyridoxal–calcium pantothenate solution: Dissolve 40 mg of pyridoxal hydrochloride and 375 µg of calcium pantothenate in 10% alcohol to make 200 mL, and mix. Store in a refrigerator, and use within 30 days.

Polysorbate 40–oleic acid solution: Dissolve 25 g of polysorbate 40 and 0.25 g of oleic acid in 20% alcohol to make 500 mL, and mix. Store in a refrigerator, and use within 30 days.

Modified pantothenate medium: Dissolve anhydrous dextrose and sodium acetate in the solutions previously mixed according to *Table 4*, adjust with 1 N sodium hydroxide to a pH of 6.8, dilute with water to 250 mL, and mix.

Table 4

Acid-hydrolyzed casein solution	25 mL
Cystine-tryptophan solution	25 mL
Polysorbate 80 solution	0.25 mL
Dextrose, anhydrous	10 g
Sodium acetate, anhydrous	5 g
Adenine-guanine-uracil solution	5 mL
Riboflavin-thiamine hydrochloride-biotin solution	5 mL
p-Aminobenzoic acid-niacin-pyridoxine hydrochloride solution	5 mL
Salt solution A	5 mL
Salt solution B	5 mL
Pyridoxal-calcium pantothenate solution	5 mL
Polysorbate 40-oleic acid solution	5 mL

Double-strength modified pantothenate medium:

Prepare as directed under *Modified pantothenate medium*, but make the final dilution to 125 mL instead of 250 mL. Prepare fresh.

Stock culture of *Pediococcus acidilactici*: Dissolve 6.0 g of peptone, 4.0 g of pancreatic digest of casein, 3.0 g of yeast extract, 1.5 g of beef extract, 1.0 g of dextrose, and 15.0 g of agar in 800 mL of water, with the aid of heat. Adjust with 0.1 N sodium hydroxide or 0.1 N hydrochloric acid to a pH between 6.5 and 6.6, dilute with water to 1000 mL, and mix. Add 10-mL portions of the solution to culture tubes, place caps on the tubes, and sterilize in an autoclave at 121° for 15 min. Cool on a slant, and store in a refrigerator. Prepare a stock culture of *Pediococcus acidilactici*⁴ on a slant of this medium. Incubate at 35° for 20–24 h, and store in a refrigerator. Maintain the stock culture by monthly transfer onto fresh slants.

Inoculum: Inoculate three 250-mL portions of sterile *Modified pantothenate medium* from a stock culture slant, and incubate at 35° for 20–24 h. Centrifuge the suspension from the combined portions, and wash the cells with sterile *Modified pantothenate medium*. Resuspend the cells in sufficient sterile *Modified pantothenate medium* so that a 1-in-50 dilution, when tested in a 13-mm diameter test tube, gives 80% light transmission at 530 nm. Transfer 1.2-mL portions of this stock suspension to sterile glass ampuls, seal, freeze in liquid nitrogen, and store in a freezer. On the day of the assay, allow the ampuls to reach room temperature, mix the contents, and dilute 1 mL of thawed culture with sterile saline TS to 150 mL.

[NOTE—This dilution may be altered when necessary to obtain the desired test response.]

Analysis: Prepare in triplicate a series of eight culture tubes by adding the following quantities of water to the tubes within a set: 5.0, 4.5, 4.0, 3.5, 3.0, 2.0, 1.0, and 0.0 mL. To these same tubes, and in the same order, add 0.0, 0.5, 1.0, 1.5, 2.0, 3.0, 4.0, and 5.0 mL of the *Standard solution*.

Prepare in duplicate a series of five culture tubes by adding the following quantities of water to the tubes within a set: 4.0, 3.5, 3.0, 2.0, and 1.0 mL. To these same tubes, and in the same order, add 1.0, 1.5, 2.0, 3.0, and 4.0 mL of the *Sample solution*.

Add 5.0 mL of *Double-strength modified pantothenate medium* to each tube, and mix. Cover the tubes with metal caps, and sterilize in an autoclave at 121° for 5 min. Cool to room temperature in a chilled water bath, and inoculate each tube with 0.5 mL of the *Inoculum*. Allow to incubate at 37° for 16 h. Terminate growth by heating to a temperature not below 80°, such as by steaming at atmospheric pressure in a sterilizer for 5 to 10 min. Cool, and concomitantly determine the percentage transmittance of the suspensions, in cells of

equal pathlength, on a suitable spectrophotometer, at a wavelength of 530 nm.

Calculation: Draw a dose-response curve on arithmetic graph paper by plotting the average response, in percent transmittance, for each set of tubes of the standard curve against the standard level concentrations. The curve is drawn by connecting each adjacent pair of points with a straight line. From this standard curve, determine by interpolation the potency, of each tube containing portions of the *Sample solution*. Divide the potency of each tube by the amount of the *Sample solution* added to it, to obtain the individual responses. Calculate the mean response by averaging the individual responses that vary from their mean by NMT 15%, using NLT half the total number of tubes. Calculate the potency of the portion of the Oral Solution taken for assay, by multiplying the mean response by the appropriate dilution factor. Calculate the percentage of the labeled amount of dexpanthenol or panthenol in the portion of Oral Solution taken:

$$\text{Result} = (P/N) \times 100$$

- P = calculated potency of dexpanthenol or panthenol in the portion of Oral Solution taken (mg)
 N = nominal amount of dexpanthenol or panthenol in the portion of Oral Solution taken (mg)

Acceptance criteria: 90.0%–150.0% of the labeled amount of dexpanthenol or panthenol (C₉H₁₉NO₄)

• **NIACIN or NIACINAMIDE**

[NOTE—Use low-actinic glassware throughout this procedure.]

Diluent: 25 mg/mL of edetate disodium in water

Mobile phase: Mix 350 mL of methanol, 15.0 mL of glacial acetic acid, 0.4 mL of triethylamine, and dilute with 0.008 M sodium 1-hexanesulfonate to 2000 mL.

Standard solution: 0.10 mg/mL of USP Niacin RS or USP Niacinamide RS in *Diluent*. [NOTE—Use USP Niacin RS for Oral Solution that contains niacin and USP Niacinamide RS for Oral Solution that contains niacinamide.]

Sample solution: Dilute an accurately measured volume of Oral Solution with *Diluent* to obtain a solution with a concentration of 0.1 mg/mL of niacin or niacinamide.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 270 nm

Column: 4.6-mm × 25-cm; packing L7

Flow rate: 2 mL/min

Injection size: 5 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of niacin (C₆H₅NO₂) or niacinamide (C₆H₆N₂O) in the portion of Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- r_U = peak area of niacin or niacinamide from the *Sample solution*
 r_S = peak area of niacin or niacinamide from the *Standard solution*
 C_S = concentration of USP Niacin RS or USP Niacinamide RS in the *Standard solution* (mg/mL)

⁴ ATCC No. 8042 is suitable.

C_U = nominal concentration of niacin or niacinamide in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–150.0% the labeled amount of niacin ($C_6H_5NO_2$) or niacinamide ($C_6H_6N_2O$)

• **PYRIDOXINE HYDROCHLORIDE**

Diluent, Mobile phase, and Chromatographic system: Proceed as directed for *Niacin* or *Niacinamide*.

Standard solution: 24 µg/mL of USP Pyridoxine Hydrochloride RS in *Diluent*

Sample solution: Equivalent to 24 µg/mL of Pyridoxine Hydrochloride from Oral Solution in *Diluent*

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of pyridoxine hydrochloride ($C_8H_{11}NO_3 \cdot HCl$) in the portion of Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of pyridoxine hydrochloride from the *Sample solution*

r_S = peak area of pyridoxine hydrochloride from the *Standard solution*

C_S = concentration of USP Pyridoxine Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of pyridoxine hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–150.0% of the labeled amount of pyridoxine hydrochloride ($C_8H_{11}NO_3 \cdot HCl$)

• **RIBOFLAVIN-5'-PHOSPHATE SODIUM, Method 1**

[NOTE—Riboflavin-5'-phosphate sodium is quantitated against USP Riboflavin RS in this procedure. In the chromatogram of the *Sample solution*, the riboflavin-5'-phosphate peak is the only peak measured for calculation.]

Diluent, Mobile phase, and Chromatographic system: Proceed as directed for *Niacin* or *Niacinamide*.

Standard solution: 8 µg/mL of USP Riboflavin RS in *Diluent*, by heating if necessary.

Sample solution: Equivalent to 8 µg/mL of Riboflavin from the Oral Solution in *Diluent*

Analysis

Samples: *Standard solution* and *Sample solution*
[NOTE—The relative retention times for riboflavin-5'-phosphate and riboflavin are about 0.18 and 1.0, respectively.]

Calculate the percentage of the labeled amount of riboflavin ($C_{17}H_{20}N_4O_6$) in the portion of Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times F \times 100$$

r_U = peak area of riboflavin-5'-phosphate from the *Sample solution*

r_S = peak area of riboflavin from the *Standard solution*

C_S = concentration of USP Riboflavin RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of riboflavin in the *Sample solution* (mg/mL)

F = factor for converting the response obtained for riboflavin-5'-phosphate to riboflavin, 1.493 [NOTE—Riboflavin phosphate sodium is a mixture of isomeric monophosphates and diphosphates containing an average amount of 67% of riboflavin-5'-monophosphate, which separates in this chromatographic system. The factor 1.493 assumes 67% of riboflavin-5'-monophosphate.]

Acceptance criteria: 90.0%–150.0% of the labeled amount of riboflavin ($C_{17}H_{20}N_4O_6$)

• **RIBOFLAVIN OR RIBOFLAVIN-5'-PHOSPHATE SODIUM, Method 2**
[NOTE—Use low-actinic glassware throughout this procedure.]

Solvent blank: 1 N hydrochloric acid, 2.5 M sodium acetate, and water (1:2:97)

Standard stock solution: Transfer 0.16 mg/mL of USP Riboflavin RS in 1 N hydrochloric acid, 2.5 M sodium acetate, and water (1:2:97). Mix the resulting solution and water (1:9).

Standard solution: Transfer 5.0 mL of the *Standard stock solution* to a 500-mL volumetric flask, add 5.0 mL of 1 N hydrochloric acid, 10.0 mL of 2.5 M sodium acetate, and dilute with water to volume.

Sample solution: Transfer an accurately measured volume of Oral Solution, equivalent to 0.8 mg of riboflavin to a 100-mL volumetric flask, and dilute with water to volume. Transfer 10.0 mL of the resulting solution to a 500-mL volumetric flask, add 5.0 mL of 1 N hydrochloric acid, 10.0 mL of 2.5 M sodium acetate, and dilute with water to volume.

Spectrometric conditions

Mode: Fluorescence

Analytical wavelength

Excitation: 440 nm

Emission: 530 nm

Blank: *Solvent blank*

Analysis

Samples: *Standard solution* and *Sample solution*
Determine the maximum fluorescence intensities, I_S and I_U , of the *Standard solution* and the *Sample solution*, respectively. Calculate the percentage of the labeled amount of riboflavin ($C_{17}H_{20}N_4O_6$) in the portion of Oral Solution taken:

$$\text{Result} = (I_U/I_S) \times (C_S/C_U) \times 100$$

I_U = fluorescence intensity from the *Sample solution*

I_S = fluorescence intensity from the *Standard solution*

C_S = concentration of USP Riboflavin RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of riboflavin in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–150.0% of the labeled amount of riboflavin ($C_{17}H_{20}N_4O_6$)

• **THIAMINE**

Diluent, Mobile phase, and Chromatographic system: Proceed as directed for *Niacin* or *Niacinamide*.

Standard solution: 24 µg/mL of USP Thiamine Hydrochloride RS in *Diluent*

Sample solution: Equivalent to 24 µg/mL of thiamine hydrochloride or thiamine mononitrate from Oral Solution in *Diluent*

Analysis

Samples: *Standard solution* and *Sample solution*
Measure the areas of the major peaks. Calculate the percentage of the labeled amount of thiamine hydrochloride ($C_{12}H_{17}ClN_4OS \cdot HCl$) or thiamine mononitrate ($C_{12}H_{17}N_5O_4S$) in the portion of Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times F \times 100$$

r_U = peak area of thiamine from the *Sample solution*

r_S = peak area of thiamine from the *Standard solution*

C_S = concentration of USP Thiamine Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of thiamine hydrochloride or thiamine mononitrate in the *Sample solution* (mg/mL)

F = 1 (for products containing thiamine hydrochloride) and 0.97 (for products containing thiamine mononitrate)

Acceptance criteria: 90.0%–200.0% of the labeled amount of thiamine hydrochloride ($C_{12}H_{17}ClN_4OS \cdot HCl$) or thiamine mononitrate ($C_{12}H_{17}N_5O_4S$)

[NOTE—Commercially available atomic absorption standard solutions for the minerals, where applicable, may be used where preparation of a standard stock solution is described in the following assays. Use deionized water where water is specified. Where atomic absorption spectrophotometry is specified in the assay, the *Standard solutions* and the *Sample solution* may be diluted quantitatively with the solvent specified, if necessary, to yield solutions of suitable concentrations adaptable to the linear or working range of the instrument.]

• CHROMIUM

Chromium standard solution: 1000 µg/mL of chromium from potassium dichromate, previously dried at 120° for 4 h in water. Store in a polyethylene bottle.

Standard stock solution: 10 µg/mL of chromium from *Chromium standard solution* diluted with 6 N hydrochloric acid and water (1 in 20)

Standard solutions: Transfer 10.0 mL and 20.0 mL of the *Standard stock solution* to separate 100-mL volumetric flasks, and transfer 15.0 mL and 20.0 mL of the *Standard stock solution* to separate 50-mL volumetric flasks. Dilute the contents of each of the four flasks with 0.125 N hydrochloric acid to volume to obtain concentrations of 1.0, 2.0, 3.0, and 4.0 µg/mL of chromium.

Sample solution: Dilute an accurately measured volume of Oral Solution to obtain a solution equivalent to 1 µg/mL of chromium in 0.125 N hydrochloric acid.

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometer

Lamp: Chromium hollow-cathode

Flame: Air–acetylene

Analytical wavelength: 357.9 nm

Blank: 0.125 N hydrochloric acid

Analysis

Samples: *Standard solutions* and *Sample solution*
Determine the absorbances of the solutions, against the blank. Plot the absorbances of the *Standard solutions* versus concentration, in µg/mL, of chromium, and draw the straight line best fitting the four plotted points. From the graph so obtained, determine the concentration, *C*, in µg/mL, of chromium in the *Sample solution*. Calculate the percentage of the labeled amount of chromium (Cr) in the portion of Oral Solution taken:

$$\text{Result} = (C/C_U) \times 100$$

C = concentration of chromium in the *Standard solution* (µg/mL)

C_U = nominal concentration of chromium in the *Sample solution*, (µg/mL)

Acceptance criteria: 90.0%–160.0% of the labeled amount of chromium (Cr)

• FLUORIDE

[NOTE—Use plastic containers throughout this procedure.]

Ascorbic acid solution: 70 mg/mL of ascorbic acid in water

Mobile phase: Alcohol, water, and 1 N sulfuric acid (50:449:1)

Standard stock solution: 220 µg/mL of USP Sodium Fluoride RS in water. This solution contains 100 µg/mL of fluoride.

Standard solution: Transfer 5.0 mL of *Standard stock solution* to a 100-mL volumetric flask. Add 2 mL of *Ascorbic acid solution*, 10 mL of alcohol, and about 70 mL of water, and mix. Adjust with 1 N sodium hydroxide to a pH of 4.25 ± 0.05. Dilute with water to volume, and mix to obtain 5 µg/mL of fluoride solution.

Sample solution: Transfer an accurately measured volume of the Oral Solution, equivalent to 0.5 mg of fluoride, to a 100-mL volumetric flask. Add 1 drop of hydrochloric acid, 10 mL of alcohol, and about 75 mL

of water, and mix. Adjust with 1 N sodium hydroxide to a pH of 4.25 ± 0.05. Dilute with water to volume.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: Conductivity

Guard column: 4.6-mm × 3-cm; packing L17

Analytical column: 7.8-mm × 30-cm; packing L17

Flow rate: 0.6 mL/min

Injection size: 100 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas of fluoride. Calculate the percentage of the labeled amount of fluorine (F) in the portion of Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of fluoride from the *Sample solution*

r_S = peak area of fluoride from the *Standard solution*

C_S = concentration of fluoride in the *Standard solution* (µg/mL)

C_U = nominal concentration of fluorine in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–160.0% of the labeled amount of fluorine (F)

• IODIDE, Method 1

Mobile phase: Dissolve 5.15 g of tetrabutylammonium bromide in 320 mL of acetonitrile. Dilute with water to 2000 mL.

Standard stock solution: 1.3 mg/mL of potassium iodide in *Mobile phase*. This solution has a concentration of 1 mg/mL of iodide.

Standard solution: 2.5 µg/mL of iodide from the *Standard stock solution* in *Mobile phase*

System suitability solution: Transfer 0.13 g of potassium iodide and 0.5 g of potassium iodate to a 100-mL volumetric flask. Dissolve in *Mobile phase*, using sonication if necessary, dilute with *Mobile phase* to volume, and mix. Transfer 1.0 mL of this solution to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Transfer 25.0 mL of this solution to a 100-mL volumetric flask, and dilute with *Mobile phase* to volume.

Sample solution: Dilute an accurately measured volume of the Oral Solution to obtain a solution with a concentration of 2.5 µg/mL of iodine in *Mobile phase*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 225 nm

Column: 4.6-mm × 15-cm; packing L1

Flow rate: 1.5 mL/min

Injection size: 30 µL

System suitability

Samples: *Standard solution* and *System suitability solution*

[NOTE—The relative retention times for iodate and iodide are about 0.32 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 2.5 between iodate and iodide, *System suitability solution*

Relative standard deviation: NMT 2.0% for the iodide peak, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of iodine (I) in the portion of Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- r_U = peak area of iodide from the *Sample solution*
 r_S = peak area of iodide from the *Standard solution*
 C_S = concentration of iodide in the *Standard solution* ($\mu\text{g/mL}$)
 C_U = nominal concentration of iodine in the *Sample solution* ($\mu\text{g/mL}$)

Acceptance criteria: 90.0%–160.0% of the labeled amount of iodine (I)

- **IODIDE, Method 2:** Proceed as directed for *Automated Methods of Analysis* (16), Assay for Iodide.

- **IRON**

Iron standard stock solution: Transfer 100 mg of iron powder to a 1000-mL volumetric flask, dissolve in 6 N hydrochloric acid, and dilute with water to volume.

Standard solutions: To separate 100-mL volumetric flasks, transfer 2.0, 4.0, 5.0, 6.0, and 8.0 mL of *Iron standard stock solution*. Dilute the contents of each flask with 0.125 N hydrochloric acid to volume to obtain concentrations of 2.0, 4.0, 5.0, 6.0, and 8.0 $\mu\text{g/mL}$ of iron.

Sample solution: 6 $\mu\text{g/mL}$ of iron from the Oral Solution in 0.125 N hydrochloric acid

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometer

Lamp: Iron hollow-cathode

Flame: Air–acetylene

Analytical wavelength: 248.3 nm

Blank: 0.125 N hydrochloric acid

Analysis

Samples: *Standard solutions* and *Sample solution*
 Determine the absorbances of the solutions, against the blank. Plot the absorbances of the *Standard solutions* versus concentration, in $\mu\text{g/mL}$, of iron, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, C , in $\mu\text{g/mL}$, of iron in the *Sample solution*. Calculate the percentage of the labeled amount of iron (Fe) in the portion of Oral Solution taken:

$$\text{Result} = (C/C_U) \times 100$$

C = concentration of iron in the *Sample solution* from the graph ($\mu\text{g/mL}$)

C_U = nominal concentration of iron in the *Sample solution* ($\mu\text{g/mL}$)

Acceptance criteria: 90.0%–125.0% of the labeled amount of iron (Fe)

- **MAGNESIUM**

Magnesium standard solution: Transfer 1.00 g of magnesium ribbon to a 1000-mL volumetric flask. Dissolve in 50 mL of 6 N hydrochloric acid, and dilute with water to volume.

Standard stock solution: 20 $\mu\text{g/mL}$ of magnesium from *Magnesium standard solution* in 0.125 N hydrochloric acid

Standard solutions: To separate 100-mL volumetric flasks transfer 5.0, 7.5, 10.0, 12.5, and 15.0 mL of *Standard stock solution*. Dilute with 0.125 N hydrochloric acid to volume to obtain concentrations of 1.0, 1.5, 2.0, 2.5, and 3.0 $\mu\text{g/mL}$ of magnesium.

Sample solution: 2.5 $\mu\text{g/mL}$ of magnesium from the Oral Solution in 0.125 N hydrochloric acid

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometer

Lamp: Magnesium hollow-cathode

Flame: Air–acetylene

Analytical wavelength: 285.2 nm

Blank: 0.125 N hydrochloric acid

Analysis

Samples: *Standard solutions* and *Sample solution*
 Determine the absorbances of the solutions, against the blank. Plot the absorbances of the *Standard solutions* versus concentration, in $\mu\text{g/mL}$, of magnesium, and

draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, C , in $\mu\text{g/mL}$, of magnesium in the *Sample solution*. Calculate the percentage of the labeled amount of magnesium (Mg) in the portion of Oral Solution taken:

$$\text{Result} = (C/C_U) \times 100$$

C = concentration of magnesium in the *Sample solution* from the graph ($\mu\text{g/mL}$)

C_U = nominal concentration of magnesium in the *Sample solution* ($\mu\text{g/mL}$)

Acceptance criteria: 90.0%–125.0% of the labeled amount of magnesium (Mg)

- **MANGANESE**

Manganese standard solution: Transfer 1.0 g of manganese to a 1000-mL volumetric flask. Dissolve in 20 mL of nitric acid, and dilute with 6 N hydrochloric acid to volume.

Standard stock solution: 50 $\mu\text{g/mL}$ of manganese from the *Manganese standard stock solution* in 0.125 N hydrochloric acid

Standard solutions: To separate 100-mL volumetric flasks transfer 1.0, 1.5, 2.0, 3.0, and 4.0 mL of *Standard stock solution*. Dilute the contents of each flask with 0.125 N hydrochloric acid to volume to obtain solutions having known concentrations of 0.5, 0.75, 1.0, 1.5, and 2.0 $\mu\text{g/mL}$ of manganese.

Sample solution: Dilute an accurately measured volume of the Oral Solution to obtain 1.5 $\mu\text{g/mL}$ of manganese in 0.125 N hydrochloric acid.

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometer

Lamp: Manganese hollow-cathode

Flame: Air–acetylene

Analytical wavelength: 279.5 nm

Blank: 0.125 N hydrochloric acid

Analysis

Samples: *Standard solutions* and *Sample solution*
 Determine the absorbances of the solutions, against the blank. Plot the absorbances of the *Standard solutions* versus concentration, in $\mu\text{g/mL}$, of manganese, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, C , in $\mu\text{g/mL}$, of manganese in the *Sample solution*. Calculate the percentage of the labeled amount of manganese (Mn) in the portion of Oral Solution taken:

$$\text{Result} = (C/C_U) \times 100$$

C = concentration of manganese in the *Sample solution* from the graph ($\mu\text{g/mL}$)

C_U = nominal concentration of manganese in the *Sample solution* ($\mu\text{g/mL}$)

Acceptance criteria: 90.0%–125.0% of the labeled amount of manganese (Mn)

- **MOLYBDENUM**

Molybdenum standard solution: Transfer 1.0 g of molybdenum wire to a 1000-mL volumetric flask, and dissolve in 50 mL of nitric acid, warming if necessary. Dilute with water to volume.

Standard stock solution: 100 $\mu\text{g/mL}$ of molybdenum from the *Molybdenum standard solution* in water

Standard solutions: To separate 100-mL volumetric flasks transfer 0.5, 1.0, 1.5, 2.0 and 3.0 mL of the *Standard stock solution*. Add 0.125 N hydrochloric acid to volume, and mix to obtain the solutions having known concentrations of about 0.5, 1.0, 1.5, 2.0, and 3.0 $\mu\text{g/mL}$ of molybdenum.

Sample solution: Dilute an accurately measured volume of the Oral Solution to obtain 1 $\mu\text{g/mL}$ of

molybdenum from the Oral Solution in 0.125 N hydrochloric acid.

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometer

Lamp: Molybdenum hollow-cathode

Flame: Nitrous oxide–acetylene

Analytical wavelength: 313.3 nm

Blank: 0.125 N hydrochloric acid

Analysis

Samples: *Standard solutions* and *Sample solution*

Determine the absorbances of the solutions, against the *Blank*. Plot the absorbances of the *Standard solutions* versus concentration, in $\mu\text{g/mL}$, of molybdenum, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, C , in $\mu\text{g/mL}$, of molybdenum in the *Sample solution*. Calculate the percentage of the labeled amount of molybdenum (Mo) in the portion of Oral Solution taken:

$$\text{Result} = (C/C_U) \times 100$$

C = concentration of molybdenum in the *Sample solution* from the graph ($\mu\text{g/mL}$)

C_U = nominal concentration of molybdenum in the *Sample solution* ($\mu\text{g/mL}$)

Acceptance criteria: 90.0%–160.0% of the labeled amount of molybdenum (Mo)

• ZINC

Zinc standard solution: Transfer 311 mg of zinc oxide to a 250-mL volumetric flask, and add 80 mL of 6 N hydrochloric acid, warming if necessary to dissolve. Cool, dilute with water to volume, and mix to obtain a solution having a known concentration of 1000 $\mu\text{g/mL}$ of zinc.

Standard stock solution: 50 $\mu\text{g/mL}$ of zinc from the *Zinc standard solution* in 0.125 N hydrochloric acid

Standard solutions: Transfer 1.0, 2.0, 3.0, 4.0, and 5.0 mL of *Standard stock solution* to separate 100-mL volumetric flasks. Dilute the contents of each flask with 0.125 N hydrochloric acid to volume to obtain concentrations of 0.5, 1.0, 1.5, 2.0, and 2.5 $\mu\text{g/mL}$ of zinc.

Sample solution: Dilute an accurately measured volume of the Oral Solution to obtain 1 $\mu\text{g/mL}$ of zinc in 0.125 N hydrochloric acid.

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometer

Lamp: Zinc hollow-cathode

Flame: Air–acetylene

Analytical wavelength: 213.8 nm

Blank: 0.125 N hydrochloric acid

Analysis

Samples: *Standard solutions* and *Sample solution*

Determine the absorbances of the solutions, against the *Blank*. Plot the absorbances of the *Standard solutions* versus concentration, in $\mu\text{g/mL}$, of zinc, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, C , in $\mu\text{g/mL}$, of zinc in the *Sample solution*. Calculate the percentage of the labeled amount of zinc (Zn) in the portion of Oral Solution taken:

$$\text{Result} = (C/C_U) \times 100$$

C = concentration of zinc in the *Sample solution* from the graph ($\mu\text{g/mL}$)

C_U = nominal concentration of zinc in the *Sample solution* ($\mu\text{g/mL}$)

Acceptance criteria: 90.0%–125.0% of the labeled amount of zinc (Zn)

OTHER COMPONENTS

- **ALCOHOL DETERMINATION, Method I (611)** (if present): 90.0%–120.0% of the labeled amount of $\text{C}_2\text{H}_5\text{OH}$

CONTAMINANTS

- **MICROBIAL ENUMERATION TESTS (2021):** The total aerobic microbial count does not exceed 3000 cfu/mL, and the combined molds and yeasts count does not exceed 300 cfu/mL.
- **MICROBIOLOGICAL PROCEDURES FOR ABSENCE OF SPECIFIED MICROORGANISMS (2022):** Meet the requirements of the tests for absence of *Salmonella* species, *Escherichia coli*, and *Staphylococcus aureus*

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, under an inert gas or with a minimum of headspace.
- **LABELING:**⁵ The label states that the product is Oil- and Water-Soluble Vitamins with Minerals Oral Solution. The label states the quantity of each vitamin and mineral in a given volume of the Oral Solution and, where necessary, the chemical form in which a vitamin is present, and states also the salt form of the mineral used as the source of each element. Where the product contains vitamin E, the label indicates whether it is the *d*- or *dl*- form. Where the product is labeled to contain panthenol, the label states the equivalent content of dexpanthenol. Where more than one assay method is given for a particular vitamin or mineral, the labeling states with which assay method the product complies only if *Method 1* is not used.
- **USP REFERENCE STANDARDS (11)**

⁵ USP Units of activity for vitamins, where such exist or formerly existed, are equivalent to the corresponding international units, where such formerly existed. The USP Unit for Vitamin E has been discontinued. International units (IU) for vitamins also have been discontinued; however, the use of IU on the labels of vitamin products continues. Where articles are labeled in terms of Units in addition to the required labeling, the relationship of the USP Units or IU to mass is as follows. One USP Vitamin A Unit = 0.3 μg of all-*trans*-retinol (vitamin A alcohol) or 0.344 μg of all-*trans*-retinyl acetate (vitamin A acetate) or 0.55 μg of all-*trans*-retinyl palmitate (vitamin A palmitate), and 1 μg of retinol (3.3 USP Vitamin A Units) = 1 retinol equivalent (RE); 1 IU of beta carotene = 0.6 μg of all-*trans*-beta carotene; 1 USP Vitamin D Unit = 0.025 μg of ergocalciferol or cholecalciferol; and 1 mg of *dl*-alpha tocopherol = 1.1 former USP Vitamin E Units, 1 mg of *dl*-alpha tocopheryl acetate = 1 former USP Vitamin E Unit, 1 mg of *dl*-alpha tocopheryl acid succinate = 0.89 former USP Vitamin E Unit, 1 mg of *d*-alpha tocopherol = 1.49 former USP Vitamin E Units, and 1 mg of *d*-alpha tocopheryl acetate = 1.36 former USP Vitamin E Units, 1 mg of *d*-alpha tocopheryl acid succinate = 1.21 former USP Vitamin E Units. In terms of *d*-alpha tocopherol equivalents, 1 mg of *d*-alpha tocopheryl acetate = 0.91, 1 mg of *d*-alpha tocopheryl acid succinate = 0.81, 1 mg of *dl*-alpha tocopherol = 0.74, 1 mg of *dl*-alpha tocopheryl acetate = 0.67, and 1 mg of *dl*-alpha tocopheryl acid succinate = 0.60.

Oil- and Water-Soluble Vitamins with Minerals Tablets

DEFINITION

Oil- and Water-Soluble Vitamins with Minerals Tablets contain one or more of the following oil-soluble vitamins: Vitamin A, Vitamin D as Ergocalciferol (Vitamin D₂) or Cholecalciferol (Vitamin D₃), Vitamin E, Phytonadione (Vitamin K₁), and Beta Carotene; one or more of the following water-soluble vitamins: Ascorbic Acid or its equivalent as Calcium Ascorbate or Sodium Ascorbate, Biotin, Cyanocobalamin, Folic Acid, Niacin or Niacinamide, Pantothenic Acid (as Calcium Pantothenate or Racemic Calcium Pantothenate), Pyridoxine Hydrochloride, Riboflavin, and Thiamine Hydrochloride or Thiamine Mononitrate; and one or more minerals derived from substances generally recognized as safe, furnishing one or more of the following elements in ionizable form: boron, calcium, chromium, copper, fluorine, iodine, iron, magnesium, manganese, molybdenum, nickel, phosphorus, potassium, selenium, tin, vanadium, and zinc. Tablets contain NLT 90.0% and NMT 165.0% of the labeled amounts of vitamin A ($C_{20}H_{30}O$) as retinol or esters of retinol in the form of retinyl acetate ($C_{22}H_{32}O_2$) or retinyl palmitate ($C_{36}H_{60}O_2$), vitamin D as cholecalciferol ($C_{27}H_{44}O$) or ergocalciferol ($C_{28}H_{44}O$), vitamin E as alpha tocopherol ($C_{29}H_{50}O_2$) or alpha tocopheryl acetate ($C_{31}H_{52}O_3$) or alpha tocopheryl acid succinate ($C_{33}H_{54}O_5$), phytonadione ($C_{31}H_{46}O_2$), and beta carotene ($C_{40}H_{56}$); NLT 90.0% and NMT 150.0% of the labeled amounts of ascorbic acid ($C_6H_8O_6$) or its salts as calcium ascorbate ($C_{12}H_{14}CaO_{12} \cdot 2H_2O$) or sodium ascorbate ($C_6H_7NaO_6$), biotin ($C_{10}H_{16}N_2O_3S$), cyanocobalamin ($C_{63}H_{88}CoN_{14}O_{14}P$), folic acid ($C_{19}H_{19}N_7O_6$), niacin ($C_6H_5NO_2$) or niacinamide ($C_6H_6N_2O$), calcium pantothenate ($C_{18}H_{32}CaN_2O_{10}$), pyridoxine hydrochloride ($C_8H_{11}NO_3 \cdot HCl$), riboflavin ($C_{17}H_{20}N_4O_6$), and thiamine ($C_{12}H_{17}ClN_4OS$) as thiamine hydrochloride or thiamine mononitrate; NLT 90.0% and NMT 125.0% of the labeled amounts of calcium (Ca), copper (Cu), iron (Fe), manganese (Mn), magnesium (Mg), phosphorus (P), potassium (K), and zinc (Zn); and NLT 90.0% and NMT 160.0% of

the labeled amounts of boron (B), chromium (Cr), fluorine (F), iodine (I), molybdenum (Mo), nickel (Ni), selenium (Se), tin (Sn), and vanadium (V).

They may contain other labeled added substances that are generally recognized as safe, in amounts that are unobjectionable.

STRENGTH

[NOTE—In the following assays, where more than one assay method is given for an individual ingredient, the requirements may be met by following any one of the specified methods, the method used being stated in the labeling only if *Method 1* is not used.]

• VITAMIN A, Method 1

[NOTE—Where the use of a vitamin A ester (retinyl acetate or retinyl palmitate) is specified in the following procedure, use the chemical form present in the formulation. USP Vitamin A RS is retinyl acetate. It is to be used where USP Vitamin A RS is specified. Use low-actinic glassware throughout this procedure.]

Mobile phase: *n*-Hexane

Standard solution: 15 µg/mL of retinyl acetate from USP Vitamin A RS in *n*-hexane

System suitability stock solution: 15 µg/mL of retinyl palmitate in *n*-hexane

System suitability solution: Mix equal volumes of *System suitability stock solution* and the *Standard solution* to obtain concentrations of 7.5 µg/mL each of retinyl acetate and retinyl palmitate.

Sample solution: Finely powder NLT 20 Tablets. Transfer a portion of the powder, equivalent to 5 Tablets, to a container having a polytetrafluoroethylene-lined screw cap. Add 10 mL of dimethyl sulfoxide and 15 mL of *n*-hexane, and shake for 45 min on a wrist-action shaker in a water bath maintained at 60°. [NOTE—Set up the wrist-action shaker to ensure that the contents of the container are mixed vigorously and thoroughly.] Centrifuge at 3000 rpm for 10 min, and transfer the hexane layer by means of a pipet to a 100-mL volumetric flask. Add 15 mL of *n*-hexane to the dimethyl sulfoxide layer, shake thoroughly for 5 min, and transfer the hexane layer by means of a pipet to the 100-mL volumetric flask. Repeat this extraction with three additional 15-mL portions of *n*-hexane. Dilute the extracts in the volumetric flask with *n*-hexane to volume. Dilute a 10-mL volume of this solution with *n*-hexane to obtain a solution with a concentration of 15 µg/mL of vitamin A as retinol ($C_{20}H_{30}O$).

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 325 nm

Column: 4.6-mm × 15-cm; 3-µm packing L8

Flow rate: 1 mL/min

Injection size: 40 µL

System suitability

Sample: *System suitability solution*

Suitability requirements

Resolution: NLT 10 between all-*trans*-retinyl acetate and all-*trans*-retinyl palmitate

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*
 Measure the peak area for all-*trans*-retinyl acetate from the *Standard solution* and the peak area for all-*trans*-retinyl acetate or all-*trans*-retinyl palmitate in the chromatogram of the *Sample solution*. For products containing vitamin A acetate or vitamin A palmitate, calculate the percentage of the labeled amount of vitamin A, as retinol ($C_{20}H_{30}O$) in the portion of the Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times F \times 100$$

- r_U = peak area of the all-*trans*-retinyl ester from the *Sample solution*
 r_S = peak area of the all-*trans*-retinyl ester from the *Standard solution*
 C_S = concentration of retinyl acetate ($C_{22}H_{32}O_2$) from USP Vitamin A RS in the *Standard solution* ($\mu\text{g/mL}$)
 C_U = nominal concentration of vitamin A, as retinol ($C_{20}H_{30}O$) in the *Sample solution* ($\mu\text{g/mL}$)
 F = factor used to convert retinyl acetate, the ester form present in USP Vitamin A RS, to retinol, 0.872

[NOTE—The molar responses of retinyl acetate and retinyl palmitate are equivalent.]

Acceptance criteria: 90.0%–165.0% of the labeled amount of vitamin A, as retinol ($C_{20}H_{30}O$)

• **VITAMIN A, Method 2**

[NOTE—Where a vitamin A ester (retinyl acetate or retinyl palmitate) is indicated in the following procedure, use the chemical form present in the formulation. USP Vitamin A RS is retinyl acetate. It is to be used where USP Vitamin A RS is specified. Use low-actinic glassware throughout this procedure.]

3 N methanolic sulfuric acid solution: Cautiously add 9 mL of sulfuric acid to 80 mL of methanol in a 100-mL volumetric flask. Cool, and dilute with methanol to volume.

Sodium ascorbate–pyrogallol solution: Transfer 10 g of sodium ascorbate and 5 g of pyrogallol to a 100-mL volumetric flask, and add sufficient water to dissolve. Add 1.7 mL of sulfuric acid, and dilute with water to volume.

Lecithin solution: 5 mg/mL of lecithin in 2,2,4-trimethylpentane

Mobile phase: *n*-Hexane and ethyl acetate (99.7:0.3)

Standard solution: 15 $\mu\text{g/mL}$ of retinyl acetate from USP Vitamin A RS in 2,2,4-trimethylpentane

System suitability stock solution: 15 $\mu\text{g/mL}$ of retinyl palmitate in 2,2,4-trimethylpentane

System suitability solution: Mix equal volumes of the *System suitability stock solution* and the *Standard solution* to obtain concentrations of 7.5 $\mu\text{g/mL}$ each of retinyl acetate and retinyl palmitate.

Sample solution: [NOTE—This preparation is suitable for the determination of vitamin A, vitamin D, and vitamin E, when present in the formulation.] Finely powder NLT 20 Tablets. If vitamin D is present in the formulation, transfer a portion of the powder, equivalent to 30 μg of the labeled amount of cholecalciferol or ergocalciferol, to a container having a polytetrafluoroethylene-lined screw cap. If vitamin D is not present in the formulation, use a portion of the powder, equivalent to 90 mg of the labeled amount of vitamin E (as α -tocopherol, α -tocopheryl acetate, or α -tocopheryl hemisuccinate). If vitamin E is not present in the formulation, use a portion of the powder, equivalent to 2.5 mg of the labeled amount of retinyl acetate or retinyl palmitate. Add 0.5 g of sodium bicarbonate, 1.5 mL of *Lecithin solution*, and 12.5 mL of 2,2,4-trimethylpentane, and disperse on a vortex mixer. Add 6 mL of *Sodium ascorbate–pyrogallol solution*, shake slowly, and allow the solution to degas. Continue shaking until the evolution of gas has ceased, and then shake for an additional 12 min. Add 6 mL of dimethyl sulfoxide, mix on a vortex mixer to form a suspension, and shake for 12 min. Add 6 mL of 3 N methanolic sulfuric acid solution, mix on a vortex mixer to form a suspension, and shake for 12 min. Add 12.5 mL of 2,2,4-trimethylpentane, mix on a vortex mixer to form a suspension, and shake for 10 min. Centrifuge for 10 min to break up the emulsion and to clarify the supernatant. [NOTE—The supernatant is used for the determination of vitamin A, and also vitamin D and vitamin E, if present in the formulation.] If necessary, quantitatively dilute a volume of the

supernatant with 2,2,4-trimethylpentane to obtain a concentration close to that of the *Standard solution*.

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak area for all-*trans*-retinyl acetate from the *Standard solution* and the peak area of all-*trans*-retinyl acetate or all-*trans*-retinyl palmitate from the *Sample solution*.

Calculate the percentage of the labeled amount of vitamin A, as retinol ($C_{20}H_{30}O$), in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times F \times 100$$

r_U = peak area of the all-*trans*-retinyl ester from the *Sample solution*
 r_S = peak area of the all-*trans*-retinyl ester from the *Standard solution*

C_S = concentration of retinyl acetate ($C_{22}H_{32}O_2$) from USP Vitamin A RS in the *Standard solution* ($\mu\text{g/mL}$)
 C_U = nominal concentration of vitamin A, as retinol ($C_{20}H_{30}O$) in the *Sample solution* ($\mu\text{g/mL}$)

F = factor used to convert retinyl acetate, the ester form present in the USP Vitamin A RS, to retinol, 0.872
 [NOTE—Account for the initial extraction volume of 26.5 mL of 2,2,4-trimethylpentane to calculate the nominal concentration. The molar responses of retinyl acetate and retinyl palmitate are equivalent.]

Acceptance criteria: 90.0%–165.0% of the labeled amount of vitamin A, as retinol ($C_{20}H_{30}O$)

• **VITAMIN A, Method 3**

[NOTE—Where a vitamin A ester (retinyl acetate or retinyl palmitate) is indicated in the following procedure, use the chemical form present in the formulation. USP Vitamin A RS is retinyl acetate. It is to be used where USP Vitamin A RS is specified. Use low-actinic glassware throughout this procedure.]

Extraction solvent: *n*-Hexane and methylene chloride (3:1)

Potassium hydroxide solution: 800 mg/mL of potassium hydroxide in water. [NOTE—Cautiously add potassium hydroxide in water. Mix, and cool.]

Diluent: 10 mg/mL of pyrogallol in alcohol

Mobile phase: *n*-Hexane and isopropyl alcohol (92:8)

Standard stock solution: 30 $\mu\text{g/mL}$ of retinyl acetate from USP Vitamin A RS in *Diluent*. [NOTE—This solution may be stored in a refrigerator for 1 week.]

Standard solution: Dilute a volume of *Standard stock solution* with *Diluent* to obtain a concentration of 1 $\mu\text{g/mL}$ of USP Vitamin A RS. Transfer 10.0 mL of this solution to a stoppered 125-mL flask, and add 5 mL of water, 5 mL of *Diluent*, and 3 mL of *Potassium hydroxide solution*. Insert the stopper tightly, shake for 15 min over a water bath maintained at $60 \pm 5^\circ$, and cool to room temperature. Add 7 mL of water and 25.0 mL of *Extraction solvent*. Insert the stopper tightly, and shake vigorously for 60 s. Rinse the sides of the flask with 60 mL of water, and allow to stand for 10 min until the layers separate. Withdraw a portion of the organic layer

for injection into the chromatograph. This *Standard solution* contains 0.34 µg/mL of retinol.

Sample solution: Finely powder a counted number of Tablets. Transfer a portion of the powder, equivalent to 1.5 mg of retinyl acetate, to a stoppered 125-mL flask. Add 5 mL of water, 15 mL of *Diluent*, and 3 mL of *Potassium hydroxide solution*. Insert the stopper tightly, shake for 15 min over a water bath maintained at 60 ± 5°, and cool to room temperature. Add 7 mL of water and 25.0 mL of *Extraction solvent*. Insert the stopper tightly, and shake vigorously for 60 s or longer, if necessary, for complete extraction. Rinse the sides of the flask with 60 mL of water, and allow to stand for 10 min until the layers separate. [NOTE—Do not shake, because an emulsion may form.] Withdraw a portion of the organic layer, and dilute with *Extraction solvent* to obtain a concentration of 0.34 µg/mL of retinol.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 335 nm

Column: 6.2-mm × 8-cm; packing L3

Column temperature: 40°

Flow rate: 4 mL/min

Injection size: 50 µL

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for 13-*cis*-retinol and all-*trans*-retinol are 0.92 and 1.0, respectively.]

Suitability requirements

Relative standard deviation: NMT 5.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas for all-*trans*-retinol and 13-*cis*-retinol. Calculate the percentage of the labeled amount of vitamin A, as retinol (C₂₀H₃₀O), in the portion of Tablets taken:

$$\text{Result} = (r_{T1}/r_{T2}) \times (C_S/C_U) \times F \times 100$$

r_{T1} = sum of the areas of the all-*trans*-retinol and 13-*cis*-retinol peaks from the *Sample solution*

r_{T2} = sum of the areas of the all-*trans*-retinol and 13-*cis*-retinol peaks from the *Standard solution*

C_S = concentration of retinyl acetate (C₂₃H₃₂O₂) from USP Vitamin A RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of vitamin A, as retinol (C₂₀H₃₀O) in the *Sample solution* (µg/mL)

F = factor used to convert retinyl acetate, the ester form present in USP Vitamin A RS, to retinol, 0.872

Acceptance criteria: 90.0%–165.0% of the labeled amount of vitamin A, as retinol (C₂₀H₃₀O)

• CHOLECALCIFEROL or ERGOCALCIFEROL (VITAMIN D), Method 1

[NOTE—Where vitamin D (cholecalciferol or ergocalciferol) is specified in the following procedure, use the chemical form present in the formulation and the relevant USP Reference Standard. Use low-actinic glassware throughout this procedure.]

Mobile phase: *n*-Hexane and isopropyl alcohol (99:1)

Standard solution: 2 µg/mL of USP Cholecalciferol RS or USP Ergocalciferol RS in *n*-hexane

System suitability solution: Heat a volume of the *Standard solution* at 60° for 1 h to partially isomerize vitamin D (cholecalciferol or ergocalciferol) to its corresponding precursor.

Sample solution: Transfer NLT 20 mL of the solution prepared as directed for *Sample solution* in *Vitamin A, Method 1* to a suitable container, and evaporate, if necessary, in vacuum at room temperature to obtain a concentration of 2 µg/mL of cholecalciferol or ergocalciferol.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 265 nm

Column: 4.6-mm × 15-cm; 3-µm packing L8

Flow rate: 1 mL/min

Injection size: 100 µL

System suitability

Sample: *Standard solution* and *System suitability solution*

Suitability requirements

Resolution: NLT 10 between the vitamin D form present and its corresponding precursor, *System suitability solution*

Relative standard deviation: NMT 3.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas for vitamin D. Calculate the percentage of the labeled amount of cholecalciferol (C₂₇H₄₄O) or ergocalciferol (C₂₈H₄₄O) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times F \times 100$$

r_U = peak area of cholecalciferol or ergocalciferol from the *Sample solution*

r_S = peak area of cholecalciferol or ergocalciferol from the *Standard solution*

C_S = concentration of USP Cholecalciferol RS or USP Ergocalciferol RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of cholecalciferol or ergocalciferol in the *Sample solution* (µg/mL)

F = correction factor to account for the average amount of previtamin D present in the *Sample solution*, 1.09

Acceptance criteria: 90.0%–165.0% of the labeled amount of vitamin D as cholecalciferol (C₂₇H₄₄O) or ergocalciferol (C₂₈H₄₄O)

• CHOLECALCIFEROL or ERGOCALCIFEROL (VITAMIN D), Method 2

[NOTE—Where vitamin D (cholecalciferol or ergocalciferol) is specified in the following procedure, use the chemical form present in the formulation and the relevant USP Reference Standard. Use low-actinic glassware throughout this procedure.]

3 N methanolic sulfuric acid solution, Sodium ascorbate-pyrogallol solution, Lecithin solution, and Sample solution: Proceed as directed in *Vitamin A, Method 2*.

Mobile phase: *n*-Hexane and tertiary butyl alcohol (98.75:1.25)

Standard solution: 1 µg/mL of USP Cholecalciferol RS or USP Ergocalciferol RS in 2,2,4-trimethylpentane

System suitability solution: Heat a volume of the *Standard solution* at 60° for 1 h to partially isomerize vitamin D (cholecalciferol or ergocalciferol) to its corresponding precursor.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 265 nm

Column: 4.6-mm × 25-cm; 5-µm packing L24

Flow rate: 1 mL/min

Injection size: 40 µL

System suitability

Sample: *Standard solution* and *System suitability solution*

Suitability requirements

Resolution: NLT 4.0 between the vitamin D form present and its corresponding precursor, *System suitability solution*

Relative standard deviation: NMT 3.0%, *Standard solution*

Analysis**Samples:** *Standard solution* and *Sample solution*

Measure the peak areas for vitamin D. Calculate the percentage of the labeled amount of cholecalciferol ($C_{27}H_{44}O$) or ergocalciferol ($C_{28}H_{44}O$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- r_U = peak area of cholecalciferol or ergocalciferol from the *Sample solution*
 r_S = peak area of cholecalciferol or ergocalciferol from the *Standard solution*
 C_S = concentration of USP Cholecalciferol RS or USP Ergocalciferol RS in the *Standard solution* ($\mu\text{g/mL}$)
 C_U = nominal concentration of cholecalciferol or ergocalciferol in the *Sample solution* ($\mu\text{g/mL}$)

[NOTE—Account for the initial extraction volume of 26.5 mL of 2,2,4-trimethylpentane to calculate the nominal concentration.]

Acceptance criteria: 90.0%–165.0% of the labeled amount of vitamin D as cholecalciferol ($C_{27}H_{44}O$) or ergocalciferol ($C_{28}H_{44}O$)

• **CHOLECALCIFEROL or ERGOCALCIFEROL (VITAMIN D),**

Method 3

[NOTE—Where vitamin D (cholecalciferol or ergocalciferol) is specified in the following procedure, use the chemical form present in the formulation and the relevant USP Reference Standard. Use low-actinic glassware throughout this procedure.]

Diluted acetic acid: Glacial acetic acid solution (1 in 10) in water

Phenolphthalein solution: 10 mg/mL of phenolphthalein in alcohol

Potassium hydroxide solution: Slowly dissolve 14 g of potassium hydroxide in a mixture of 31 mL of dehydrated alcohol and 5 mL of water. Prepare fresh daily.

Extraction solvent: Methylene chloride and isopropyl alcohol (99.8:0.2)

Mobile phase: Acetonitrile and methanol (91:9)

Standard stock solution: 0.2 mg/mL of USP Cholecalciferol RS or USP Ergocalciferol RS in dehydrated alcohol. [NOTE—Prepare fresh every 4 weeks. Store in a freezer.]

Standard solution: [NOTE—Condition the solid-phase extraction column specified for use in the *Standard solution* and the *Sample solution* by initially washing the column with 4.0 mL of a mixture of methylene chloride and isopropyl alcohol (4:1), followed by 5.0 mL of *Extraction solvent*. Do not allow the column to dry.] Dilute a volume of *Standard stock solution* with dehydrated alcohol to obtain a concentration of 5 $\mu\text{g/mL}$ of USP Cholecalciferol RS or USP Ergocalciferol RS. Prepare this solution fresh daily. Transfer 2.0 mL of this solution to a stoppered 125-mL flask. Add 15.0 mL of water and 15.0 mL of *Potassium hydroxide solution*, insert the stopper, and shake for 30 min in a water bath maintained at 60°. Allow to cool to room temperature, and transfer the contents of the flask to a 250-mL separatory funnel. Add 15.0 mL of water to the flask, insert the stopper, shake vigorously, and transfer this solution to the separatory funnel. Rinse the flask with 60 mL of *n*-hexane, and transfer the rinsing to the separatory funnel. Insert the stopper, shake vigorously for 90 s, and allow to stand for 15 min until the layers separate. Drain and discard the aqueous layer. Add 15.0 mL of water to the hexane layer in the separatory funnel, insert the stopper, and shake vigorously. Allow to stand for 10 min until the layers separate, and discard the aqueous layer. Add 1 drop of *Phenolphthalein solution* and 15.0 mL of water to the separatory funnel. Add *Diluted acetic acid* dropwise, with shaking, until the washing is neutral. Allow to

stand for 10 min until the layers separate. Drain and discard the aqueous layer. Filter the hexane layer through anhydrous sodium sulfate supported by a small pledget of cotton into a 100-mL, round-bottom flask. Rinse the funnel and sodium sulfate with a few mL of *n*-hexane, and collect the rinsings in the same flask. Evaporate the hexane in the flask on a rotary evaporator at 50° to dryness. Immediately add 2.0 mL of *Extraction solvent* to dissolve the residue. Transfer this solution to a freshly conditioned solid-phase extraction column containing silica packing with a sorbent mass to column volume ratio of 500 mg to 2.8 mL or equivalent, rinse the round-bottom flask with 1.0 mL of *Extraction solvent*, and transfer to the column. Elute the column with 2.0 mL of *Extraction solvent*, and discard this fraction. Elute the column with 7.0 mL of *Extraction solvent*, and collect the eluate in a suitable flask. Place the flask in a warm water bath maintained at 42°, and evaporate the solvent with the aid of a stream of nitrogen. Immediately add 2.0 mL of acetonitrile to the residue, and use the solution for injection into the chromatograph.

Sample solution: Finely powder NLT 20 Tablets. Transfer a portion of the powder, equivalent to 10 μg of cholecalciferol or ergocalciferol, to the stoppered 125-mL flask, and proceed as directed for the *Standard solution*, beginning with "Add 15.0 mL of water and 15.0 mL of *Potassium hydroxide solution*".

Column temperature: 27°

Flow rate: 0.7 mL/min

Injection size: 15 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 4.0%

Analysis**Samples:** *Standard solution* and *Sample solution*

Measure the peak areas for vitamin D. Calculate the percentage of the labeled amount of cholecalciferol ($C_{27}H_{44}O$) or ergocalciferol ($C_{28}H_{44}O$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- r_U = peak area of cholecalciferol or ergocalciferol from the *Sample solution*
 r_S = peak area of cholecalciferol or ergocalciferol from the *Standard solution*
 C_S = concentration of USP Cholecalciferol RS or USP Ergocalciferol RS in the *Standard solution* ($\mu\text{g/mL}$)
 C_U = nominal concentration of cholecalciferol or ergocalciferol in the *Sample solution* ($\mu\text{g/mL}$)

Acceptance criteria: 90.0%–165.0% of the labeled amount of vitamin D as cholecalciferol ($C_{27}H_{44}O$) or ergocalciferol ($C_{28}H_{44}O$)

• **VITAMIN E, Method 1**

[NOTE—Where vitamin E (alpha tocopherol, alpha tocopheryl acetate, or alpha tocopheryl acid succinate) is specified in the following procedure, use the chemical form present in the formulation and the relevant USP Reference Standard. Use low-actinic glassware throughout this procedure.]

Solution A: Phosphoric acid solution (1 in 100) in water

Mobile phase: Methanol and *Solution A* (19:1)

System suitability solution: Prepare a 0.65-mg/mL solution of USP Ergocalciferol RS in methanol. Transfer 1.0 mL of this solution to a 100-mL volumetric flask containing 100 mg of USP Alpha Tocopheryl Acetate RS.

Dissolve in 30 mL of methanol, with the aid of sonication if necessary, and dilute with methanol to volume. Store this solution in a refrigerator.

Standard solution: 2 mg/mL of USP Alpha Tocopherol RS, USP Alpha Tocopheryl Acetate RS, or USP Alpha Tocopheryl Acid Succinate RS in methanol

Sample solution: Transfer NLT 20 mL of the solution prepared as directed for *Sample solution in Vitamin A, Method 1* to a suitable container, and evaporate in vacuum at room temperature to dryness. Transfer the residue with the aid of methanol to a suitable volumetric flask, and dilute with methanol to volume to obtain a concentration of 2 mg/mL of alpha tocopherol, alpha tocopheryl acetate, or alpha tocopheryl acid succinate.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 8-mm × 10-cm; 5-μm packing L1

Flow rate: 2 mL/min

Injection size: 100 μL

System suitability

Samples: *Standard solution* and *System suitability solution*

[NOTE—The relative retention times for ergocalciferol and alpha tocopheryl acetate are about 0.5 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 12 between ergocalciferol and alpha tocopheryl acetate, *System suitability solution*

Tailing factor: Between 0.8 and 1.2, *System suitability solution*

Relative standard deviation: NMT 3.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*
Measure the peak areas. Calculate the percentage of the labeled amount of alpha tocopherol (C₂₉H₅₀O₂), alpha tocopheryl acetate (C₃₁H₅₂O₃), or alpha tocopheryl acid succinate (C₃₃H₅₄O₅) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of the relevant vitamin E form from the *Sample solution*

r_S = peak area of the relevant vitamin E form from the *Standard solution*

C_S = concentration of the corresponding USP Reference Standard in the *Standard solution* (mg/mL)

C_U = nominal concentration of the corresponding form of vitamin E in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–165.0% of the labeled amount of vitamin E as alpha tocopherol (C₂₉H₅₀O₂), alpha tocopheryl acetate (C₃₁H₅₂O₃), or alpha tocopheryl acid succinate (C₃₃H₅₄O₅)

• VITAMIN E, Method 2

[NOTE—Where vitamin E (alpha tocopherol, alpha tocopheryl acetate, or alpha tocopheryl acid succinate) is specified in the following procedure, use the chemical form present in the formulation and the relevant USP Reference Standard. Use low-actinic glassware throughout this procedure.]

Mobile phase: Mix 240 mL of methanol with 10 mL of water followed by 0.5 mL of 50% phosphoric acid, and dilute with acetonitrile to 1000 mL.

System suitability solution: 2 mg/mL each of USP Alpha Tocopherol RS, USP Alpha Tocopheryl Acetate RS, and USP Alpha Tocopheryl Acid Succinate RS in methanol

Standard solution: 2 mg/mL of USP Alpha Tocopherol RS, USP Alpha Tocopheryl Acetate RS, or USP Alpha Tocopheryl Acid Succinate RS in methanol

Sample solution: Proceed as directed for *Sample solution in Vitamin A, Method 2*. Transfer a volume of the supernatant 2,2,4-trimethylpentane to a suitable volumetric flask, the volume of the specimen withdrawn from the 2,2,4-trimethylpentane and the size of the volumetric flask being such that the final concentration of the *Sample solution* is equivalent to that of the *Standard solution*. Evaporate nearly to dryness, add several mL of methanol, and evaporate the remaining 2,2,4-trimethylpentane. Dilute with methanol to volume.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 4.6-mm × 25-cm; 5-μm packing L1

Flow rate: 1.5 mL/min

Injection size: 25 μL

System suitability

Samples: *Standard solution* and *System suitability solution*

[NOTE—The relative retention times for alpha tocopheryl acid succinate, alpha tocopherol, and alpha tocopheryl acetate are about 0.6, 0.8, and 1.0, respectively.]

Suitability requirements

Resolution: NLT 4.0 between alpha tocopheryl acid succinate and alpha tocopherol; NLT 3.0 between alpha tocopherol and alpha tocopheryl acetate, *System suitability solution*

Relative standard deviation: NMT 3.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*
Measure the peak areas. Calculate the percentage of the labeled amount of alpha tocopherol (C₂₉H₅₀O₂), alpha tocopheryl acetate (C₃₁H₅₂O₃), or alpha tocopheryl acid succinate (C₃₃H₅₄O₅) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of the relevant vitamin E form from the *Sample solution*

r_S = peak area of the relevant vitamin E form from the *Standard solution*

C_S = concentration of the corresponding USP Reference Standard in the *Standard solution* (mg/mL)

C_U = nominal concentration of the corresponding form of vitamin E in the *Sample solution* (mg/mL)

[NOTE—Account for the initial extraction volume of 26.5 mL of 2,2,4-trimethylpentane and the dilution factor to exchange the solvent from 2,2,4-trimethylpentane to methanol to calculate the nominal concentration.]

Acceptance criteria: 90.0%–165.0% of the labeled amount of vitamin E as alpha tocopherol (C₂₉H₅₀O₂), alpha tocopheryl acetate (C₃₁H₅₂O₃), or alpha tocopheryl acid succinate (C₃₃H₅₄O₅)

• VITAMIN E, Method 3

Diluent: Acetonitrile and ethyl acetate (1:1)

Mobile phase: Methanol, acetonitrile, and *n*-hexane (46.5:46.5:7.0)

Standard solution: 0.3 mg/mL of USP Alpha Tocopherol RS in methanol

Sample solution: Finely powder NLT 20 Tablets. Transfer a portion of the powder, equivalent to 8 mg of alpha tocopherol, to a 125-mL flask fitted with a ground-glass joint. Add 25.0 mL of water, 25.0 mL of dehydrated alcohol, and 3.5 g of potassium hydroxide

pellets. Shake for 1 h in a water bath maintained at 55°. Cool, and transfer with the aid of a minimum volume of water to a 125-mL separatory funnel. Rinse the flask with 50 mL of *n*-hexane, and add the rinsing to the separatory funnel. Insert the stopper, shake vigorously for 60 s, and allow the layers to separate. Drain the aqueous layer into a second 250-mL separatory funnel, and repeat the extraction with 50 mL of *n*-hexane. Discard the aqueous layer, and combine the hexane extracts. Wash the combined extracts with 25 mL of water, allow the layers to separate, and discard the aqueous layer. Add 3 drops of glacial acetic acid, and repeat the washing procedure two more times. Filter the washed hexane layer through anhydrous sodium sulfate into a 250-mL round-bottom flask. Rinse the funnel and sodium sulfate with a few mL of *n*-hexane, and add the rinsing to the hexane solution in the flask. Place the flask in a water bath maintained at 50°, and evaporate the hexane solution with the aid of a rotary evaporator to dryness. Immediately add 25.0 mL of *Diluent*, and swirl to dissolve the residue.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Injection size: 20 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 5.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas. Calculate the percentage of the labeled amount of vitamin E as alpha tocopherol ($C_{29}H_{50}O_2$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of alpha tocopherol from the *Sample solution*

r_S = peak area of alpha tocopherol from the *Standard solution*

C_S = concentration of alpha tocopherol in the *Standard solution* (mg/mL)

C_U = nominal concentration of vitamin E as alpha tocopherol in the *Sample solution* (mg/mL)

[NOTE—Calculate the nominal amount of vitamin E as alpha tocopherol ($C_{29}H_{50}O_2$), by multiplying the content of alpha tocopheryl acetate ($C_{31}H_{52}O_3$) or alpha tocopheryl acid succinate ($C_{33}H_{54}O_5$), in mg/tablet, by the factors 0.91 or 0.81, respectively.]

Acceptance criteria: 90.0%–165.0% of the labeled amount of vitamin E as alpha tocopherol ($C_{29}H_{50}O_2$), alpha tocopheryl acetate ($C_{31}H_{52}O_3$), or alpha tocopheryl acid succinate ($C_{33}H_{54}O_5$)

• PHYTONADIONE, *Method 1*

[NOTE—Use low-actinic glassware throughout this procedure.]

Mobile phase: Methanol and water (19:1)

Standard stock solution: 200 µg/mL of USP

Phytonadione RS in methanol. Dissolve with the aid of sonication if necessary.

Standard solution: 20 µg/mL of USP Phytonadione RS from *Standard stock solution* diluted with methanol.

System suitability solution: 0.65 mg/mL of USP Alpha Tocopheryl Acetate RS and 20 µg/mL of USP Phytonadione RS from *Standard stock solution* diluted with methanol. [NOTE—Dissolve USP Alpha Tocopheryl Acetate RS in a portion of methanol, add the *Standard stock solution*, and then dilute with methanol to volume.]

Sample solution: Transfer NLT 20 mL of the solution prepared as directed for *Sample solution* in *Vitamin A, Method 1* to a suitable container, and evaporate in a vacuum at room temperature to dryness. Transfer the residue with the aid of methanol to a suitable volumetric flask, and dilute with methanol to volume to obtain a concentration of 20 µg/mL of phytonadione.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 8-mm × 10-cm; 5-µm packing L1

Flow rate: 2 mL/min

Injection size: 100 µL

System suitability

Samples: *Standard solution* and *System suitability solution*

[NOTE—The relative retention times for alpha tocopheryl acetate and phytonadione are 0.68 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 5 between alpha tocopheryl acetate and phytonadione, *System suitability solution*

Relative standard deviation: NMT 3.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas. Calculate the percentage of the labeled amount of phytonadione ($C_{31}H_{46}O_2$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area from the *Sample solution*

r_S = peak area from the *Standard solution*

C_S = concentration of USP Phytonadione RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of phytonadione in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–165.0% of the labeled amount of phytonadione ($C_{31}H_{46}O_2$)

• PHYTONADIONE, *Method 2*

[NOTE—Use low-actinic glassware throughout this procedure.]

Solvent: Methanol and isopropyl alcohol (19:1)

Mobile phase: Mix 800 mL of methanol, 200 mL of methylene chloride, 0.1 mL of glacial acetic acid, 1.36 g of zinc chloride, and 0.41 g of sodium acetate.

Internal standard solution: 5 µg/mL of menaquinone 4 (vitamin K₂) in *Solvent*. [NOTE—A concentrated stock solution of menaquinone 4 (100 µg/mL) can be stored for 2 months in a refrigerator.]

Standard stock solution: 5 µg/mL of USP

Phytonadione RS, prepared by dissolving in methylene chloride with the aid of sonication, and diluting with *Solvent* to final volume.

Standard solution: Transfer 1.0 mL of the *Standard stock solution* and 1.0 mL of the *Internal standard solution* to a suitable flask and dilute with *Solvent* to 5 mL. Pass through a membrane filter of 0.45-µm or finer pore size.

Sample solution: Finely powder NLT 20 Tablets. To a centrifuge tube fitted with a cap transfer an amount of powder, not exceeding 800 mg and equivalent to an amount of phytonadione not exceeding 50 µg. Add 4 mL of water. Insert the stopper, and mix using a vortex mixer until the sample is dispersed. Place the tube in a water bath at 60° for 5 min. Remove from the bath, and again shake or mix using a vortex mixer for 1 min while the preparation is still hot. Add 8 mL of alcohol, and swirl the contents to mix. Place the tube in a water bath at 60° for 5 min. Remove from the bath, and again shake or mix using a vortex mixer for 2 min while the preparation is still hot. Cool to room temperature. Add a volume of *Internal standard solution*,

equivalent to 1.0 mL per each 5 µg of the expected amount of phytonadione in the aliquot taken. Add 20.0 mL of petroleum ether, and cap the tube tightly. Shake or mix using a vortex mixer for 15 min to thoroughly mix the contents. Centrifuge to separate the two layers. Transfer a volume of the top layer of petroleum ether, equivalent to 5–50 µg of the nominal amount of phytonadione, to an appropriate flask. Place the flask in a water bath at 35°–45°, and evaporate the solvent under a stream of nitrogen until an oily residue is left. Dissolve the residue in a volume of *Solvent* to obtain a concentration of 1 µg/mL of phytonadione.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: Fluorometric detector set at 320 nm for excitation and 420 nm for emission

Column: 4.6-mm × 25-cm; 5-µm, end-capped packing L1, and a postcolumn reactor constituted with a 4.6-mm × 3-cm PEEK column tightly packed with zinc powder. [NOTE—Prepare the postcolumn reactor daily, or as necessary, to meet the system suitability requirements.]

Flow rate: 1 mL/min

Injection size: 25 µL

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for the internal standard and phytonadione are 1.0 and 1.4, respectively.]

Suitability requirements

Column efficiency: NLT 2500 theoretical plates for the phytonadione peak

Tailing factor: NMT 1.5 for the phytonadione peak

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of phytonadione (C₃₁H₄₆O₂) in the portion of Tablets taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = peak response ratio of phytonadione to that of the internal standard from the *Sample solution*

R_S = peak response ratio of phytonadione to that of the internal standard from the *Standard solution*

C_S = concentration of USP Phytonadione RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of phytonadione in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–165.0% of labeled amount of phytonadione (C₃₁H₄₆O₂)

• BETA CAROTENE

[NOTE—Use low-actinic glassware throughout this procedure.]

Potassium hydroxide solution: Dissolve 58.8 g potassium hydroxide in 50 mL of water.

Iodine solution: 0.01 mg/mL of iodine in cyclohexane. [NOTE—Prepare this solution fresh daily.]

Sample solution: Weigh NLT 20 Tablets. Grind the Tablets to a fine powder, and transfer a quantity of the powder, equivalent to 2 mg of beta carotene, to a 500-mL saponification flask. Add 100 mL of alcohol, 6 mL of *Potassium hydroxide solution*, and a magnetic stirring bar. Attach an air condenser to the flask, and heat under reflux for 45 min with constant stirring. Cool to room temperature, add 170 mL of solvent hexane, and stir for 30 min. Quantitatively transfer the contents of the flask to a 500-mL separatory funnel with portions of solvent hexane. Allow the layers to separate for 5–10 min, and transfer the upper organic layer to a 500-mL volumetric flask. Transfer the lower

aqueous layer into the saponification flask, add 170 mL of solvent hexane, and stir for an additional 20 min. Quantitatively transfer the contents of the saponification flask to the separatory funnel with the aid of portions of solvent hexane. Allow the layers to separate for 10 min. Drain the lower aqueous layer, and discard. Transfer the organic layer to the volumetric flask containing the previously collected organic layer. Rinse the separatory funnel with small portions of solvent hexane, and transfer the washings to the volumetric flask. Dilute the hexane extracts with solvent hexane to volume, add 3 g of anhydrous sodium sulfate, shake, and allow to settle. Quantitatively transfer a volume of this solution, equivalent to 100 µg of beta carotene, to a 50-mL volumetric flask. Evaporate under a stream of nitrogen to dryness, and immediately add cyclohexane. Add 2 mL of *Iodine solution*, and heat for 15 min in a water bath maintained at 65°. Cool rapidly, and dilute with cyclohexane to volume.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* <851>.)

Mode: Vis

Analytical wavelength: 452 nm

Blank: Cyclohexane

Analysis

Sample: *Sample solution*

Determine the absorbance against the *Blank*. Calculate the percentage of the labeled amount of beta carotene (C₄₀H₅₆) in the portion of Tablets taken:

$$\text{Result} = (A_U/F) \times (100/C_U)$$

A_U = absorbance of the *Sample solution*

F = absorptivity of beta carotene at 452 nm, 223

C_U = nominal concentration of beta carotene in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–165.0% of the labeled amount of beta carotene (C₄₀H₅₆)

• ASCORBIC ACID, Method 1

Sample solution: Finely powder NLT 20 Tablets.

Transfer a portion of the powder, equivalent of 100 mg of ascorbic acid, to a 200-mL volumetric flask, and add 75 mL of metaphosphoric–acetic acids TS. Insert a stopper into the flask, and shake by mechanical means for 30 min. Dilute with water to volume. Transfer a portion of the solution to a centrifuge tube, and centrifuge until a clear supernatant is obtained. Pipet 4.0 mL of this solution into a 50-mL conical flask, and add 5 mL of metaphosphoric–acetic acids TS.

Analysis: Titrate with standard dichlorophenol–indophenol solution VS to a rose-pink color that persists for at least 5 s. Correct for the volume of dichlorophenol–indophenol solution consumed by a mixture of 5.5 mL of metaphosphoric–acetic acids TS and 15 mL of water. From the ascorbic acid equivalent of the standard dichlorophenol–indophenol solution, calculate the content of ascorbic acid in each Tablet.

Acceptance criteria: 90.0%–150.0% of the labeled amount of ascorbic acid (C₆H₈O₆)

• ASCORBIC ACID, Method 2: Proceed as directed in *Automated Methods of Analysis* <16>, *Assay for Ascorbic Acid*.

Acceptance criteria: 90.0%–150.0% of the labeled amount of ascorbic acid (C₆H₈O₆)

• CALCIUM ASCORBATE, Method 1: Proceed as directed in *Ascorbic Acid, Method 1*.

Acceptance criteria: 90.0%–150.0% of the labeled amount of calcium ascorbate (C₁₂H₁₄CaO₁₂ · 2H₂O)

• CALCIUM ASCORBATE, Method 2: Proceed as directed in *Automated Methods of Analysis* <16>, *Assay for Ascorbic Acid*.

Acceptance criteria: 90.0%–150.0% of the labeled amount of calcium ascorbate (C₁₂H₁₄CaO₁₂ · 2H₂O)

- **SODIUM ASCORBATE, Method 1:** Proceed as directed in *Ascorbic Acid, Method 1*.
Acceptance criteria: 90.0%–150.0% of the labeled amount of sodium ascorbate ($C_6H_7NaO_6$)
- **SODIUM ASCORBATE, Method 2:** Proceed as directed in *Automated Methods of Analysis* (16), *Assay for Ascorbic Acid*.
Acceptance criteria: 90.0%–150.0% of the labeled amount of sodium ascorbate ($C_6H_7NaO_6$)
- **BIOTIN, Method 1**
[NOTE—Use low-actinic glassware throughout this procedure.]
Mobile phase: Mix 85 mL of acetonitrile, 1 g of sodium perchlorate, 1 mL of phosphoric acid, and dilute with water to 1000 mL.
Standard stock solution: 0.333 mg/mL of USP Biotin RS in dimethyl sulfoxide
Standard solution: 5 µg/mL of USP Biotin RS prepared by diluting the *Standard stock solution* in water
Sample solution: Finely powder NLT 20 Tablets. Transfer a portion of the powder, equivalent to 1 mg of biotin, to a 200-mL volumetric flask, add 3 mL of dimethyl sulfoxide, and swirl to wet. Place the flask in a water bath at 60°–70° for 5 min. Sonicate for 5 min, dilute with water to volume, and filter.
Chromatographic system
(See *Chromatography* (621), *System Suitability*.)
Mode: LC
Detector: UV 200 nm
Column: 4.6-mm × 15-cm; 3-µm packing L7
Flow rate: 1.2 mL/min
Injection size: 100 µL
System suitability
Sample: *Standard solution*
Suitability requirements
Relative standard deviation: NMT 3.0%
Analysis
Samples: *Standard solution* and *Sample solution*
Measure the responses for the biotin peaks. Calculate the percentage of the labeled amount of biotin ($C_{10}H_{16}N_2O_3S$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- r_U = peak response from the *Sample solution*
 r_S = peak response from the *Standard solution*
 C_S = concentration of USP Biotin RS in the *Standard solution* (µg/mL)
 C_U = nominal concentration of biotin in the *Sample solution* (µg/mL)

- Acceptance criteria:** 90.0%–150.0% of the labeled amount of biotin ($C_{10}H_{16}N_2O_3S$)
- **BIOTIN, Method 2**
[NOTE—Use low-actinic glassware throughout this procedure.]
Dehydrated mixtures yielding formulations similar to the media described herein may be used provided that, when constituted as directed, they have growth-promoting properties equal to or superior to those obtained with the media prepared as described herein.
Standard stock solution: 50 µg/mL of USP Biotin RS in 50% alcohol. Store this solution in a refrigerator.
Standard solution: 0.1 ng/mL of USP Biotin RS in water, prepared by dilution of the *Standard stock solution* with water on the day of the assay.
Sample solution: Finely powder NLT 30 Tablets. Transfer a portion of the powder, equivalent to 100 µg of biotin, to a 200-mL volumetric flask. Add 3 mL of 50% alcohol, and swirl to wet the contents. Heat the flask in a water bath at 60°–70° for 5 min. Sonicate for 5 min, dilute with 50% alcohol to volume, and filter. Dilute a volume of the filtrate, quantitatively and stepwise if necessary, with water to obtain a solution with a concentration of 0.1 ng/mL.

Acid-hydrolyzed casein solution: Mix 100 g of vitamin-free casein with 500 mL of 6 N hydrochloric acid, and reflux the mixture for 8–12 h. Remove the hydrochloric acid from the mixture by distillation under reduced pressure until a thick paste remains. Redissolve the resulting paste in water, adjust the solution with 1 N sodium hydroxide to a pH of 3.5 ± 0.1, and add water to make 1000 mL. Add 20 g of activated charcoal, stir for 1 h, and filter. Repeat the treatment with activated charcoal. Store under toluene in a cool place at a temperature not below 10°. Filter the solution if a precipitate forms during storage.

Cystine–tryptophan solution: Suspend 4.0 g of L-cystine in a solution of 1.0 g of L-tryptophan (or 2.0 g of D,L-tryptophan) in 700–800 mL of water, heat to 70°–80°, and add dilute hydrochloric acid (1 in 2) dropwise, with stirring, until the solids are dissolved. Cool, and add water to make 1000 mL. Store under toluene in a cool place at a temperature not below 10°.

Adenine–guanine–uracil solution: Dissolve 200 mg each of adenine sulfate, guanine hydrochloride, and uracil, with the aid of heat, in 10 mL of 4 N hydrochloric acid. Cool, and add water to make 200 mL. Store under toluene in a refrigerator.

Polysorbate 80 solution: 100 mg/mL of polysorbate 80 in alcohol

Calcium pantothenate solution: 10 µg/mL of calcium pantothenate in 50% alcohol. Store in a refrigerator.

Riboflavin–thiamine hydrochloride solution: 20 µg/mL of riboflavin and 10 µg/mL of thiamine hydrochloride in 0.02 N acetic acid. Store under toluene, protected from light, in a refrigerator.

p-Aminobenzoic acid–niacin–pyridoxine hydrochloride solution: 10 µg/mL of p-aminobenzoic acid, 50 µg/mL of niacin, and 40 µg/mL of pyridoxine hydrochloride in a mixture of neutralized alcohol and water (1:3). Store in a refrigerator.

Salt solution A: 25 g of monobasic potassium phosphate and 25 g of dibasic potassium phosphate in water to make 500 mL. Add 5 drops of hydrochloric acid. Store under toluene.

Salt solution B: 10 g of magnesium sulfate, 0.5 g of sodium chloride, 0.5 g of ferrous sulfate, and 0.5 g of manganese sulfate in water to make 500 mL. Add 5 drops of hydrochloric acid, and mix. Store under toluene.

Basal medium stock solution: Dissolve the anhydrous dextrose and anhydrous sodium acetate in the solutions previously mixed according to *Table 1*, and adjust with 1 N sodium hydroxide to a pH of 6.8. Dilute with water to 250 mL.

Table 1

Acid-hydrolyzed casein solution	25 mL
Cystine–tryptophan solution	25 mL
Polysorbate 80 solution	0.25 mL
Dextrose, anhydrous	10 g
Sodium acetate, anhydrous	5 g
Adenine–guanine–uracil solution	5 mL
Calcium pantothenate solution	5 mL
Riboflavin–thiamine hydrochloride solution	5 mL
p-Aminobenzoic acid–niacin–pyridoxine hydrochloride solution	5 mL
Salt solution A	5 mL
Salt solution B	5 mL

Stock culture of *Lactobacillus plantarum*: Dissolve 2.0 g of yeast extract in 100 mL of water. Add 500 mg of anhydrous dextrose, 500 mg of anhydrous sodium acetate, and 1.5 g of agar, and heat the mixture on a steam bath, with stirring, until the agar dissolves. Add

10-mL portions of the hot solution to test tubes, close or cover the tubes, sterilize in an autoclave at 121° for 15 min, and allow the tubes to cool in an upright position. Prepare stab cultures in three or more of the tubes, using a pure culture of *Lactobacillus plantarum*,¹ incubating for 16–24 h at a temperature between 30° and 37° held constant to within ±0.5°. Store in a refrigerator. Prepare a fresh stab of the stock culture every week, and do not use for *Inoculum* if the culture is more than 1 week old.

Culture medium: To each of a series of test tubes containing 5.0 mL of *Basal medium stock solution* add 5.0 mL of water containing 0.5 ng of biotin. Plug the tubes with cotton, sterilize in an autoclave at 121° for 15 min, and cool.

Inoculum: [NOTE—A frozen suspension of *Lactobacillus plantarum* may be used as the stock culture, provided it yields an inoculum comparable to a fresh culture.] Make a transfer of cells from the *Stock culture of Lactobacillus plantarum* to a sterile tube containing 10 mL of culture medium. Incubate this culture for 16–24 h at a temperature between 30° and 37° held constant to within ±0.5°. The cell suspension so obtained is the *Inoculum*.

Analysis

Samples: *Standard solution* and *Sample solution*
To similar separate test tubes add, in duplicate, 1.0 and/or 1.5, 2.0, 3.0, 4.0, and 5.0 mL of the *Standard solution*. To each tube and to four similar empty tubes add 5.0 mL of *Basal medium stock solution* and sufficient water to make 10 mL.

To similar test tubes add, in duplicate, volumes of the *Sample solution* corresponding to three or more of the levels specified for the *Standard solution*, including the levels of 2.0, 3.0, and 4.0 mL. To each tube add 5.0 mL of the *Basal medium stock solution* and sufficient water to make 10 mL. Place one complete set of Standard and sample tubes together in one tube rack and the duplicate set in a second rack or section of a rack, preferably in random order.

Cover the tubes of both series to prevent contamination, and sterilize in an autoclave at 121° for 5 min. Cool, and add 1 drop of *Inoculum* to each tube, except two of the four tubes containing no *Standard solution* (the uninoculated blanks). Incubate the tubes at a temperature between 30° and 37° held constant to within ±0.5° until, following 16–24 h of incubation, there has been no substantial increase in turbidity in the tubes containing the highest level of Standard during a 2-h period.

Determine the transmittance of the tubes in the following manner. Mix the contents of each tube, and transfer to a spectrophotometer cell. Place the cell in a spectrophotometer that has been set at a specific wavelength from 540 to 660 nm, and read the transmittance when a steady state is reached. This steady state is observed a few seconds after agitation when the galvanometer reading remains constant for 30 s or more. Allow approximately the same time interval for the reading on each tube.

With the transmittance set at 1.00 for the uninoculated blank, read the transmittance of the inoculated blank. With the transmittance set at 1.00 for the inoculated blank, read the transmittance for each of the remaining tubes. If there is evidence of contamination with a foreign microorganism, disregard the result of the assay.

Calculation: Prepare a standard concentration-response curve as follows. For each level of the Standard, calculate the response from the sum of the duplicate values of the transmittance (ΣS) as the difference, $y = 2.00 - \Sigma S$. Plot this response on the ordinate of cross-

section paper against the logarithm of the mL of *Standard solution* per tube on the abscissa, using for the ordinate either an arithmetic or a logarithmic scale, whichever gives the better approximation to a straight line. Draw the straight line or smooth curve that best fits the plotted points.

Calculate the response, $y = 2.00 - \Sigma U$, adding together the two transmittances for each level of the *Sample solution* (ΣU). Read from the standard curve the logarithm of the volume of the *Standard solution* corresponding to each of those values of y that fall within the range of lowest and highest points plotted for the Standard. Subtract from each logarithm so obtained the logarithm of the volume, in mL, of the *Sample solution* to obtain the difference, X , for each dosage level. Average the values of X for each of three or more dosage levels to obtain \bar{X} , which equals the log-relative potency, M' , of the *Sample solution*. Determine the quantity, in μg , of biotin in the portion of Tablets taken:

$$\text{antilog } M = \text{antilog } (M' + \log R)$$

R = number of μg of biotin that was assumed to be present in the portion of the Tablets taken

Calculate the percentage of the labeled amount of biotin ($\text{C}_{10}\text{H}_{16}\text{N}_2\text{O}_3\text{S}$) in the portion of the Tablets taken

$$\text{Result} = [(\text{antilog } M)/N] \times 100$$

N = nominal amount of biotin in the portion of the Tablets taken (μg)

Replication: Repeat the entire determination at least once, using separately prepared *Sample solutions*. If the difference between the two log-potencies M is NMT 0.08, their mean, \bar{M} , is the assayed log-potency of the test material (see *Design and Analysis of Biological Assays* (111), *The Confidence Interval and Limits of Potency*). If the two determinations differ by more than 0.08, conduct one or more additional determinations. From the mean of two or more values of M that do not differ by more than 0.15, compute the mean potency of the preparation under assay.

Acceptance criteria: 90.0%–150.0% of the labeled amount of biotin ($\text{C}_{10}\text{H}_{16}\text{N}_2\text{O}_3\text{S}$)

• BIOTIN, Method 3

[NOTE—Use low-actinic glassware throughout this procedure.]

Solution A: Transfer 800 mL of water and 100 mL of triethylamine to a 1000-mL volumetric flask. Add 80 mL of 85% phosphoric acid, and dilute with water to volume.

Mobile phase: Transfer 80 mL of acetonitrile and 10 mL of *Solution A* to a 1000-mL volumetric flask. Dilute with water to volume.

Standard solution: 0.6 $\mu\text{g}/\text{mL}$ of USP Biotin RS in water. [NOTE—A portion of the *Standard solution* will be used to determine the percent recovery of biotin from the *Solid-phase extraction* procedure.]

Sample solution: Finely powder NLT 20 Tablets.

Transfer an amount of powdered Tablets to a volumetric flask to obtain a concentration of 0.6 $\mu\text{g}/\text{mL}$ of biotin. Add water up to 80% of the flask capacity, sonicate for 30–40 min, with occasional mixing, to dissolve. Dilute with water to volume, and filter. Adjust the pH of the solution with either dilute acetic acid or 0.1 N sodium hydroxide to 6.0–7.0.

Solid-phase extraction: [NOTE—Condition the extraction column specified in this procedure in the following manner. Wash the column with a 2-mL portion of methanol. Equilibrate with a 2-mL portion of water.] Separately pipet 5.0 mL of the *Sample solution* and *Standard solution* into freshly conditioned solid-phase extraction columns consisting of a mixed-mode packing

¹ ATCC No. 8014 is suitable. This strain was formerly known as *Lactobacillus arabinosus* 17-5.

with a sorbent-mass of 60 mg. [NOTE—The mixed-mode packing consists of anion-exchange and reversed-phase sorbents. The reverse-phase component is a polymer of copolymer *N*-vinylpyrrolidone and divinylbenzene. The anion exchange moiety is a trialkylamino group.²] Wash the column with 10 mL of 30% methanol in water. Apply an appropriate volume (4.9 mL) of 30% methanol in 0.1 N hydrochloric acid to the column. Collect the eluate in a 5-mL volumetric flask, containing 100 µL of 40% (w/v) sodium acetate in water, and dilute with 30% methanol in 0.1 N hydrochloric acid to volume.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 200 nm

Column: 4.6-mm × 25-cm; packing L1

Flow rate: 2 mL/min

Injection size: 100 µL

System suitability

Samples: *Standard solution* and portion of *Standard solution* that has undergone *Solid-phase extraction*

Suitability requirements

Tailing factor: NMT 1.5, *Standard solution*

Relative standard deviation: NMT 2.0%, *Standard solution* and the *Standard solution* that has undergone *Solid-phase extraction*

Recovery: 95%–100%, *Standard solution* that has undergone *Solid-phase extraction*

Analysis

Samples: *Standard solution* and *Sample solution* that have both undergone *Solid-phase extraction*

Measure the responses for the biotin peak. Calculate the percentage of the labeled amount of biotin ($C_{10}H_{16}N_2O_3S$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Biotin RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of biotin in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–150.0% of the labeled amount of biotin ($C_{10}H_{16}N_2O_3S$)

• CYANOCOBALAMIN, Method 1

[NOTE—Use low-actinic glassware throughout this procedure.]

Mobile phase: Methanol and water (7:13)

Standard stock solution: 10 µg/mL of USP Cyanocobalamin RS in water. [NOTE—Store this stock solution in a dark place, and discard after 1 week.]

Standard solution: 1 µg/mL of USP Cyanocobalamin RS from *Standard stock solution* diluted with water

Sample solution: Finely powder NLT 30 Tablets.

Transfer a portion of the powder, equivalent to 100 µg of cyanocobalamin, to a 250-mL flask. Quantitatively add 100.0 mL of water, and carefully extract for 2 min. Filter 10 mL of the extract, and use the filtrate.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak responses for cyanocobalamin.

Calculate the percentage of the labeled amount of cyanocobalamin ($C_{63}H_{88}CoN_{14}O_{14}P$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Cyanocobalamin RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of cyanocobalamin in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–150.0% of the labeled amount of cyanocobalamin ($C_{63}H_{88}CoN_{14}O_{14}P$)

• CYANOCOBALAMIN, Method 2

[NOTE—Use low-actinic glassware throughout this procedure.]

Standard stock solution: 1.0 µg/mL of USP

Cyanocobalamin RS in 25% alcohol. Store in a refrigerator.

Standard solution: Dilute a suitable volume of *Standard stock solution* with water to a measured volume such that after the incubation period as described in the *Analysis*, the difference in transmittance between the inoculated blank and the 5.0-mL level of the *Standard solution* is NLT that which corresponds to a difference of 1.25 mg in dried cell weight. This concentration usually falls between 0.01 and 0.04 ng/mL of *Standard solution*. Prepare this solution fresh for each assay.

Sample solution: Finely powder NLT 20 Tablets.

Transfer a portion of the powdered Tablets, equivalent to 1.0 µg of cyanocobalamin, to an appropriate vessel containing, for each g of powdered Tablets taken, 25 mL of an aqueous extracting solution prepared just before use to contain, in each 100 mL, 1.29 g of dibasic sodium phosphate, 1.1 g of anhydrous citric acid, and 1.0 g of sodium metabisulfite. Autoclave the mixture at 121° for 10 min. Allow any undissolved particles of the extract to settle, and filter or centrifuge if necessary. Dilute an aliquot of the clear solution with water to obtain a final solution containing vitamin B₁₂ activity equivalent to the nominal activity of the *Standard solution*.

Acid-hydrolyzed casein solution: Prepare as directed in *Biotin, Method 2*.

Asparagine solution: Dissolve 2.0 g of L-asparagine in water to make 200 mL. Store under toluene in a refrigerator.

Adenine–guanine–uracil solution: Prepare as directed in *Biotin, Method 2*.

Xanthine solution: Suspend 0.20 g of xanthine in 30–40 mL of water, heat to 70°, add 6.0 mL of 6 N ammonium hydroxide, and stir until the solid is dissolved. Cool, and add water to make 200 mL. Store under toluene in a refrigerator.

Salt solution A: Dissolve 10 g of monobasic potassium phosphate and 10 g of dibasic potassium phosphate in water to make 200 mL, and add 2 drops of hydrochloric acid. Store this solution under toluene.

Salt solution B: Dissolve 4.0 g of magnesium sulfate, 0.20 g of sodium chloride, 0.20 g of ferrous sulfate, and 0.20 g of manganese sulfate in water to make 200 mL,

and add 2 drops of hydrochloric acid. Store this solution under toluene.

Polysorbate 80 solution: 20 g of polysorbate 80 in alcohol to make 200 mL. Store in a refrigerator.

Vitamin solution A: 10 mg of riboflavin, 10 mg of thiamine hydrochloride, 100 µg of biotin, and 20 mg of niacin in 0.02 N acetic acid to make 400 mL. Store under toluene, protected from light, in a refrigerator.

Vitamin solution B: 20 mg of *p*-aminobenzoic acid, 10 mg of calcium pantothenate, 40 mg of pyridoxine hydrochloride, 40 mg of pyridoxal hydrochloride, 8 mg of pyridoxamine dihydrochloride, and 2 mg of folic acid in a mixture of water and neutralized alcohol (3:1) to make 400 mL. Store, protected from light, in a refrigerator.

Basal medium stock solution: Prepare the medium according to the following formula and directions. A dehydrated mixture containing the same ingredients may be used provided that, when constituted as directed in the labeling, it yields a medium comparable to that obtained from the formula given herein.

Add the ingredients in the order listed in Table 2, carefully dissolving cystine and tryptophan in the hydrochloric acid before adding the next eight solutions to the resulting solution. Add 100 mL of water, and dissolve the dextrose, sodium acetate, and ascorbic acid. Filter, if necessary. Add the *Polysorbate 80 solution*, adjust with 1 N sodium hydroxide to a pH of between 5.5 and 6.0, and add *Purified Water* to make 250 mL.

Table 2

L-Cystine	0.1 g
L-Tryptophan	0.05 g
1 N hydrochloric acid	10 mL
Adenine–guanine–uracil solution	5 mL
Xanthine solution	5 mL
Vitamin solution A	10 mL
Vitamin solution B	10 mL
Salt solution A	5 mL
Salt solution B	5 mL
Asparagine solution	5 mL
Acid-hydrolyzed casein solution	25 mL
Dextrose, anhydrous	10 g
Sodium acetate, anhydrous	5 g
Ascorbic acid	1 g
Polysorbate 80 solution	5 mL

Tomato juice preparation: Centrifuge commercially canned tomato juice so that most of the pulp is removed. Suspend 5 g/L of analytical filter aid in the supernatant, and pass, with the aid of reduced pressure, through a layer of the filter aid. Repeat, if necessary, until a clear, straw-colored filtrate is obtained. Store under toluene in a refrigerator.

Culture medium: [NOTE—A dehydrated mixture containing the same ingredients may be used provided that, when constituted as directed in the labeling, it yields a medium equivalent to that obtained from the formula given herein.] Dissolve 0.75 g of yeast extract, 0.75 g of dried peptone, 1.0 g of anhydrous dextrose, and 0.20 g of monobasic potassium phosphate in 60–70 mL of water. Add 10 mL of *Tomato juice preparation* and 1 mL of *Polysorbate 80 solution*. Adjust with 1 N sodium hydroxide to a pH of 6.8, and add water to make 100 mL. Place 10-mL portions of the solution in test tubes, and plug with cotton. Sterilize the tubes and contents in an autoclave at 121° for 15 min. Cool as rapidly as possible to avoid color formation resulting from overheating the medium.

Suspension medium: Dilute a measured volume of *Basal medium stock solution* with an equal volume of

water. Place 10-mL portions of the diluted medium in test tubes. Sterilize, and cool as directed for *Culture medium*.

Stock culture of *Lactobacillus leichmannii*: To 100 mL of *Culture medium* add 1.0–1.5 g of agar, and heat the mixture on a steam bath, with stirring, until the agar dissolves. Place 10-mL portions of the hot solution in test tubes, cover the tubes, sterilize at 121° for 15 min in an autoclave, and allow the tubes to cool in an upright position. Inoculate three or more of the tubes by stab transfer of a pure culture of *Lactobacillus leichmannii*.³ [NOTE—Before first using a fresh culture in this assay, make NLT 10 successive transfers of the culture in a 2-week period.]

Incubate for 16–24 h at a temperature between 30° and 40° held constant to within ±0.5°. Store in a refrigerator.

Prepare fresh stab cultures at least three times each week, and do not use them for preparing the *Inoculum* if more than 4 days old. The activity of the microorganism can be increased by daily or twice-daily transfer of the stab culture, to the point where definite turbidity in the liquid *Inoculum* can be observed 2–4 h after inoculation. A slow-growing culture seldom gives a suitable response curve and may lead to erratic results.

Inoculum: [NOTE—A frozen suspension of *Lactobacillus leichmannii* may be used as the stock culture, provided it yields an *Inoculum* comparable to a fresh culture.]

Make a transfer of cells from the *Stock culture of Lactobacillus leichmannii* to two sterile tubes containing 10 mL of the *Culture medium* each. Incubate these cultures for 16–24 h at a temperature between 30° and 40° held constant to within ±0.5°. Under aseptic conditions centrifuge the cultures, and decant the supernatant. Suspend the cells from the culture in 5 mL of sterile *Suspension medium*, and combine. Using sterile *Suspension medium*, adjust the volume so that a 1-in-20 dilution in saline TS produces 70% transmittance when read on a suitable spectrophotometer that has been set at a wavelength of 530 nm, equipped with a 10-mm cell, and read against saline TS set at 100% transmittance. Prepare a 1-in-400 dilution of the adjusted suspension using sterile *Basal medium stock solution*. The cell suspension so obtained is the *Inoculum*. [NOTE—This dilution may be altered, when necessary, to obtain the desired test response.]

Calibration of spectrophotometer: Check the wavelength of the spectrophotometer periodically, using a standard wavelength cell or other suitable device. Before reading any tests, calibrate the spectrophotometer for 0% and 100% transmittance, using water and with the wavelength set at 530 nm.

Analysis

Samples: *Standard solution* and *Sample solution*
Because of the high sensitivity of the test organism to minute amounts of vitamin B₁₂ activity and to traces of many cleansing agents, cleanse meticulously by suitable means, followed preferably by heating at 250° for 2 h, using hard-glass 20-mm × 150-mm test tubes, and other necessary glassware.

To separate test tubes add, in duplicate, 1.0, 1.5, 2.0, 3.0, 4.0, and 5.0 mL of the *Standard solution*. To each of these tubes and to four similar empty tubes add 5.0 mL of *Basal medium stock solution* and sufficient water to make 10 mL.

To similar separate test tubes add, in duplicate, 1.0, 1.5, 2.0, 3.0, and 4.0 mL of the *Sample solution*. To each tube add 5.0 mL of *Basal medium stock solution* and sufficient water to make 10 mL. Place one complete set of standard and sample tubes together in one tube rack and the duplicate set in a second rack or section of a rack, preferably in random order.

³ Pure cultures of *Lactobacillus leichmannii* may be obtained as No. 7830 from ATCC, 10801 University Blvd., Manassas, VA 20110-2209.

Cover the tubes to prevent bacterial contamination, and sterilize in an autoclave at 121° for 5 min, arranging to reach this temperature in NMT 10 min by preheating the autoclave if necessary. Cool as rapidly as possible to avoid color formation resulting from overheating the medium. Take precautions to maintain uniformity of sterilizing and cooling conditions throughout the assay, because packing the tubes too closely in the autoclave or overloading it may cause variation in the heating rate.

Aseptically add 0.5 mL of *Inoculum* to each tube so prepared, except two of the four containing no *Standard solution* (the uninoculated blanks). Incubate the tubes at a temperature between 30° and 40°, held constant to within $\pm 0.5^\circ$, for 16–24 h.

Terminate growth by heating to a temperature NLT 80° for 5 min. Cool to room temperature. After agitating its contents, and read the transmittance at 530 nm when a steady state is reached. This steady state is observed a few seconds after agitation when the reading remains constant for 30 s or more. Allow approximately the same time interval for the reading on each tube.

With the transmittance set at 100% for the uninoculated blank, read the transmittance of the inoculated blank. If the difference is greater than 5% or if there is evidence of contamination with a foreign microorganism, disregard the results of the assay.

With the transmittance set at 100% for the uninoculated blank, read the transmittance of each of the remaining tubes. Disregard the results of the assay if the slope of the standard curve indicates a problem with sensitivity.

Calculation: Prepare a standard concentration-response curve by the following procedure. Test for and replace any aberrant individual transmittances. For each level of the Standard, calculate the response from the sum of the duplicate values of the transmittances (Σ_s) as the difference, $y = 2.00 - \Sigma_s$. Plot this response on the ordinate of cross-section paper against the logarithm of the mL of *Standard solution* per tube on the abscissa, using for the ordinate either an arithmetic or a logarithmic scale, whichever gives the better approximation to a straight line. Draw the straight line or smooth curve that best fits the plotted points.

Calculate the response, $y = 2.00 - \Sigma_u$, adding together the two transmittances for each level of the *Sample solution* (Σ_u). Read from the standard curve the logarithm of the volume of the *Standard solution* corresponding to each of those values of y that falls within the range of the lowest and highest points plotted for the Standard. Subtract from each logarithm so obtained the logarithm of the volume, in mL, of the *Sample solution* to obtain the difference, X , for each dosage level. Average the values of X for each of three or more dosage levels to obtain \bar{X} , which equals the log-relative potency, M' , of the *Sample solution*. Determine the quantity, in μg , of cyanocobalamin in the portion of Tablets taken:

$$\text{antilog } M = \text{antilog } (M' + \log R)$$

R = number of μg of cyanocobalamin that was assumed to be present in the portion of Tablets taken

Calculate the percentage of the labeled amount of cyanocobalamin in the portion of the Tablets taken:

$$\text{Result} = [(\text{antilog } M)/N] \times 100$$

N = nominal amount of cyanocobalamin in the portion of the Tablets taken (μg)

Replication: Repeat the entire determination at least once, using separately prepared *Sample solutions*. If the difference between the two log-potencies M is NMT 0.08, their mean, \bar{M} , is the assayed log-potency of the test material (see *Vitamin B₁₂ Activity in Design and*

Analysis of Biological Assays (111), *The Confidence Interval and Limits of Potency*). If the two determinations differ by more than 0.08, conduct one or more additional determinations. From the mean of two or more values of M that do not differ by more than 0.15, compute the mean potency of the preparation under assay.

Acceptance criteria: 90.0%–150.0% of the labeled amount of cyanocobalamin ($\text{C}_{63}\text{H}_{88}\text{CoN}_{14}\text{O}_{14}\text{P}$)

• Folic Acid, Method 1

[NOTE—Use low-actinic glassware throughout this procedure.]

Reagent A: 25% solution of tetrabutylammonium hydroxide in methanol

Reagent B: Transfer 5.0 g of pentetic acid to a 50-mL volumetric flask. Using sonication if necessary, dissolve in and dilute with 1 N sodium hydroxide to volume.

Mobile phase: 2 g of monobasic potassium phosphate in 650 mL of water. Add 12.0 mL of *Reagent A*, 7.0 mL of 3 N phosphoric acid, and 240 mL of methanol. Cool to room temperature, adjust with phosphoric acid or ammonia TS to a pH of 7.0, dilute with water to 1000 mL, and filter. Recheck the pH before use.

[NOTE—The methanol and water content may be varied (between 1% and 3%) by adding water or methanol to the prepared *Mobile phase* to obtain baseline separation of folic acid and the internal standard. The pH may be increased up to 7.15 to obtain better separation.]

Internal standard solution: Transfer 40 mg of methylparaben to a 1000-mL volumetric flask, and add 220 mL of methanol to dissolve. Dissolve 2.0 g of monobasic potassium phosphate in 300 mL of water in a separate beaker, quantitatively transfer this solution to the flask containing the methylparaben solution, and add an additional 300 mL of water. Add 19 mL of *Reagent A*, 7 mL of 3 N phosphoric acid, and 30 mL of *Reagent B*. Adjust with ammonia TS to a pH of 9.8, bubble nitrogen through the solution for 30 min, dilute with water to volume, and mix.

Standard solution: 0.016 mg/mL of USP Folic Acid RS in *Internal standard solution*

Sample solution: Finely powder NLT 30 Tablets.

Transfer a portion of powder, equivalent to 0.4 mg of folic acid, to a 50-mL amber-colored centrifuge tube. Add 25.0 mL of *Internal standard solution*, shake by mechanical means for 10 min, and centrifuge. Filter a portion of the clear supernatant, and use the filtrate.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 3.9-mm \times 30-cm; packing L1

Flow rate: 1 mL/min

Injection size: 15 μL

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for folic acid and methylparaben are about 0.8 and 1.0, respectively.]

Suitability requirements

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas for folic acid and methylparaben. Calculate the percentage of the labeled amount of folic acid ($\text{C}_{19}\text{H}_{19}\text{N}_7\text{O}_6$) in the portion of Tablets taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = peak area ratio of folic acid to methylparaben from the *Sample solution*

R_S = peak area ratio of folic acid to methylparaben from the *Standard solution*

C_S = concentration of USP Folic Acid RS in the *Standard solution* ($\mu\text{g/mL}$)

C_U = nominal concentration of folic acid in the
Sample solution ($\mu\text{g/mL}$)

Acceptance criteria: 90.0%–150.0% of the labeled amount of folic acid ($\text{C}_{19}\text{H}_{19}\text{N}_7\text{O}_6$)

• **FOLIC ACID, Method 2**

[NOTE—Use low-actinic glassware throughout this procedure.]

Reagent: Dissolve 7.5 g of edetate disodium, with stirring, in 500 mL of water containing 10 mL of ammonium hydroxide.

Diluent: 60 $\mu\text{g/mL}$ of ammonium hydroxide

Mobile phase: Transfer 0.4 mL of triethylamine, 15 mL of glacial acetic acid, and 350 mL of methanol to a 2000-mL volumetric flask, and dilute with 0.008 M sodium 1-hexanesulfonate to volume.

Standard stock solution: 60 $\mu\text{g/mL}$ of USP Folic Acid RS in Diluent. Prepare this solution fresh daily.

Standard solution: Mix 5.0 mL of Standard stock solution with 10.0 mL of methanol and 35.0 mL of Reagent, and shake for 15 min in a water bath maintained at 60°, and cool. Filter, discarding the first few mL of the filtrate.

Sample solution: Transfer a portion of finely powdered Tablets, equivalent to 0.3 mg of folic acid, to a 125-mL stoppered flask. Add 10.0 mL of methanol and 35.0 mL of Reagent. Shake for 15 min in a water bath maintained at 60°, and cool. Filter, discarding the first few mL of the filtrate.

Analysis

Samples: Standard solution and Sample solution
Measure the areas of the major peaks. Calculate the percentage of the labeled amount of folic acid ($\text{C}_{19}\text{H}_{19}\text{N}_7\text{O}_6$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of folic acid from the Sample solution

r_S = peak area of folic acid from the Standard solution

C_S = concentration of USP Folic Acid RS in the Standard solution ($\mu\text{g/mL}$)

C_U = nominal concentration of folic acid in the Sample solution ($\mu\text{g/mL}$)

Acceptance criteria: 90.0%–150.0% of the labeled amount of folic acid ($\text{C}_{19}\text{H}_{19}\text{N}_7\text{O}_6$)

• **CALCIUM PANTOTHENATE, Method 1**

Mobile phase: Phosphoric acid and water (1:1000)

Internal standard solution: 80 mg of *p*-hydroxybenzoic acid in 3 mL of alcohol. Add 50 mL of water and 7.1 g of dibasic sodium phosphate, and dilute with water to 1000 mL. Adjust with phosphoric acid to a pH of 6.7.

Standard solution: 0.6 mg/mL of USP Calcium Pantothenate RS in Internal standard solution

Sample solution: Finely powder NLT 30 Tablets. Transfer a portion of the powder, equivalent to 15 mg of calcium pantothenate, to a centrifuge tube. Add 25.0 mL of the Internal standard solution, and shake vigorously for 10 min. Centrifuge, filter, and use the clear filtrate.

Chromatographic system

(See Chromatography <621>, System Suitability.)

Mode: LC

Detector: UV 210 nm

Column: 3.9-mm \times 15-cm; packing L1

Flow rate: 1.5 mL/min

Injection size: 10 μL

System suitability

Sample: Standard solution

[NOTE—The relative retention times for calcium pantothenate and *p*-hydroxybenzoic acid are about 0.5 and 1.0, respectively.]

Suitability requirements

Relative standard deviation: NMT 3.0%

Analysis

Samples: Standard solution and Sample solution

Measure the peak responses for calcium pantothenate and the internal standard. Calculate the percentage of the labeled amount of calcium pantothenate ($\text{C}_{18}\text{H}_{32}\text{CaN}_2\text{O}_{10}$) in the portion of Tablets taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = peak response ratio of calcium pantothenate to *p*-hydroxybenzoic acid from the Sample solution

R_S = peak response ratio of calcium pantothenate to *p*-hydroxybenzoic acid from the Standard solution

C_S = concentration of USP Calcium Pantothenate RS in the Standard solution (mg/mL)

C_U = nominal concentration of calcium pantothenate in the Sample solution (mg/mL)

Acceptance criteria: 90.0%–150.0% of the labeled amount of calcium pantothenate ($\text{C}_{18}\text{H}_{32}\text{CaN}_2\text{O}_{10}$)

• **CALCIUM PANTOTHENATE, Method 2**

Standard stock solution: Dissolve 50 mg of USP Calcium Pantothenate RS, previously dried and stored in the dark over phosphorus pentoxide and protected from absorption of moisture while weighing, in 500 mL of water in a 1000-mL volumetric flask. Add 10 mL of 0.2 N acetic acid and 100 mL of sodium acetate solution (1 in 60), and dilute with water to volume, to obtain a concentration of 50 $\mu\text{g/mL}$ of USP Calcium Pantothenate RS. Store under toluene in a refrigerator.

Standard solution: On the day of the assay, dilute a volume of Standard stock solution with water to obtain a concentration of 0.01–0.04 $\mu\text{g/mL}$ of calcium pantothenate, the exact concentration being such that the responses obtained as directed in the Analysis, 2.0 and 4.0 mL of the Standard solution being used, are within the linear portion of the log-concentration response curve.

Sample solution: Finely powder NLT 30 Tablets. Transfer a portion of the powder, equivalent to 50 mg of calcium pantothenate, to a 1000-mL volumetric flask containing 500 mL of water. Add 10 mL of 0.2 N acetic acid and 100 mL of sodium acetate solution (1 in 60), dilute with water to volume, and filter. Dilute a volume of this solution to obtain a solution having approximately the same concentration as that of the Standard solution.

Acid-hydrolyzed casein solution: Mix 100 g of vitamin-free casein with 500 mL of 6 N hydrochloric acid, and reflux the mixture for 8–12 h. Remove the hydrochloric acid from the mixture by distillation under reduced pressure until a thick paste remains. Redissolve the resulting paste in water, adjust the solution with 1 N sodium hydroxide to a pH of 3.5 \pm 0.1, and add water to make 1000 mL. Add 20 g of activated charcoal, stir for 1 h, and filter. Repeat the treatment with activated charcoal. Store under toluene in a cool place at a temperature not below 10°. Filter the solution if a precipitate forms during storage.

Cystine-tryptophan solution: Suspend 4.0 g of L-cystine in a solution of 1.0 g of L-tryptophan (or 2.0 g of D,L-tryptophan) in 700–800 mL of water, heat to

70°–80°, and add dilute hydrochloric acid (1 in 2) dropwise, with stirring, until the solids are dissolved. Cool, and add water to make 1000 mL. Store under toluene in a cool place at a temperature not below 10°.

Adenine–guanine–uracil solution: Dissolve 200 mg each of adenine sulfate, guanine hydrochloride, and uracil, with the aid of heat, in 10 mL of 4 N hydrochloric acid. Cool, and add water to make 200 mL. Store under toluene in a refrigerator.

Polysorbate 80 solution: 100 mg/mL of polysorbate 80 in alcohol

Riboflavin–thiamine hydrochloride–biotin solution: 20 µg/mL of riboflavin, 10 µg/mL of thiamine hydrochloride, and 0.04 µg/mL of biotin in 0.02 N acetic acid. Store under toluene, protected from light, in a refrigerator.

p-Aminobenzoic acid–niacin–pyridoxine hydrochloride solution: 10 µg/mL of p-aminobenzoic acid, 50 µg/mL of niacin, and 40 µg/mL of pyridoxine hydrochloride in a mixture of neutralized alcohol and water (1:3). Store in a refrigerator.

Salt solution A: Dissolve 25 g of monobasic potassium phosphate and 25 g of dibasic potassium phosphate in water to make 500 mL. Add 5 drops of hydrochloric acid. Store under toluene.

Salt solution B: Dissolve 10 g of magnesium sulfate, 0.5 g of sodium chloride, 0.5 g of ferrous sulfate, and 0.5 g of manganese sulfate in water to make 500 mL. Add 5 drops of hydrochloric acid. Store under toluene.

Basal medium stock solution: Dissolve the anhydrous dextrose and anhydrous sodium acetate in the solutions previously mixed according to Table 3, and adjust with 1 N sodium hydroxide to a pH of 6.8. Dilute with water to 250 mL.

Table 3

Acid-hydrolyzed casein solution	25 mL
Cystine–tryptophan solution	25 mL
Polysorbate 80 solution	0.25 mL
Dextrose, anhydrous	10 g
Sodium acetate, anhydrous	5 g
Adenine–guanine–uracil solution	5 mL
Riboflavin–thiamine hydrochloride–biotin solution	5 mL
p-Aminobenzoic acid–niacin–pyridoxine hydrochloride solution	5 mL
Salt solution A	5 mL
Salt solution B	5 mL

Stock culture of *Lactobacillus plantarum*: Dissolve 2.0 g of yeast extract in 100 mL of water; add 500 mg of anhydrous dextrose, 500 mg of anhydrous sodium acetate, and 1.5 g of agar; and heat the mixture on a steam bath, with stirring, until the agar dissolves. Add 10-mL portions of the hot solution to the test tubes, close or cover the tubes, sterilize in an autoclave at 121° for 15 min, and allow the tubes to cool in an upright position. Prepare stab cultures in three or more of the tubes, using a pure culture of *Lactobacillus plantarum*⁴ incubating for 16–24 h at a temperature between 30° and 37° held constant to within ±0.5°. Store in a refrigerator. Prepare a fresh stab of the stock culture every week, and do not use for *Inoculum* if the culture is more than 1 week old.

Culture medium: To each of a series of test tubes containing 5.0 mL of *Basal medium stock solution* add 5.0 mL of water containing 0.2 µg of calcium pantothenate. Plug the tubes with cotton, sterilize in an autoclave at 121° for 15 min, and cool.

Inoculum: [NOTE—A frozen suspension of *Lactobacillus plantarum* may be used as the stock culture, provided it yields an *Inoculum* comparable to a fresh culture.]

Make a transfer of cells from the *Stock culture* of *Lactobacillus plantarum* to a sterile tube containing 10 mL of *Culture medium*. Incubate this culture for 16–24 h at a temperature between 30° and 37° held constant to within ±0.5°. The cell suspension so obtained is the *Inoculum*.

Analysis

Samples: *Standard solution* and *Sample solution*
To similar separate test tubes add, in duplicate, 1.0 and/or 1.5, 2.0, 3.0, 4.0, and 5.0 mL of the *Standard solution*. To each tube and to four similar empty tubes add 5.0 mL of *Basal medium stock solution* and sufficient water to make 10 mL.

To similar separate test tubes add, in duplicate, volumes of the *Sample solution* corresponding to three or more of the levels specified for the *Standard solution*, including the levels of 2.0, 3.0, and 4.0 mL. To each tube add 5.0 mL of the *Basal medium stock solution* and sufficient water to make 10 mL. Place one complete set of *Standard* and *sample* tubes together in one tube rack and the duplicate set in a second rack or section of a rack, preferably in random order.

Cover the tubes of both series to prevent contamination, and sterilize in an autoclave at 121° for 5 min. Cool, and add 1 drop of *Inoculum* to each tube, except two of the four tubes containing no *Standard solution* (the uninoculated blanks). Incubate the tubes at a temperature between 30° and 37°, held constant to within ±0.5° until, following 16–24 h of incubation, there has been no substantial increase in turbidity in the tubes containing the highest level of *Standard* during a 2-h period.

Determine the transmittance of the tubes in the following manner. Mix the contents of each tube, and transfer to an optical container if necessary. Read the transmittance between 540 and 660 nm when a steady state is reached. This steady state is observed a few seconds after agitation when the galvanometer reading remains constant for 30 s or more. Allow approximately the same time interval for the reading on each tube.

With the transmittance set at 1.00 for the uninoculated blank, read the transmittance of the inoculated blank. With the transmittance set at 1.00 for the inoculated blank, read the transmittance for each of the remaining tubes. If there is evidence of contamination with a foreign microorganism, disregard the result of the assay.

Calculation: Prepare a standard concentration-response curve as follows. For each level of the *Standard*, calculate the response from the sum of the duplicate values of the transmittance (Σ_s) as the difference, $y = 2.00 - \Sigma_s$. Plot this response on the ordinate of cross-section paper against the logarithm of the mL of *Standard solution* per tube on the abscissa, using for the ordinate either an arithmetic or a logarithmic scale, whichever gives the better approximation to a straight line. Draw the straight line or smooth curve that best fits the plotted points. Calculate the response, $y = 2.00 - \Sigma_u$, adding together the two transmittances for each level of the *Sample solution* (Σ_u). Read from the standard curve the logarithm of the volume of the *Standard solution* corresponding to each of those values of y that fall within the range of the lowest and highest points plotted for the *Standard*. Subtract from each logarithm so obtained the logarithm of the volume, in mL, of the *Sample solution* to obtain the difference, X , for each dosage level. Average the values of X for each of three or more dosage levels to obtain \bar{X} , which equals the log-relative potency, M' , of the *Sample solution*. Determine the quantity, in mg, of calcium

⁴ ATCC No. 8014 is suitable. This strain was formerly known as *Lactobacillus arabinosus* 17-5.

pantothenate ($C_{18}H_{32}CaN_2O_{10}$) in the portion of Tablets taken:

$$\text{antilog } M = \text{antilog } (M' + \log R)$$

R = number of mg of calcium pantothenate that was assumed to be present in the portion of the Tablets taken

Calculate the percentage of the labeled amount of calcium pantothenate in the portion of the Tablets taken:

$$\text{Result} = [(\text{antilog } M)/N] \times 100$$

N = nominal amount of calcium pantothenate in the portion of the Tablets taken (mg)

Replication: Repeat the entire determination at least once, using separately prepared *Sample solutions*. If the difference between the two log-potencies M is NMT 0.08, their mean, \bar{M} , is the assayed log-potency of the test material (see *Design and Analysis of Biological Assays* (111), *The Confidence Interval and Limits of Potency*). If the two determinations differ by more than 0.08, conduct one or more additional determinations. From the mean of two or more values of M that do not differ by more than 0.15, compute the mean potency of the preparation under assay.

Acceptance criteria: 90.0%–150.0% of the labeled amount of calcium pantothenate ($C_{18}H_{32}CaN_2O_{10}$)

• **CALCIUM PANTOTHENATE**, *Method 3*

Buffer solution: Dissolve 10.0 g of monobasic potassium phosphate in 2000 mL of water, and adjust with phosphoric acid to a pH of 3.5.

Mobile phase: Methanol and *Buffer solution* (1:9)

Standard stock solution: 0.25 mg/mL of USP Calcium Pantothenate RS in water. Prepare fresh every 4 weeks. Store in a refrigerator.

Standard solution: 40 μ g/mL of USP Calcium Pantothenate RS from *Standard stock solution* diluted with water

Sample solution: Finely powder NLT 20 Tablets. Transfer a portion of the powder, equivalent to 10 mg of calcium pantothenate, to a 250-mL volumetric flask. Add 10 mL of methanol, and swirl the flask to disperse. Dilute with water to volume, mix, and filter.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas for calcium pantothenate.

Calculate the percentage of the labeled amount of calcium pantothenate ($C_{18}H_{32}CaN_2O_{10}$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area from the *Sample solution*

r_S = peak area from the *Standard solution*

C_S = concentration of USP Calcium Pantothenate RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of calcium pantothenate in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–150.0% of the labeled amount of calcium pantothenate ($C_{18}H_{32}CaN_2O_{10}$)

• **NIACIN or NIACINAMIDE, PYRIDOXINE HYDROCHLORIDE, RIBOFLAVIN, and THIAMINE**, *Method 1*

[NOTE—Use low-actinic glassware throughout this procedure.]

Diluent: Acetonitrile, glacial acetic acid, and water (5:1:94)

Mobile phase: A mixture of methanol, glacial acetic acid, and water (27:1:73) containing 140 mg of sodium 1-hexanesulfonate per 100 mL

Standard solution: [NOTE—Use USP Niacin RS in place of USP Niacinamide RS for formulations containing niacin.] Transfer 80 mg of USP Niacinamide RS, 20 mg of USP Pyridoxine Hydrochloride RS, 20 mg of USP Riboflavin RS, and 20 mg of USP Thiamine Hydrochloride RS, to a 200-mL volumetric flask, and add 180 mL of *Diluent*. Immerse the flask in a hot water bath maintained at 65°–70° for 10 min with regular shaking or using a vortex mixer, until all the solid materials are dissolved. Chill rapidly in a cold water bath for 10 min to room temperature, and dilute with *Diluent* to volume.

Sample solution: Finely powder NLT 30 Tablets. Transfer a portion of the powder, equivalent to 10 mg of niacinamide and 2.5 mg each of pyridoxine hydrochloride, riboflavin, and thiamine hydrochloride, to a 50-mL centrifuge tube. Add 25.0 mL of *Diluent*, and mix using a vortex mixer for 30 s to completely suspend the powder. Immerse the centrifuge tube in a hot water bath maintained at 65°–70°, heat for 5 min, and mix on a vortex mixer for 30 s. Return the tube to the hot water bath, heat for another 5 min, and mix on a vortex mixer for 30 s. Filter a portion of the solution, cool to room temperature, and use the clear filtrate. [NOTE—Use the filtrate within 3 h of filtration.]

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 3.9-mm \times 30-cm; packing L1

Flow rate: 1 mL/min

Injection size: 10 μ L

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for niacinamide, pyridoxine, riboflavin, and thiamine are about 0.3, 0.5, 0.8, and 1.0, respectively.]

Suitability requirements

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas for niacin or niacinamide, pyridoxine, riboflavin, and thiamine. Calculate the percentage of the labeled amount of niacinamide ($C_6H_6N_2O$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of niacinamide from the *Sample solution*

r_S = peak area of niacinamide from the *Standard solution*

C_S = concentration of USP Niacinamide RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of niacinamide in the *Sample solution* (mg/mL)

For formulations containing niacin:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of niacin from the *Sample solution*

r_S = peak area of niacin from the *Standard solution*

C_S = concentration of USP Niacin RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of niacin in the *Sample solution* (mg/mL)

Separately calculate the percentage of the labeled amount of pyridoxine hydrochloride ($C_8H_{11}NO_3 \cdot HCl$), riboflavin ($C_{17}H_{20}N_4O_6$), and thiamine hydrochloride ($C_{12}H_{17}ClN_4OS \cdot HCl$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- r_U = peak area of the corresponding vitamin from the *Sample solution*
 r_S = peak area of the corresponding vitamin from the *Standard solution*
 C_S = concentration of the relevant USP Reference Standard in the *Standard solution* (mg/mL)
 C_U = nominal concentration of the corresponding vitamin in the *Sample solution* (mg/mL)

For products containing thiamine mononitrate, calculate the percentage of the labeled amount of thiamine mononitrate ($C_{12}H_{17}N_5O_4S$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

- r_U = peak area of thiamine from the *Sample solution*
 r_S = peak area of thiamine from the *Standard solution*
 C_S = concentration of USP Thiamine Hydrochloride RS in the *Standard solution* (mg/mL)
 C_U = nominal concentration of thiamine mononitrate in the *Sample solution* (mg/mL)
 M_{r1} = molecular weight of thiamine mononitrate, 327.36
 M_{r2} = molecular weight of thiamine hydrochloride, 337.27

Acceptance criteria: 90.0%–150.0% of the labeled amount of niacinamide ($C_6H_6N_2O$) or niacin ($C_6H_5NO_2$), pyridoxine hydrochloride ($C_8H_{11}NO_3 \cdot HCl$), riboflavin ($C_{17}H_{20}N_4O_6$), and thiamine as thiamine hydrochloride ($C_{12}H_{17}ClN_4OS \cdot HCl$) or thiamine mononitrate ($C_{12}H_{17}N_5O_4S$)

• **NIACIN, Method 2**

[NOTE—Use low-actinic glassware throughout this procedure.]

Solution A: Transfer 1 mL of glacial acetic acid and 2.5 g of edetate disodium to a 100-mL volumetric flask. Dissolve in and dilute with water to volume.

Extraction solvent: *Solution A* and methanol (3:1)

Mobile phase: 0.1 M sodium acetate solution (13.6 mg/mL of sodium acetate in water). Adjust with acetic acid to a pH of 5.4. [NOTE—A small amount of methanol (up to 1%) may be added to the *Mobile phase* to improve resolution.]

Standard stock solution: 1 mg/mL of USP Niacin RS in *Extraction solvent*

Standard solution: Transfer 5.0 mL of *Standard stock solution* to a 25-mL volumetric flask, and dilute with *Extraction solvent* to volume.

Sample solution: [NOTE—This preparation is suitable for the determination of niacin or niacinamide, pyridoxine, and riboflavin, when present in the formulation.] Finely powder NLT 20 Tablets. Transfer a portion of the powder, equivalent to 2 mg of riboflavin, to a 200-mL volumetric flask. If riboflavin is not present in the formulation, transfer a portion of the powder, equivalent to 2 mg of pyridoxine. If pyridoxine is not present in the formulation, transfer a portion of the powder, equivalent to 20 mg of niacin or niacinamide. Add 100.0 mL of *Extraction solvent*, and mix for 20 min, using a wrist-action shaker. Immerse the flask in a water

bath maintained at 70°–75°, and heat for 20 min. Mix on a vortex mixer for 30 s, cool to room temperature, and filter. Use the clear filtrate.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm × 25-cm; packing L1

Flow rate: 1 mL/min

Injection size: 20 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 3.0%

[NOTE—If necessary, flush the column with methanol between injections.]

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas for niacin. Calculate the percentage of the labeled amount of niacin ($C_6H_5NO_2$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- r_U = peak area from the *Sample solution*
 r_S = peak area from the *Standard solution*
 C_S = concentration of USP Niacin RS in the *Standard solution* (mg/mL)
 C_U = nominal concentration of niacin in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–150.0% of the labeled amount of niacin ($C_6H_5NO_2$)

• **NIACINAMIDE, Method 2**

[NOTE—Use low-actinic glassware throughout this procedure.]

Solution A, Extraction solvent, Mobile phase, Standard stock solution, Standard solution, Sample solution, Chromatographic system, and System suitability: Using USP Niacinamide RS in place of USP Niacin RS, proceed as directed for *Niacin, Method 2*.

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas for niacinamide. Calculate the percentage of the labeled amount of niacinamide ($C_6H_6N_2O$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- r_U = peak area from the *Sample solution*
 r_S = peak area from the *Standard solution*
 C_S = concentration of USP Niacinamide RS in the *Standard solution* (mg/mL)
 C_U = nominal concentration of niacinamide in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–150.0% of the labeled amount of niacinamide ($C_6H_6N_2O$)

• **PYRIDOXINE HYDROCHLORIDE, Method 2**

[NOTE—Use low-actinic glassware throughout this procedure.]

Extraction solvent, Mobile phase, and Sample

solution: Prepare as directed for *Niacin, Method 2*.

Standard stock solution: 0.1 mg/mL of USP Pyridoxine Hydrochloride RS in *Extraction solvent*

Standard solution: Transfer 5.0 mL of *Standard stock solution* to a 25-mL volumetric flask, and dilute with *Extraction solvent* to volume.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm × 25-cm; packing L1

Flow rate: 1 mL/min

Injection size: 20 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas for pyridoxine. Calculate the percentage of the labeled amount of pyridoxine hydrochloride ($C_8H_{11}NO_3 \cdot HCl$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area from the *Sample solution*

r_S = peak area from the *Standard solution*

C_S = concentration of USP Pyridoxine Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of pyridoxine hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–150.0% of the labeled amount of pyridoxine hydrochloride ($C_8H_{11}NO_3 \cdot HCl$)

• **RIBOFLAVIN, Method 2**

[NOTE—Use low-actinic glassware throughout this procedure.]

Extraction solvent and Sample solution: Prepare as directed for *Niacin, Method 2*.

Solution A: 6.8 mg/mL of sodium acetate in water

Mobile phase: Prepare a mixture of *Solution A* and methanol (13:7). Add 2 mL of triethylamine per L of the mixture, and adjust with glacial acetic acid to a pH of 5.2.

Standard stock solution: Transfer 20 mg of USP Riboflavin RS to a 200-mL volumetric flask, and add 180 mL of *Extraction solvent*. Immerse the flask for 5 min in a water bath maintained at 65°–75°. Mix well, and repeat if necessary until dissolved. Chill rapidly in a cold water bath to room temperature, and dilute with *Extraction solvent* to volume.

Standard solution: Dilute 5.0 mL of *Standard stock solution* with *Extraction solvent* to 25.0 mL.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm × 25-cm; packing L1

Flow rate: 1 mL/min

Injection size: 20 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas for riboflavin. Calculate the percentage of the labeled amount of riboflavin ($C_{17}H_{20}N_4O_6$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area from the *Sample solution*

r_S = peak area from the *Standard solution*

C_S = concentration of USP Riboflavin RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of riboflavin in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–150.0% of the labeled amount of riboflavin ($C_{17}H_{20}N_4O_6$)

• **THIAMINE, Method 2**

[NOTE—Use low-actinic glassware throughout this procedure.]

Solution A: 1.88 g/L of sodium 1-hexanesulfonate in 0.1% phosphoric acid

Mobile phase: *Solution A* and acetonitrile (46:9)

Standard stock solution: 0.1 mg/mL of USP Thiamine Hydrochloride RS in 0.2 N hydrochloric acid

Standard solution: 0.02 mg/mL of USP Thiamine Hydrochloride RS from *Standard stock solution* diluted with 0.2 N hydrochloric acid

Sample solution: Weigh and finely powder NLT 20 Tablets. Mix a portion of the Tablets' powder with a volume of 0.2 N hydrochloric acid to obtain a concentration of 0.02 mg/mL of thiamine. Shake for 15 min with a wrist-action shaker, and heat to boiling for 30 min. Cool to room temperature, and filter. Use the clear filtrate.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm × 25-cm; packing L1

Flow rate: 2 mL/min

Injection size: 20 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the areas for the major peaks. For products containing thiamine hydrochloride, calculate the percentage of the labeled amount of thiamine hydrochloride ($C_{12}H_{17}ClN_4OS \cdot HCl$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of thiamine from the *Sample solution*

r_S = peak area of thiamine from the *Standard solution*

C_S = concentration of USP Thiamine Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of thiamine hydrochloride in the *Sample solution* (mg/mL)

For products containing thiamine mononitrate, calculate the percentage of the labeled amount of thiamine mononitrate ($C_{12}H_{17}N_5O_4S$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak area of thiamine from the *Sample solution*

r_S = peak area of thiamine from the *Standard solution*

C_S = concentration of USP Thiamine Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of thiamine mononitrate in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of thiamine mononitrate, 327.36

M_{r2} = molecular weight of thiamine hydrochloride, 337.27

Acceptance criteria: 90.0%–150.0% of the labeled amount of thiamine as thiamine hydrochloride ($C_{12}H_{17}ClN_4OS \cdot HCl$) or thiamine mononitrate ($C_{12}H_{17}N_5O_4S$)

• **NIACIN or NIACINAMIDE, PYRIDOXINE HYDROCHLORIDE, RIBOFLAVIN, and THIAMINE, Method 3**

[NOTE—Use low-actinic glassware throughout this procedure.]

Reagent: 25 mg/mL of edetate disodium in water

Mobile phase: Transfer 0.4 mL of triethylamine, 15.0 mL of glacial acetic acid, and 350 mL of methanol to a 2000-mL volumetric flask. Dilute with 0.008 M sodium 1-hexanesulfonate to volume.

Standard stock solution: 1.5 mg/mL of USP Niacin RS or USP Niacinamide RS, 0.24 mg/mL of USP Pyridoxine Hydrochloride RS, 0.08 mg/mL of USP Riboflavin RS, and 0.24 mg/mL of USP Thiamine Hydrochloride RS in the *Reagent*, with heating if necessary

Standard solution: Transfer 5.0 mL of *Standard stock solution* to a stoppered 125-mL flask. Add 10.0 mL of a mixture of methanol and glacial acetic acid (9:1) and 30.0 mL of a mixture of methanol and ethylene glycol (1:1). Insert the stopper, shake for 15 min in a water bath maintained at 60°, and cool. Filter, discarding the first few mL of the filtrate.

Sample solution: Weigh and finely powder NLT 20 Tablets. Transfer a portion of the powder, equivalent to 7.5 mg of niacin or niacinamide, 1.2 mg of pyridoxine hydrochloride, 0.4 mg of riboflavin, and 1.2 mg of thiamine hydrochloride to a stoppered 125-mL flask. Add 10.0 mL of a mixture of methanol and glacial acetic acid (9:1) and 30.0 mL of a mixture of methanol and ethylene glycol (1:1). Insert the stopper, shake for 15 min in a water bath maintained at 60°, and cool. Filter, discarding the first few mL of the filtrate.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 270 nm

Column: 4.6-mm × 25-cm; packing L7

Column temperature: 50°

Flow rate: 2.0 mL/min

Injection size: 5 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the areas of the peaks. Calculate the percentage of the labeled amount of niacin (C₆H₅NO₂) or niacinamide (C₆H₆N₂O) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of niacin or niacinamide from the *Sample solution*

r_S = peak area of niacin or niacinamide from the *Standard solution*

C_S = concentration of USP Niacin RS or USP Niacinamide RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of niacin or niacinamide in the *Sample solution* (mg/mL)

Separately calculate the percentage of the labeled amount of pyridoxine hydrochloride (C₈H₁₁NO₃ · HCl), riboflavin (C₁₇H₂₀N₄O₆), and thiamine hydrochloride (C₁₂H₁₇ClN₄OS · HCl) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of the corresponding vitamin from the *Sample solution*

r_S = peak area of the corresponding vitamin from the *Standard solution*

C_S = concentration of the relevant USP Reference Standard in the *Standard solution* (mg/mL)

C_U = nominal concentration of the corresponding vitamin in the *Sample solution* (mg/mL)

For products containing thiamine mononitrate, calculate the percentage of the labeled amount of thiamine

mononitrate (C₁₂H₁₇N₅O₄S) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak area of thiamine from the *Sample solution*

r_S = peak area of thiamine from the *Standard solution*

C_S = concentration of USP Thiamine Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of thiamine mononitrate in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of thiamine mononitrate, 327.36

M_{r2} = molecular weight of thiamine hydrochloride, 337.27

Acceptance criteria: 90.0%–150.0% of the labeled amount of niacinamide (C₆H₆N₂O) or niacin (C₆H₅NO₂), pyridoxine hydrochloride (C₈H₁₁NO₃ · HCl), riboflavin (C₁₇H₂₀N₄O₆), and thiamine as thiamine hydrochloride (C₁₂H₁₇ClN₄OS · HCl) or thiamine mononitrate (C₁₂H₁₇N₅O₄S)

[NOTE—Commercially available atomic absorption standard solutions for the minerals, where applicable, may be used where preparation of a *Standard stock solution* is described in the following assays. Use deionized water where water is specified. Where atomic absorption spectrophotometry is specified in the assay, the *Standard solutions* and the *Sample solution* may be diluted quantitatively with the solvent specified, if necessary, to yield solutions of suitable concentrations adaptable to the linear or working range of the instrument.]

• CALCIUM, Method 1

Lanthanum chloride solution: 267 mg/mL of lanthanum chloride heptahydrate in 0.125 N hydrochloric acid

Calcium standard solution: 400 µg/mL of calcium. Dissolve 1.001 g of calcium carbonate, previously dried at 300° for 3 h and cooled in a desiccator for 2 h, in 25 mL of 1 N hydrochloric acid. Boil to expel carbon dioxide, and dilute with water to 1000 mL.

Standard stock solution: 100 µg/mL of calcium from *Calcium standard solution* diluted with 0.125 N hydrochloric acid

Standard solutions: Into separate 100-mL volumetric flasks pipet 1.0, 1.5, 2.0, 2.5, and 3.0 mL of the *Standard stock solution*. To each flask add 1.0 mL of *Lanthanum chloride solution*, and dilute with water to volume to obtain concentrations of 1.0, 1.5, 2.0, 2.5, and 3.0 µg/mL of calcium.

Sample solution: Finely powder NLT 20 Tablets. Transfer a portion of the powder, equivalent to 5 Tablets, to a porcelain crucible. Heat the crucible in a muffle furnace maintained at 550° for 6–12 h, and cool. Add 60 mL of hydrochloric acid, and boil gently on a hot plate or steam bath for 30 min, intermittently rinsing the inner surface of the crucible with 6 N hydrochloric acid. Cool, and quantitatively transfer the contents of the crucible to a 100-mL volumetric flask. Rinse the crucible with small portions of 6 N hydrochloric acid, and add the rinsings to the flask. Dilute with water to volume, and filter, discarding the first 5 mL of the filtrate. Dilute this solution quantitatively, with 0.125 N hydrochloric acid, to obtain a concentration of 2 µg/mL of calcium, adding 1 mL of *Lanthanum chloride solution* per 100 mL of the final volume.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* <851>.)

Mode: Atomic absorption spectrophotometry

Analytical wavelength: Calcium emission line at 422.7 nm

Lamp: Calcium hollow-cathode
Flame: Nitrous oxide–acetylene
Blank: 0.125 N hydrochloric acid containing 1 mL of Lanthanum chloride solution per 100 mL

Analysis

Samples: *Standard solutions* and *Sample solution*
 Determine the absorbances of the solutions, against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in µg/mL, of calcium, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, *C*, in µg/mL, of calcium in the *Sample solution*.

Calculate the percentage of the labeled amount of calcium (Ca) in the portion of Tablets taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of calcium in the *Sample solution* (µg/mL)

C_U = nominal concentration of calcium in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–125.0% of the labeled amount of calcium (Ca)

• **CHROMIUM, Method 1**

Chromium standard solution: 1000 µg/mL of chromium from potassium dichromate, previously dried at 120° for 4 h in water. Store in a polyethylene bottle.

Standard stock solution: 10 µg/mL of chromium from *Chromium standard solution* diluted with 6 N hydrochloric acid and water (1 in 20)

Standard solutions: Transfer 10.0 and 20.0 mL of the *Standard stock solution* to separate 100-mL volumetric flasks, and transfer 15.0 and 20.0 mL of the *Standard stock solution* to separate 50-mL volumetric flasks. Dilute the contents of each of the four flasks with 0.125 N hydrochloric acid to volume to obtain concentrations of 1.0, 2.0, 3.0, and 4.0 µg/mL of chromium.

Sample solution: Proceed as directed for *Calcium, Method 1*, except to prepare the *Sample solution* to contain 1 µg/mL of chromium and to omit the use of the *Lanthanum chloride solution*.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry

Analytical wavelength: Chromium emission line at 357.9 nm

Lamp: Chromium hollow-cathode

Flame: Air–acetylene

Blank: 0.125 N hydrochloric acid

Analysis

Samples: *Standard solutions* and *Sample solution*
 Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in µg/mL, of chromium, and draw the straight line best fitting the four plotted points. From the graph so obtained, determine the concentration, *C*, in µg/mL, of chromium in the *Sample solution*.

Calculate the percentage of the labeled amount of chromium (Cr) in the portion of Tablets taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of chromium in the *Sample solution* (µg/mL)

C_U = nominal concentration of chromium in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–160.0% of the labeled amount of chromium (Cr)

• **COPPER, Method 1**

Copper standard solution: Dissolve 1.00 g of copper foil in a minimum volume of a 50% solution of nitric acid, and dilute with a 1% solution of nitric acid to 1000 mL. This solution contains 1000 µg/mL of copper.

Standard stock solution: 100 µg/mL of copper from *Copper standard solution* diluted with 0.125 N hydrochloric acid

Standard solutions: To separate 200-mL volumetric flasks transfer 1.0, 2.0, 4.0, 6.0, and 8.0 mL of the *Standard stock solution*. Dilute with water to volume to obtain concentrations of 0.5, 1.0, 2.0, 3.0, and 4.0 µg/mL of copper.

Sample solution: Proceed as directed for *Calcium, Method 1*, except to prepare the *Sample solution* to contain 2 µg/mL of copper and to omit the use of the *Lanthanum chloride solution*.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry

Analytical wavelength: Copper emission line at 324.7 nm

Lamp: Copper hollow-cathode

Flame: Air–acetylene

Blank: 0.125 N hydrochloric acid

Analysis

Samples: *Standard solutions* and *Sample solution*
 Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in µg/mL, of copper, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, *C*, in µg/mL, of copper in the *Sample solution*.

Calculate the percentage of the labeled amount of copper (Cu) in the portion of Tablets taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of copper in the *Sample solution* (µg/mL)

C_U = nominal concentration of copper in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–125.0% of the labeled amount of copper (Cu)

• **FLUORIDE, Method 1**

[NOTE—Store all solutions in plastic containers.]

3 M sodium acetate solution: Dissolve 408 g of sodium acetate in 600 mL of water contained in a 1000-mL volumetric flask. Allow the solution to equilibrate to room temperature, and dilute with water to volume. Adjust with a few drops of acetic acid to a pH of 7.0.

Sodium citrate solution: Dissolve 222 g of sodium citrate in 250 mL of water in a 1000-mL volumetric flask. Add 28 mL of perchloric acid, and dilute with water to volume.

Fluoride standard stock solution: 500 µg/mL of fluoride from a quantity of sodium fluoride, previously dried at 100° for 4 h and cooled in a desiccator, in water

Intermediate stock solution A: 100 µg/mL of fluoride from *Fluoride standard stock solution* diluted with water

Intermediate stock solution B: 10 µg/mL of fluoride from *Fluoride standard stock solution* diluted with water

Standard solutions: To five separate 100-mL volumetric flasks transfer 3.0, 5.0, and 10.0 mL of *Intermediate stock solution B* and 5.0 and 10.0 mL of *Intermediate stock solution A*. To each flask add 10.0 mL of 1 N hydrochloric acid, 25 mL of 3 M *sodium acetate solution*, and 25.0 mL of *Sodium citrate solution*. Dilute the contents of each flask with water to volume to obtain concentrations of 0.3, 0.5, 1.0, 5.0, and 10.0 µg/mL of fluoride.

Sample solution: Transfer a quantity of the finely powdered Tablets, equivalent to 200 µg of fluoride, to a 100-mL volumetric flask. Add 10.0 mL of 1 N hydrochloric acid, 25.0 mL of 3 M *sodium acetate solution*, and 25.0 mL of *Sodium citrate solution*, and dilute with water to volume.

Analysis

Samples: *Standard solutions* and *Sample solution*

To separate plastic beakers, each containing a plastic-coated stirring bar, transfer 50.0 mL each of the *Standard solutions* and the *Sample solution*. Measure the potentials (see *pH* <791>), in mV, of the *Standard solutions* and the *Sample solution*, with a pH meter capable of a minimum reproducibility of ± 0.2 mV and equipped with a fluoride-specific ion-indicating electrode and a calomel reference electrode. [NOTE—When taking measurements, immerse the electrodes in the solution, stir on a magnetic stirrer having an insulated top until equilibrium is attained (1–2 min), and record the potential. Rinse and dry the electrodes between measurements, taking care to avoid damaging the crystal of the specific-ion electrode.]

Plot the logarithms of fluoride concentrations, in $\mu\text{g/mL}$, of the *Standard solutions* versus potential, in mV. From the standard response curve so obtained and the measured potential of the *Sample solution*, determine the concentration, C , in $\mu\text{g/mL}$, of fluoride in the *Sample solution*.

Calculate the percentage of the labeled amount of fluorine (F) in the portion of Tablets taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of fluoride in the *Sample solution* ($\mu\text{g/mL}$)

C_U = nominal concentration of fluorine in the *Sample solution* ($\mu\text{g/mL}$)

Acceptance criteria: 90.0%–160.0% of the labeled amount of fluorine (F)

• **FLUORIDE, Method 2**

[NOTE—Use plastic containers and deionized water throughout this procedure.]

pH 10.0 buffer: Add 214 mL of 0.1 N sodium hydroxide to 1000 mL of 0.05 M sodium bicarbonate.

Mobile phase: Alcohol, 0.1 N sulfuric acid, and water (20:5:175)

Standard stock solution: 220 $\mu\text{g/mL}$ of USP Sodium Fluoride RS in water. This solution contains 100 $\mu\text{g/mL}$ of fluoride.

Standard solution: [NOTE—Condition the solid-phase extraction column specified for use in the *Standard solution* and the *Sample solution* in the following manner. Using a vacuum at a pressure not exceeding 5 mm of mercury, wash the column with one column volume of methanol followed by one column volume of *pH 10.0 buffer*. Do not allow the column top to dry. If the top of the column becomes dry, recondition the column.] Transfer 10.0 mL of *Standard stock solution* to a 100-mL volumetric flask. Add 75 mL of water, and adjust with 0.1 N sodium hydroxide to a pH of 10.4 ± 0.1 . Dilute with water to volume. Filter, discarding the first 15 mL of the filtrate. Transfer 25.0 mL of the filtrate to a 50-mL volumetric flask, add 15.0 mL of water, and adjust with 0.1 N sodium hydroxide to a pH of 10.0. Dilute with *pH 10.0 buffer* to volume. Elute a portion of this solution through a 3-mL solid-phase extraction column containing L1 packing that is connected through an adaptor to a second solid-phase extraction column containing sulfonfylpropyl strong cation-exchange packing. Discard the first 3 mL of the eluate, and collect the rest of the eluate in a suitable flask for injection into the chromatograph.

Sample solution: Finely powder NLT 20 Tablets. Transfer a portion of powdered Tablets, equivalent to 1 mg of fluorine, in 15 mL of water, and shake vigorously. Rinse the sides of the flask with 15 mL of water, and allow to stand for 10 min. Dilute with water to 85 mL, adjust with 1 N sodium hydroxide to a pH of 10.4 ± 0.1 , and dilute with water to 100 mL. Proceed as directed for the *Standard solution*, beginning with "Filter, discarding the first 15 mL of the filtrate."

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: Conductivity

Guard column: 4.6-mm \times 3-cm; packing L17

Analytical column: 7.8-mm \times 30-cm; packing L17

Flow rate: 0.5 mL/min

Injection size: 100 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas for fluoride. Calculate the percentage of the labeled amount of fluorine (F) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area from the *Sample solution*

r_S = peak area from the *Standard solution*

C_S = concentration of fluoride in the *Standard solution* ($\mu\text{g/mL}$)

C_U = nominal concentration of fluorine in the *Sample solution* ($\mu\text{g/mL}$)

Acceptance criteria: 90.0%–160.0% of the labeled amount of fluorine (F)

• **IODIDE, Method 1**

Bromine water: To 20 mL of bromine in a glass-stoppered bottle add 100 mL of water. Insert the stopper into the bottle, and shake. Allow to stand for 30 min, and use the supernatant.

Analysis

Sample: Tablets

Transfer an amount of finely powdered Tablets, equivalent to 3 mg of iodide, to a nickel crucible. Add 5 g of sodium carbonate, 5 mL of 50% (w/v) sodium hydroxide solution, and 10 mL of alcohol, taking care that the entire specimen is moistened. Heat the crucible on a steam bath to evaporate the alcohol, then dry the crucible at 100° for 30 min to prevent spattering upon subsequent heating. Transfer the crucible with its contents to a furnace heated to 500° , and heat the crucible for 15 min. [NOTE—Heating at 500° is necessary to carbonize any organic matter present; a higher temperature may be used, if necessary, to ensure complete carbonization of all organic matter.] Cool the crucible, add 25 mL of water, cover the crucible with a watchglass, and boil gently for 10 min. Filter the solution, and wash the crucible with boiling water, collecting the filtrate and washings in a beaker. Add phosphoric acid until the solution is neutral to methyl orange, then add 1 mL excess of phosphoric acid. Add excess of *Bromine water*, and boil the solution gently until colorless and then for 5 min longer. Add a few crystals of salicylic acid, and cool the solution to 20° . Add 1 mL of phosphoric acid and 0.5 g of potassium iodide, and titrate the liberated iodine with 0.005 N sodium thiosulfate VS, adding starch TS when the liberated iodine color has nearly disappeared. Calculate the percentage of the labeled amount of iodine (I) in the portion of Tablets taken:

$$\text{Result} = V \times N_A \times F \times Ime \times (Aw/W) \times (100/L)$$

V = volume of sodium thiosulfate consumed (mL)

N_A = actual normality of the sodium thiosulfate solution used

F = correction factor to convert mg to μg (1000 $\mu\text{g/mL}$)

Ime = milliequivalent of I (21.16 mg/meq)

Aw = average weight of the Tablets

W = weight of the portion of Tablets taken

L = labeled amount of iodine ($\mu\text{g/Tablet}$)

Acceptance criteria: 90.0%–160.0% of the labeled amount of iodine (I)

- **IODIDE, Method 2:** Proceed as directed in *Automated Methods of Analysis* (16), *Assay for Iodide*.

Acceptance criteria: 90.0%–160.0% of the labeled amount of iodine (I)

- **IRON, Method 1**

Iron standard stock solution: Transfer 100 mg of iron powder to a 1000-mL volumetric flask. Dissolve in 25 mL of 6 N hydrochloric acid, dilute with water to volume, and mix.

Standard solutions: To separate 100-mL volumetric flasks transfer 2.0, 4.0, 5.0, 6.0, and 8.0 mL of *Iron standard stock solution*. Dilute the contents of each flask with water to volume to obtain concentrations of 2.0, 4.0, 5.0, 6.0, and 8.0 µg/mL of iron.

Sample solution: Proceed as directed for *Calcium, Method 1*, except to prepare the *Sample solution* to contain a concentration of 5 µg/mL of iron and to omit the use of the *Lanthanum chloride solution*.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry

Analytical wavelength: Iron emission line at 248.3 nm

Lamp: Iron hollow-cathode

Flame: Air–acetylene

Blank: 0.125 N hydrochloric acid

Analysis

Samples: *Standard solutions* and *Sample solution*
Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in µg/mL, of iron, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, *C*, in µg/mL, of iron in the *Sample solution*.

Calculate the percentage of the labeled amount of iron (Fe) in the portion of Tablets taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of iron in the *Sample solution* (µg/mL)

C_U = nominal concentration of iron in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–125.0% of the labeled amount of iron (Fe)

- **MAGNESIUM, Method 1**

Lanthanum chloride solution: Prepare as directed in *Calcium, Method 1*.

Magnesium standard solution: Transfer 1.0 g of magnesium ribbon to a 1000-mL volumetric flask, dissolve in 50 mL of 6 N hydrochloric acid, dilute with water to volume, and mix to obtain a solution with a known concentration of 1000 µg/mL of magnesium.

Standard stock solution: 20 µg/mL of magnesium from *Magnesium standard solution* diluted with 0.125 N hydrochloric acid

Standard solutions: To separate 100-mL volumetric flasks transfer 1.0, 1.5, 2.0, 2.5, and 3.0 mL of *Standard stock solution*. To each flask add 1.0 mL of *Lanthanum chloride solution*, and dilute with 0.125 N hydrochloric acid to volume to obtain concentrations of 0.2, 0.3, 0.4, 0.5, and 0.6 µg/mL of magnesium.

Sample solution: Proceed as directed for *Calcium, Method 1*, except to prepare the *Sample solution* to contain a concentration of 0.4 µg/mL of magnesium.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry

Analytical wavelength: Magnesium emission line at 285.2 nm

Lamp: Magnesium hollow-cathode

Flame: Air–acetylene

Blank: 0.125 N hydrochloric acid containing 1 mL of *Lanthanum chloride solution* per 100 mL

Analysis

Samples: *Standard solutions* and *Sample solution*
Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in µg/mL, of magnesium, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, *C*, in µg/mL, of magnesium in the *Sample solution*.

Calculate the percentage of the labeled amount of magnesium (Mg) in the portion of Tablets taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of magnesium in the *Sample solution* (µg/mL)

C_U = nominal concentration of magnesium in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–125.0% of the label claim

- **MANGANESE, Method 1**

Manganese standard stock solution: Transfer 1.00 g of manganese to a 1000-mL volumetric flask. Dissolve in 20 mL of nitric acid, dilute with 6 N hydrochloric acid to volume, and mix to obtain a solution with a concentration of 1000 µg/mL of manganese.

Standard stock solution: 50 µg/mL of manganese from *Manganese standard stock solution* diluted with 0.125 N hydrochloric acid

Standard solutions: To separate 100-mL volumetric flasks transfer 1.0, 1.5, 2.0, 3.0, and 4.0 mL of *Standard stock solution*. Dilute the contents of each flask with 0.125 N hydrochloric acid to volume to obtain solutions with known concentrations of 0.5, 0.75, 1.0, 1.5, and 2.0 µg/mL of manganese.

Sample solution: Proceed as directed for *Calcium, Method 1*, except to prepare the *Sample solution* to contain a concentration of 1 µg/mL of manganese and to omit the use of the *Lanthanum chloride solution*.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry

Analytical wavelength: Manganese emission line at 279.5 nm

Lamp: Manganese hollow-cathode

Flame: Air–acetylene

Blank: 0.125 N hydrochloric acid

Analysis

Samples: *Standard solutions* and *Sample solution*
Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in µg/mL, of manganese, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, *C*, in µg/mL, of manganese in the *Sample solution*.

Calculate the percentage of the labeled amount of manganese (Mn) in the portion of Tablets taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of manganese in the *Sample solution* (µg/mL)

C_U = nominal concentration of manganese in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–125.0% of the labeled amount of manganese (Mn)

- **MOLYBDENUM, Method 1**

Diluent: 20 mg/mL of ammonium chloride in water

Molybdenum standard solution: Transfer 1.0 g of molybdenum wire to a 1000-mL volumetric flask, and dissolve in 50 mL of nitric acid, warming if necessary.

Dilute with water to volume, and mix to obtain a solution with a concentration of 1000 µg/mL of molybdenum.

Standard stock solution: 100 µg/mL of molybdenum from *Molybdenum standard solution* diluted with water

Standard solutions: To separate 100-mL volumetric flasks transfer 2.0, 10.0, and 25.0 mL of the *Standard stock solution*, and add 5.0 mL of perchloric acid to each flask. Gently boil the solution in each flask for 15 min, cool to room temperature, and dilute each with *Diluent* to volume to obtain concentrations of 5.0, 10.0, and 25.0 µg/mL of molybdenum.

Sample solution: Transfer a portion of the powder, equivalent to 1000 µg of molybdenum, to a suitable flask, and add 12 mL of nitric acid. [NOTE—The volume of nitric acid may be varied to ensure that the powder is uniformly dispersed.] Carefully swirl the flask to disperse the test specimen. Sonicate for 10 min, or until the test specimen is completely dissolved. Gently boil the solution for 15 min, and cool to room temperature. Carefully add 8 mL of perchloric acid, heat until perchloric acid fumes appear, and swirl the flask to dissipate the fumes. Repeat the heating and swirling until the fumes appear again. Cool to room temperature. Quantitatively transfer the contents of the flask to a 100-mL volumetric flask with the aid of the *Diluent*, and dilute with *Diluent* to volume.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry

Analytical wavelength: Molybdenum emission line at 313.3 nm

Lamp: Molybdenum hollow-cathode

Flame: Nitrous oxide-acetylene

Blank: *Diluent* and perchloric acid (20:1)

Analysis

Samples: *Standard solutions* and *Sample solution*

Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in µg/mL, of molybdenum, and draw the straight line best fitting the three plotted points. From the graph so obtained, determine the concentration, *C*, in µg/mL, of molybdenum in the *Sample solution*.

Calculate the percentage of the labeled amount of molybdenum (Mo) in the portion of Tablets taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of molybdenum in the *Sample solution* (µg/mL)

C_U = nominal concentration of molybdenum in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–160.0% of the labeled amount of molybdenum (Mo)

• MOLYBDENUM, Method 2

Sodium fluoride solution: Add 200 mL of water to 10 g of sodium fluoride, stir until the solution is saturated, and filter. Store in a polyethylene bottle.

Ferrous sulfate solution: 4.98 mg/mL of ferrous sulfate in water

Potassium thiocyanate solution: 200 mg/mL of potassium thiocyanate in water

20% stannous chloride solution: Transfer 40 mg of stannous chloride to a beaker, add 20 mL of 6.5 N hydrochloric acid solution, and heat the solution until the stannous chloride is dissolved. Cool and dilute with water to 100 mL.

Diluted stannous chloride solution: 20% *stannous chloride solution* diluted with water (1 in 25). Prepare this solution fresh at the time of use.

Standard solution: 20 µg/mL of molybdenum in water

Sample: A portion of finely powdered Tablets, equivalent to 40 µg of molybdenum

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Vis

Analytical wavelength: 465 nm

Cell: 1 cm

Blank: Amyl alcohol

Analysis

Samples: *Standard solution* and *Sample*

Transfer the *Sample* and 2.0 mL of the *Standard solution* to separate 200-mL beakers. Add 20 mL of nitric acid to each beaker. Cover each beaker with a watchglass, and boil slowly on a hot plate for 45 min. Cool to room temperature. Add 6 mL of perchloric acid, cover the beakers with a watchglass, and continue the heating until digestion is complete, as indicated when the liquid becomes colorless or pale yellow. Evaporate the solutions in the beakers to dryness. Rinse the sides of the beakers and the watchglasses with water, and add more water to complete 50 mL in each beaker. Gently boil the water solution for a few min. Cool to room temperature. Add 2 drops of methyl orange TS, and neutralize with ammonium hydroxide. Add 8.2 mL of hydrochloric acid. Quantitatively transfer the contents of the beakers to separate 100-mL volumetric flasks, rinse the beakers with water, transfer the rinsings to the corresponding volumetric flasks, and dilute with water to volume. Transfer 50.0 mL of each solution to separatory funnels. To each separatory funnel add 1.0 mL of *Sodium fluoride solution*, 0.5 mL of *Ferrous sulfate solution*, 4.0 mL of *Potassium thiocyanate solution*, 1.5 mL of 20% *Stannous chloride solution*, and 15.0 mL of amyl alcohol, and shake the separatory funnel for 1 min. Allow the layers to separate, and discard the aqueous layers. Add 25 mL of *Diluted stannous chloride solution* to each separatory funnel, and shake gently for 15 s. Allow the layers to separate, and discard the aqueous layers. Transfer the organic layer from each separatory funnel to a centrifuge tube, and centrifuge at 2000 rpm for 10 min. Determine the absorbances of the organic phases obtained from the *Standard solution* and the *Sample*, and correct with the *Blank*.

Calculate the percentage of the labeled amount of molybdenum (Mo) in the portion of Tablets taken:

$$\text{Result} = (A_U/A_S) \times [(V \times C_S)/M_U] \times 100$$

A_U = absorbance of the *Sample*

A_S = absorbance of the *Standard solution*

V = volume of the *Standard solution* analyzed, 2.0 mL

C_S = concentration of molybdenum in the *Standard solution* (µg/mL)

M_U = nominal amount of molybdenum in the *Sample* (µg)

Acceptance criteria: 90.0%–160.0% of the labeled amount of molybdenum (Mo)

• PHOSPHORUS, Method 1

Sulfuric acid solution: Cautionously add sulfuric acid to water (37.5:100), and mix.

Ammonium molybdate solution: 50 mg/mL of ammonium molybdate in *Sulfuric acid solution* and water (2:3). [NOTE—Dissolve in water first, and then dilute with *Sulfuric acid solution* to volume.]

Hydroquinone solution: 5 mg/mL of hydroquinone in water. Add one drop of sulfuric acid per 100 mL of solution.

Sodium bisulfite solution: 200 mg/mL of sodium bisulfite in water

Phosphorus standard stock solution: Weigh 4.395 g of monobasic potassium phosphate, previously dried at 105° for 2 h and stored in a desiccator, and transfer to a 1000-mL volumetric flask. Dissolve in water, add 6 mL of sulfuric acid as a preservative, dilute with water to

volume, and mix to obtain a solution with a concentration of 1000 µg/mL of phosphorus.

Standard solution: 20 µg/mL of phosphorus from *Phosphorus standard stock solution* diluted with water

Sample solution: [NOTE—Finely powder and weigh a counted number of Tablets.] Transfer a portion of the powder, equivalent to 100 mg of phosphorus, to 25 mL of nitric acid, and digest on a hot plate for 30 min. Add 15 mL of hydrochloric acid, and continue the digestion to the cessation of brown fumes. Cool, and transfer the contents of the flask to a 500-mL volumetric flask with the aid of small portions of water. Dilute with water to volume. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, and dilute with water to volume.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Vis

Analytical wavelength: 650 nm

Cell: 1 cm

Analysis

Samples: *Standard solution* and *Sample solution*

To three separate 25-mL volumetric flasks transfer 5.0 mL each of the *Standard solution*, the *Sample solution*, and water to provide the blank. To each of the three flasks add 1.0 mL each of *Ammonium molybdate solution*, *Hydroquinone solution*, and *Sodium bisulfite solution*, and swirl to mix. Dilute the contents of each flask with water to volume, and allow the flasks to stand for 30 min. Determine the absorbances of the solutions against the blank.

Calculate the percentage of the labeled amount of phosphorus (P) in the portion of Tablets taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

A_U = absorbance of the *Sample solution*

A_S = absorbance of the *Standard solution*

C_S = concentration of phosphorus in the *Standard solution* (µg/mL)

C_U = nominal concentration of phosphorus in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–125.0% of the labeled amount of phosphorus (P)

• POTASSIUM

Potassium standard solution: 100 µg/mL of potassium from potassium chloride, previously dried at 105° for 2 h, in water

Standard stock solution: 10 µg/mL of potassium from *Potassium standard solution* diluted with 0.125 N hydrochloric acid

Standard solutions: Transfer 5.0, 10.0, 15.0, 20.0, and 25.0 mL of the *Standard stock solution* to separate 100-mL volumetric flasks. Dilute the contents of each flask with 0.125 N hydrochloric acid to volume to obtain solutions containing 0.5, 1.0, 1.5, 2.0, and 2.5 µg/mL of potassium.

Sample solution: Proceed as directed for *Calcium, Method 1*, except to prepare the *Sample solution* to contain a concentration of 1 µg/mL of potassium and to omit the use of the *Lanthanum chloride solution*.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry

Analytical wavelength: Potassium emission line at 766.5 nm

Lamp: Potassium hollow-cathode

Flame: Air–acetylene

Blank: Water

Analysis

Samples: *Standard solutions* and *Sample solution*

Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in µg/mL, of potassium, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the

concentration, C , in µg/mL, of potassium in the *Sample solution*.

Calculate the percentage of the labeled amount of potassium (K) in the portion of Tablets taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of potassium in the *Sample solution* (µg/mL)

C_U = nominal concentration of potassium in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–125.0% of the labeled amount of potassium (K)

• SELENIUM, Method 1

Diluent: Prepare as directed in *Molybdenum, Method 1*.

Selenium standard solution: [CAUTION—Selenium is toxic; handle it with care.] Dissolve 1 g of metallic selenium in a minimum volume of nitric acid. Evaporate to dryness, add 2 mL of water, and evaporate to dryness. Repeat the addition of water and the evaporation to dryness three times. Dissolve the residue in 3 N hydrochloric acid, transfer to a 1000-mL volumetric flask, and dilute with 3 N hydrochloric acid to volume to obtain a concentration of 1000 µg/mL of selenium.

Standard stock solution: 100 µg/mL of selenium from *Selenium standard solution* diluted with water

Standard solutions: To separate 100-mL volumetric flasks transfer 5.0, 10.0, and 25.0 mL of the *Standard stock solution*, and add 5.0 mL of perchloric acid to each flask. Gently boil the solutions for 15 min, cool to room temperature, and dilute each with *Diluent* to volume to obtain solutions with concentrations of 5.0, 10.0, and 25.0 µg/mL of selenium.

Sample solution: Transfer a portion of the powder, equivalent to 1000 µg of selenium, to a suitable flask, and add 12 mL of nitric acid. [NOTE—The volume of nitric acid may be varied to ensure that the powder is uniformly dispersed.] Carefully swirl the flask to disperse the test specimen. Sonicate for 10 min or until the test specimen is completely dissolved. Gently boil the solution for 15 min, and cool to room temperature. Carefully add 8 mL of perchloric acid to the flask, heat the flask until perchloric acid fumes appear, and swirl the flask to dissipate the fumes. Repeat the heating and swirling until the fumes appear again. Cool to room temperature. Transfer the contents of the flask to a 50-mL volumetric flask with the aid of the *Diluent*, and dilute with *Diluent* to volume.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry

Analytical wavelength: Selenium emission line at 196.0 nm

Lamp: Selenium hollow-cathode

Flame: Air–acetylene

Blank: *Diluent* and perchloric acid (20:1)

Analysis

Samples: *Standard solutions* and *Sample solution*

Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in µg/mL, of selenium, and draw the straight line best fitting the three plotted points. From the graph so obtained, determine the concentration, C , in µg/mL, of selenium in the *Sample solution*.

Calculate the percentage of the labeled amount of selenium (Se) in the portion of Tablets taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of selenium in the *Sample solution* (µg/mL)

C_U = nominal concentration of selenium in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–160.0% of the labeled amount of selenium (Se)

• **SELENIUM, Method 2**

Hydrochloric acid solution: Hydrochloric acid diluted with water (1 in 10)

50% ammonium hydroxide solution: Ammonium hydroxide diluted with water (1 in 2)

Reagent A: 9 mg/mL of edetate disodium and 25 mg/mL of hydroxylamine hydrochloride in water. [NOTE—Dissolve edetate disodium in a portion of water first, then add hydroxylamine hydrochloride, and dilute with water to volume.]

Reagent B: Transfer 200 mg of 2,3-diaminonaphthalene to a 250-mL separatory funnel, and add 200 mL of 0.1 N hydrochloric acid. Wash the solution with three 40-mL portions of cyclohexane, and discard the cyclohexane layer. Filter the solution into a brown bottle, and cover the solution with a 1-cm layer of cyclohexane. This solution is stable for 1 week if stored in a refrigerator.

Standard stock solution: [CAUTION—Selenium is toxic; handle it with care.] Dissolve 1 g of metallic selenium in a minimum volume of nitric acid. Evaporate to dryness, add 2 mL of water, and evaporate to dryness. Repeat the addition of water and evaporation to dryness three times. Dissolve the residue in 3 N hydrochloric acid, transfer to a 1000-mL volumetric flask, and dilute with 3 N hydrochloric acid to volume to obtain a solution with a concentration of 1000 µg/mL of selenium. Dilute a volume of the solution with 0.125 N hydrochloric acid to obtain a concentration of 2.0 µg/mL of selenium.

Standard solution: Transfer 10 mL of the *Standard stock solution* to a glass-stoppered flask. Add 1 mL of perchloric acid and 1 mL of *Hydrochloric acid solution*, and dilute with water to 20 mL.

Sample solution: Transfer a portion of finely powdered Tablets, equivalent to 20 µg of selenium, to a suitable flask. Add 10 mL of nitric acid, and warm gently on a hot plate. Continue heating until the initial nitric acid reaction has subsided, then add 3 mL of perchloric acid. [CAUTION—Exercise care at this stage, because the perchloric acid reaction becomes vigorous.]

Continue heating on the hot plate until the appearance of white fumes of perchloric acid or until the digest begins to darken. Add 0.5 mL of nitric acid and resume heating, adding additional amounts of nitric acid if further darkening occurs. Digest for 10 min after the first appearance of perchloric acid fumes or until the digest becomes colorless. Cool the flask, add 2.5 mL of *Hydrochloric acid solution*, and return the flask to the hot plate to expel residual nitric acid. Heat the mixture for 3 min after it begins to boil. Cool the flask to room temperature, and dilute with water to 20 mL.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: UV

Analytical wavelength: 380 nm

Cell: 1 cm

Blank: 1 mL of perchloric acid and 1 mL of *Hydrochloric acid solution* diluted with water to 20 mL

Analysis

Samples: *Standard solution* and *Sample solution*
Treat the *Sample solution*, the *Standard solution*, and the *Blank* as follows. Add 5 mL of *Reagent A* to each flask, and swirl gently to mix. Adjust the solution in each flask with 50% *Ammonium hydroxide solution* to a pH of 1.1 ± 0.1. Add 5 mL of *Reagent B* to each flask, and swirl gently to mix. Place the flasks in a water bath maintained at 50°, and equilibrate for 30 min, taking care that the flasks are covered to protect them from light. Cool to room temperature, and transfer the contents of each flask to separate separatory funnels.

Transfer 10.0 mL of cyclohexane to each separatory funnel, and extract vigorously for 1 min. Discard the aqueous layer. Transfer the cyclohexane layer to a centrifuge tube, and centrifuge at 1000 rpm for 1 min to remove any remaining water. Determine the absorbances of the solutions obtained from the *Samples* against the solution obtained from the *Blank*. Calculate the percentage of the labeled amount of selenium (Se) in the portion of Tablets taken:

$$\text{Result} = (A_U/A_S) \times [(V \times C_S)/M_U] \times 100$$

A_U = absorbances of the cyclohexane layer from the *Sample solution*

A_S = absorbances of the cyclohexane layer from the *Standard solution*

V = volume of the *Standard stock solution* used to prepare the *Standard solution*, 10 mL

C_S = concentration of selenium in the *Standard stock solution* (µg/mL)

M_U = nominal amount of selenium in the *Sample solution* (µg)

Acceptance criteria: 90.0%–160.0% of the labeled amount of selenium (Se)

• **ZINC, Method 1**

Zinc standard solution: 1000 µg/mL of zinc from zinc oxide in 5 M hydrochloric acid (3.89 mg/mL) and diluted with water to final volume. [NOTE—Dissolve in 5 M hydrochloric acid by warming, if necessary, cool, and then dilute to final volume.]

Standard stock solution: 50 µg/mL of zinc from *Zinc standard stock solution* diluted with 0.125 N hydrochloric acid

Standard solutions: Transfer 1.0, 2.0, 3.0, 4.0, and 5.0 mL of *Standard stock solution* to separate 100-mL volumetric flasks. Dilute the contents of each flask with 0.125 N hydrochloric acid to volume to obtain concentrations of 0.5, 1.0, 1.5, 2.0, and 2.5 µg/mL of zinc.

Sample solution: Proceed as directed for the *Sample solution* in *Calcium, Method 1*, except to prepare the *Sample solution* to contain a concentration of 2 µg/mL of zinc and to omit the use of the *Lanthanum chloride solution*.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry

Analytical wavelength: Zinc emission line at 213.8 nm

Lamp: Zinc hollow-cathode

Flame: Air–acetylene

Blank: 0.125 N hydrochloric acid

Analysis

Samples: *Standard solutions* and *Sample solution*
Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in µg/mL, of zinc, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, C , in µg/mL, of zinc in the *Sample solution*.

Calculate the percentage of the labeled amount of zinc (Zn) in the portion of Tablets taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of zinc in the *Sample solution* (µg/mL)

C_U = nominal concentration of zinc in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–125.0% of the labeled amount of zinc (Zn)

- **BORON, NICKEL, TIN, and VANADIUM**, *Method 1*; **CALCIUM, CHROMIUM, COPPER, IRON, MAGNESIUM, MANGANESE, PHOSPHORUS, and ZINC**, *Method 2*; **MOLYBDENUM and SELENIUM**, *Method 3*

Stock aqua regia solution: Prepare a mixture of hydrochloric acid and nitric acid (3:1) by adding the nitric acid to the hydrochloric acid. [NOTE—Periodically vent the solution in an appropriate fume hood.]

Diluent: Prepare a mixture of *Stock aqua regia solution* and water (1:9) by adding one volume of *Stock aqua regia solution* to two volumes of water. Dilute with additional water to volume, and mix well.

System suitability solution: Prepare a mixture of 1000 mg/L of yttrium in 5% nitric acid solution, 1000 mg/L of scandium in 5% nitric acid solution, and *Diluent* (1:1:198), and mix.

Standard stock solution 1 (Ca, Cu, Fe, Mg, Mn, P, and Zn): [NOTE—It is only necessary to include the minerals of interest in the solution.] Using commercially available element standard (single- or multi-element) solutions in 5% nitric acid solution, pipet the appropriate amount of element standard solution into a volumetric flask, and dilute with 5% nitric acid solution to obtain a solution having final concentrations of about 1000 mg/L of calcium, 100 mg/L of copper, 250 mg/L of iron, 500 mg/L of magnesium, 100 mg/L of manganese, 800 mg/L of phosphorus, and 250 mg/L of zinc.

Standard stock solution 2 (B, Cr, Mo, Ni, Se, Sn, and V): [NOTE—It is only necessary to include the minerals of interest in the solution.] Using commercially available element standard (single- or multi-element) solutions in 20% hydrochloric acid solution, pipet the appropriate amount of element standard solution into a volumetric flask, and dilute with 20% hydrochloric acid solution to obtain a solution having final concentrations of about 200 mg/L of boron, and 100 mg/L each of chromium, molybdenum, nickel, selenium, tin, and vanadium.

Standard solutions: Prepare a mixture of *Standard stock solution 1* and *Standard stock solution 2*, as required, in *Diluent* to prepare a six-point calibration curve to bracket the concentration range of each mineral of interest.

Sample solution 1 (for Tablets containing minerals found in *Standard stock solution 1* and *Standard stock solution 2*): Weigh and finely powder NLT 20 Tablets. Transfer a portion, equal to 3.5 times the average Tablet weight, to a 250-mL volumetric flask. Slowly add 25 mL of *Stock aqua regia solution* in 5-mL increments followed by mixing. [NOTE—If the sample contains a carbonate, bubbling will occur. Wait until bubbling ends to proceed.] Bring the solution to a boil on a hot plate. Continue to heat gently until fumes cease (about 1 h). [NOTE—If the sample contains selenium, digest for NMT 15 min.] Remove from heat, cool, and dilute with water to volume. Filter about 30 mL into a centrifuge tube using a 5- μ m pore size nylon syringe filter. If necessary, make any further dilutions using the *Diluent*.

Sample solution 2 (for Tablets containing minerals found only in *Standard stock solution 2*): Weigh and finely powder NLT 20 Tablets. Transfer a portion, equal to 3.5 times the average Tablet weight, to a 250-mL volumetric flask. Slowly add 25 mL of *Stock aqua regia solution* in 5-mL increments followed by mixing. [NOTE—If the sample contains a carbonate, bubbling will occur. Wait until bubbling ends to proceed.] Bring the solution to a boil on a hot plate. Continue to heat gently until fumes cease (about 1 h). [NOTE—If the sample contains selenium, digest for NMT 15 min.] Remove from heat, cool, and dilute with water to volume. Filter about 30 mL into a centrifuge tube using a 5- μ m pore size nylon syringe filter. If necessary, make any further dilutions using the *Diluent*.

Sample solution 3 (for Tablets containing minerals found only in *Standard stock solution 1*): Weigh and

finely powder NLT 20 Tablets. Transfer a portion, equal to the average Tablet weight, to a 250-mL volumetric flask. Slowly add 25 mL of *Stock aqua regia solution* in 5-mL increments, followed by mixing. [NOTE—If the sample contains a carbonate, bubbling will occur. Wait until bubbling ends to proceed.] Bring the solution to a boil on a hot plate. Continue to heat gently (about 1 h) until fumes cease. Remove from heat, cool, and dilute with water to volume. Filter about 30 mL into a centrifuge tube using a 5- μ m pore size nylon syringe filter. If necessary, make any further dilutions using the *Diluent*.

Instrumental conditions

(See *Plasma Spectrochemistry* <730>.)

Mode: Inductively coupled plasma spectrometry, using a spectrometer set to measure the emission of each mineral of interest at about the corresponding wavelength. [NOTE—The operating conditions may be developed and optimized based on the manufacturer's recommendation. The wavelengths selected should be demonstrated experimentally to provide sufficient specificity, sensitivity, linearity, accuracy, and precision.]

System suitability

[NOTE—Analyze the *System suitability solution*, and obtain the response as directed in the *Analysis*.]

Suitability requirements

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solutions* and *Sample solution*

Determine the emission of each mineral of interest in the *Standard solutions* and *Sample solution* with an inductively coupled plasma system using the *Diluent* as the blank. Plot the emission of the *Standard solutions* versus the concentration, in mg/L, of the minerals of interest, and draw the straight line best fitting the plotted points. From the graph so obtained, determine the concentration, *C*, in mg/L, for each mineral of interest in the *Sample solution*. Calculate the percentage of the labeled amount for each mineral taken:

$$\text{Result} = C \times (V/W) \times F \times (C_w/L) \times 100$$

C = measured concentration of the relevant element in the *Sample solution* (mg/L)

V = volume of the *Sample solution* (L)

W = sample weight (mg)

F = dilution factor of the *Sample solution*

C_w = average Tablet weight (mg)

L = labeled amount per Tablet (mg)

Acceptance criteria: 90.0%–125.0% of the labeled amount of calcium (Ca), copper (Cu), iron (Fe), magnesium (Mg), manganese (Mn), phosphorus (P), and zinc (Zn); and 90.0%–160.0% of the labeled amounts of boron (B), chromium (Cr), molybdenum (Mo), nickel (Ni), selenium (Se), tin (Sn), and vanadium (V)

PERFORMANCE TESTS

- **DISINTEGRATION AND DISSOLUTION OF DIETARY SUPPLEMENTS** <2040>: Meet the requirements for *Dissolution*
- **WEIGHT VARIATION OF DIETARY SUPPLEMENTS** <2091>: Meet the requirements

CONTAMINANTS

- **MICROBIAL ENUMERATION TESTS** <2021>: The total aerobic microbial count does not exceed 3000 cfu/g, and the combined molds and yeasts count does not exceed 300 cfu/g.
- **MICROBIOLOGICAL PROCEDURES FOR ABSENCE OF SPECIFIED MICROORGANISMS** <2022>: Meet the requirements of the tests for absence of *Salmonella* species, *Escherichia coli*, and *Staphylococcus aureus*

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.
- **LABELING:**⁵ The label states that the product is Oil- and Water-Soluble Vitamins with Minerals Tablets. The label also states the quantity of each vitamin and mineral per dosage unit and where necessary the chemical form in which a vitamin is present and also states the salt form of the mineral used as the source of each element. Where the product contains vitamin E, the label indicates whether it is the D- or DL- form. Where more than one assay method is given for a particular vitamin, the labeling states with which assay method the product complies only if *Method 1* is not used.

 - USP Vitamin A RS

Water-Soluble Vitamins Capsules

DEFINITION

Water-Soluble Vitamins Capsules contain two or more of the following water-soluble vitamins: Ascorbic Acid or its equivalent as Calcium Ascorbate or Sodium Ascorbate, Biotin, Cyanocobalamin, Folic Acid, Dexpantenol or Panthenol, Pantothenic Acid (as Calcium Pantothenate or Racemic Calcium Pantothenate), Niacin or Niacinamide, Pyridoxine Hydrochloride, Riboflavin, and Thiamine Hydrochloride or Thiamine Mononitrate. Capsules contain NLT 90.0% and NMT 150.0% of the labeled amounts of ascorbic acid ($C_6H_8O_6$), biotin ($C_{10}H_{16}N_2O_3S$), cyanocobalamin ($C_{63}H_{88}CoN_{14}O_{14}P$), folic acid ($C_{19}H_{19}N_7O_6$), dexpantenol ($C_9H_{19}NO_4$) or panthenol ($C_9H_{19}NO_4$), calcium pantothenate ($C_{18}H_{32}CaN_2O_{10}$), niacin ($C_6H_5NO_2$) or niacinamide ($C_6H_6N_2O$), pyridoxine hydrochloride ($C_8H_{11}NO_3 \cdot HCl$), riboflavin ($C_{17}H_{20}N_4O_6$), and thiamine ($C_{12}H_{17}ClN_4OS$) as thiamine hydrochloride or thiamine mononitrate.

⁵ USP Units of activity for vitamins, where such exist or formerly existed, are equivalent to the corresponding international units, where such formerly existed. The USP Unit for Vitamin E has been discontinued. International units (IU) for vitamins also have been discontinued; however, the use of IU on the labels of vitamin products continues. Where articles are labeled in terms of Units in addition to the required labeling, the relationship of the USP Units or IU to mass is as follows. One USP Vitamin A Unit = 0.3 μ g of all-*trans*-retinol (vitamin A alcohol) or 0.344 μ g of all-*trans*-retinyl acetate (vitamin A acetate) or 0.55 μ g of all-*trans*-retinyl palmitate (vitamin A palmitate), and 1 μ g of retinol (3.3 USP Vitamin A Units) = 1 retinol equivalent (RE); 1 IU of beta carotene = 0.6 μ g of all-*trans*-beta carotene; 1 USP Vitamin D Unit = 0.025 μ g of ergocalciferol or cholecalciferol; and 1 mg of *dl*-alpha tocopherol = 1.1 former USP Vitamin E Units, 1 mg of *dl*-alpha tocopheryl acetate = 1 former USP Vitamin E Unit, 1 mg of *dl*-alpha tocopheryl acid succinate = 0.89 former USP Vitamin E Unit, 1 mg of *d*-alpha tocopherol = 1.49 former USP Vitamin E Units, and 1 mg of *d*-alpha tocopheryl acetate = 1.36 former USP Vitamin E Units, 1 mg of *d*-alpha tocopheryl acid succinate = 1.21 former USP Vitamin E Units. In terms of *d*-alpha tocopherol equivalents, 1 mg of *d*-alpha tocopheryl acetate = 0.91, 1 mg of *d*-alpha tocopheryl acid succinate = 0.81, 1 mg of *dl*-alpha tocopherol = 0.74, 1 mg of *dl*-alpha tocopheryl acetate = 0.67, and 1 mg of *dl*-alpha tocopheryl acid succinate = 0.60.

They do not contain any form of Beta Carotene or Vitamin A, D, E, or K. They do not contain any minerals for which nutritional value is claimed. They may contain other labeled added substances in quantities that are unobjectionable.

STRENGTH

[NOTE—In the following assays, where more than one assay method is given for an individual ingredient, the requirements may be met by following any one of the specified methods, the method used being stated in the labeling only if *Method 1* is not used.]

- **ASCORBIC ACID, Method 1**

Sample solution: Weigh NLT 20 Capsules in a tared weighing bottle. Open the Capsules, without the loss of shell material, and transfer the contents to a 100-mL beaker. Remove any contents adhering to the empty shells by washing, if necessary, with several portions of ether. Discard the washings, and dry the Capsule shells with the aid of a current of dry air until the odor of ether is no longer perceptible. Weigh the empty Capsule shells in the tared weighing bottle, and calculate the average net weight per Capsule. Transfer a portion of the Capsule contents, equivalent to a nominal amount of 100 mg of ascorbic acid, to a 200-mL volumetric flask, and add 75 mL of metaphosphoric-acetic acids TS. Insert a stopper into the flask, and shake by mechanical means for 30 min. Dilute with water to volume. Transfer a portion of the solution to a centrifuge tube, and centrifuge until a clear supernatant is obtained. Pipet 4.0 mL of this solution into a 50-mL conical flask, and add 5 mL of metaphosphoric-acetic acids TS.

Analysis: Titrate with standard dichlorophenol-indophenol solution VS to a rose-pink color that persists for at least 5 s. Correct for the volume of dichlorophenol-indophenol solution consumed by a mixture of 5.5 mL of metaphosphoric-acetic acids TS and 15 mL of water. From the ascorbic acid equivalent of the standard dichlorophenol-indophenol solution, calculate the content of ascorbic acid in each Capsule.

Acceptance criteria: 90.0%–150.0% of the labeled amount of ascorbic acid ($C_6H_8O_6$)

- **ASCORBIC ACID, Method 2:** Proceed as directed in *Automated Methods of Analysis* (16), Assay for Ascorbic Acid.

Acceptance criteria: 90.0%–150.0% of the labeled amount of ascorbic acid ($C_6H_8O_6$)

- **CALCIUM ASCORBATE, Method 1:** Proceed as directed in *Ascorbic Acid, Method 1*.

Acceptance criteria: 90.0%–150.0% of the labeled amount of calcium ascorbate ($C_{12}H_{14}CaO_{12} \cdot 2H_2O$)

- **CALCIUM ASCORBATE, Method 2:** Proceed as directed in *Automated Methods of Analysis* (16), Assay for Ascorbic Acid.

Acceptance criteria: 90.0%–150.0% of the labeled amount of calcium ascorbate ($C_{12}H_{14}CaO_{12} \cdot 2H_2O$)

- **SODIUM ASCORBATE, Method 1:** Proceed as directed in *Ascorbic Acid, Method 1*.

Acceptance criteria: 90.0%–150.0% of the labeled amount of sodium ascorbate ($C_6H_7NaO_6$)

- **SODIUM ASCORBATE, Method 2:** Proceed as directed in *Automated Methods of Analysis* (16), Assay for Ascorbic Acid.

Acceptance criteria: 90.0%–150.0% of the labeled amount of sodium ascorbate ($C_6H_7NaO_6$)

- **BIOTIN, Method 1**

[NOTE—Use low-actinic glassware throughout this procedure.]

Mobile phase: Mix 85 mL of acetonitrile, 1 g of sodium perchlorate, and 1 mL of phosphoric acid, and dilute with water to 1000 mL.

Standard stock solution: 0.333 mg/mL of USP Biotin RS in dimethyl sulfoxide

Standard solution: 5 μ g/mL of USP Biotin RS prepared by diluting the *Standard stock solution* in water

Sample solution: Proceed as directed in *Ascorbic Acid, Method 1*, through “calculate the average net weight

per Capsule.” Transfer a portion of the Capsule contents, equivalent to a nominal amount of 1 mg of biotin, to a 200-mL volumetric flask. Add 3 mL of dimethyl sulfoxide, and swirl to wet the contents. Place the flask in a water bath at 60°–70° for 5 min. Sonicate for 5 min, dilute with water to volume, and filter.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 200 nm

Column: 4.6-mm × 15-cm; 3-μm packing L7

Flow rate: 1.2 mL/min

Injection size: 100 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas of biotin. Calculate the percentage of the labeled amount of biotin (C₁₀H₁₆N₂O₃S) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of biotin from the *Sample solution*

r_S = peak area of biotin from the *Standard solution*

C_S = concentration of USP Biotin RS in the *Standard solution* (μg/mL)

C_U = nominal concentration of biotin in the *Sample solution* (μg/mL)

Acceptance criteria: 90.0%–150.0% of the labeled amount of biotin (C₁₀H₁₆N₂O₃S)

• BIOTIN, Method 2

[NOTE—Use low-actinic glassware throughout this procedure.]

Dehydrated mixtures yielding formulations similar to the media described herein may be used, provided that, when constituted as directed, they have growth-promoting properties equal to or superior to those obtained with the media prepared as described herein.

Standard stock solution: 50 μg/mL of USP Biotin RS in 50% alcohol. Store this solution in a refrigerator.

Standard solution: 0.1 ng/mL of USP Biotin RS in water, prepared by dilution of the *Standard stock solution* with water on the day of the assay.

Sample solution: Proceed as directed in *Ascorbic Acid, Method 1*, through “calculate the average net weight per Capsule.” Transfer a portion of the Capsule contents, equivalent to 100 μg of biotin, to a 200-mL volumetric flask. Add 3 mL of 50% alcohol, and swirl to wet the contents. Heat the flask in a water bath at 60°–70° for 5 min. Sonicate for 5 min, dilute with 50% alcohol to volume, and filter. Dilute a volume of the filtrate quantitatively, and stepwise if necessary, with water to obtain a solution having a concentration of 0.1 ng/mL.

Acid-hydrolyzed casein solution: Mix 100 g of vitamin-free casein with 500 mL of 6 N hydrochloric acid, and reflux the mixture for 8–12 h. Remove the hydrochloric acid from the mixture by distillation under reduced pressure until a thick paste remains. Redissolve the resulting paste in water, adjust the solution with 1 N sodium hydroxide to a pH of 3.5 ± 0.1, and add water to make 1000 mL. Add 20 g of activated charcoal, stir for 1 h, and filter. Repeat the treatment with activated charcoal. Store under toluene in a cool place at a temperature not below 10°. Filter the solution if a precipitate forms during storage.

Cystine–tryptophan solution: Suspend 4.0 g of L-cystine in a solution of 1.0 g of L-tryptophan (or 2.0 g of D,L-tryptophan) in 700–800 mL of water. Heat to 70°–80°, and add dilute hydrochloric acid (1 in 2) dropwise, with stirring, until the solids are dissolved.

Cool, and add water to make 1000 mL. Store under toluene in a cool place at a temperature not below 10°.

Adenine–guanine–uracil solution: Dissolve 200 mg each of adenine sulfate, guanine hydrochloride, and uracil, with the aid of heat, in 10 mL of 4 N hydrochloric acid. Cool, and add water to make 200 mL. Store under toluene in a refrigerator.

Polysorbate 80 solution: 100 mg/mL of polysorbate 80 in alcohol

Calcium pantothenate solution: 10 μg/mL of calcium pantothenate in 50% alcohol. Store in a refrigerator.

Riboflavin–thiamine hydrochloride solution: 20 μg/mL of riboflavin and 10 μg/mL of thiamine hydrochloride in 0.02 N acetic acid. Store under toluene, protected from light, in a refrigerator.

p-Aminobenzoic acid–niacin–pyridoxine hydrochloride solution: 10 μg/mL of p-aminobenzoic acid, 50 μg/mL of niacin, and 40 μg/mL of pyridoxine hydrochloride in a mixture of neutralized alcohol and water (1:3). Store in a refrigerator.

Salt solution A: 25 g of monobasic potassium phosphate and 25 g of dibasic potassium phosphate in water to make 500 mL. Add 5 drops of hydrochloric acid. Store under toluene.

Salt solution B: 10 g of magnesium sulfate, 0.5 g of sodium chloride, 0.5 g of ferrous sulfate, and 0.5 g of manganese sulfate in water to make 500 mL. Add 5 drops of hydrochloric acid, and mix. Store under toluene.

Basal medium stock solution: Dissolve anhydrous dextrose and anhydrous sodium acetate in the solutions previously mixed according to *Table 1*, and adjust with 1 N sodium hydroxide to a pH of 6.8. Dilute with water to 250 mL.

Table 1

Acid-hydrolyzed casein solution	25 mL
Cystine–tryptophan solution	25 mL
Polysorbate 80 solution	0.25 mL
Dextrose, anhydrous	10 g
Sodium acetate, anhydrous	5 g
Adenine–guanine–uracil solution	5 mL
Calcium pantothenate solution	5 mL
Riboflavin–thiamine hydrochloride solution	5 mL
p-Aminobenzoic acid–niacin–pyridoxine hydrochloride solution	5 mL
Salt solution A	5 mL
Salt solution B	5 mL

Stock culture of *Lactobacillus plantarum*: Dissolve 2.0 g of yeast extract in 100 mL of water. Add 500 mg of anhydrous dextrose, 500 mg of anhydrous sodium acetate, and 1.5 g of agar, and heat the mixture on a steam bath, with stirring, until the agar dissolves. Add 10-mL portions of the hot solution to test tubes, close or cover the tubes, sterilize in an autoclave at 121° for 15 min, and allow the tubes to cool in an upright position. Prepare stab cultures in three or more of the tubes, using a pure culture of *Lactobacillus plantarum*,¹ incubating for 16–24 h at a temperature between 30° and 37° held constant to within ±0.5°. Store in a refrigerator. Prepare a fresh stab of the stock culture every week, and do not use for *Inoculum* if the culture is more than 1 week old.

Culture medium: To each of a series of test tubes containing 5.0 mL of *Basal medium stock solution* add 5.0 mL of water containing 0.5 ng of biotin. Plug the tubes with cotton, sterilize in an autoclave at 121° for 15 min, and cool.

¹ATCC No. 8014 is suitable. This strain was formerly known as *Lactobacillus arabinosus* 17-5.

Inoculum: [NOTE—A frozen suspension of *Lactobacillus plantarum* may be used as the stock culture, provided it yields an *Inoculum* comparable to a fresh culture.] Transfer cells from the *Stock culture of Lactobacillus plantarum* to a sterile tube containing 10 mL of *Culture medium*. Incubate this culture for 16–24 h at a temperature between 30° and 37° held constant to within $\pm 0.5^\circ$. The cell suspension so obtained is the *Inoculum*.

Analysis

Samples: *Standard solution* and *Sample solution*
To similar separate test tubes add, in duplicate, 1.0 and/or 1.5, 2.0, 3.0, 4.0, and 5.0 mL of the *Standard solution*. To each tube and to four similar empty tubes add 5.0 mL of *Basal medium stock solution* and sufficient water to make 10 mL.

To similar test tubes add, in duplicate, volumes of the *Sample solution* corresponding to three or more of the levels specified for the *Standard solution*, including the levels of 2.0, 3.0, and 4.0 mL. To each tube add 5.0 mL of the *Basal medium stock solution* and sufficient water to make 10 mL. Place one complete set of *Standard* and *sample* tubes together in one tube rack and the duplicate set in a second rack or section of a rack, preferably in random order.

Cover the tubes of both series to prevent contamination, and sterilize in an autoclave at 121° for 5 min. Cool. Add 1 drop of *Inoculum* to each tube, except two of the four tubes containing no *Standard solution* (the uninoculated blanks). Incubate the tubes at a temperature between 30° and 37° held constant to within $\pm 0.5^\circ$ until, following 16–24 h of incubation, there has been no substantial increase in turbidity in the tubes containing the highest level of *Standard* during a 2-h period.

Determine the transmittance of the tubes in the following manner. Mix the contents of each tube, and transfer to a spectrophotometer cell. Place the cell in a spectrophotometer that has been set at a specific wavelength from 540 to 660 nm, and read the transmittance when a steady state is reached. This steady state is observed a few seconds after agitation when the galvanometer reading remains constant for 30 s or more. Allow approximately the same time interval for the reading on each tube.

With the transmittance set at 1.00 for the uninoculated blank, read the transmittance of the inoculated blank. With the transmittance set at 1.00 for the inoculated blank, read the transmittance for each of the remaining tubes. If there is evidence of contamination with a foreign microorganism, disregard the result of the assay.

Calculation: Prepare a standard concentration-response curve as follows. For each level of the *Standard*, calculate the response from the sum of the duplicate values of the transmittance (ΣS) as the difference, $y = 2.00 - \Sigma S$. Plot this response on the ordinate of cross-section paper against the logarithm of the mL of *Standard solution* per tube on the abscissa, using for the ordinate either an arithmetic or a logarithmic scale, whichever gives the better approximation to a straight line. Draw the straight line or smooth curve that best fits the plotted points.

Calculate the response $y = 2.00 - \Sigma U$, adding together the two transmittances (ΣU) for each level of the *Sample solution*. Read from the standard curve the logarithm of the volume of the *Standard solution* corresponding to each of those values of y that fall within the range of lowest and highest points plotted for the *Standard*. Subtract from each logarithm so obtained the logarithm of the volume, in mL, of the *Sample solution* to obtain the difference, x , for each dosage level. Average the values of x for each of three or more dosage levels to obtain \bar{x} , which equals the log-relative potency, M' , of

the *Sample solution*. Determine the quantity, in μg , of biotin ($\text{C}_{10}\text{H}_{16}\text{N}_2\text{O}_3\text{S}$) in the portion of Capsules taken:

$$\text{antilog } M = \text{antilog } (M' + \log R)$$

R = number of μg of biotin assumed to be present in the portion of Capsules taken

Calculate the percentage of the labeled amount of biotin in the portion of Capsules taken:

$$\text{Result} = [(\text{antilog } M)/N] \times 100$$

N = nominal amount of biotin ($\text{C}_{10}\text{H}_{16}\text{N}_2\text{O}_3\text{S}$) in the portion of Capsules taken (μg)

Replication: Repeat the entire determination at least once, using separately prepared *Sample solutions*. If the difference between the two log-potencies M is NMT 0.08, their mean, \bar{M} , is the assayed log-potency of the test material (see *Design and Analysis of Biological Assays* (111), *The Confidence Interval and Limits of Potency*). If the two determinations differ by more than 0.08, conduct one or more additional determinations. From the mean of two or more values of M that do not differ by more than 0.15, compute the mean potency of the preparation under assay.

Acceptance criteria: 90.0%–150.0% of the labeled amount of biotin ($\text{C}_{10}\text{H}_{16}\text{N}_2\text{O}_3\text{S}$)

• CYANOCOBALAMIN, Method 1

[NOTE—Use low-actinic glassware throughout this procedure.]

Mobile phase: Methanol and water (7:13)

Standard stock solution: 10 $\mu\text{g}/\text{mL}$ of USP

Cyanocobalamin RS in water. [NOTE—Store this stock solution in a dark place, and discard after 1 week.]

Standard solution: 1 $\mu\text{g}/\text{mL}$ of USP Cyanocobalamin RS from the *Standard stock solution* diluted with water

Sample solution: Weigh NLT 30 Capsules in a tared weighing bottle. Open the Capsules, without the loss of shell material, and transfer the contents to a 100-mL beaker. Remove any contents adhering to the empty shells by washing, if necessary, with several portions of ether. Discard the washings, and dry the Capsule shells with the aid of a current of dry air until the odor of ether is no longer perceptible. Weigh the empty Capsule shells in the tared weighing bottle, and calculate the average net weight per Capsule. Transfer a portion of the Capsule contents, equivalent to 100 μg of cyanocobalamin, to a 250-mL flask. Add 100.0 mL of water, and carefully extract for 2 min. Filter 10 mL of the extract, and use the clear filtrate.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: 550 nm

Column: 4.6-mm \times 15-cm; 5- μm packing L1

Flow rate: 0.5 mL/min

Injection size: 200 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*
Measure the peak areas of cyanocobalamin. Calculate the percentage of the labeled amount of cyanocobalamin ($\text{C}_{63}\text{H}_{88}\text{CoN}_{14}\text{O}_{14}\text{P}$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of cyanocobalamin from the *Sample solution*

r_S = peak area of cyanocobalamin from the *Standard solution*

- C_s = concentration of USP Cyanocobalamin RS in the *Standard solution* ($\mu\text{g/mL}$)
 C_u = nominal concentration of cyanocobalamin in the *Sample solution* ($\mu\text{g/mL}$)

Acceptance criteria: 90.0%–150.0% of the labeled amount of cyanocobalamin ($\text{C}_{63}\text{H}_{88}\text{CoN}_{14}\text{O}_{14}\text{P}$)

• **CYANOCOBALAMIN, Method 2**

[NOTE—Use low-actinic glassware throughout this procedure.]

Standard stock solution: 1.0 $\mu\text{g/mL}$ of USP Cyanocobalamin RS in 25% alcohol. Store in a refrigerator.

Standard solution: Dilute a suitable volume of *Standard stock solution* with water to a measured volume such that after the incubation period as described in the *Analysis*, the difference in transmittance between the inoculated blank and the 5.0-mL level of the *Standard solution* is NLT that which corresponds to a difference of 1.25 mg in dried cell weight. This concentration usually falls between 0.01 and 0.04 ng/mL of the *Standard solution*. Prepare this solution fresh for each assay.

Sample solution: Proceed as directed in *Ascorbic Acid, Method 1*, through “calculate the average net weight per Capsule.” Transfer a portion of the Capsule contents, equivalent to 1.0 μg of cyanocobalamin, to an appropriate vessel containing, for each g of Capsule contents taken, 25 mL of an aqueous extracting solution prepared just before use to contain 12.9 mg/mL of dibasic sodium phosphate, 11.0 mg/mL of anhydrous citric acid, and 10 mg/mL of sodium metabisulfite. Autoclave the mixture at 121° for 10 min. Allow any undissolved particles of the extract to settle, and filter or centrifuge, if necessary. Dilute an aliquot of the clear solution with water to obtain a final solution containing vitamin B₁₂ activity approximately equivalent to that of the *Standard solution*.

Acid-hydrolyzed casein solution: Prepare as directed in *Calcium Pantothenate, Method 2*.

Asparagine solution: Dissolve 2.0 g of L-asparagine in water to make 200 mL. Store under toluene in a refrigerator.

Adenine–guanine–uracil solution: Prepare as directed in *Calcium Pantothenate, Method 2*.

Xanthine solution: Suspend 0.20 g of xanthine in 30–40 mL of water, heat to 70°, add 6.0 mL of 6 N ammonium hydroxide, and stir until the solid is dissolved. Cool, and add water to make 200 mL. Store under toluene in a refrigerator.

Salt solution A: Dissolve 10 g of monobasic potassium phosphate and 10 g of dibasic potassium phosphate in water to make 200 mL, and add 2 drops of hydrochloric acid. Store this solution under toluene.

Salt solution B: Dissolve 4.0 g of magnesium sulfate, 0.20 g of sodium chloride, 0.20 g of ferrous sulfate, and 0.20 g of manganese sulfate in water to make 200 mL. Add 2 drops of hydrochloric acid. Store this solution under toluene.

Polysorbate 80 solution: 20 g of polysorbate 80 in alcohol to make 200 mL. Store in a refrigerator.

Vitamin solution A: 10 mg of riboflavin, 10 mg of thiamine hydrochloride, 100 μg of biotin, and 20 mg of niacin in 0.02 N acetic acid to make 400 mL. Store under toluene, protected from light, in a refrigerator.

Vitamin solution B: 20 mg of *p*-aminobenzoic acid, 10 mg of calcium pantothenate, 40 mg of pyridoxine hydrochloride, 40 mg of pyridoxal hydrochloride, 8 mg of pyridoxamine dihydrochloride, and 2 mg of folic acid in a mixture of water and neutralized alcohol (3:1) to make 400 mL. Store, protected from light, in a refrigerator.

Basal medium stock solution: Prepare the medium according to the following formula and directions. A dehydrated mixture containing the same ingredients may be used, provided that, when constituted as

directed in the labeling, it yields a medium comparable to that obtained from the formula given herein.

Add the ingredients in the order listed in *Table 2*, carefully dissolving cystine and tryptophan in the hydrochloric acid before adding the next eight solutions to the resulting solution. Add 100 mL of water, and dissolve the dextrose, sodium acetate, and ascorbic acid. Filter, if necessary. Add the *Polysorbate 80 solution*, adjust with 1 N sodium hydroxide to a pH between 5.5 and 6.0, and add Purified Water to make 250 mL.

Table 2

L-Cystine	0.1 g
L-Tryptophan	0.05 g
1 N Hydrochloric acid	10 mL
Adenine–guanine–uracil solution	5 mL
Xanthine solution	5 mL
Vitamin solution A	10 mL
Vitamin solution B	10 mL
Salt solution A	5 mL
Salt solution B	5 mL
Asparagine solution	5 mL
Acid-hydrolyzed casein solution	25 mL
Dextrose, anhydrous	10 g
Sodium acetate, anhydrous	5 g
Ascorbic acid	1 g
Polysorbate 80 solution	5 mL

Tomato juice preparation: Centrifuge commercially canned tomato juice so that most of the pulp is removed. Suspend 5 g/L of analytical filter-aid in the supernatant, and pass, with the aid of reduced pressure, through a layer of the filter-aid. Repeat, if necessary, until a clear, straw-colored filtrate is obtained. Store under toluene in a refrigerator.

Culture medium: [NOTE—A dehydrated mixture containing the same ingredients may be used, provided that, when constituted as directed in the labeling, it yields a medium equivalent to that obtained from the formula given herein.] Dissolve 0.75 g of yeast extract, 0.75 g of dried peptone, 1.0 g of anhydrous dextrose, and 0.20 g of monobasic potassium phosphate in 60–70 mL of water. Add 10 mL of *Tomato juice preparation* and 1 mL of *Polysorbate 80 solution*. Adjust with 1 N sodium hydroxide to a pH of 6.8, and add water to make 100 mL. Place 10-mL portions of the solution in test tubes, and plug with cotton. Sterilize the tubes and contents in an autoclave at 121° for 15 min. Cool as rapidly as possible to avoid color formation resulting from overheating the medium.

Suspension medium: Dilute a measured volume of *Basal medium stock solution* with an equal volume of water. Place 10-mL portions of the diluted medium in test tubes. Sterilize, and cool as directed for *Culture medium*.

Stock culture of *Lactobacillus leichmannii*: To 100 mL of *Culture medium* add 1.0–1.5 g of agar, and heat the mixture on a steam bath, with stirring, until the agar dissolves. Place 10-mL portions of the hot solution in test tubes, cover the tubes, sterilize at 121° for 15 min in an autoclave, and allow the tubes to cool in an upright position. Inoculate three or more of the tubes by stab transfer of a pure culture of *Lactobacillus leichmannii*.² [NOTE—Before first using a fresh culture in this assay, make NLT 10 successive transfers of the culture in a 2-week period.]

Incubate for 16–24 h at a temperature between 30° and 40° held constant to within $\pm 0.5^\circ$. Store in a refrigerator.

²Pure cultures of *Lactobacillus leichmannii* may be obtained as No. 7830 from ATCC, 10801 University Blvd., Manassas, VA 20110-2209.

Prepare fresh stab cultures at least three times each week, and do not use them for preparing the *Inoculum* if more than 4 days old. The activity of the microorganism can be increased by daily or twice-daily transfer of the stab culture, to the point where definite turbidity in the liquid *Inoculum* can be observed 2–4 h after inoculation. A slow-growing culture seldom gives a suitable response curve and may lead to erratic results.

Inoculum: [NOTE—A frozen suspension of *Lactobacillus leichmannii* may be used as the stock culture, provided it yields an *Inoculum* comparable to a fresh culture.] Make a transfer of cells from the *Stock culture* of *Lactobacillus leichmannii* to two sterile tubes containing 10 mL of the *Culture medium* each. Incubate these cultures for 16–24 h at a temperature between 30° and 40° held constant to within $\pm 0.5^\circ$. Under aseptic conditions, centrifuge the cultures, and decant the supernatant. Suspend the cells from the culture in 5 mL of sterile *Suspension medium*, and combine. Using sterile *Suspension medium*, adjust the volume so that a 1-in-20 dilution in saline TS produces 70% transmittance when read on a suitable spectrophotometer that has been set at a wavelength of 530 nm, equipped with a 10-mm cell, and read against saline TS set at 100% transmittance. Prepare a 1-in-400 dilution of the adjusted suspension, using sterile *Basal medium stock solution*. [NOTE—This dilution may be altered, when necessary, to obtain the desired test response.] The cell suspension so obtained is the *Inoculum*.

Calibration of spectrophotometer: Check the wavelength of the spectrophotometer periodically, using a standard wavelength cell or other suitable device. Before reading any tests, calibrate the spectrophotometer for 0% and 100% transmittance, using water, with the wavelength set at 530 nm.

Analysis

Samples: *Standard solution* and *Sample solution*
Because of the high sensitivity of the test organism to minute amounts of vitamin B₁₂ activity and to traces of many cleansing agents, cleanse meticulously by suitable means, followed preferably by heating at 250° for 2 h, using hard-glass 20-mm \times 150-mm test tubes and other necessary glassware.

To separate test tubes add, in duplicate, 1.0, 1.5, 2.0, 3.0, 4.0, and 5.0 mL of the *Standard solution*. To each of these tubes and to four similar empty tubes add 5.0 mL of *Basal medium stock solution* and sufficient water to make 10 mL.

To similar separate test tubes add, in duplicate, 1.0, 1.5, 2.0, 3.0, and 4.0 mL of the *Sample solution*. To each tube add 5.0 mL of *Basal medium stock solution* and sufficient water to make 10 mL. Place one complete set of Standard and sample tubes together in one tube rack and the duplicate set in a second rack or section of a rack, preferably in random order.

Cover the tubes to prevent bacterial contamination, and sterilize in an autoclave at 121° for 5 min, arranging to reach this temperature in NMT 10 min by preheating the autoclave if necessary. Cool as rapidly as possible to avoid color formation resulting from overheating the medium. Take precautions to maintain uniformity of sterilizing and cooling conditions throughout the assay, because packing the tubes too closely in the autoclave or overloading it may cause variation in the heating rate.

Aseptically add 0.5 mL of *Inoculum* to each tube so prepared, except two of the four containing no *Standard solution* (the uninoculated blanks). Incubate the tubes at a temperature between 30° and 40°, held constant to within $\pm 0.5^\circ$, for 16–24 h.

Terminate growth by heating to a temperature NLT 80° for 5 min. Cool to room temperature. After agitating its contents, read the transmittance at 530 nm when a steady state is reached. This steady state is observed a few seconds after agitation when the reading remains

constant for 30 s or more. Allow approximately the same time interval for the reading on each tube.

With the transmittance set at 100% for the uninoculated blank, read the transmittance of the inoculated blank. If the difference is greater than 5% or if there is evidence of contamination with a foreign microorganism, disregard the results of the assay.

With the transmittance set at 100% for the uninoculated blank, read the transmittance of each of the remaining tubes. Disregard the results of the assay if the slope of the standard curve indicates a problem with sensitivity.

Calculation: Prepare a standard concentration-response curve by the following procedure. Test for and replace any aberrant individual transmittances. For each level of the Standard, calculate the response from the sum of the duplicate values of the transmittances (Σ_s) as the difference, $y = 2.00 - \Sigma_s$. Plot this response on the ordinate of cross-section paper against the logarithm of the mL of *Standard solution* per tube on the abscissa, using for the ordinate either an arithmetic or a logarithmic scale, whichever gives the better approximation to a straight line. Draw the straight line or smooth curve that best fits the plotted points.

Calculate the response, $y = 2.00 - \Sigma_u$, adding together the two transmittances (Σ_u) for each level of the *Sample solution*. Read from the standard curve the logarithm of the volume of the *Standard solution* corresponding to each of those values of y that falls within the range of the lowest and highest points plotted for the Standard. Subtract from each logarithm so obtained the logarithm of the volume, in mL, of the *Sample solution* to obtain the difference, x , for each dosage level. Average the values of x for each of three or more dosage levels to obtain \bar{x} , which equals the log-relative potency, M' , of the *Sample solution*. Determine the quantity, in μg , of cyanocobalamin in the portion of Capsules taken:

$$\text{antilog } M = \text{antilog } (M' + \log R)$$

R = number of μg of cyanocobalamin that was assumed to be present in the portion of Capsules taken

Calculate the percentage of the labeled amount of cyanocobalamin in the portion of Capsules taken:

$$\text{Result} = [(\text{antilog } M)/N] \times 100$$

N = nominal amount of cyanocobalamin in the portion of Capsules taken (μg)

Replication: Repeat the entire determination at least once, using separately prepared *Sample solutions*. If the difference between the two log-potencies M is NMT 0.08, their mean, \bar{M} , is the assayed log-potency of the test material (see *Vitamin B₁₂ Activity in Design and Analysis of Biological Assays* (111), *The Confidence Interval and Limits of Potency*). If the two determinations differ by more than 0.08, conduct one or more additional determinations. From the mean of two or more values of M that do not differ by more than 0.15, compute the mean potency of the preparation under assay.

Acceptance criteria: 90.0%–150.0% of the labeled amount of cyanocobalamin ($\text{C}_{63}\text{H}_{88}\text{CoN}_{14}\text{O}_{14}\text{P}$)

• FOLIC ACID, Method 1

[NOTE—Use low-actinic glassware throughout this procedure.]

Reagent A: 25% solution of tetrabutylammonium hydroxide in methanol

Reagent B: Transfer 5.0 g of pentetic acid to a 50-mL volumetric flask. Using sonication if necessary, dissolve in and dilute with 1 N sodium hydroxide to volume.

Mobile phase: 2 g of monobasic potassium phosphate in 650 mL of water. Add 12.0 mL of *Reagent A*, 7.0 mL of 3 N phosphoric acid, and 240 mL of methanol. Cool to room temperature, adjust with phosphoric acid or

ammonia TS to a pH of 7.0, dilute with water to 1000 mL, and filter. Recheck the pH before use by adding water or methanol to the prepared *Mobile phase* to obtain baseline separation of folic acid and the internal standard. The pH may be increased up to 7.15 to obtain better separation. [NOTE—The methanol and water content may be varied (between 1% and 3%).]

Internal standard solution: Transfer 40 mg of methylparaben to a 1000-mL volumetric flask, and add 220 mL of methanol to dissolve. Dissolve 2.0 g of monobasic potassium phosphate in 300 mL of water in a separate beaker, quantitatively transfer this solution to the flask containing the methylparaben solution, and add an additional 300 mL of water. Add 19 mL of *Reagent A*, 7 mL of 3 N phosphoric acid, and 30 mL of *Reagent B*. Adjust with ammonia TS to a pH of 9.8, bubble nitrogen through the solution for 30 min, dilute with water to volume, and mix.

Standard solution: 0.016 mg/mL of USP Folic Acid RS in *Internal standard solution*

Sample solution: Proceed as directed in *Ascorbic Acid, Method 1*, through “calculate the average net weight per Capsule.” Transfer an amount of Capsule contents to a suitable centrifuge tube, and add a volume of *Internal standard solution* to obtain a nominal concentration of 0.016 mg/mL of folic acid. Shake by mechanical means for 10 min, and centrifuge. Filter a portion of the clear supernatant, and use the filtrate.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 3.9-mm × 30-cm; packing L1

Flow rate: 1 mL/min

Injection size: 15 µL

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for folic acid and methylparaben are about 0.8 and 1.0, respectively.]

Suitability requirements

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas for folic acid and methylparaben. Calculate the percentage of the labeled amount of folic acid ($C_{19}H_{19}N_7O_6$) in the portion of Capsules taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = peak area ratio of folic acid to methylparaben from the *Sample solution*

R_S = peak area ratio of folic acid to methylparaben from the *Standard solution*

C_S = concentration of USP Folic Acid RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of folic acid in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–150.0% of the labeled amount of folic acid ($C_{19}H_{19}N_7O_6$)

• Folic Acid, Method 2

[NOTE—Use low-actinic glassware throughout this procedure.]

Mobile phase: Transfer 0.4 mL of triethylamine, 15.0 mL of glacial acetic acid, and 350 mL of methanol to a 2000-mL volumetric flask, and dilute with 0.008 M sodium 1-hexanesulfonate to volume.

Diluent: 60 µg/mL of ammonium hydroxide

Standard stock solution: 60 µg/mL of USP Folic Acid RS in *Diluent*. Prepare this solution fresh daily.

Standard solution: Mix 5.0 mL of *Standard stock solution* with 10.0 mL of a mixture of methanol and glacial acetic acid (9:1) and 30.0 mL of a mixture of methanol and ethylene glycol (1:1). Shake for 15 min

in a water bath maintained at 60°, and cool. Filter, discarding the first few mL of the filtrate.

Sample solution: Proceed as directed for the *Sample solution* in *Ascorbic Acid, Method 1*, through “calculate the net average weight per Capsule.” Transfer a portion of the Capsule contents, equivalent to 0.3 mg of folic acid, to a 125-mL stoppered flask. Add 10.0 mL of a mixture of methanol and glacial acetic acid (9:1) and 30.0 mL of a mixture of methanol and ethylene glycol (1:1). Shake for 15 min in a water bath maintained at 60°, and cool. Filter, discarding the first few mL of the filtrate.

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the areas of the major peaks. Calculate the percentage of the labeled amount of folic acid ($C_{19}H_{19}N_7O_6$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of folic acid from the *Sample solution*

r_S = peak area of folic acid from the *Standard solution*

C_S = concentration of USP Folic Acid RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of folic acid in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–150.0% of the labeled amount of folic acid ($C_{19}H_{19}N_7O_6$)

• DEXPANTHENOL or PANTHENOL

[NOTE—The following procedure is applicable also to the determination of the dextrorotatory component of racemic panthenol in preparations containing panthenol.]

Dehydrated mixtures yielding formulations similar to the media described herein may be used, provided that, when constituted as directed, they have growth-promoting properties equal to or superior to those obtained with the media prepared as described herein.

Standard stock solution: 800 µg/mL of USP Dexpantenol RS or 1600 µg/mL of USP Racemic Panthenol RS in water. Store in a refrigerator, protected from light, and use within 30 days.

Standard solution: On the day of the assay, prepare a dilution of 1.2 µg/mL of dexpantenol or 2.4 µg/mL of panthenol from *Standard stock solution* diluted with water.

Sample solution: Weigh NLT 30 Capsules in a tared weighing bottle. Open the Capsules, without loss of shell material, and transfer the contents as completely as possible to a beaker. Remove any contents adhering to the empty Capsule shells by washing with several portions of ether. Discard the washings, and dry the Capsule shells with the aid of a current of dry air until the odor of ether is no longer perceptible. Weigh the empty Capsule shells in the tared weighing bottle, and calculate the average net weight per Capsule. Dissolve a portion of the Capsule contents, equivalent to 1.2 mg of dexpantenol or 2.4 mg of panthenol, in 100.0 mL of water. Quantitatively dilute a portion of this solution with water to obtain a concentration of 1.2 µg/mL of dexpantenol or 2.4 µg/mL of panthenol.

Acid-hydrolyzed casein solution: Mix 100 g of vitamin-free casein with 500 mL of 6 N hydrochloric acid, and reflux the mixture for 8–12 h. Remove the hydrochloric acid from the mixture by distillation under reduced pressure until a thick paste remains. Redissolve the resulting paste in about 500 mL of water, adjust the solution with 1 N sodium hydroxide to a pH of 3.5 ± 0.1 , and add water to make 1000 mL. Add 20 g of activated charcoal, stir for 1 h, and filter. Repeat the treatment with activated charcoal. Store under toluene in a cool place at a temperature not below 10°. Filter the solution if a precipitate forms during storage.

Cystine-tryptophan solution: Suspend 4.0 g of L-cystine in a solution of 1.0 g of L-tryptophan (or 2.0 g of D,L-tryptophan) in 700–800 mL of water, heat to $75 \pm 5^\circ$, and add hydrochloric acid solution (1 in 2) dropwise, with stirring, until the solids are dissolved. Cool, and add water to make 1000 mL. Store under toluene in a cool place at a temperature not below 10°.

Adenine-guanine-uracil solution: Dissolve 200 mg each of adenine sulfate, guanine hydrochloride, and uracil, with the aid of heat, in 10 mL of 4 N hydrochloric acid. Cool, and add water to make 200 mL. Store under toluene in a refrigerator.

Polysorbate 80 solution: 100 mg/mL of polysorbate 80 in alcohol

Riboflavin-thiamine hydrochloride-biotin solution: 20 µg/mL of riboflavin, 10 µg/mL of thiamine hydrochloride, and 0.04 µg/mL of biotin in 0.02 N acetic acid. Store under toluene, protected from light, in a refrigerator.

p-Aminobenzoic acid-niacin-pyridoxine hydrochloride solution: 10 µg/mL of p-aminobenzoic acid, 50 µg/mL of niacin, and 40 µg/mL of pyridoxine hydrochloride in neutral 25% alcohol. Store in a refrigerator.

Salt solution A: 50 mg/mL of monobasic potassium phosphate and 50 mg/mL of dibasic potassium phosphate in water. Add 10 drops of hydrochloric acid per L of solution. Store under toluene.

Salt solution B: 20 mg/mL of magnesium sulfate, 1 mg/mL of sodium chloride, 1 mg/mL of ferrous sulfate, and 1 mg/mL of manganese sulfate in water. Add 10 drops of hydrochloric acid per L of the solution. Store under toluene.

Pyridoxal-calcium pantothenate solution: 200 µg/mL of pyridoxal hydrochloride and 1.875 µg/mL of calcium pantothenate in 10% alcohol. Store in a refrigerator, and use within 30 days.

Polysorbate 40-oleic acid solution: 50 mg/mL of polysorbate 40 and 0.5 mg/mL of oleic acid in 20% alcohol. Store in a refrigerator, and use within 30 days.

Modified pantothenate medium: Dissolve anhydrous dextrose and sodium acetate in the solutions previously mixed according to Table 3, and adjust with 1 N sodium hydroxide to a pH of 6.8. Dilute with water to 250 mL.

Double-strength modified pantothenate medium:

Prepare as directed in *Modified pantothenate medium*, but make the final dilution to 125 mL instead of 250 mL. Prepare fresh.

Stock culture of *Pediococcus acidilactici*: Dissolve in 800 mL of water, with the aid of heat, 6.0 g of peptone, 4.0 g of pancreatic digest of casein, 3.0 g of yeast extract, 1.5 g of beef extract, 1.0 g of dextrose, and 15.0 g of agar. Adjust with 0.1 N sodium hydroxide or 0.1 N hydrochloric acid to a pH of 6.5–6.6, and dilute with water to 1000 mL. Add 10-mL portions of the solution to culture tubes, place caps on the tubes, and sterilize in an autoclave at 121° for 15 min. Cool on a slant, and store in a refrigerator. Prepare a stock culture of *Pediococcus acidilactici*³ on a slant of this medium. Incubate at 35° for 20–24 h, and store in a refrigerator. Maintain the stock culture by monthly transfer onto fresh slants.

Inoculum: Inoculate three 250-mL portions of sterile *Modified pantothenate medium* from a stock culture slant, and incubate at 35° for 20–24 h. Centrifuge the suspension from the combined portions, and wash the cells with sterile *Modified pantothenate medium*. Resuspend the cells in enough sterile *Modified pantothenate medium* that a 1-in-50 dilution, when tested in a 13-mm diameter test tube, gives 80% light transmission at 530 nm. Transfer 1.2-mL portions of this stock suspension to sterile glass ampuls, seal, freeze in liquid nitrogen, and store in a freezer. On the day of the assay, allow the ampuls to reach room temperature, mix the contents, and dilute 1 mL of thawed culture with sterile saline TS to 150 mL. [NOTE—This dilution may be altered when necessary to obtain the desired test response.]

Analysis: Prepare in triplicate a series of eight culture tubes by adding the following quantities of water to the tubes within a set: 5.0, 4.5, 4.0, 3.5, 3.0, 2.0, 1.0, and 0.0 mL. To these same tubes and in the same order, add 0.0, 0.5, 1.0, 1.5, 2.0, 3.0, 4.0, and 5.0 mL of the *Standard solution*.

Prepare in duplicate a series of five culture tubes by adding the following quantities of water to the tubes within a set: 4.0, 3.5, 3.0, 2.0, and 1.0 mL. To these same tubes, and in the same order, add 1.0, 1.5, 2.0, 3.0, and 4.0 mL of the *Sample solution*.

Add 5.0 mL of *Double-strength modified pantothenate medium* to each tube. Cover the tubes with metal caps, and sterilize in an autoclave at 121° for 5 min. Cool to room temperature in a chilled water bath, and inoculate each tube with 0.5 mL of the *Inoculum*. Allow to incubate at 37° for 16 h. Terminate growth by heating to a temperature NLT 80°, such as by steaming at atmospheric pressure in a sterilizer for 5–10 min. Cool, and determine the percentage transmittance of the suspensions, in cells of equal path length, on a suitable spectrophotometer, at a wavelength of 530 nm.

Calculation: Draw a dose-response curve on arithmetic graph paper by plotting the average response, in percentage of transmittance, for each set of tubes of the standard curve against the standard level concentrations. The curve is drawn by connecting each adjacent pair of points with a straight line. From this standard curve, determine by interpolation the potency of each tube containing portions of the *Sample solution*. To obtain the individual responses, divide the potency of each tube by the amount of the *Sample solution* added to it. Calculate the mean response by averaging the individual responses that vary from their mean by NMT 15%, using NLT half the total number of tubes. Calculate the potency of the portion of the material taken for assay by multiplying the mean response by the appropriate dilution factor.

Table 3

Acid-hydrolyzed casein solution	25 mL
Cystine-tryptophan solution	25 mL
Polysorbate 80 solution	0.25 mL
Dextrose, anhydrous	10 g
Sodium acetate, anhydrous	5 g
Adenine-guanine-uracil solution	5 mL
Riboflavin-thiamine hydrochloride-biotin solution	5 mL
p-Aminobenzoic acid-niacin-pyridoxine hydrochloride solution	5 mL
Salt solution A	5 mL
Salt solution B	5 mL
Pyridoxal-calcium pantothenate solution	5 mL
Polysorbate 40-oleic acid solution	5 mL

³ATCC No. 8042 is suitable.

Calculate the percentage of the labeled amount of dexpantenol or panthenol in the portion of Capsules taken:

$$\text{Result} = (P/N) \times 100$$

P = potency of dexpantenol or panthenol in the portion of Capsules taken (mg)

N = nominal amount of dexpantenol or panthenol in the portion of Capsules taken (mg)

Acceptance criteria: 90.0%–150.0% of the labeled amount of dexpantenol or panthenol ($\text{C}_9\text{H}_{19}\text{NO}_4$)

• **CALCIUM PANTOTHENATE, Method 1**

Mobile phase: Phosphoric acid and water (1:1000)

Internal standard solution: 80 mg of *p*-hydroxybenzoic acid in 3 mL of alcohol. Add 50 mL of water and 7.1 g of dibasic sodium phosphate, and dilute with water to 1000 mL. Adjust with phosphoric acid to a pH of 6.7.

Standard solution: 0.6 mg/mL of USP Calcium Pantothenate RS in *Internal standard solution*

Sample solution: Proceed as directed in *Ascorbic Acid, Method 1*, through “calculate the average net weight per Capsule.” To a centrifuge tube, transfer an amount of mixed Capsule contents and a volume of *Internal standard solution* to obtain a nominal concentration of 0.6 mg/mL in the *Sample solution*.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 210 nm

Column: 3.9-mm \times 15-cm; packing L1

Flow rate: 1.5 mL/min

Injection size: 10 μL

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for calcium pantothenate and *p*-hydroxybenzoic acid are about 0.5 and 1.0, respectively.]

Suitability requirements

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas of calcium pantothenate and the internal standard. Calculate the percentage of the labeled amount of calcium pantothenate ($\text{C}_{18}\text{H}_{32}\text{CaN}_2\text{O}_{10}$) in the portion of Capsules taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = peak area ratio of calcium pantothenate to *p*-hydroxybenzoic acid from the *Sample solution*

R_S = peak area ratio of calcium pantothenate to *p*-hydroxybenzoic acid from the *Standard solution*

C_S = concentration of USP Calcium Pantothenate RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of calcium pantothenate in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–150.0% of the labeled amount of calcium pantothenate ($\text{C}_{18}\text{H}_{32}\text{CaN}_2\text{O}_{10}$)

• **CALCIUM PANTOTHENATE, Method 2**

Standard stock solution: Dissolve 50 mg of USP Calcium Pantothenate RS, previously dried and stored in the dark over phosphorus pentoxide and protected from absorption of moisture while weighing, in 500 mL of water in a 1000-mL volumetric flask. Add 10 mL of 0.2 N acetic acid and 100 mL of sodium acetate solution (1 in 60), and dilute with water to volume to obtain a concentration of 50 μg /mL of USP Calcium Pantothenate RS. Store under toluene in a refrigerator.

Standard solution: On the day of the assay, dilute a volume of *Standard stock solution* with water to obtain a concentration of 0.01–0.04 μg /mL of calcium panto-

thenate, the exact concentration being such that the responses obtained as directed in the *Analysis*, 2.0 and 4.0 mL of the *Standard solution* being used, are within the linear portion of the log-concentration response curve.

Sample solution: Proceed as directed in *Ascorbic Acid, Method 1*, through “calculate the average net weight per Capsule.” Transfer a portion of the Capsule contents, equivalent to a nominal amount of 50 mg of calcium pantothenate, to a 1000-mL volumetric flask containing 500 mL of water. Add 10 mL of 0.2 N acetic acid and 100 mL of sodium acetate solution (1 in 60), dilute with water to volume, and filter. Dilute a volume of this solution to obtain a solution having approximately the same concentration as that of the *Standard solution*.

Acid-hydrolyzed casein solution: Mix 100 g of vitamin-free casein with 500 mL of 6 N hydrochloric acid, and reflux the mixture for 8–12 h. Remove the hydrochloric acid from the mixture by distillation under reduced pressure until a thick paste remains. Redissolve the resulting paste in water, adjust the solution with 1 N sodium hydroxide to a pH of 3.5 ± 0.1 , and add water to make 1000 mL. Add 20 g of activated charcoal, stir for 1 h, and filter. Repeat the treatment with activated charcoal. Store under toluene in a cool place at a temperature not below 10°. Filter the solution if a precipitate forms during storage.

Cystine-tryptophan solution: Suspend 4.0 g of L-cystine in a solution of 1.0 g of L-tryptophan (or 2.0 g of D,L-tryptophan) in 700–800 mL of water, heat to 70°–80°, and add dilute hydrochloric acid (1 in 2) dropwise, with stirring, until the solids are dissolved. Cool, and add water to make 1000 mL. Store under toluene in a cool place at a temperature not below 10°.

Adenine-guanine-uracil solution: Dissolve 200 mg each of adenine sulfate, guanine hydrochloride, and uracil, with the aid of heat, in 10 mL of 4 N hydrochloric acid. Cool, and add water to make 200 mL. Store under toluene in a refrigerator.

Polysorbate 80 solution: 100 mg/mL of polysorbate 80 in alcohol

Riboflavin-thiamine hydrochloride-biotin solution: 20 μg /mL of riboflavin, 10 μg /mL of thiamine hydrochloride, and 0.04 μg /mL of biotin in 0.02 N acetic acid. Store under toluene, protected from light, in a refrigerator.

***p*-Aminobenzoic acid-niacin-pyridoxine hydrochloride solution:** 10 μg /mL of *p*-aminobenzoic acid, 50 μg /mL of niacin, and 40 μg /mL of pyridoxine hydrochloride in a mixture of neutralized alcohol and water (1:3). Store in a refrigerator.

Salt solution A: Dissolve 25 g of monobasic potassium phosphate and 25 g of dibasic potassium phosphate in water to make 500 mL. Add 5 drops of hydrochloric acid. Store under toluene.

Salt solution B: Dissolve 10 g of magnesium sulfate, 0.5 g of sodium chloride, 0.5 g of ferrous sulfate, and 0.5 g of manganese sulfate in water to make 500 mL. Add 5 drops of hydrochloric acid. Store under toluene.

Basal medium stock solution: Dissolve anhydrous dextrose and anhydrous sodium acetate in the solutions previously mixed according to *Table 4*, and adjust with 1 N sodium hydroxide to a pH of 6.8. Dilute with water to 250 mL.

Table 4

Acid-hydrolyzed casein solution	25 mL
Cystine-tryptophan solution	25 mL
Polysorbate 80 solution	0.25 mL
Dextrose, anhydrous	10 g
Sodium acetate, anhydrous	5 g
Adenine-guanine-uracil solution	5 mL

Table 4 (Continued)

Riboflavin–thiamine hydrochloride–biotin solution	5 mL
p-Aminobenzoic acid–niacin–pyridoxine hydrochloride solution	5 mL
Salt solution A	5 mL
Salt solution B	5 mL

Stock culture of *Lactobacillus plantarum*: Dissolve 2.0 g of yeast extract in 100 mL of water. Add 500 mg of anhydrous dextrose, 500 mg of anhydrous sodium acetate, and 1.5 g of agar, and heat the mixture on a steam bath, with stirring, until the agar dissolves. Add 10-mL portions of the hot solution to the test tubes, close or cover the tubes, sterilize in an autoclave at 121° for 15 min, and allow the tubes to cool in an upright position. Prepare stab cultures in three or more of the tubes, using a pure culture of *Lactobacillus plantarum*¹ incubating for 16–24 h at a temperature between 30° and 37° held constant to within ±0.5°. Store in a refrigerator. Prepare a fresh stab of the stock culture every week, and do not use for *Inoculum* if the culture is more than 1 week old.

Culture medium: Add 5.0 mL of water containing 0.2 µg of calcium pantothenate to each of a series of test tubes containing 5.0 mL of *Basal medium stock solution*. Plug the tubes with cotton, sterilize in an autoclave at 121° for 15 min, and cool.

Inoculum: [NOTE—A frozen suspension of *Lactobacillus plantarum* may be used as the stock culture, provided it yields an *Inoculum* comparable to a fresh culture.] Transfer cells from the of *Stock culture of Lactobacillus plantarum* to a sterile tube containing 10 mL of *Culture medium*. Incubate this culture for 16–24 h at a temperature between 30° and 37° held constant to within ±0.5°. The cell suspension so obtained is the *Inoculum*.

Analysis

Samples: *Standard solution* and *Sample solution*

To similar separate test tubes add, in duplicate, 1.0 and/or 1.5, 2.0, 3.0, 4.0, and 5.0 mL of the *Standard solution*. To each tube and to four similar empty tubes add 5.0 mL of *Basal medium stock solution* and sufficient water to make 10 mL.

To similar separate test tubes add, in duplicate, volumes of the *Sample solution* corresponding to three or more of the levels specified for the *Standard solution*, including the levels of 2.0, 3.0, and 4.0 mL. To each tube add 5.0 mL of the *Basal medium stock solution* and sufficient water to make 10 mL. Place one complete set of *Standard* and *sample* tubes together in one tube rack and the duplicate set in a second rack or section of a rack, preferably in random order.

Cover the tubes of both series to prevent contamination, and sterilize in an autoclave at 121° for 5 min. Cool, and add 1 drop of *Inoculum* to each tube, except two of the four tubes containing no *Standard solution* (the uninoculated blanks). Incubate the tubes at a temperature between 30° and 37°, held constant to within ±0.5°, until, following 16–24 h of incubation, there has been no substantial increase in turbidity in the tubes containing the highest level of *Standard* during a 2-h period.

Determine the transmittance of the tubes in the following manner. Mix the contents of each tube, and transfer to an optical container if necessary. Read the transmittance between 540 and 660 nm when a steady state is reached. This steady state is observed a few seconds after agitation when the galvanometer reading remains constant for 30 s or more. Allow approximately the same time interval for the reading on each tube.

With the transmittance set at 1.00 for the uninoculated blank, read the transmittance of the inoculated blank. With the transmittance set at 1.00 for the inoculated blank, read the transmittance for each of the remaining

tubes. If there is evidence of contamination with a foreign microorganism, disregard the result of the assay.

Calculation: Prepare a standard concentration-response curve as follows. For each level of the *Standard*, calculate the response from the sum of the duplicate values of the transmittance (Σ_s) as the difference $y = 2.00 - \Sigma_s$. Plot this response on the ordinate of cross-section paper against the logarithm of the mL of *Standard solution* per tube on the abscissa, using for the ordinate either an arithmetic or a logarithmic scale, whichever gives the better approximation to a straight line. Draw the straight line or smooth curve that best fits the plotted points.

Calculate the response $y = 2.00 - \Sigma_u$, adding together the two transmittances for each level of the *Sample solution* (Σ_u). Read from the standard curve the logarithm of the volume of the *Standard solution* corresponding to each of those values of y that fall within the range of the lowest and highest points plotted for the *Standard*. Subtract from each logarithm so obtained the logarithm of the volume, in mL, of the *Sample solution* to obtain the difference, x , for each dosage level. Average the values of x for each of three or more dosage levels to obtain \bar{x} , which equals the log-relative potency, M' , of the *Sample solution*. Determine the quantity, in mg, of calcium pantothenate ($C_{18}H_{32}CaN_2O_{10}$) in the portion of Capsules taken:

$$\text{antilog } M = \text{antilog } (M' + \log R)$$

R = number of mg of calcium pantothenate assumed to be present in the portion of Capsules taken

Calculate the percentage of the labeled amount of calcium pantothenate ($C_{18}H_{32}CaN_2O_{10}$) in the portion of Capsules taken:

$$\text{Result} = [(\text{antilog } M)/N] \times 100$$

N = nominal amount of calcium pantothenate in the portion of Capsules taken (mg)

Replication: Repeat the entire determination at least once, using separately prepared *Sample solutions*. If the difference between the two log-potencies M is NMT 0.08, their mean, \bar{M} , is the assayed log-potency of the test material (see *Design and Analysis of Biological Assays* (111), *The Confidence Interval and Limits of Potency*). If the two determinations differ by more than 0.08, conduct one or more additional determinations. From the mean of two or more values of M that do not differ by more than 0.15, compute the mean potency of the preparation under assay.

Acceptance criteria: 90.0%–150.0% of the labeled amount of calcium pantothenate ($C_{18}H_{32}CaN_2O_{10}$)

• CALCIUM PANTOTHENATE, Method 3

Buffer solution: Dissolve 10.0 g of monobasic potassium phosphate in 2000 mL of water, and adjust with phosphoric acid to a pH of 3.5.

Mobile phase: Methanol and *Buffer solution* (1:9)

Standard stock solution: 0.25 mg/mL of USP Calcium Pantothenate RS in water. Prepare fresh every 4 weeks. Store in a refrigerator.

Standard solution: 40 µg/mL of USP Calcium Pantothenate RS from the *Standard stock solution* diluted with water

Sample solution: Proceed as directed for the *Sample solution* in *Ascorbic Acid, Method 1*, through “calculate the average net weight per Capsule.” Transfer a portion of the Capsule contents, equivalent to a nominal amount of 10 mg of calcium pantothenate, to a 250-mL volumetric flask. Add 10 mL of methanol, and swirl the flask to disperse the Capsule contents. Dilute with water to volume, mix, and filter.

Chromatographic system(See *Chromatography* <621>, *System Suitability*.)**Mode:** LC**Detector:** UV 205 nm**Column:** 3.9-mm × 30-cm; 5-μm packing L1**Column temperature:** 50°**Flow rate:** 2 mL/min**Injection size:** 25 μL**System suitability****Sample:** *Standard solution***Suitability requirements****Relative standard deviation:** NMT 3.0%**Analysis****Samples:** *Standard solution* and *Sample solution*

Measure the peak areas of calcium pantothenate.

Calculate the percentage of the labeled amount of calcium pantothenate ($C_{18}H_{32}CaN_2O_{10}$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

 r_U = peak area of calcium pantothenate from the *Sample solution* r_S = peak area of calcium pantothenate from the *Standard solution* C_S = concentration of USP Calcium Pantothenate RS in the *Standard solution* (mg/mL) C_U = nominal concentration of calcium pantothenate in the *Sample solution* (mg/mL)**Acceptance criteria:** 90.0%–150.0% of the labeled amount of calcium pantothenate ($C_{18}H_{32}CaN_2O_{10}$)• **NIACIN OR NIACINAMIDE, PYRIDOXINE HYDROCHLORIDE, RIBOFLAVIN, and THIAMINE, Method 1**

[NOTE—Use low-actinic glassware throughout this procedure.]

Mobile phase: A mixture of methanol, glacial acetic acid, and water (27:1:73) containing 140 mg of sodium 1-hexanesulfonate per 100 mL**Diluent:** Acetonitrile, glacial acetic acid, and water (5:1:94)**Standard solution:** [NOTE—Use USP Niacin RS in place of USP Niacinamide RS for formulations containing niacin.] Transfer 80 mg of USP Niacinamide RS, 20 mg of USP Pyridoxine Hydrochloride RS, 20 mg of USP Riboflavin RS, and 20 mg of USP Thiamine Hydrochloride RS to a 200-mL volumetric flask, and add 180 mL of *Diluent*. Immerse the flask in a hot water bath maintained at 65°–70° for 10 min with regular shaking or on a vortex mixer, until all the solid materials are dissolved. Chill rapidly in a cold water bath for 10 min to room temperature, and dilute with *Diluent* to volume.**Sample solution:** Proceed as directed in *Ascorbic Acid, Method 1*, through “calculate the average net weight per Capsule.” Transfer a portion of the Capsule contents, equivalent to 10 mg of niacinamide and 2.5 mg each of pyridoxine hydrochloride, riboflavin, and thiamine hydrochloride, to a 50-mL centrifuge tube. Add 25.0 mL of *Diluent*, and mix on a vortex mixer for 30 s to completely suspend the powder. Immerse the centrifuge tube in a hot water bath maintained at 65°–70°, heat for 5 min, and mix on a vortex mixer for 30 s. Return the tube to the hot water bath, heat for another 5 min, and mix on a vortex mixer for 30 s. Filter a portion of the solution, cool to room temperature, and use the clear filtrate. [NOTE—Use the filtrate within 3 h of filtration.]**Chromatographic system**(See *Chromatography* <621>, *System Suitability*.)**Mode:** LC**Detector:** UV 280 nm**Column:** 3.9-mm × 30-cm; packing L1**Flow rate:** 1 mL/min**Injection size:** 10 μL**System suitability****Sample:** *Standard solution*

(C₁₇H₂₀N₄O₆), and thiamine as thiamine hydrochloride (C₁₂H₁₇ClN₄OS · HCl) or thiamine mononitrate (C₁₂H₁₇N₅O₄S)

• **NIACIN, Method 2**

[NOTE—Use low-actinic glassware throughout this procedure.]

Solution A: Transfer 1 mL of glacial acetic acid and 2.5 g of edetate disodium to a 100-mL volumetric flask. Dissolve in and dilute with water to volume.

Extraction solvent: *Solution A* and methanol (3:1)

Mobile phase: 0.1 M sodium acetate solution (13.6 mg/mL of sodium acetate in water). Adjust with acetic acid to a pH of 5.4. [NOTE—A small amount of methanol (up to 1%) may be added to the *Mobile phase* to improve resolution.]

Standard stock solution: 1 mg/mL of USP Niacin RS in *Extraction solvent*

Standard solution: Transfer 5.0 mL of *Standard stock solution* to a 25-mL volumetric flask. Dilute with *Extraction solvent* to volume.

Sample solution: [NOTE—This preparation is suitable for the determination of niacin or niacinamide, pyridoxine, and riboflavin, when present in the formulation.] Weigh NLT 20 Capsules in a tared weighing bottle. Open the Capsules, without loss of shell material, and transfer the contents to a beaker. Remove any contents adhering to the shells by washing with several portions of ether. Discard the washings, and dry the Capsule shells with the aid of a current of dry air. Weigh the empty Capsule shells in the tared weighing bottle, and calculate the net weight of the Capsule contents. Transfer a portion of the Capsule contents, equivalent to a nominal amount of 2 mg of riboflavin, to a 200-mL volumetric flask. If riboflavin is not present in the formulation, use a portion equivalent to a nominal amount of 2 mg of pyridoxine. If pyridoxine is not present in the formulation, use a portion equivalent to a nominal amount of 20 mg of niacin or niacinamide. Add 100.0 mL of *Extraction solvent*, and mix for 20 min, using a wrist-action shaker. Immerse the flask in a water bath maintained at 70°–75°, and heat for 20 min. Mix on a vortex mixer for 30 s, cool to room temperature, and filter. Use the clear filtrate.

Chromatographic system

Analysis

Samples: *Standard solution* and *Sample solution*
Measure the peak areas of pyridoxine. Calculate the percentage of the labeled amount of pyridoxine hydrochloride (C₈H₁₁NO₃ · HCl) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of pyridoxine from the *Sample solution*

r_S = peak area of pyridoxine from the *Standard solution*

C_S = concentration of USP Pyridoxine Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of pyridoxine hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–150.0% of the labeled amount of pyridoxine hydrochloride (C₈H₁₁NO₃ · HCl)

• **RIBOFLAVIN, Method 2**

[NOTE—Use low-actinic glassware throughout this procedure.]

Extraction solvent and Sample solution: Prepare as directed for *Niacin, Method 2*.

Solution B: 6.8 mg/mL of sodium acetate in water

Mobile phase: Prepare a mixture of *Solution B* and methanol (13:7). Add 2 mL of triethylamine per L of the mixture, and adjust with glacial acetic acid to a pH of 5.2.

Standard stock solution: Transfer 20 mg of USP Riboflavin RS to a 200-mL volumetric flask, and add 180 mL of *Extraction solvent*. Immerse the flask for 5 min in a water bath maintained at 65°–75°. Mix well, and repeat if necessary until dissolved. Chill rapidly in a cold water bath to room temperature, and dilute with *Extraction solvent* to volume.

Standard solution: Dilute 5.0 mL of *Standard stock solution* with *Extraction solvent* to 25.0 mL.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm × 25-cm; packing L1

Flow rate: 1 mL/min

Injection size: 20 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*
Measure the peak areas of riboflavin. Calculate the percentage of the labeled amount of riboflavin ($C_{17}H_{20}N_4O_6$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of riboflavin from the *Sample solution*

r_S = peak area of riboflavin from the *Standard solution*

C_S = concentration of USP Riboflavin RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of riboflavin in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–150.0% of the labeled amount of riboflavin ($C_{17}H_{20}N_4O_6$)

• THIAMINE, Method 2

[NOTE—Use low-actinic glassware throughout this procedure.]

Solution A: 1.88 mg/mL of sodium 1-hexanesulfonate in 0.1% phosphoric acid

Mobile phase: *Solution A* and acetonitrile (46:9)

Standard stock solution: 0.1 mg/mL of USP Thiamine Hydrochloride RS in 0.2 N hydrochloric acid

Standard solution: 0.02 mg/mL of USP Thiamine Hydrochloride RS from the *Standard stock solution* diluted with 0.2 N hydrochloric acid

Sample solution: Proceed as directed for the *Sample solution* in *Ascorbic Acid, Method 1*, through “calculate the average net weight per Capsule.” Mix a portion of the Capsule contents with a volume of 0.2 N hydrochloric acid to obtain a nominal concentration of 0.02 mg/mL of thiamine. Shake for 15 min with a wrist-action shaker, and heat to boiling for 30 min. Cool to room temperature, and filter. Use the clear filtrate.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm × 25-cm; packing L1

Flow rate: 2 mL/min

Injection size: 20 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Sample solution* and *Standard solution*
Measure the peak areas of the major peaks. For products containing thiamine hydrochloride, calculate the percentage of the labeled amount of thiamine

hydrochloride ($C_{12}H_{17}ClN_4OS \cdot HCl$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of thiamine from the *Sample solution*

r_S = peak area of thiamine from the *Standard solution*

C_S = concentration of USP Thiamine Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of thiamine hydrochloride in the *Sample solution* (mg/mL)

For products containing thiamine mononitrate, calculate the percentage of the labeled amount of thiamine mononitrate ($C_{12}H_{17}N_5O_4S$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak area of thiamine from the *Sample solution*

r_S = peak area of thiamine from the *Standard solution*

C_S = concentration of USP Thiamine Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of thiamine mononitrate in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of thiamine mononitrate, 327.36

M_{r2} = molecular weight of thiamine hydrochloride, 337.27

Acceptance criteria: 90.0%–150.0% of the labeled amount of thiamine as thiamine hydrochloride ($C_{12}H_{17}ClN_4OS \cdot HCl$) or thiamine mononitrate ($C_{12}H_{17}N_5O_4S$)

• NIACIN OR NIACINAMIDE, PYRIDOXINE HYDROCHLORIDE, RIBOFLAVIN, and THIAMINE, Method 3

[NOTE—Use low-actinic glassware throughout this procedure.]

Reagent: 25 mg/mL of edetate disodium in water

Mobile phase: Transfer 0.4 mL of triethylamine, 15.0 mL of glacial acetic acid, and 350 mL of methanol to a 2000-mL volumetric flask. Dilute with 0.008 M sodium 1-hexanesulfonate to volume.

Standard stock solution: 1.5 mg/mL of USP Niacin RS or USP Niacinamide RS, 0.24 mg/mL of USP Pyridoxine Hydrochloride RS, 0.08 mg/mL of USP Riboflavin RS, and 0.24 mg/mL of USP Thiamine Hydrochloride RS in the *Reagent*, with heating if necessary

Standard solution: Transfer 5.0 mL of *Standard stock solution* to a stoppered 125-mL flask. Add 10.0 mL of a mixture of methanol and glacial acetic acid (9:1) and 30.0 mL of a mixture of methanol and ethylene glycol (1:1). Insert the stopper, shake for 15 min in a water bath maintained at 60°, and cool. Filter, discarding the first few mL of the filtrate.

Sample solution: Proceed as directed for the *Sample solution* in *Ascorbic Acid, Method 1*, through “calculate the average net weight per Capsule.” Transfer a portion of the Capsule contents, equivalent to 7.5 mg of niacin or niacinamide, 1.2 mg of pyridoxine hydrochloride, 0.4 mg of riboflavin, and 1.2 mg of thiamine hydrochloride, to a stoppered 125-mL flask. Add 10.0 mL of a mixture of methanol and glacial acetic acid (9:1), and 30.0 mL of a mixture of methanol and ethylene glycol (1:1). Insert the stopper, shake for 15 min in a water bath maintained at 60°, and cool. Filter, discarding the first few mL of the filtrate.

Chromatographic system

Mode: LC

Detector: UV 270 nm

Column: 4.6-mm × 25-cm; packing L7

Column temperature: 50°

Flow rate: 2 mL/min

Injection size: 5 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas of niacin or niacinamide.

Calculate the percentage of the labeled amount of niacin (C₆H₅NO₂) or niacinamide (C₆H₆N₂O) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of niacin or niacinamide from the *Sample solution*

r_S = peak area of niacin or niacinamide from the *Standard solution*

C_S = concentration of USP Niacin RS or USP Niacinamide RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of niacin or niacinamide in the *Sample solution* (mg/mL)

Separately calculate the percentage of the labeled amount of pyridoxine hydrochloride (C₈H₁₁NO₃ · HCl), riboflavin (C₁₇H₂₀N₄O₆) and thiamine hydrochloride (C₁₂H₁₇ClN₄OS · HCl) (for products containing thiamine hydrochloride) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of the corresponding vitamin from the *Sample solution*

r_S = peak area of the corresponding vitamin from the *Standard solution*

C_S = concentration of the relevant USP Reference Standard in the *Standard solution* (mg/mL)

C_U = nominal concentration of the corresponding vitamin in the *Sample solution* (mg/mL)

For products containing thiamine mononitrate, calculate the percentage of the labeled amount of thiamine mononitrate (C₁₂H₁₇N₅O₄S) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak area of thiamine from the *Sample solution*

r_S = peak area of thiamine from the *Standard solution*

C_S = concentration of USP Thiamine Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of thiamine mononitrate in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of thiamine mononitrate, 327.36

M_{r2} = molecular weight of thiamine hydrochloride, 337.27

Acceptance criteria: 90.0%–150.0% of the labeled amount of niacinamide (C₆H₆N₂O) or niacin (C₆H₅NO₂), pyridoxine hydrochloride (C₈H₁₁NO₃ · HCl), riboflavin (C₁₇H₂₀N₄O₆), and thiamine as thiamine hydrochloride (C₁₂H₁₇ClN₄OS · HCl) or thiamine mononitrate (C₁₂H₁₇N₅O₄S)

PERFORMANCE TESTS

- **DISINTEGRATION AND DISSOLUTION OF DIETARY SUPPLEMENTS <2040>:** Meet the requirements for *Dissolution*
- **WEIGHT VARIATION OF DIETARY SUPPLEMENTS <2091>:** Meet the requirements

CONTAMINANTS

- **MICROBIAL ENUMERATION TESTS <2021>:** The total aerobic microbial count does not exceed 3000 cfu/g, and the combined molds and yeasts count does not exceed 300 cfu/g.
- **MICROBIOLOGICAL PROCEDURES FOR ABSENCE OF SPECIFIED MICROORGANISMS <2022>:** Meet the requirements of the tests for absence of *Salmonella* species, *Escherichia coli*, and *Staphylococcus aureus*.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.
- **LABELING:** The label states that the product is Water-Soluble Vitamins Capsules. The label also states the quantity of each vitamin in terms of metric units per dosage unit and where necessary the salt form in which it is present. Where more than one assay method is given for a particular vitamin, the labeling states which assay method is used only if *Method 1* is not used. Where products are labeled to contain panthenol, the label states the equivalent content of dexpantenol.
- **USP REFERENCE STANDARDS <11>**

Water-Soluble Vitamins Tablets

DEFINITION

Water-Soluble Vitamins Tablets contain two or more of the following water-soluble vitamins: Ascorbic Acid or its equivalent as Sodium Ascorbate or Calcium Ascorbate, Biotin, Cyanocobalamin, Folic Acid, Niacin or Niacinamide, Pantothenic Acid (as Calcium Pantothenate or Racemic Calcium Pantothenate), Pyridoxine Hydrochloride, Riboflavin, and Thiamine Hydrochloride or Thiamine Mononitrate. Tablets contain NLT 90.0% and NMT 150.0% of the

labeled amounts of ascorbic acid ($C_6H_8O_6$) or its equivalent as sodium ascorbate or calcium ascorbate, biotin ($C_{10}H_{16}N_2O_3S$), cyanocobalamin ($C_{63}H_{88}CoN_{14}O_{14}P$), folic acid ($C_{19}H_{19}N_7O_6$), niacin ($C_6H_5NO_2$) or niacinamide ($C_6H_6N_2O$), calcium pantothenate ($C_{18}H_{32}CaN_2O_{10}$), pyridoxine hydrochloride ($C_8H_{11}NO_3 \cdot HCl$), riboflavin ($C_{17}H_{20}N_4O_6$), and thiamine ($C_{12}H_{17}ClN_4OS$) as thiamine hydrochloride or thiamine mononitrate.

They do not contain any form of Beta Carotene or Vitamin A, D, E, or K. They do not contain any minerals for which nutritional value is claimed. They may contain other labeled added substances in quantities that are unobjectionable.

STRENGTH

[NOTE—In the following assays, where more than one assay method is given for an individual ingredient, the requirements may be met by following any one of the specified methods, the method used being stated in the labeling only if *Method 1* is not used.]

• ASCORBIC ACID, Method 1

Sample solution: Finely powder NLT 20 Tablets. Transfer a portion of the powder, equivalent to 100 mg of ascorbic acid, to a 200-mL volumetric flask, and add 75 mL of metaphosphoric-acetic acids TS. Insert a stopper into the flask, and shake by mechanical means for 30 min. Dilute with water to volume. Transfer a portion of the solution to a centrifuge tube, and centrifuge until a clear supernatant is obtained. Pipet 4.0 mL of this solution into a 50-mL conical flask, and add 5 mL of metaphosphoric-acetic acids TS.

Analysis: Titrate with standard dichlorophenol-indophenol solution VS to a rose-pink color that persists for at least 5 s. Correct for the volume of dichlorophenol-indophenol solution consumed by a mixture of 5.5 mL of metaphosphoric-acetic acids TS and 15 mL of water. From the ascorbic acid equivalent of the standard dichlorophenol-indophenol solution, calculate the content of ascorbic acid in each Tablet.

Acceptance criteria: 90.0%–150.0% of the labeled amount of ascorbic acid ($C_6H_8O_6$)

• ASCORBIC ACID, Method 2: Proceed as directed in *Automated Methods of Analysis* (16), *Assay for Ascorbic Acid*.

Acceptance criteria: 90.0%–150.0% of the labeled amount of ascorbic acid ($C_6H_8O_6$)

• CALCIUM ASCORBATE, Method 1: Proceed as directed in *Ascorbic Acid, Method 1*.

Acceptance criteria: 90.0%–150.0% of the labeled amount of calcium ascorbate ($C_{12}H_{14}CaO_{12} \cdot 2H_2O$)

• CALCIUM ASCORBATE, Method 2: Proceed as directed in *Automated Methods of Analysis* (16), *Assay for Ascorbic Acid*.

Acceptance criteria: 90.0%–150.0% of the labeled amount of calcium ascorbate ($C_{12}H_{14}CaO_{12} \cdot 2H_2O$)

• SODIUM ASCORBATE, Method 1: Proceed as directed in *Ascorbic Acid, Method 1*.

Acceptance criteria: 90.0%–150.0% of the labeled amount of sodium ascorbate ($C_6H_7NaO_6$)

• SODIUM ASCORBATE, Method 2: Proceed as directed in *Automated Methods of Analysis* (16), *Assay for Ascorbic Acid*.

Acceptance criteria: 90.0%–150.0% of the labeled amount of sodium ascorbate ($C_6H_7NaO_6$)

• BIOTIN, Method 1

[NOTE—Use low-actinic glassware throughout this procedure.]

Mobile phase: Mix 85 mL of acetonitrile, 1 g of sodium perchlorate, and 1 mL of phosphoric acid, and dilute with water to 1000 mL.

Standard stock solution: 0.333 mg/mL of USP Biotin RS in dimethyl sulfoxide

Standard solution: 5 µg/mL of USP Biotin RS prepared by diluting the *Standard stock solution* in water

Sample solution: Finely powder NLT 20 Tablets. Transfer a portion of the powder, equivalent to 1 mg of biotin, to a 200-mL volumetric flask, add 3 mL of dimethyl sulfoxide, and swirl to wet. Place the flask in a water

bath at 60°–70° for 5 min. Sonicate for 5 min, dilute with water to volume, and filter.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 200 nm

Column: 4.6-mm × 15-cm; 3-µm packing L7

Flow rate: 1.2 mL/min

Injection size: 100 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the responses for the biotin peaks. Calculate the percentage of the labeled amount of biotin ($C_{10}H_{16}N_2O_3S$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Biotin RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of biotin in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–150.0% of the labeled amount of biotin ($C_{10}H_{16}N_2O_3S$)

• BIOTIN, Method 2

[NOTE—Use low-actinic glassware throughout this procedure.]

Dehydrated mixtures yielding formulations similar to the media described herein may be used provided that, when constituted as directed, they have growth-promoting properties equal to or superior to those obtained with the media prepared as described herein.

Standard stock solution: 50 µg/mL of USP Biotin RS in 50% alcohol. Store this solution in a refrigerator.

Standard solution: 0.1 ng/mL of USP Biotin RS in water, prepared by dilution of the *Standard stock solution* with water on the day of the assay

Sample solution: Finely powder NLT 30 Tablets.

Transfer a portion of the powder, equivalent to 100 µg of biotin, to a 200-mL volumetric flask. Add 3 mL of 50% alcohol, and swirl to wet the contents. Heat the flask in a water bath at 60°–70° for 5 min. Sonicate for 5 min, dilute with 50% alcohol to volume, and filter. Dilute a volume of the filtrate, quantitatively, and stepwise if necessary, with water to obtain a solution with a concentration of 0.1 ng/mL.

Acid-hydrolyzed casein solution: Mix 100 g of vitamin-free casein with 500 mL of 6 N hydrochloric acid, and reflux the mixture for 8–12 h. Remove the hydrochloric acid from the mixture by distillation under reduced pressure until a thick paste remains. Redissolve the resulting paste in water, adjust the solution with 1 N sodium hydroxide to a pH of 3.5 ± 0.1 , and add water to make 1000 mL. Add 20 g of activated charcoal, stir for 1 h, and filter. Repeat the treatment with activated charcoal. Store under toluene in a cool place at a temperature not below 10°. Filter the solution if a precipitate forms during storage.

Cystine-tryptophan solution: Suspend 4.0 g of L-cystine in a solution of 1.0 g of L-tryptophan (or 2.0 g of D,L-tryptophan) in 700–800 mL of water, heat to 70°–80°, and add dilute hydrochloric acid (1 in 2) dropwise, with stirring, until the solids are dissolved. Cool, and add water to make 1000 mL. Store under toluene in a cool place at a temperature not below 10°.

Adenine-guanine-uracil solution: Dissolve 200 mg each of adenine sulfate, guanine hydrochloride, and uracil, with the aid of heat, in 10 mL of 4 N hydrochloric acid. Cool, and add water to make 200 mL. Store under toluene in a refrigerator.

Polysorbate 80 solution: 100 mg/mL of polysorbate 80 in alcohol

Calcium pantothenate solution: 10 µg/mL of calcium pantothenate in 50% alcohol. Store in a refrigerator.

Riboflavin–thiamine hydrochloride solution:

20 µg/mL of riboflavin and 10 µg/mL of thiamine hydrochloride in 0.02 N acetic acid. Store under toluene, protected from light, in a refrigerator.

p-Aminobenzoic acid–niacin–pyridoxine hydrochloride solution: 10 µg/mL of p-aminobenzoic acid, 50 µg/mL of niacin, and 40 µg/mL of pyridoxine hydrochloride in a mixture of neutralized alcohol and water (1:3). Store in a refrigerator.

Salt solution A: Dissolve 25 g of monobasic potassium phosphate and 25 g of dibasic potassium phosphate in water to make 500 mL. Add 5 drops of hydrochloric acid. Store under toluene.

Salt solution B: Dissolve 10 g of magnesium sulfate, 0.5 g of sodium chloride, 0.5 g of ferrous sulfate, and 0.5 g of manganese sulfate in water to make 500 mL. Add 5 drops of hydrochloric acid, and mix. Store under toluene.

Basal medium stock solution

Acid-hydrolyzed casein solution	25 mL
Cystine–tryptophan solution	25 mL
Polysorbate 80 solution	0.25 mL
Dextrose, anhydrous	10 g
Sodium acetate, anhydrous	5 g
Adenine–guanine–uracil solution	5 mL
Calcium pantothenate solution	5 mL
Riboflavin–thiamine hydrochloride solution	5 mL
p-Aminobenzoic acid–niacin–pyridoxine hydrochloride solution	5 mL
Salt solution A	5 mL
Salt solution B	5 mL

Dissolve the anhydrous dextrose and anhydrous sodium acetate in the solutions previously mixed, and adjust with 1 N sodium hydroxide to a pH of 6.8. Dilute with water to 250 mL.

Stock culture of *Lactobacillus plantarum*: Dissolve 2.0 g of yeast extract in 100 mL of water. Add 500 mg of anhydrous dextrose, 500 mg of anhydrous sodium acetate, and 1.5 g of agar, and heat the mixture on a steam bath, with stirring, until the agar dissolves. Add 10-mL portions of the hot solution to test tubes, close or cover the tubes, sterilize in an autoclave at 121° for 15 min, and allow the tubes to cool in an upright position. Prepare stab cultures in three or more of the tubes, using a pure culture of *Lactobacillus plantarum*,¹ incubating for 16–24 h at a temperature between 30° and 37° held constant to within ±0.5°. Store in a refrigerator. Prepare a fresh stab of the stock culture every week, and do not use for *Inoculum* if the culture is more than 1 week old.

Culture medium: To each of a series of test tubes containing 5.0 mL of *Basal medium stock solution* add 5.0 mL of water containing 0.5 ng of biotin. Plug the tubes with cotton, sterilize in an autoclave at 121° for 15 min, and cool.

Inoculum: [NOTE—A frozen suspension of *Lactobacillus plantarum* may be used as the stock culture, provided it yields an *Inoculum* comparable to a fresh culture.] Make a transfer of cells from the *Stock culture* of *Lactobacillus plantarum* to a sterile tube containing 10 mL of *Culture medium*. Incubate this culture for 16–24 h at a temperature between 30° and 37° held constant to within ±0.5°. The cell suspension so obtained is the *Inoculum*.

Analysis

Samples: *Standard solution* and *Sample solution*

To similar separate test tubes add, in duplicate, 1.0 and/or 1.5, 2.0, 3.0, 4.0, and 5.0 mL of the *Standard solution*. To each tube and to four similar empty tubes add 5.0 mL of *Basal medium stock solution* and sufficient water to make 10 mL.

To similar test tubes add, in duplicate, volumes of the *Sample solution* corresponding to three or more of the levels specified for the *Standard solution*, including the levels of 2.0, 3.0, and 4.0 mL. To each tube add 5.0 mL of the *Basal medium stock solution* and sufficient water to make 10 mL. Place one complete set of *Standard* and sample tubes together in one tube rack and the duplicate set in a second rack or section of a rack, preferably in random order.

Cover the tubes of both series to prevent contamination, and sterilize in an autoclave at 121° for 5 min. Cool, and add 1 drop of *Inoculum* to each tube, except two of the four tubes containing no *Standard solution* (the uninoculated blanks). Incubate the tubes at a temperature between 30° and 37° held constant to within ±0.5° until, following 16–24 h of incubation, there has been no substantial increase in turbidity in the tubes containing the highest level of *Standard* during a 2-h period.

Determine the transmittance of the tubes in the following manner. Mix the contents of each tube, and transfer to a spectrophotometer cell. Place the cell in a spectrophotometer that has been set at a specific wavelength of 540–660 nm, and read the transmittance when a steady state is reached. This steady state is observed a few seconds after agitation when the galvanometer reading remains constant for 30 s or more. Allow approximately the same time interval for the reading on each tube.

With the transmittance set at 1.00 for the uninoculated blank, read the transmittance of the inoculated blank. With the transmittance set at 1.00 for the inoculated blank, read the transmittance for each of the remaining tubes. If there is evidence of contamination with a foreign microorganism, disregard the result of the assay.

Calculation: Prepare a standard concentration-response curve as follows. For each level of the *Standard*, calculate the response from the sum of the duplicate values of the transmittance (ΣS) as the difference, $y = 2.00 - \Sigma S$. Plot this response on the ordinate of cross-section paper against the logarithm of the mL of *Standard solution* per tube on the abscissa, using for the ordinate either an arithmetic or a logarithmic scale, whichever gives the better approximation to a straight line. Draw the straight line or smooth curve that best fits the plotted points.

Calculate the response, $y = 2.00 - \Sigma U$, adding together the two transmittances for each level of the *Sample solution* (ΣU). Read from the standard curve the logarithm of the volume of the *Standard solution* corresponding to each of those values of y that falls within the range of lowest and highest points plotted for the *Standard*. Subtract from each logarithm so obtained the logarithm of the volume, in mL, of the *Sample solution* to obtain the difference, X , for each dosage level. Average the values of X for each of three or more dosage levels to obtain \bar{X} , which equals the log-relative potency, M' , of the *Sample solution*. Determine the quantity, in µg, of biotin ($C_{10}H_{16}N_2O_3S$) in the portion of Tablets taken:

$$\text{antilog } M = \text{antilog } (M' + \log R)$$

R = number of µg of biotin that was assumed to be present in the portion of Tablets taken

¹ ATCC No. 8014 is suitable. This strain was formerly known as *Lactobacillus arabinosus* 17-5.

Calculate the percentage of the labeled amount of biotin ($C_{10}H_{16}N_2O_3S$) in the portion of Tablets taken:

$$\text{Result} = [(\text{antilog } M)/N] \times 100$$

N = nominal amount of biotin in the portion of Tablets taken (μg)

Replication: Repeat the entire determination at least once, using separately prepared *Sample solutions*. If the difference between the two log-potencies M is NMT 0.08, their mean, \bar{M} , is the assayed log-potency of the test material (see *Design and Analysis of Biological Assays* (111), *The Confidence Interval and Limits of Potency*). If the two determinations differ by more than 0.08, conduct one or more additional determinations. From the mean of two or more values of M that do not differ by more than 0.15, compute the mean potency of the preparation under assay.

Acceptance criteria: 90.0%–150.0% of the labeled amount of biotin ($C_{10}H_{16}N_2O_3S$)

• **BIOTIN, Method 3**

[NOTE—Use low-actinic glassware throughout this procedure.]

Solution A: Transfer 800 mL of water and 100 mL of triethylamine to a 1000-mL volumetric flask. Add 80 mL of 85% phosphoric acid, and dilute with water to volume.

Mobile phase: Transfer 80 mL of acetonitrile and 10 mL of *Solution A* to a 1000-mL volumetric flask. Dilute with water to volume.

Standard solution: 0.6 $\mu\text{g/mL}$ of USP Biotin RS in water. [NOTE—A portion of the *Standard solution* will be used to determine the percent recovery of biotin from the *Solid-phase extraction* procedure.]

Sample solution: Finely powder NLT 20 Tablets. Transfer an amount of powdered Tablets to a volumetric flask to obtain a concentration of 0.6 $\mu\text{g/mL}$ of biotin. Add water up to 80% of the flask capacity, and sonicate for 30–40 min, with occasional mixing, to dissolve. Dilute with water to volume, and filter. Adjust the pH of the solution with either diluted acetic acid or 0.1 N sodium hydroxide to 6.0–7.0.

Solid-phase extraction [NOTE—Condition the extraction column specified in this procedure in the following manner. Wash the column with a 2-mL portion of methanol. Equilibrate with a 2-mL portion of water.]

Separately pipet 5.0 mL of the *Sample solution* and *Standard solution* into freshly conditioned solid-phase extraction columns consisting of a mixed-mode packing with a sorbent-mass of 60 mg. [NOTE—The mixed-mode packing consists of anion-exchange and reversed-phase sorbents. The reverse-phase component is a copolymer of *N*-vinylpyrrolidone and divinylbenzene. The anion exchange moiety is a trialkylamino group.²]

Wash the column with 10 mL of 30% (v/v) methanol in water. Apply an appropriate volume (4.9 mL) of 30% (v/v) methanol in 0.1 N hydrochloric acid to the column. Collect the eluate in a 5-mL volumetric flask, containing 100 μL of 40% (w/v) sodium acetate in water, and dilute with 30% (v/v) methanol in 0.1 N hydrochloric acid to volume.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 200 nm

Column: 4.6-mm \times 25-cm; packing L1

Flow rate: 2 mL/min

Injection size: 100 μL

System suitability

Samples: *Standard solution* and a portion of *Standard solution* that has undergone *Solid-phase extraction*

Suitability requirements

Tailing factor: NMT 1.5, *Standard solution*

Relative standard deviation: NMT 2.0%, *Standard solution* and the *Standard solution* that has undergone *Solid-phase extraction*

Recovery: 95%–100%, *Standard solution* that has undergone *Solid-phase extraction*

Analysis

Samples: *Standard solution* and *Sample solution* that have both undergone *Solid-phase extraction*

Measure the responses for the biotin peak. Calculate the percentage of the labeled amount of biotin ($C_{10}H_{16}N_2O_3S$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Biotin RS in the *Standard solution* ($\mu\text{g/mL}$)

C_U = nominal concentration of biotin in the *Sample solution* ($\mu\text{g/mL}$)

Acceptance criteria: 90.0%–150.0% of the labeled amount of biotin ($C_{10}H_{16}N_2O_3S$)

• **CYANOCOBALAMIN, Method 1**

[NOTE—Use low-actinic glassware throughout this procedure.]

Mobile phase: Methanol and water (7:13)

Standard stock solution: 10 $\mu\text{g/mL}$ of USP Cyanocobalamin RS in water. [NOTE—Store this stock solution in a dark place, and discard after 1 week.]

Standard solution: 1 $\mu\text{g/mL}$ of USP Cyanocobalamin RS from *Standard stock solution*, diluted with water

Sample solution: Finely powder NLT 30 Tablets.

Transfer a portion of the powder, equivalent to 100 μg of cyanocobalamin, to a 250-mL flask. Quantitatively add 100.0 mL of water, and carefully extract for 2 min. Filter 10 mL of the extract, and use the filtrate.

Chromatographic system

Suitability requirements

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak responses for cyanocobalamin.

Calculate the percentage of the labeled amount of cyanocobalamin ($C_{63}H_{88}CoN_{14}O_{14}P$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Cyanocobalamin RS in the *Standard solution* ($\mu\text{g/mL}$)

C_U = nominal concentration of cyanocobalamin in the *Sample solution* ($\mu\text{g/mL}$)

Acceptance criteria: 90.0%–150.0% of the labeled amount of cyanocobalamin ($C_{63}H_{88}CoN_{14}O_{14}P$)

• **CYANOCOBALAMIN, Method 2**

[NOTE—Use low-actinic glassware throughout this procedure.]

Standard stock solution: 1.0 $\mu\text{g/mL}$ of USP

Cyanocobalamin RS in 25% alcohol. Store in a refrigerator.

Standard solution: Dilute a suitable volume of *Standard stock solution* with water to a measured volume such that after the incubation period as described in the

² A suitable cartridge is the Waters, Oasis MAX Vac RC cartridge, particle size 30 μm , part 186000371.

Analysis, the difference in transmittance between the inoculated blank and the 5.0-mL level of the *Standard solution* is NLT that which corresponds to a difference of 1.25 mg in dried cell weight. This concentration usually falls between 0.01 and 0.04 ng/mL of *Standard solution*. Prepare this solution fresh for each assay.

Sample solution: Finely powder NLT 20 Tablets.

Transfer a portion of the powdered Tablets, equivalent to 1.0 µg of cyanocobalamin, to an appropriate vessel containing, for each g of powdered Tablets taken, 25 mL of an aqueous extracting solution prepared just before use to contain, in each 100 mL, 1.29 g of dibasic sodium phosphate, 1.1 g of anhydrous citric acid, and 1.0 g of sodium metabisulfite. Autoclave the mixture at 121° for 10 min. Allow any undissolved particles of the extract to settle, and filter or centrifuge if necessary. Dilute an aliquot of the clear solution with water to obtain a final solution containing vitamin B₁₂ activity equivalent to the nominal activity of the *Standard solution*.

Acid-hydrolyzed casein solution: Prepare as directed in *Biotin, Method 2*.

Asparagine solution: Dissolve 2.0 g of L-asparagine in water to make 200 mL. Store under toluene in a refrigerator.

Adenine–guanine–uracil solution: Prepare as directed in *Biotin, Method 2*.

Xanthine solution: Suspend 0.20 g of xanthine in 30–40 mL of water, heat to 70°, add 6.0 mL of 6 N ammonium hydroxide, and stir until the solid is dissolved. Cool, and add water to make 200 mL. Store under toluene in a refrigerator.

Salt solution A: Dissolve 10 g of monobasic potassium phosphate and 10 g of dibasic potassium phosphate in water to make 200 mL, and add 2 drops of hydrochloric acid. Store this solution under toluene.

Salt solution B: Dissolve 4.0 g of magnesium sulfate, 0.20 g of sodium chloride, 0.20 g of ferrous sulfate, and 0.20 g of manganese sulfate in water to make 200 mL, and add 2 drops of hydrochloric acid. Store this solution under toluene.

Polysorbate 80 solution: Dissolve 20 g of polysorbate 80 in alcohol to make 200 mL. Store in a refrigerator.

Vitamin solution A: Dissolve 10 mg of riboflavin, 10 mg of thiamine hydrochloride, 100 µg of biotin, and 20 mg of niacin in 0.02 N acetic acid to make 400 mL. Store under toluene, protected from light, in a refrigerator.

Vitamin solution B: Dissolve 20 mg of *p*-aminobenzoic acid, 10 mg of calcium pantothenate, 40 mg of pyridoxine hydrochloride, 40 mg of pyridoxal hydrochloride, 8 mg of pyridoxamine dihydrochloride, and 2 mg of folic acid in a mixture of water and neutralized alcohol (3:1) to make 400 mL. Store, protected from light, in a refrigerator.

Basal medium stock solution: Prepare the medium according to the following formula and directions. A dehydrated mixture containing the same ingredients may be used provided that, when constituted as directed in the labeling, it yields a medium comparable to that obtained from the formula given herein.

Add the ingredients in the order listed, carefully dissolving cystine and tryptophan in the hydrochloric acid before adding the next eight solutions to the resulting solution. Add 100 mL of water, and dissolve dextrose, sodium acetate, and ascorbic acid. Filter, if necessary. Add the *Polysorbate 80 solution*, adjust with 1 N sodium hydroxide to a pH between 5.5 and 6.0, and add *Purified Water* to make 250 mL.

L-Cystine	0.1 g
L-Tryptophan	0.05 g
1 N Hydrochloric acid	10 mL
Adenine–guanine–uracil solution	5 mL

Xanthine solution	5 mL
Vitamin solution A	10 mL
Vitamin solution B	10 mL
Salt solution A	5 mL
Salt solution B	5 mL
Asparagine solution	5 mL
Acid-hydrolyzed casein solution	25 mL
Dextrose, anhydrous	10 g
Sodium acetate, anhydrous	5 g
Ascorbic acid	1 g
Polysorbate 80 solution	5 mL

Tomato juice preparation: Centrifuge commercially canned tomato juice so that most of the pulp is removed. Suspend 5 g/L of analytical filter aid in the supernatant, and pass, with the aid of reduced pressure, through a layer of the filter aid. Repeat, if necessary, until a clear, straw-colored filtrate is obtained. Store under toluene in a refrigerator.

Culture medium: [NOTE—A dehydrated mixture containing the same ingredients may be used provided that, when constituted as directed in the labeling, it yields a medium equivalent to that obtained from the formula given herein.] Dissolve 0.75 g of yeast extract, 0.75 g of dried peptone, 1.0 g of anhydrous dextrose, and 0.20 g of monobasic potassium phosphate in 60–70 mL of water. Add 10 mL of *Tomato juice preparation* and 1 mL of *Polysorbate 80 solution*. Adjust with 1 N sodium hydroxide to a pH of 6.8, and add water to make 100 mL. Place 10-mL portions of the solution in test tubes, and plug with cotton. Sterilize the tubes and contents in an autoclave at 121° for 15 min. Cool as rapidly as possible to avoid color formation resulting from overheating the medium.

Suspension medium: Dilute a measured volume of *Basal medium stock solution* with an equal volume of water. Place 10-mL portions of the diluted medium in test tubes. Sterilize, and cool as directed for *Culture medium*.

Stock culture of *Lactobacillus leichmannii*: To 100 mL of *Culture medium* add 1.0–1.5 g of agar, and heat the mixture on a steam bath, with stirring, until the agar dissolves. Place 10-mL portions of the hot solution in test tubes, cover the tubes, sterilize at 121° for 15 min in an autoclave, and allow the tubes to cool in an upright position. Inoculate three or more of the tubes by stab transfer of a pure culture of *Lactobacillus leichmannii*.³ [NOTE—Before first using a fresh culture in this assay, make NLT 10 successive transfers of the culture in a 2-week period.] Incubate for 16–24 h at a temperature between 30° and 40° held constant to within ±0.5°. Store in a refrigerator.

Prepare fresh stab cultures at least three times each week, and do not use them for preparing the *Inoculum* if more than 4 days old. The activity of the microorganism can be increased by daily or twice-daily transfer of the stab culture, to the point where definite turbidity in the liquid *Inoculum* can be observed 2–4 h after inoculation. A slow-growing culture seldom gives a suitable response curve and may lead to erratic results.

Inoculum: [NOTE—A frozen suspension of *Lactobacillus leichmannii* may be used as the stock culture, provided it yields an *Inoculum* comparable to a fresh culture.]

Make a transfer of cells from the *Stock culture of Lactobacillus leichmannii* to two sterile tubes containing 10 mL of the *Culture medium* each. Incubate these cultures for 16–24 h at a temperature between 30° and 40° held constant to within ±0.5°. Under aseptic conditions centrifuge the cultures, and decant the supernatant. Suspend the cells from the culture in 5 mL

³ Pure cultures of *Lactobacillus leichmannii* (listed as *Lactobacillus delbrueckii*) may be obtained as No. 7830 from ATCC, 10801 University Blvd., Manassas, VA 20110-2209 (www.atcc.org).

of *Suspension medium*, and combine. Using *Suspension medium*, adjust the volume so that a 1-in-20 dilution in saline TS produces 70% transmittance when read on a suitable spectrophotometer that has been set at a wavelength of 530 nm, equipped with a 10-mm cell, and read against saline TS set at 100% transmittance. Prepare a 1-in-400 dilution of the adjusted suspension using sterile *Basal medium stock solution*. The cell suspension so obtained is the *Inoculum*. [NOTE—This dilution may be altered, when necessary, to obtain the desired test response.]

Calibration of spectrophotometer: Check the wavelength of the spectrophotometer periodically, using a standard wavelength cell or other suitable device. Before reading any tests, calibrate the spectrophotometer for 0% and 100% transmittance, using water and with the wavelength set at 530 nm.

Analysis

Samples: *Standard solution* and *Sample solution*
Because of the high sensitivity of the test organism to minute amounts of vitamin B₁₂ activity and to traces of many cleansing agents, cleanse meticulously by suitable means, followed preferably by heating at 250° for 2 h, using hard-glass 20-mm × 150-mm test tubes, and other necessary glassware.

To separate test tubes add, in duplicate, 1.0, 1.5, 2.0, 3.0, 4.0, and 5.0 mL of the *Standard solution*. To each of these tubes and to four similar empty tubes add 5.0 mL of *Basal medium stock solution* and sufficient water to make 10 mL.

To similar separate test tubes add, in duplicate, 1.0, 1.5, 2.0, 3.0, and 4.0 mL of the *Sample solution*. To each tube add 5.0 mL of *Basal medium stock solution* and sufficient water to make 10 mL. Place one complete set of Standard and sample tubes together in one tube rack and the duplicate set in a second rack or section of a rack, preferably in random order.

Cover the tubes to prevent bacterial contamination, and sterilize in an autoclave at 121° for 5 min, arranging to reach this temperature in NMT 10 min by preheating the autoclave if necessary. Cool as rapidly as possible to avoid color formation resulting from overheating the medium. Take precautions to maintain uniformity of sterilizing and cooling conditions throughout the assay, because packing the tubes too closely in the autoclave or overloading it may cause variation in the heating rate.

Aseptically add 0.5 mL of *Inoculum* to each tube so prepared, except two of the four containing no *Standard solution* (the uninoculated blanks). Incubate the tubes at a temperature between 30° and 40°, held constant to within ±0.5°, for 16–24 h.

Terminate growth by heating to a temperature NLT 80° for 5 min. Cool to room temperature. After agitating its contents, read the transmittance at 530 nm when a steady state is reached. This steady state is observed a few seconds after agitation when the reading remains constant for 30 s or more. Allow approximately the same time interval for the reading on each tube.

With the transmittance set at 100% for the uninoculated blank, read the transmittance of the inoculated blank. If the difference is greater than 5%, or if there is evidence of contamination with a foreign microorganism, disregard the results of the assay.

With the transmittance set at 100% for the uninoculated blank, read the transmittance of each of the remaining tubes. Disregard the results of the assay if the slope of the standard curve indicates a problem with sensitivity.

Calculation: Prepare a standard concentration-response curve by the following procedure. Test for and replace any aberrant individual transmittances. For each level of the Standard, calculate the response from the sum of the duplicate values of the transmittances (Σ_s) as the difference, $y = 2.00 - \Sigma_s$. Plot this response on the ordinate of cross-section paper against the

logarithm of the mL of *Standard solution* per tube on the abscissa, using for the ordinate either an arithmetic or a logarithmic scale, whichever gives the better approximation to a straight line. Draw the straight line or smooth curve that best fits the plotted points.

Calculate the response, $y = 2.00 - \Sigma_u$, adding together the two transmittances for each level of the *Sample solution* (Σ_u). Read from the standard curve the logarithm of the volume of the *Standard solution* corresponding to each of those values of y that falls within the range of the lowest and highest points plotted for the Standard. Subtract from each logarithm so obtained the logarithm of the volume, in mL, of the *Sample solution* to obtain the difference, X , for each dosage level. Average the values of X for each of three or more dosage levels to obtain \bar{X} , which equals the log-relative potency, M' , of the *Sample solution*. Determine the quantity, in μg , of cyanocobalamin ($\text{C}_{63}\text{H}_{88}\text{CoN}_{14}\text{O}_{14}\text{P}$) in the portion of Tablets taken:

$$\text{antilog } M = \text{antilog } (M' + \log R)$$

R = number of μg of cyanocobalamin that was assumed to be present in the portion of Tablets taken

Calculate the percentage of the labeled amount of cyanocobalamin ($\text{C}_{63}\text{H}_{88}\text{CoN}_{14}\text{O}_{14}\text{P}$) in the portion of Tablets taken:

$$\text{Result} = [(\text{antilog } M)/N] \times 100$$

N = nominal amount of cyanocobalamin in the portion of Tablets taken (μg)

Replication: Repeat the entire determination at least once, using separately prepared *Sample solutions*. If the difference between the two log-potencies M is NMT 0.08, their mean, \bar{M} , is the assayed log-potency of the test material (see *Vitamin B₁₂ Activity in Design and Analysis of Biological Assays* (111), *The Confidence Interval and Limits of Potency*). If the two determinations differ by more than 0.08, conduct one or more additional determinations. From the mean of two or more values of M that do not differ by more than 0.15, compute the mean potency of the preparation under assay.

Acceptance criteria: 90.0%–150.0% of the labeled amount of cyanocobalamin ($\text{C}_{63}\text{H}_{88}\text{CoN}_{14}\text{O}_{14}\text{P}$)

• Folic Acid, Method 1

[NOTE—Use low-actinic glassware throughout this procedure.]

Reagent A: 25% solution of tetrabutylammonium hydroxide in methanol

Reagent B: Transfer 5.0 g of pentetic acid to a 50-mL volumetric flask. Using sonication if necessary, dissolve in and dilute with 1 N sodium hydroxide to volume.

Mobile phase: 2 g of monobasic potassium phosphate in 650 mL of water. Add 12.0 mL of *Reagent A*, 7.0 mL of 3 N phosphoric acid, and 240 mL of methanol. Cool to room temperature, adjust with phosphoric acid or ammonia TS to a pH of 7.0, dilute with water to 1000 mL, and filter. Recheck the pH before use.

[NOTE—The methanol and water content may be varied (between 1% and 3%) by adding water or methanol to the prepared *Mobile phase* to obtain baseline separation of folic acid and the internal standard. The pH may be increased up to 7.15 to obtain better separation.]

Internal standard solution: Transfer 40 mg of methylparaben to a 1000-mL volumetric flask, and add 220 mL of methanol to dissolve. Dissolve 2.0 g of monobasic potassium phosphate in 300 mL of water in a separate beaker, quantitatively transfer this solution to the flask containing the methylparaben solution, and add an additional 300 mL of water. Add 19 mL of *Reagent A*, 7 mL of 3 N phosphoric acid, and 30 mL of *Reagent B*. Adjust with ammonia TS to a pH of 9.8,

bubble nitrogen through the solution for 30 min, dilute with water to volume, and mix.

Standard solution: 0.016 mg/mL of USP Folic Acid RS in *Internal standard solution*

Sample solution: Finely powder NLT 30 Tablets.

Transfer a portion of powder, equivalent to 0.4 mg of folic acid, to a 50-mL amber-colored centrifuge tube. Add 25.0 mL of *Internal standard solution*, shake by mechanical means for 10 min, and centrifuge. Filter a portion of the clear supernatant, and use the filtrate.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 3.9-mm × 30-cm; packing L1

Flow rate: 1 mL/min

Injection size: 15 µL

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for folic acid and methylparaben are about 0.8 and 1.0, respectively.]

Suitability requirements

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas for folic acid and methylparaben. Calculate the percentage of the labeled amount of folic acid ($C_{19}H_{19}N_7O_6$) in the portion of Tablets taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = peak area ratio of folic acid to methylparaben from the *Sample solution*

R_S = peak area ratio of folic acid to methylparaben from the *Standard solution*

C_S = concentration of USP Folic Acid RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of folic acid in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–150.0% of the labeled amount of folic acid ($C_{19}H_{19}N_7O_6$)

• FOLIC ACID, Method 2

[NOTE—Use low-actinic glassware throughout this procedure.]

Diluent: 60 µg/mL of ammonium hydroxide

Mobile phase: Transfer 0.4 mL of triethylamine, 15.0 mL of glacial acetic acid, and 350 mL of methanol to a 2000-mL volumetric flask, and dilute with 0.008 M sodium 1-hexanesulfonate to volume.

Standard stock solution: 60 µg/mL of USP Folic Acid RS in *Diluent*. Prepare this solution fresh daily.

Standard solution: Mix 5.0 mL of *Standard stock solution* with 10.0 mL of a mixture of methanol and glacial acetic acid (9:1) and 30.0 mL of a mixture of methanol and ethylene glycol (1:1). Shake for 15 min in a water bath maintained at 60°, and cool. Filter, discarding the first few mL of the filtrate.

Sample solution: Transfer a portion of finely powdered Tablets, equivalent to 0.3 mg of folic acid, to a 125-mL stoppered flask. Add 10.0 mL of a mixture of methanol and glacial acetic acid (9:1) and 30.0 mL of a mixture of methanol and ethylene glycol (1:1). Shake for 15 min in a water bath maintained at 60°, and cool. Filter, discarding the first few mL of the filtrate.

Suitability requirements

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak responses for calcium pantothenate and the internal standard. Calculate the percentage of the labeled amount of calcium pantothenate ($C_{18}H_{32}CaN_2O_{10}$) in the portion of Tablets taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = peak response ratio of calcium pantothenate to *p*-hydroxybenzoic acid from the *Sample solution*

R_S = peak response ratio of calcium pantothenate to *p*-hydroxybenzoic acid from the *Standard solution*

C_S = concentration of USP Calcium Pantothenate RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of calcium pantothenate in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–150.0% of the labeled amount of calcium pantothenate ($C_{18}H_{32}CaN_2O_{10}$)

• **CALCIUM PANTOTHENATE, Method 2**

Standard stock solution: Dissolve 50 mg of USP Calcium Pantothenate RS, previously dried and stored in the dark over phosphorus pentoxide and protected from absorption of moisture while weighing, in 500 mL of water in a 1000-mL volumetric flask. Add 10 mL of 0.2 N acetic acid and 100 mL of sodium acetate solution (1 in 60), and dilute with water to volume, to obtain a concentration of 50 µg/mL of USP Calcium Pantothenate RS. Store under toluene in a refrigerator.

Standard solution: On the day of the assay, dilute a volume of *Standard stock solution* with water to obtain a concentration of 0.01–0.04 µg/mL of calcium pantothenate, the exact concentration being such that the responses obtained as directed in the *Analysis*, 2.0 and 4.0 mL of the *Standard solution* being used, are within the linear portion of the log-concentration response curve.

Sample solution: Finely powder NLT 30 Tablets. Transfer a portion of the powder, equivalent to 50 mg of calcium pantothenate, to a 1000-mL volumetric flask containing 500 mL of water. Add 10 mL of 0.2 N acetic acid and 100 mL of sodium acetate solution (1 in 60), dilute with water to volume, and filter. Dilute a volume of this solution to obtain a solution having approximately the same concentration as that of the *Standard solution*.

Acid-hydrolyzed casein solution: Mix 100 g of vitamin-free casein with 500 mL of 6 N hydrochloric acid, and reflux the mixture for 8–12 h. Remove the hydrochloric acid from the mixture by distillation under reduced pressure until a thick paste remains. Redissolve the resulting paste in water, adjust the solution with 1 N sodium hydroxide to a pH of 3.5 ± 0.1 , and add water to make 1000 mL. Add 20 g of activated charcoal, stir for 1 h, and filter. Repeat the treatment with activated charcoal. Store under toluene in a cool place at a temperature not below 10°. Filter the solution if a precipitate forms during storage.

Cystine–tryptophan solution: Suspend 4.0 g of L-cystine in a solution of 1.0 g of L-tryptophan (or 2.0 g of D,L-tryptophan) in 700–800 mL of water, heat to 70°–80°, and add dilute hydrochloric acid (1 in 2) dropwise, with stirring, until the solids are dissolved. Cool, and add water to make 1000 mL. Store under toluene in a cool place at a temperature not below 10°.

Adenine–guanine–uracil solution: Dissolve 200 mg each of adenine sulfate, guanine hydrochloride, and uracil, with the aid of heat, in 10 mL of 4 N hydrochloric acid. Cool, and add water to make 200 mL. Store under toluene in a refrigerator.

Polysorbate 80 solution: 100 mg/mL of polysorbate 80 in alcohol

Riboflavin–thiamine hydrochloride–biotin solution: 20 µg/mL of riboflavin, 10 µg/mL of thiamine hydrochloride, and 0.04 µg/mL of biotin in 0.02 N acetic acid. Store under toluene, protected from light, in a refrigerator.

p-Aminobenzoic acid–niacin–pyridoxine hydrochloride solution: 10 µg/mL of p-aminobenzoic acid, 50 µg/mL of niacin, and 40 µg/mL of pyridoxine hydrochloride in a mixture of neutralized alcohol and water (1:3). Store in a refrigerator.

Salt solution A: Dissolve 25 g of monobasic potassium phosphate and 25 g of dibasic potassium phosphate in water to make 500 mL. Add 5 drops of hydrochloric acid. Store under toluene.

Salt solution B: Dissolve 10 g of magnesium sulfate, 0.5 g of sodium chloride, 0.5 g of ferrous sulfate, and 0.5 g of manganese sulfate in water to make 500 mL. Add 5 drops of hydrochloric acid. Store under toluene.

Basal medium stock solution

Acid-hydrolyzed casein solution	25 mL
Cystine–tryptophan solution	25 mL
Polysorbate 80 solution	0.25 mL
Dextrose, anhydrous	10 g
Sodium acetate, anhydrous	5 g
Adenine–guanine–uracil solution	5 mL
Riboflavin–thiamine hydrochloride–biotin solution	5 mL
p-Aminobenzoic acid–niacin–pyridoxine hydrochloride solution	5 mL
Salt solution A	5 mL
Salt solution B	5 mL

Dissolve the anhydrous dextrose and anhydrous sodium acetate in the solutions previously mixed, and adjust with 1 N sodium hydroxide to a pH of 6.8. Dilute with water to 250 mL.

Stock culture of *Lactobacillus plantarum*: Dissolve 2.0 g of yeast extract in 100 mL of water; add 500 mg of anhydrous dextrose, 500 mg of anhydrous sodium acetate, and 1.5 g of agar; and heat the mixture on a steam bath, with stirring, until the agar dissolves. Add 10-mL portions of the hot solution to the test tubes, close or cover the tubes, sterilize in an autoclave at 121° for 15 min, and allow the tubes to cool in an upright position. Prepare stab cultures in three or more of the tubes, using a pure culture of *Lactobacillus plantarum*⁴ incubating for 16–24 h at a temperature between 30° and 37° held constant to within $\pm 0.5^\circ$. Store in a refrigerator. Prepare a fresh stab of the stock culture every week, and do not use for *Inoculum* if the culture is more than 1 week old.

Culture medium: To each of a series of test tubes containing 5.0 mL of *Basal medium stock solution* add 5.0 mL of water containing 0.2 µg of calcium pantothenate. Plug the tubes with cotton, sterilize in an autoclave at 121° for 15 min, and cool.

Inoculum: [NOTE—A frozen suspension of *Lactobacillus plantarum* may be used as the stock culture, provided it yields an *Inoculum* comparable to a fresh culture.]

Make a transfer of cells from the *Stock culture* of *Lactobacillus plantarum* to a sterile tube containing 10 mL of *Culture medium*. Incubate this culture for 16–24 h at a temperature between 30° and 37° held constant to within $\pm 0.5^\circ$. The cell suspension so obtained is the *Inoculum*.

Analysis

Samples: *Standard solution* and *Sample solution*
To similar separate test tubes add, in duplicate, 1.0 and/or 1.5, 2.0, 3.0, 4.0, and 5.0 mL of the *Standard solution*. To each tube and to four similar empty tubes add 5.0 mL of *Basal medium stock solution* and sufficient water to make 10 mL.

To similar separate test tubes add, in duplicate, volumes of the *Sample solution* corresponding to three or more of the levels specified for the *Standard solution*, including the levels of 2.0, 3.0, and 4.0 mL. To each tube add 5.0 mL of the *Basal medium stock solution* and sufficient water to make 10 mL. Place one complete set of *Standard* and *sample* tubes together in one tube rack and the duplicate set in a second rack or section of a rack, preferably in random order.

Cover the tubes of both series to prevent contamination, and sterilize in an autoclave at 121° for 5 min. Cool, and add 1 drop of *Inoculum* to each tube, except two of the four tubes containing no *Standard solution* (the uninoculated blanks). Incubate the tubes at a temperature between 30° and 37°, held constant to within $\pm 0.5^\circ$ until, following 16–24 h of incubation, there has been no substantial increase in turbidity in

⁴ ATCC No. 8014 is suitable. This strain was formerly known as *Lactobacillus arabinosus* 17-5.

the tubes containing the highest level of Standard during a 2-h period.

Determine the transmittance of the tubes in the following manner. Mix the contents of each tube, and transfer to an optical container if necessary. Place the container in a spectrophotometer that has been set at a specific wavelength between 540 and 660 nm, and read the transmittance when a steady state is reached. This steady state is observed a few seconds after agitation when the galvanometer reading remains constant for 30 s or more. Allow approximately the same time interval for the reading on each tube.

With the transmittance set at 1.00 for the uninoculated blank, read the transmittance of the inoculated blank. With the transmittance set at 1.00 for the inoculated blank, read the transmittance for each of the remaining tubes. If there is evidence of contamination with a foreign microorganism, disregard the result of the assay.

Calculation: Prepare a standard concentration-response curve as follows. For each level of the Standard, calculate the response from the sum of the duplicate values of the transmittance (Σ_s) as the difference, $y = 2.00 - \Sigma_s$. Plot this response on the ordinate of cross-section paper against the logarithm of the mL of *Standard solution* per tube on the abscissa, using for the ordinate either an arithmetic or a logarithmic scale, whichever gives the better approximation to a straight line. Draw the straight line or smooth curve that best fits the plotted points.

Calculate the response, $y = 2.00 - \Sigma_u$, adding together the two transmittances for each level of the *Sample solution* (Σ_u). Read from the standard curve the logarithm of the volume of the *Standard solution* corresponding to each of those values of y that falls within the range of the lowest and highest points plotted for the Standard. Subtract from each logarithm so obtained the logarithm of the volume, in mL, of the *Sample solution* to obtain the difference, X , for each dosage level. Average the values of X for each of three or more dosage levels to obtain \bar{X} , which equals the log-relative potency, M' , of the *Sample solution*. Determine the quantity, in mg, of calcium pantothenate ($C_{18}H_{32}CaN_2O_{10}$) in the portion of Tablets taken:

$$\text{antilog } M = \text{antilog } (M' + \log R)$$

R = number of mg of calcium pantothenate that was assumed to be present in the portion of Tablets taken

Calculate the percentage of the labeled amount of calcium pantothenate in the portion of Tablets taken:

$$\text{Result} = [(\text{antilog } M)/N] \times 100$$

N = nominal amount of calcium pantothenate in the portion of Tablets taken (mg)

Replication: Repeat the entire determination at least once, using separately prepared *Sample solutions*. If the difference between the two log-potencies M is NMT 0.08, their mean, \bar{M} , is the assayed log-potency of the test material (see *Design and Analysis of Biological Assays* (111), *The Confidence Interval and Limits of Potency*). If the two determinations differ by more than 0.08, conduct one or more additional determinations. From the mean of two or more values of M that do not differ by more than 0.15, compute the mean potency of the preparation under assay.

Acceptance criteria: 90.0%–150.0% of the labeled amount of calcium pantothenate ($C_{18}H_{32}CaN_2O_{10}$)

• **CALCIUM PANTOTHENATE, Method 3**

Buffer solution: Dissolve 10.0 g of monobasic potassium phosphate in 2000 mL of water, and adjust with phosphoric acid to a pH of 3.5.

Mobile phase: Methanol and *Buffer solution* (1:9)

Standard stock solution: 0.25 mg/mL of USP Calcium Pantothenate RS in water. Prepare fresh every 4 weeks. Store in a refrigerator.

Standard solution: 40 µg/mL of USP Calcium Pantothenate RS from *Standard stock solution* diluted with water

Sample solution: Finely powder NLT 20 Tablets. Transfer a portion of the powder, equivalent to 10 mg of calcium pantothenate, to a 250-mL volumetric flask. Add 10 mL of methanol, and swirl the flask to disperse. Dilute with water to volume, mix, and filter.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 205 nm

Column: 3.9-mm × 30-cm; 5-µm packing L1

Column temperature: 50°

Flow rate: 2 mL/min

Injection size: 25 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas for calcium pantothenate.

Calculate the percentage of the labeled amount of calcium pantothenate ($C_{18}H_{32}CaN_2O_{10}$) in the portion of Tablets taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

r_u = peak area from the *Sample solution*

r_s = peak area from the *Standard solution*

C_s = concentration of USP Calcium Pantothenate RS in the *Standard solution* (mg/mL)

C_u = nominal concentration of calcium pantothenate in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–150.0% of the labeled amount of calcium pantothenate ($C_{18}H_{32}CaN_2O_{10}$)

• **NIACIN or NIACINAMIDE, PYRIDOXINE HYDROCHLORIDE, RIBOFLAVIN, and THIAMINE, Method 1**

[NOTE—Use low-actinic glassware throughout this procedure.]

Diluent: Acetonitrile, glacial acetic acid, and water (5:1:94)

Mobile phase: A mixture of methanol, glacial acetic acid, and water (27:1:73) containing 140 mg of sodium 1-hexanesulfonate per 100 mL

Standard solution: [NOTE—Use USP Niacin RS in place of USP Niacinamide RS for formulations containing niacin.] Transfer 80 mg of USP Niacinamide RS, 20 mg of USP Pyridoxine Hydrochloride RS, 20 mg of USP Riboflavin RS, and 20 mg of USP Thiamine Hydrochloride RS to a 200-mL volumetric flask, and add 180 mL of *Diluent*. Immerse the flask in a hot water bath maintained at 65°–70° for 10 min with regular shaking or using a vortex mixer, until all the solid materials are dissolved. Chill rapidly in a cold water bath for 10 min to room temperature, and dilute with *Diluent* to volume.

Sample solution: Finely powder NLT 30 Tablets. Transfer a portion of the powder, equivalent to 10 mg of niacinamide and 2.5 mg each of pyridoxine hydrochloride, riboflavin, and thiamine hydrochloride, to a 50-mL centrifuge tube. Add 25.0 mL of *Diluent*, and mix using a vortex mixer for 30 s to completely suspend the powder. Immerse the centrifuge tube in a hot water bath maintained at 65°–70°, heat for 5 min, and mix on a vortex mixer for 30 s. Return the tube to the hot water bath, heat for another 5 min, and mix on a vortex mixer for 30 s. Filter a portion of the solution,

cool to room temperature, and use the clear filtrate.
[NOTE—Use the filtrate within 3 h of filtration.]

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 3.9-mm × 30-cm; packing L1

Flow rate: 1 mL/min

Injection size: 10 µL

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for niacinamide, pyridoxine, riboflavin, and thiamine are about 0.3, 0.5, 0.8, and 1.0, respectively.]

Suitability requirements

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas for niacin or niacinamide, pyridoxine, riboflavin, and thiamine. Calculate the percentage of the labeled amount of niacinamide ($C_6H_6N_2O$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of niacinamide from the *Sample solution*

r_S = peak area of niacinamide from the *Standard solution*

C_S = concentration of USP Niacinamide RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of niacinamide in the *Sample solution* (mg/mL)

For formulations containing niacin:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of niacin from the *Sample solution*

r_S = peak area of niacin from the *Standard solution*

C_S = concentration of USP Niacin RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of niacin in the *Sample solution* (mg/mL)

Separately calculate the percentage of the labeled amount of pyridoxine hydrochloride ($C_8H_{11}NO_3 \cdot HCl$), riboflavin ($C_{17}H_{20}N_4O_6$), and thiamine hydrochloride ($C_{12}H_{17}ClN_4OS \cdot HCl$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of the corresponding vitamin from the *Sample solution*

r_S = peak area of the corresponding vitamin from the *Standard solution*

C_S = concentration of the relevant USP Reference Standard in the *Standard solution* (mg/mL)

C_U = nominal concentration of the corresponding vitamin in the *Sample solution* (mg/mL)

For products containing thiamine mononitrate, calculate the percentage of the labeled amount of thiamine mononitrate ($C_{12}H_{17}N_5O_4S$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak area of thiamine from the *Sample solution*

r_S = peak area of thiamine from the *Standard solution*

C_S = concentration of USP Thiamine Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of thiamine mononitrate in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of thiamine mononitrate, 327.36

M_{r2} = molecular weight of thiamine hydrochloride, 337.27

Acceptance criteria: 90.0%–150.0% of the labeled amount of niacinamide ($C_6H_6N_2O$) or niacin ($C_6H_5NO_2$), pyridoxine hydrochloride ($C_8H_{11}NO_3 \cdot HCl$), riboflavin ($C_{17}H_{20}N_4O_6$), and thiamine as thiamine hydrochloride ($C_{12}H_{17}ClN_4OS \cdot HCl$) or thiamine mononitrate ($C_{12}H_{17}N_5O_4S$)

• NIACIN, Method 2

[NOTE—Use low-actinic glassware throughout this procedure.]

Solution A: Transfer 1 mL of glacial acetic acid and 2.5 g of edetate disodium to a 100-mL volumetric flask. Dissolve in and dilute with water to volume.

Extraction solvent: *Solution A* and methanol (3:1)

Mobile phase: 0.1 M Sodium acetate solution (13.6 mg/mL of sodium acetate in water). Adjust with acetic acid to a pH of 5.4. [NOTE—A small amount of methanol (up to 1%) may be added to the *Mobile phase* to improve resolution.]

Standard stock solution: 1 mg/mL of USP Niacin RS in *Extraction solvent*

Standard solution: Transfer 5.0 mL of *Standard stock solution* to a 25-mL volumetric flask, and dilute with *Extraction solvent* to volume.

Sample solution: [NOTE—This preparation is suitable for the determination of niacin or niacinamide, pyridoxine, and riboflavin, when present in the formulation.] Finely powder NLT 20 Tablets. Transfer a portion of the powder, equivalent to 2 mg of riboflavin, to a 200-mL volumetric flask. If riboflavin is not present in the formulation, transfer a portion of the powder, equivalent to 2 mg of pyridoxine. If pyridoxine is not present in the formulation, transfer a portion of the powder, equivalent to 20 mg of niacin or niacinamide. Add 100.0 mL of *Extraction solvent*, and mix for 20 min, using a wrist-action shaker. Immerse the flask in a water bath maintained at 70°–75°, and heat for 20 min. Mix on a vortex mixer for 30 s, cool to room temperature, and filter. Use the clear filtrate.

Samples: *Standard solution* and *Sample solution*

Measure the areas of the peaks. Calculate the percentage of the labeled amount of niacin ($C_6H_5NO_2$)

or niacinamide ($C_6H_6N_2O$) in the portion of Tablets taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

- r_u = peak area of niacin or niacinamide from the *Sample solution*
 r_s = peak area of niacin or niacinamide from the *Standard solution*
 C_s = concentration of USP Niacin RS or USP Niacinamide RS in the *Standard solution* (mg/mL)
 C_u = nominal concentration of niacin or niacinamide in the *Sample solution* (mg/mL)

Separately calculate the percentage of the labeled amount of pyridoxine hydrochloride ($C_8H_{11}NO_3 \cdot HCl$), riboflavin ($C_{17}H_{20}N_4O_6$), and thiamine hydrochloride ($C_{12}H_{17}ClN_4OS \cdot HCl$) in the portion of Tablets taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

- r_u = peak area of the corresponding vitamin from the *Sample solution*
 r_s = peak area of the corresponding vitamin from the *Standard solution*
 C_s = concentration of the relevant USP Reference Standard in the *Standard solution* (mg/mL)
 C_u = nominal concentration of the corresponding vitamin in the *Sample solution* (mg/mL)

For products containing thiamine mononitrate, calculate the percentage of the labeled amount of thiamine mononitrate ($C_{12}H_{17}N_5O_4S$) in the portion of Tablets taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times (M_{r1}/M_{r2}) \times 100$$

- r_u = peak area of thiamine from the *Sample solution*
 r_s = peak area of thiamine from the *Standard solution*
 C_s = concentration of USP Thiamine Hydrochloride RS in the *Standard solution* (mg/mL)
 C_u = nominal concentration of thiamine mononitrate in the *Sample solution* (mg/mL)
 M_{r1} = molecular weight of thiamine mononitrate, 327.36
 M_{r2} = molecular weight of thiamine hydrochloride, 337.27

Acceptance criteria: 90.0%–150.0% of the labeled amount of niacin ($C_6H_5NO_2$) or niacinamide ($C_6H_6N_2O$), pyridoxine hydrochloride ($C_8H_{11}NO_3 \cdot HCl$), riboflavin ($C_{17}H_{20}N_4O_6$), and thiamine as thiamine hydrochloride ($C_{12}H_{17}ClN_4OS \cdot HCl$) or thiamine mononitrate ($C_{12}H_{17}N_5O_4S$)

PERFORMANCE TESTS

- **DISINTEGRATION AND DISSOLUTION OF DIETARY SUPPLEMENTS** <2040>: Meet the requirements for *Dissolution*
- **WEIGHT VARIATION OF DIETARY SUPPLEMENTS** <2091>: Meet the requirements

CONTAMINANTS

- **MICROBIAL ENUMERATION TESTS—NUTRITIONAL AND DIETARY SUPPLEMENTS** <2021>: The total aerobic microbial count does not exceed 3000 cfu/g, and the combined molds and yeasts count does not exceed 300 cfu/g.
- **MICROBIOLOGICAL PROCEDURES FOR ABSENCE OF SPECIFIED MICROORGANISMS—NUTRITIONAL AND DIETARY SUPPLEMENTS** <2022>: Meet the requirements of the tests for absence of *Salmonella* species, *Escherichia coli*, and *Staphylococcus aureus*

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.

- **LABELING:** The label states that the product is Water-Soluble Vitamins Tablets. The label also states the quantity of each vitamin in terms of metric units per dosage unit, and where necessary, the salt form in which it is present. Where more than one assay method is given for a particular vitamin, the labeling states which assay method is used only if *Method 1* is not used.
- **USP REFERENCE STANDARDS** <11>

Water-Soluble Vitamins with Minerals Capsules

DEFINITION

Water-Soluble Vitamins with Minerals Capsules contain one or more of the following water-soluble vitamins: Ascorbic Acid or its equivalent as Calcium Ascorbate or Sodium Ascorbate, Biotin, Cyanocobalamin, Folic Acid, Dexpantenol or Panthenol, Pantothenic Acid (as Calcium Pantothenate or Racemic Calcium Pantothenate), Niacin or Niacinamide, Pyridoxine Hydrochloride, Riboflavin, and Thiamine Hydrochloride or Thiamine Mononitrate; and one mineral or more, furnishing one or more of the following elements in ionizable form: boron, calcium, chromium, copper, fluorine, iodine, iron, magnesium, manganese, molybdenum, nickel, phosphorus, potassium, selenium, tin, vanadium, and zinc, derived from substances generally recognized as safe. Capsules contain NLT 90.0% and NMT 150.0% of the labeled quantities of ascorbic acid ($C_6H_8O_6$) or its salts as calcium ascorbate ($C_{12}H_{14}CaO_{12} \cdot 2H_2O$) or sodium ascorbate ($C_6H_7NaO_6$), biotin ($C_{10}H_{16}N_2O_3S$), cyanocobalamin ($C_{63}H_{88}CoN_{14}O_{14}P$), folic acid ($C_{19}H_{19}N_7O_6$), dexpantenol ($C_9H_{19}NO_4$) or panthenol ($C_9H_{19}NO_4$), calcium pantothenate ($C_{18}H_{32}CaN_2O_{10}$), niacin ($C_6H_5NO_2$) or niacinamide ($C_6H_6N_2O$), pyridoxine hydrochloride ($C_8H_{11}NO_3 \cdot HCl$), riboflavin ($C_{17}H_{20}N_4O_6$), and thiamine ($C_{12}H_{17}ClN_4OS$) as thiamine hydrochloride or thiamine mononitrate; NLT 90.0% and NMT 125.0% of the labeled quantities of calcium (Ca), copper (Cu), iron (Fe), magnesium (Mg), manganese (Mn), phosphorus (P), potassium (K), and zinc (Zn); and NLT 90.0% and NMT 160.0% of the labeled quantities of boron (B), chromium (Cr), fluorine (F), iodine (I), molybdenum (Mo), nickel (Ni), selenium (Se), tin (Sn), and vanadium (V).

They do not contain any form of Beta Carotene or Vitamin A, D, E, or K. They may contain other labeled added substances that are generally recognized as safe, in quantities that are unobjectionable.

STRENGTH

[NOTE—In the following assays, where more than one assay method is given for an individual ingredient, the requirements may be met by following any one of the specified methods, the method used being stated in the labeling only if *Method 1* is not used.]

- **ASCORBIC ACID, Method 1**
Sample solution: Weigh NLT 20 Capsules in a tared weighing bottle. Open the Capsules, without the loss of

shell material, and transfer the contents to a 100-mL beaker. Remove any contents adhering to the empty shells by washing, if necessary, with several portions of ether. Discard the washings, and dry the Capsule shells with the aid of a current of dry air until the odor of ether is no longer perceptible. Weigh the empty Capsule shells in the tared weighing bottle, and calculate the average net weight/Capsule. Transfer a portion of the Capsule contents, equivalent to a nominal amount of 100 mg of ascorbic acid, to a 200-mL volumetric flask, and add 75 mL of metaphosphoric-acetic acids TS. Insert a stopper into the flask, and shake by mechanical means for 30 min. Dilute with water to volume. Transfer a portion of the solution to a centrifuge tube, and centrifuge until a clear supernatant is obtained. Pipet 4.0 mL of this solution into a 50-mL conical flask, and add 5 mL of metaphosphoric-acetic acids TS.

Analysis: Titrate with standard dichlorophenol-indophenol solution VS to a rose-pink color that persists for at least 5 s. Correct for the volume of dichlorophenol-indophenol solution consumed by a mixture of 5.5 mL of metaphosphoric-acetic acids TS and 15 mL of water. From the ascorbic acid equivalent of the standard dichlorophenol-indophenol solution, calculate the content of ascorbic acid in each Capsule.

Acceptance criteria: 90.0%–150.0% of the labeled amount of ascorbic acid ($C_6H_8O_6$)

- **ASCORBIC ACID, Method 2:** Proceed as directed in *Automated Methods of Analysis* <16>, Assay for Ascorbic Acid.
Acceptance criteria: 90.0%–150.0% of the labeled amount of ascorbic acid ($C_6H_8O_6$)
- **CALCIUM ASCORBATE, Method 1:** Proceed as directed in the assay for Ascorbic Acid, Method 1.
Acceptance criteria: 90.0%–150.0% of the labeled amount of calcium ascorbate ($C_{12}H_{14}CaO_{12} \cdot 2H_2O$)
- **CALCIUM ASCORBATE, Method 2:** Proceed as directed in *Automated Methods of Analysis* <16>, Assay for Ascorbic Acid.
Acceptance criteria: 90.0%–150.0% of the labeled amount of calcium ascorbate ($C_{12}H_{14}CaO_{12} \cdot 2H_2O$)
- **SODIUM ASCORBATE, Method 1:** Proceed as directed in the assay for Ascorbic Acid, Method 1.
Acceptance criteria: 90.0%–150.0% of the labeled amount of sodium ascorbate ($C_6H_7NaO_6$)
- **SODIUM ASCORBATE, Method 2:** Proceed as directed in *Automated Methods of Analysis* <16>, Assay for Ascorbic Acid.
Acceptance criteria: 90.0%–150.0% of the labeled amount of sodium ascorbate ($C_6H_7NaO_6$)

- **BIOTIN, Method 1**
 [NOTE—Use low-actinic glassware throughout this procedure.]

Mobile phase: Mix 85 mL of acetonitrile, 1 g of sodium perchlorate, and 1 mL of phosphoric acid, and dilute with water to 1000 mL.

Standard stock solution: 0.333 mg/mL of USP Biotin RS in dimethyl sulfoxide

Standard solution: 5 µg/mL of USP Biotin RS, prepared by diluting the *Standard stock solution* with water

Sample solution: Proceed as directed in the assay for Ascorbic Acid, Method 1, through “calculate the average net weight/Capsule”. Transfer a portion of the Capsule contents, equivalent to a nominal amount of 1 mg of biotin, to a 200-mL volumetric flask. Add 3 mL of dimethyl sulfoxide, and swirl to wet the contents. Place the flask in a water bath at 60°–70° for 5 min. Sonicate for 5 min, dilute with water to volume, and filter.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 200 nm

Column: 4.6-mm × 15-cm; 3-μm packing L7

Flow rate: 1.2 mL/min

Injection size: 100 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the responses for the biotin peaks. Calculate the percentage of the labeled amount of biotin ($C_{10}H_{16}N_2O_3S$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Biotin RS in the *Standard solution* (μg/mL)

C_U = nominal concentration of biotin in the *Sample solution* (μg/mL)

Acceptance criteria: 90.0%–150.0% of the labeled amount of biotin ($C_{10}H_{16}N_2O_3S$)

• **BIOTIN, Method 2**

[NOTE—Use low-actinic glassware throughout this procedure.]

Dehydrated mixtures yielding formulations similar to the media described herein may be used provided that, when constituted as directed, they have growth-promoting properties equal to or superior to those obtained with the media prepared as described herein.

Standard stock solution: 50 μg/mL of USP Biotin RS in 50% alcohol. Store this solution in a refrigerator.

Standard solution: On the day of the assay, dilute the *Standard stock solution* with water to a concentration of 0.1 ng/mL of USP Biotin RS.

Sample solution: Proceed as directed in the assay for *Ascorbic Acid, Method 1*, through “calculate the average net weight/Capsule”. Transfer a portion of the Capsule contents, equivalent to a nominal amount of 100 μg of biotin, to a 200-mL volumetric flask. Add 3 mL of 50% alcohol, and swirl to wet the contents. Heat the flask in a water bath at 60°–70° for 5 min. Sonicate for 5 min, dilute with diluted alcohol to volume, and filter. Dilute a volume of the filtrate quantitatively, and stepwise if necessary, with water to obtain a solution with a concentration of 0.1 ng/mL.

Acid-hydrolyzed casein solution: Mix 100 g of vitamin-free casein with 500 mL of 6 N hydrochloric acid, and reflux the mixture for 8–12 h. Remove the hydrochloric acid from the mixture by distillation under reduced pressure until a thick paste remains. Redissolve the resulting paste in water, adjust the solution with 1 N sodium hydroxide to a pH of 3.5 ± 0.1 , and add water to make 1000 mL. Add 20 g of activated charcoal, stir for 1 h, and filter. Repeat the treatment with activated charcoal. Store under toluene in a refrigerator at a temperature not below 10°. Filter the solution if a precipitate forms during storage.

Cystine–tryptophan solution: Suspend 4.0 g of L-cystine in 1.0 g of L-tryptophan (or 2.0 g of D,L-tryptophan) in 700–800 mL of water. Heat to 70°–80°, and add dilute hydrochloric acid (1 in 2) dropwise, with stirring, until the solids are dissolved. Cool, and add water to make 1000 mL. Store under toluene in a refrigerator at a temperature not below 10°.

Adenine–guanine–uracil solution: Dissolve 200 mg each of adenine sulfate, guanine hydrochloride, and uracil, with the aid of heat, in 10 mL of 4 N hydrochloric acid. Cool, and add water to make 200 mL. Store under toluene in a refrigerator.

Polysorbate 80 solution: 100 mg/mL of polysorbate 80 in alcohol

Calcium pantothenate solution: 10 μg/mL of calcium pantothenate in 50% alcohol. Store in a refrigerator.

Riboflavin–thiamine hydrochloride solution:

20 μg/mL of riboflavin and 10 μg/mL of thiamine hydrochloride in 0.02 N acetic acid. Store under toluene, protected from light, in a refrigerator.

p-Aminobenzoic acid–niacin–pyridoxine hydrochloride solution: 10 μg/mL of p-aminobenzoic acid, 50 μg/mL of niacin, and 40 μg/mL of pyridoxine hydrochloride in a mixture of neutralized alcohol and water (1:3). Store in a refrigerator.

Salt solution A: 25 g of monobasic potassium phosphate and 25 g of dibasic potassium phosphate in water to make 500 mL. Add 5 drops of hydrochloric acid. Store under toluene.

Salt solution B: 10 g of magnesium sulfate, 0.5 g of sodium chloride, 0.5 g of ferrous sulfate, and 0.5 g of manganese sulfate in water to make 500 mL. Add 5 drops of hydrochloric acid, and mix. Store under toluene.

Basal medium stock solution

Acid-hydrolyzed casein solution	25 mL
Cystine–tryptophan solution	25 mL
Polysorbate 80 solution	0.25 mL
Dextrose, anhydrous	10 g
Sodium acetate, anhydrous	5 g
Adenine–guanine–uracil solution	5 mL
Calcium pantothenate solution	5 mL
Riboflavin–thiamine hydrochloride solution	5 mL
p-Aminobenzoic acid–niacin–pyridoxine hydrochloride solution	5 mL
Salt solution A	5 mL
Salt solution B	5 mL

Dissolve the anhydrous dextrose and anhydrous sodium acetate in the solutions previously mixed, and adjust with 1 N sodium hydroxide to a pH of 6.8. Dilute with water to 250 mL.

Stock culture of *Lactobacillus plantarum*: Dissolve 2.0 g of yeast extract in 100 mL of water. Add 500 mg of anhydrous dextrose, 500 mg of anhydrous sodium acetate, and 1.5 g of agar, and heat the mixture on a steam bath, with stirring, until the agar dissolves. Add 10-mL portions of the hot solution to test tubes, close or cover the tubes, sterilize in an autoclave at 121°, and allow the tubes to cool in an upright position. Prepare stab cultures in three or more of the tubes, using a pure culture of *Lactobacillus plantarum*,¹ incubating for 16–24 h at a temperature between 30° and 37° held constant to within $\pm 0.5^\circ$. Store in a refrigerator. Prepare a fresh stab of the stock culture every week, and do not use for *Inoculum* if the culture is more than 1 week old.

Culture medium: Add 0.5 ng of biotin in 5.0 mL of water to each tube containing 5.0 mL of *Basal medium stock solution*. Plug the tubes with cotton, sterilize in an autoclave at 121°, and cool.

Inoculum: [NOTE—A frozen suspension of *Lactobacillus plantarum* may be used as the stock culture, provided it yields an *Inoculum* comparable to a fresh culture.] Make a transfer of cells from the *Stock culture* of *Lactobacillus plantarum* to a sterile tube containing 10 mL of *Culture medium*. Incubate this culture for 16–24 h at a temperature between 30° and 37° held constant to within $\pm 0.5^\circ$. The cell suspension so obtained is the *Inoculum*.

Analysis: To similar separate test tubes add, in duplicate, 1.0 and/or 1.5, 2.0, 3.0, 4.0, and 5.0 mL of the *Standard solution*. To each tube and to four similar empty tubes add 5.0 mL of *Basal medium stock solution* and sufficient water to make 10 mL.

¹ATCC No. 8014 is suitable. This strain was formerly known as *Lactobacillus arabinosus* 17-5.

To similar test tubes add, in duplicate, volumes of the *Sample solution* corresponding to three or more of the levels specified for the *Standard solution*, including the levels of 2.0, 3.0, and 4.0 mL. To each tube add 5.0 mL of the *Basal medium stock solution* and sufficient water to make 10 mL. Place one complete set of Standard and sample tubes together in one tube rack and the duplicate set in a second rack or section of a rack, preferably in random order.

Cover the tubes of both series to prevent contamination, and sterilize in an autoclave at 121° for 5 min. Cool. Add 1 drop of *Inoculum* to each tube, except two of the four tubes containing no *Standard solution* (the uninoculated blanks). Incubate the tubes at a temperature between 30° and 37° held constant to within $\pm 0.5^\circ$ until, following 16–24 h of incubation, there has been no substantial increase in turbidity in the tubes containing the highest level of Standard during a 2-h period.

Determine the transmittance of the tubes in the following manner. Mix the contents of each tube, and transfer to a spectrophotometer cell. Place the cell in a spectrophotometer that has been set at a specific wavelength 540–660 nm, and read the transmittance when a steady state is reached. This steady state is observed a few seconds after agitation when the galvanometer reading remains constant for 30 s or more. Allow approximately the same time interval for the reading on each tube.

With the transmittance set at 1.00 for the uninoculated blank, read the transmittance of the inoculated blank. With the transmittance set at 1.00 for the inoculated blank, read the transmittance for each of the remaining tubes. If there is evidence of contamination with a foreign microorganism, disregard the result of the assay.

Calculation: Prepare a standard concentration-response curve as follows. For each level of the Standard, calculate the response from the sum of the duplicate values of the transmittance (Σ) as the difference, $y = 2.00 - \Sigma$. Plot this response on the ordinate of cross-section paper against the logarithm of the mL of *Standard solution*/tube on the abscissa, using for the ordinate either an arithmetic or a logarithmic scale, whichever gives the better approximation to a straight line. Draw the straight line or smooth curve that best fits the plotted points. Calculate the response, y , adding together the two transmittances for each level of the *Sample solution*. Read from the standard curve the logarithm of the volume of the *Standard solution* corresponding to each of those values of y that fall within the range of lowest and highest points plotted for the Standard. Subtract from each logarithm so obtained the logarithm of the volume, in mL, of the *Sample solution* to obtain the difference, X , for each dosage level. Average the values of X for each of three or more dosage levels to obtain \bar{X} , which equals the log-relative potency, M' , of the *Sample solution*. Determine the quantity, in μg , of USP Biotin RS corresponding to the biotin in each mg of the portion of Capsules taken:

$$\text{antilog } M = \text{antilog } (M' + \log R)$$

R = number of μg of biotin that was assumed to be present in each mg of the portion of the Capsules taken

Replication: Repeat the entire determination at least once, using separately prepared *Sample solutions*. If the difference between the two log-potencies M is NMT 0.08, their mean, \bar{M} , is the assayed log-potency of the test material (see *Design and Analysis of Biological Assays* (111), *The Confidence Interval and Limits of Potency*). If the two determinations differ by more than 0.08, conduct one or more additional determinations.

From the mean of two or more values of M that do not differ by more than 0.15, compute the mean potency of the preparation under assay.

Acceptance criteria: 90.0%–150.0% of the labeled amount of biotin ($\text{C}_{10}\text{H}_{16}\text{N}_2\text{O}_3\text{S}$)

• **CYANOCOBALAMIN, Method 1**

[NOTE—Use low-actinic glassware throughout this procedure.]

Mobile phase: Methanol and water (7:13)

Standard stock solution: 10 $\mu\text{g/mL}$ of USP

Cyanocobalamin RS in water. [NOTE—Store this stock solution in a dark place, and discard after 1 week.]

Standard solution: 1 $\mu\text{g/mL}$ of USP Cyanocobalamin RS from *Standard stock solution* diluted with water

Sample solution: Proceed as directed in the assay for *Ascorbic Acid, Method 1*, through “calculate the average net weight/Capsule.” Transfer a portion of the Capsule contents, equivalent to 100 μg of cyanocobalamin, to a 250-mL flask. Add 100.0 mL of water, and carefully extract for 2 min. Filter 10 mL of the extract, and use the clear filtrate.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: 550 nm

Column: 4.6-mm \times 15-cm; 5- μm packing L1

Flow rate: 0.5 mL/min

Injection size: 200 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak responses for cyanocobalamin.

Calculate the percentage of the labeled amount of cyanocobalamin ($\text{C}_{63}\text{H}_{88}\text{CoN}_{14}\text{O}_{14}\text{P}$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Cyanocobalamin RS in the *Standard solution* ($\mu\text{g/mL}$)

C_U = nominal concentration of cyanocobalamin in the *Sample solution* ($\mu\text{g/mL}$)

Acceptance criteria: 90.0%–150.0% of the labeled amount of cyanocobalamin ($\text{C}_{63}\text{H}_{88}\text{CoN}_{14}\text{O}_{14}\text{P}$)

• **CYANOCOBALAMIN, Method 2**

[NOTE—Use low-actinic glassware throughout this procedure.]

Standard cyanocobalamin stock solution: 1.0 $\mu\text{g/mL}$ of USP Cyanocobalamin RS in 25% alcohol. Store in a refrigerator.

Standard solution: Dilute a suitable volume of *Standard cyanocobalamin stock solution* with water to a measured volume such that after the incubation period as described in the *Analysis*, the difference in transmittance between the inoculated blank and the 5.0-mL level of the *Standard solution* is NLT that which corresponds to a difference of 1.25 mg in dried cell weight. This concentration usually falls between 0.01 and 0.04 ng/mL of the *Standard solution*. Prepare this solution fresh for each assay.

Sample solution: Proceed as directed in the assay for *Ascorbic Acid, Method 1*, through “calculate the average net weight/Capsule.” Transfer a portion of the Capsule contents, equivalent to 1.0 μg of cyanocobalamin, to an appropriate vessel containing, for each g of Capsule contents taken, 25 mL of an aqueous extracting solution prepared just before use to contain 12.9 mg/mL of dibasic sodium phosphate, 11.0 mg/mL of anhydrous citric acid, and 10 mg/mL of sodium metabisulfite. Autoclave the mixture at 121° for 10 min.

Allow any undissolved particles of the extract to settle, and filter or centrifuge, if necessary. Dilute an aliquot of the clear solution with water to obtain a final solution containing vitamin B₁₂ activity approximately equivalent to that of the *Standard solution*.

Acid-hydrolyzed casein solution: Prepare as directed in the assay for *Calcium Pantothenate, Method 2*.

Asparagine solution: Dissolve 2.0 g of L-asparagine in water to make 200 mL. Store under toluene in a refrigerator.

Adenine-guanine-uracil solution: Prepare as directed in the assay for *Calcium Pantothenate, Method 2*.

Xanthine solution: Suspend 0.20 g of xanthine in 30–40 mL of water, heat to 70°, add 6.0 mL of 6 N ammonium hydroxide, and stir until the solid is dissolved. Cool, and add water to make 200 mL. Store under toluene in a refrigerator.

Salt solution A: Dissolve 10 g of monobasic potassium phosphate and 10 g of dibasic potassium phosphate in water to make 200 mL, and add 2 drops of hydrochloric acid. Store this solution under toluene.

Salt solution B: Dissolve 4.0 g of magnesium sulfate, 0.20 g of sodium chloride, 0.20 g of ferrous sulfate, and 0.20 g of manganese sulfate in water to make 200 mL. Add 2 drops of hydrochloric acid. Store this solution under toluene.

Polysorbate 80 solution: 20 g of polysorbate 80 in alcohol to make 200 mL. Store in a refrigerator.

Vitamin solution A: 10 mg of riboflavin, 10 mg of thiamine hydrochloride, 100 µg of biotin, and 20 mg of niacin in 0.02 N glacial acetic acid to make 400 mL. Store under toluene, protected from light, in a refrigerator.

Vitamin solution B: 20 mg of *p*-aminobenzoic acid, 10 mg of calcium pantothenate, 40 mg of pyridoxine hydrochloride, 40 mg of pyridoxal hydrochloride, 8 mg of pyridoxamine dihydrochloride, and 2 mg of folic acid in a mixture of water and neutralized alcohol (3:1) to make 400 mL. Store, protected from light, in a refrigerator.

Basal medium stock solution: Prepare the medium according to the following formula and directions. A dehydrated mixture containing the same ingredients may be used provided that, when constituted as directed in the labeling, it yields a medium comparable to that obtained from the formula given herein.

Add the ingredients in the order listed, carefully dissolving cystine and tryptophan in the hydrochloric acid before adding the next eight solutions in the resulting solution. Add 100 mL of water, and dissolve the dextrose, sodium acetate, and ascorbic acid. Filter, if necessary. Add the *Polysorbate 80 solution*, adjust with 1 N sodium hydroxide to a pH of between 5.5 and 6.0, and add Purified Water to make 250 mL.

L-Cystine	0.1 g
L-Tryptophan	0.05 g
1 N Hydrochloric acid	10 mL
Adenine-guanine-uracil solution	5 mL
Xanthine solution	5 mL
Vitamin solution A	10 mL
Vitamin solution B	10 mL
Salt solution A	5 mL
Salt solution B	5 mL
Asparagine solution	5 mL
Acid-hydrolyzed casein solution	25 mL
Dextrose, anhydrous	10 g
Sodium acetate, anhydrous	5 g
Ascorbic acid	1 g
Polysorbate 80 solution	5 mL

Tomato juice preparation: Centrifuge commercially canned tomato juice so that most of the pulp is removed. Suspend 5 g/L of analytical filter aid in the supernatant, and pass, with the aid of reduced pressure, through a layer of the filter aid. Repeat, if necessary, until a clear, straw-colored filtrate is obtained. Store under toluene in a refrigerator.

Culture medium: [NOTE—A dehydrated mixture containing the same ingredients may be used provided that, when constituted as directed in the labeling, it yields a medium equivalent to that obtained from the formula given herein.] Dissolve 0.75 g of yeast extract, 0.75 g of dried peptone, 1.0 g of anhydrous dextrose, and 0.20 g of monobasic potassium phosphate in 60–70 mL of water. Add 10 mL of *Tomato juice preparation* and 1 mL of *Polysorbate 80 solution*. Adjust with 1 N sodium hydroxide to a pH of 6.8, and add water to make 100 mL. Place 10-mL portions of the solution in test tubes, and plug with cotton. Sterilize the tubes and contents in an autoclave at 121° for 15 min. Cool as rapidly as possible to avoid color formation resulting from overheating the medium.

Suspension medium: Dilute a measured volume of *Basal medium stock solution* with an equal volume of water. Place 10-mL portions of the diluted medium in test tubes. Sterilize, and cool as directed for *Culture medium*.

Stock culture of *Lactobacillus leichmannii*: To 100 mL of *Culture medium* add 1.0–1.5 g of agar, and heat the mixture on a steam bath, with stirring, until the agar dissolves. Place 10-mL portions of the hot solution in test tubes, cover the tubes, sterilize at 121° for 15 min in an autoclave (exhaust line temperature), and allow the tubes to cool in an upright position. Inoculate three or more of the tubes by stab transfer of a pure culture of *Lactobacillus leichmannii*.² [NOTE—Before first using a fresh culture in this assay, make NLT 10 successive transfers of the culture in a 2-week period.]

Incubate for 16–24 h at a temperature between 30° and 40° held constant to within ±0.5°. Store in a refrigerator.

Prepare fresh stab cultures at least three times each week, and do not use them for preparing the *Inoculum* if more than 4 days old. The activity of the microorganism can be increased by daily or twice-daily transfer of the stab culture, to the point where definite turbidity in the liquid *Inoculum* can be observed 2–4 h after inoculation. A slow-growing culture seldom gives a suitable response curve and may lead to erratic results.

Inoculum: [NOTE—A frozen suspension of *Lactobacillus leichmannii* may be used as the stock culture, provided it yields an *Inoculum* comparable to a fresh culture.]

Make a transfer of cells from the *Stock culture of Lactobacillus leichmannii* to two sterile tubes containing 10 mL of the *Culture medium* each. Incubate these cultures for 16–24 h at a temperature between 30° and 40° held constant to within ±0.5°. Under aseptic conditions centrifuge the cultures, and decant the supernatant. Suspend the cells from the culture in 5 mL of sterile *Suspension medium*, and combine. Using sterile *Suspension medium*, adjust the volume so that a 1-in-20 dilution in saline TS produces 70% transmittance when read on a suitable spectrophotometer that has been set at a wavelength of 530 nm, equipped with a 10-mm cell, and read against saline TS set at 100% transmittance. Prepare a 1-in-400 dilution of the adjusted suspension using *Basal medium stock solution*. The cell suspension so obtained is the *Inoculum*.

[NOTE—This dilution may be altered, when necessary, to obtain the desired test response.]

Calibration of spectrophotometer: Check the wavelength of the spectrophotometer periodically,

²Pure cultures of *Lactobacillus leichmannii* may be obtained as No. 7830 from ATCC, 10801 University Blvd., Manassas, VA 20110-2209.

using a standard wavelength cell or other suitable device. Before reading any tests, calibrate the spectrophotometer for 0% and 100% transmittance, using water and with the wavelength set at 530 nm.

Analysis: Because of the high sensitivity of the test organism to minute amounts of vitamin B₁₂ activity and to traces of many cleansing agents, cleanse meticulously by suitable means, followed preferably by heating at 250° for 2 h, using hard-glass 20-mm × 150-mm test tubes, and other necessary glassware. To separate test tubes add, in duplicate, 1.0, 1.5, 2.0, 3.0, 4.0, and 5.0 mL of the *Standard solution*. To each of these tubes and to four similar empty tubes add 5.0 mL of *Basal medium stock solution* and sufficient water to make 10 mL.

To similar separate test tubes add, in duplicate, 1.0, 1.5, 2.0, 3.0, and 4.0 mL of the *Sample solution*. To each tube add 5.0 mL of *Basal medium stock solution* and sufficient water to make 10 mL. Place one complete set of Standard and sample tubes together in one tube rack and the duplicate set in a second rack or section of a rack, preferably in random order.

Cover the tubes to prevent bacterial contamination, and sterilize in an autoclave at 121° for 5 min, arranging to reach this temperature in NMT 10 min by preheating the autoclave if necessary. Cool as rapidly as possible to avoid color formation resulting from overheating the medium. Take precautions to maintain uniformity of sterilizing and cooling conditions throughout the assay, because packing the tubes too closely in the autoclave or overloading it may cause variation in the heating rate.

Aseptically add 0.5 mL of *Inoculum* to each tube so prepared, except two of the four containing no *Standard solution* (the uninoculated blanks). Incubate the tubes at a temperature between 30° and 40°, held constant to within ±0.5°, for 16–24 h.

Terminate growth by heating to a temperature NLT 80° for 5 min. Cool to room temperature. After agitating its contents, place the container in a spectrophotometer that has been set at a wavelength of 530 nm, and read the transmittance when a steady state is reached. This steady state is observed a few seconds after agitation when the reading remains constant for 30 s or more. Allow approximately the same time interval for the reading on each tube.

With the transmittance set at 100% for the uninoculated blank, read the transmittance of the inoculated blank. If the difference is greater than 5% or if there is evidence of contamination with a foreign microorganism, disregard the results of the assay.

With the transmittance set at 100% for the uninoculated blank, read the transmittance of each of the remaining tubes. Disregard the results of the assay if the slope of the standard curve indicates a problem with sensitivity.

Calculation: Prepare a standard concentration-response curve by the following procedure. Test for and replace any aberrant individual transmittances. For each level of the Standard, calculate the response from the sum of the duplicate values of the transmittances (Σ) as the difference, $y = 2.00 - \Sigma$. Plot this response on the ordinate of cross-section paper against the logarithm of the mL of *Standard solution* per tube on the abscissa, using for the ordinate either an arithmetic or a logarithmic scale, whichever gives the better approximation to a straight line. Draw the straight line or smooth curve that best fits the plotted points.

Calculate the response, y , adding together the two transmittances for each level of the *Sample solution*. Read from the standard curve the logarithm of the volume of the *Standard solution* corresponding to each of those values of y that falls within the range of the lowest and highest points plotted for the Standard. Subtract from each logarithm so obtained the logarithm of the volume, in mL, of the *Sample solution* to obtain the difference, X , for each dosage level. Average the values of X for each of three or more dosage levels to obtain \bar{X} , which equals the log-relative potency, M' , of the *Sample solution*. Determine the quantity, in μg , of USP Cyanocobalamin RS corresponding to the cyanocobalamin in each mg of the portion of Capsules taken:

$$\text{antilog } M = \text{antilog } (M' + \log R)$$

R = number of μg of cyanocobalamin that was assumed to be present in each mg of the portion of the Capsules taken

Replication: Repeat the entire determination at least once, using separately prepared *Sample solutions*. If the difference between the two log-potencies M is NMT 0.08, their mean, \bar{M} , is the assayed log-potency of the test material (see *Design and Analysis of Biological Assays* (111), *The Confidence Interval and Limits of Potency*). If the two determinations differ by more than 0.08, conduct one or more additional determinations. From the mean of two or more values of M that do not differ by more than 0.15, compute the mean potency of the preparation under assay.

Acceptance criteria: 90.0%–150.0% of the labeled amount of cyanocobalamin (C₆₃H₈₈CoN₁₄O₁₄P)

• Folic Acid, Method 1

[NOTE—Use low-actinic glassware throughout this procedure.]

Reagent A: 25% solution of tetrabutylammonium hydroxide in methanol

Reagent B: Transfer 5.0 g of pentetic acid to a 50-mL volumetric flask. Using sonication if necessary, dissolve in and dilute with 1 N sodium hydroxide to volume.

Mobile phase: 2 g of monobasic potassium phosphate in 650 mL of water. Add 12.0 mL of *Reagent A*, 7.0 mL of 3 N phosphoric acid, and 240 mL of methanol. Cool to room temperature, adjust with phosphoric acid or ammonia TS to a pH of 7.0, dilute with water to 1000 mL, and filter. Recheck the pH before use by adding water or methanol to the prepared *Mobile phase* to obtain baseline separation of folic acid and the internal standard. The pH may be increased up to 7.15 to obtain better separation. [NOTE—The methanol and water content may be varied (between 1% and 3%).]

Internal standard solution: Transfer 40 mg of methylparaben to a 1000-mL volumetric flask, and add 220 mL of methanol to dissolve. Dissolve 2.0 g of monobasic potassium phosphate in 300 mL of water in a separate beaker, quantitatively transfer this solution to the flask containing the methylparaben solution, and add an additional 300 mL of water. Add 19 mL of *Reagent A*, 7 mL of 3 N phosphoric acid, and 30 mL of *Reagent B*. Adjust with ammonia TS to a pH of 9.8, bubble nitrogen through the solution for 30 min, dilute with water to volume, and mix.

Standard solution: 0.016 mg/mL of USP Folic Acid RS in *Internal standard solution*

Sample solution: Proceed as directed in the assay for *Ascorbic Acid, Method 1*, through "calculate the average net weight/Capsule." Transfer an amount of Capsule contents to a suitable centrifuge tube, and add a volume of *Internal standard solution* to obtain a nominal concentration of 0.016 mg/mL of folic acid. Shake by mechanical means for 10 min, and centrifuge. Filter a portion of the clear supernatant, and use the filtrate.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 3.9-mm × 30-cm; packing L1

Flow rate: 1 mL/min

Injection size: 15 µL

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for folic acid and methylparaben are about 0.8 and 1.0, respectively.]

Suitability requirements

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas for folic acid and methylparaben. Calculate the percentage of the labeled amount of folic acid ($C_{19}H_{19}N_7O_6$) in the portion of Capsules taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = peak area ratio of folic acid to methylparaben from the *Sample solution*

R_S = peak area ratio of folic acid to methylparaben from the *Standard solution*

C_S = concentration of USP Folic Acid RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of folic acid in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–150.0% of the labeled amount of folic acid ($C_{19}H_{19}N_7O_6$)

• FOLIC ACID, Method 2

[NOTE—Use low-actinic glassware throughout this procedure.]

Reagent: Dissolve 7.5 g of edetate disodium, with stirring, in 500 mL of water containing 10 mL of ammonium hydroxide.

Diluent: 60 µg/mL of ammonium hydroxide

Mobile phase: Transfer 0.4 mL of triethylamine, 15 mL of glacial acetic acid, and 350 mL of methanol to a 2000-mL volumetric flask, and dilute with 0.008 M sodium 1-hexanesulfonate to volume.

Standard stock solution: 60 µg/mL of USP Folic Acid RS in *Diluent*. Prepare this solution fresh daily.

Standard solution: Mix 5.0 mL of *Standard stock solution* with 10.0 mL of methanol and 35.0 mL of *Reagent*. Shake for 15 min in a water bath maintained at 60°, and cool. Filter, discarding the first few mL of the filtrate.

Sample solution: Proceed as directed for the *Sample solution* in the assay for *Ascorbic Acid, Method 1* through "calculate the average net weight/Capsule." Transfer a portion of the Capsule contents, equivalent to a nominal amount of 0.3 mg of folic acid, to a 125-mL stoppered flask. Add 10.0 mL of methanol and 35.0 mL of *Reagent*. Shake for 15 min in a water bath maintained at 60°, and cool. Filter, discarding the first few mL of the filtrate.

Chromatographic system

Detector: UV 270 nm

Column: 4.6-mm × 25-cm; packing L7

Column temperature: 50°

Flow rate: 2 mL/min

Injection size: 5 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the areas of the major peaks. Calculate the percentage of the labeled amount of folic acid ($C_{19}H_{19}N_7O_6$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of folic acid from the *Sample solution*

r_S = peak area of folic acid from the *Standard solution*

C_S = concentration of USP Folic Acid RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of folic acid in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–150.0% of the labeled amount of folic acid ($C_{19}H_{19}N_7O_6$)

• DEXPANTHENOL OR PANTHENOL

[NOTE—The following procedure is applicable also to the determination of the dextrorotatory component of racemic panthenol in preparations containing panthenol.]

Dehydrated mixtures yielding formulations similar to the media described herein may be used provided that, when constituted as directed, they have growth-promoting properties equal to or superior to those obtained with the media prepared as described herein.

Standard stock solution: 800 µg/mL of USP

Dexpantenol RS in water. Store in a refrigerator, protected from light, and use within 30 days.

Standard solution: On the day of the assay, prepare a dilution of 1.2 µg/mL of dexpantenol from *Standard stock solution* diluted with water.

Sample solution: Weigh NLT 30 Capsules in a tared weighing bottle. Open the Capsules, without loss of shell material, and transfer the contents as completely as possible to a beaker. Remove any contents adhering to the empty Capsule shells by washing with several portions of ether. Discard the washings, and dry the Capsule shells with the aid of a current of dry air until the odor of ether is no longer perceptible. Weigh the empty Capsule shells in the tared weighing bottle, and calculate the average net weight/Capsule. Dissolve a portion of the Capsule contents, nominally equivalent to 1.2 mg of dexpantenol or 2.4 mg of panthenol, in 100.0 mL of water. Quantitatively dilute a portion of this solution with water to obtain a nominal concentration of 1.2 µg/mL of dexpantenol or 2.4 µg/mL of panthenol.

Acid-hydrolyzed casein solution: Mix 100 g of vitamin-free casein with 500 mL of 6 N hydrochloric acid, and reflux the mixture for 8–12 h. Remove the hydrochloric acid from the mixture by distillation under reduced pressure until a thick paste remains. Redissolve the resulting paste in about 500 mL of water, adjust the solution with 1 N sodium hydroxide to a pH of 3.5 ± 0.1 , and add water to make 1000 mL. Add 20 g of activated charcoal, stir for 1 h, and filter. Repeat the treatment with activated charcoal. Store under toluene in a cool place at a temperature not below 10°. Filter the solution if a precipitate forms during storage.

Cystine-tryptophan solution: Suspend 4.0 g of L-cystine and 1.0 g of L-tryptophan (or 2.0 g of D,L-tryptophan) in 700–800 mL of water, heat to

75 ± 5°, and add hydrochloric acid solution (1 in 2) dropwise, with stirring, until the solids are dissolved. Cool, and add water to make 1000 mL. Store under toluene in a cool place at a temperature not below 10°.

Adenine–guanine–uracil solution: Dissolve 200 mg each of adenine sulfate, guanine hydrochloride, and uracil, with the aid of heat, in 10 mL of 4 N hydrochloric acid. Cool. Add water to make 200 mL. Store under toluene in a refrigerator.

Polysorbate 80 solution: 100 mg/mL of polysorbate 80 in alcohol

Riboflavin–thiamine hydrochloride–biotin solution: 20 µg/mL of riboflavin, 10 µg/mL of thiamine hydrochloride, and 0.04 µg/mL of biotin in 0.02 N acetic acid. Store under toluene, protected from light, in a refrigerator.

p-Aminobenzoic acid–niacin–pyridoxine hydrochloride solution: 10 µg/mL of p-aminobenzoic acid, 50 µg/mL of niacin, and 40 µg/mL of pyridoxine hydrochloride in neutral 25% alcohol. Store in a refrigerator.

Salt solution A: 50 mg/mL of monobasic potassium phosphate and 50 mg/mL of dibasic potassium phosphate in water. Add 10 drops of hydrochloric acid/L of solution. Store under toluene.

Salt solution B: 20 mg/mL of magnesium sulfate, 1 mg/mL of sodium chloride, 1 mg/mL of ferrous sulfate, and 1 mg/mL of manganese sulfate in water. Add 10 drops of hydrochloric acid/L of the solution. Store under toluene.

Pyridoxal–calcium pantothenate solution: 200 µg/mL of pyridoxal hydrochloride and 1.875 µg/mL of calcium pantothenate in 10% alcohol. Store in a refrigerator, and use within 30 days.

Polysorbate 40–oleic acid solution: 50 mg/mL of polysorbate 40 and 0.5 mg/mL of oleic acid in 20% alcohol. Store in a refrigerator, and use within 30 days.

Modified pantothenate medium

Acid-hydrolyzed casein solution	25 mL
Cystine–tryptophan solution	25 mL
Polysorbate 80 solution	0.25 mL
Dextrose, anhydrous	10 g
Sodium acetate, anhydrous	5 g
Adenine–guanine–uracil solution	5 mL
Riboflavin–thiamine hydrochloride–biotin solution	5 mL
p-Aminobenzoic acid–niacin–pyridoxine hydrochloride solution	5 mL
Salt solution A	5 mL
Salt solution B	5 mL
Pyridoxal–calcium pantothenate solution	5 mL
Polysorbate 40–oleic acid solution	5 mL

Dissolve anhydrous dextrose and sodium acetate in the solutions previously mixed, and adjust with 1 N sodium hydroxide to a pH of 6.8. Finally, dilute with water to 250 mL.

Double-strength modified pantothenate medium:

Prepare as directed for the *Modified pantothenate medium*, but make the final dilution to 125 mL instead of 250 mL. Prepare fresh.

Stock culture of *Pediococcus acidilactici*: Dissolve in 800 mL of water, with the aid of heat, 6.0 g of peptone, 4.0 g of pancreatic digest of casein, 3.0 g of yeast extract, 1.5 g of beef extract, 1.0 g of dextrose, and 15.0 g of agar. Adjust with 0.1 N sodium hydroxide or 0.1 N hydrochloric acid to a pH of 6.5–6.6, and dilute with water to 1000 mL. Add 10-mL portions of the solution to culture tubes, place caps on the tubes, and sterilize in an autoclave at 121° for 15 min. Cool on a slant, and store in a refrigerator. Prepare a stock culture of *Pediococcus acidilactici*³ on a slant of

this medium. Incubate at 35° for 20–24 h, and store in a refrigerator. Maintain the stock culture by monthly transfer onto fresh slants.

Inoculum: Inoculate three 250-mL portions of *Modified pantothenate medium* from a stock culture slant, and incubate at 35° for 20–24 h. Centrifuge the suspension from the combined portions, and wash the cells with *Modified pantothenate medium*. Resuspend the cells in sufficient *Modified pantothenate medium* so that a 1-in-50 dilution, when tested in a 13-mm diameter test tube, gives 80% light transmission at 530 nm. Transfer 1.2-mL portions of this stock suspension to glass ampuls, seal, freeze in liquid nitrogen, and store in a freezer. On the day of the assay, allow the ampuls to reach room temperature, mix the contents, and dilute 1 mL of thawed culture with sterile saline TS to 150 mL. [NOTE—This dilution may be altered when necessary to obtain the desired test response.]

Analysis: Prepare in triplicate a series of eight culture tubes by adding the following quantities of water to the tubes within a set: 5.0, 4.5, 4.0, 3.5, 3.0, 2.0, 1.0, and 0.0 mL. To these same tubes, and in the same order, add 0.0, 0.5, 1.0, 1.5, 2.0, 3.0, 4.0, and 5.0 mL of the *Standard solution*.

Prepare in duplicate a series of five culture tubes by adding the following quantities of water to the tubes within a set: 4.0, 3.5, 3.0, 2.0, and 1.0 mL. To these same tubes, and in the same order, add 1.0, 1.5, 2.0, 3.0, and 4.0 mL of the *Sample solution*.

Add 5.0 mL of *Double-strength modified pantothenate medium* to each tube. Cover the tubes with metal caps, and sterilize in an autoclave at 121° for 5 min. Cool to room temperature in a chilled water bath, and inoculate each tube with 0.5 mL of the *Inoculum*. Allow to incubate at 37° for 16 h. Terminate growth by heating to a temperature NLT 80°, such as by steaming at atmospheric pressure in a sterilizer for 5–10 min. Cool, and determine the percentage transmittance of the suspensions, in cells of equal pathlength, on a suitable spectrophotometer, at a wavelength of 530 nm.

Calculation: Draw a dose-response curve on arithmetic graph paper by plotting the average response, in percentage of transmittance, for each set of tubes of the standard curve against the Standard level concentrations. The curve is drawn by connecting each adjacent pair of points with a straight line. From this standard curve, determine by interpolation the potency, in terms of dexpantenol, of each tube containing portions of the *Sample solution*. Divide the potency of each tube by the amount of the *Sample solution* added to it, to obtain the individual responses. Calculate the mean response by averaging the individual responses that vary from their mean by NMT 15%, using NLT half the total number of tubes. Calculate the potency of the portion of the material taken for assay, in terms of dexpantenol, by multiplying the mean response by the appropriate dilution factor.

Acceptance criteria: 90.0%–150.0% of the labeled amount of dexpantenol (C₉H₁₉NO₄) or panthenol (C₉H₁₉NO₄)

• CALCIUM PANTOTHENATE, Method 1

Mobile phase: Phosphoric acid and water (1:1000)

Internal standard solution: 80 mg of p-hydroxybenzoic acid in 3 mL of alcohol. Add 50 mL of water and 7.1 g of dibasic sodium phosphate, and dilute with water to 1000 mL. Adjust with phosphoric acid to a pH of 6.7.

Standard solution: 0.6 mg/mL of USP Calcium Pantothenate RS in *Internal standard solution*

Sample solution: Proceed as directed in the assay for *Ascorbic Acid, Method 1*, through “calculate the average net weight/Capsule.” Transfer the equivalent to 0.6 mg/mL of calcium pantothenate, from mixed Capsule contents, in *Internal standard solution*, and

³ATCC No. 8042 is suitable.

shake vigorously for 10 min. Centrifuge, filter, and use the clear filtrate.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 210 nm

Column: 3.9-mm × 15-cm; packing L1

Flow rate: 1.5 mL/min

Injection size: 10 µL

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for calcium pantothenate and *p*-hydroxybenzoic acid are about 0.5 and 1.0, respectively.]

Suitability requirements

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak responses for calcium pantothenate and the internal standard. Calculate the percentage of the labeled amount of calcium pantothenate ($C_{18}H_{32}CaN_2O_{10}$) in the portion of Capsules taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = peak response ratio of calcium pantothenate to *p*-hydroxybenzoic acid from the *Sample solution*

R_S = peak response ratio of calcium pantothenate to *p*-hydroxybenzoic acid from the *Standard solution*

C_S = concentration of USP Calcium Pantothenate RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of calcium pantothenate in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–150.0% of the labeled amount of calcium pantothenate ($C_{18}H_{32}CaN_2O_{10}$)

• CALCIUM PANTOTHENATE, *Method 2*

Standard stock solution: Dissolve 50 mg of USP Calcium Pantothenate RS, previously dried and stored in the dark over phosphorus pentoxide while protected from absorption of moisture during the weighing, in 500 mL of water in a 1000-mL volumetric flask. Add 10 mL of 0.2 N acetic acid and 100 mL of sodium acetate solution (1 in 60), and dilute with water to volume to obtain a concentration of 50 µg/mL of USP Calcium Pantothenate RS. Store under toluene in a refrigerator.

Standard solution: On the day of the assay, dilute a volume of *Standard stock solution* with water to obtain a concentration of 0.01–0.04 µg/mL of calcium pantothenate, the exact concentration being such that the responses obtained as directed for *Analysis*, 2.0–4.0 mL of the *Standard solution* being used, are within the linear portion of the log-concentration response curve.

Sample solution: Proceed as directed in the assay for *Ascorbic Acid, Method 1*, through “calculate the average net weight/Capsule.” Transfer a portion of the Capsule contents, equivalent to a nominal amount of 50 mg of calcium pantothenate, to a 1000-mL volumetric flask containing 500 mL of water. Add 10 mL of 0.2 N acetic acid and 100 mL of sodium acetate solution (16.66 mg/mL), dilute with water to volume, and filter. Dilute a volume of this solution to obtain a solution having approximately the same concentration as that of the *Standard solution*.

Acid-hydrolyzed casein solution: Mix 100 g of vitamin-free casein with 500 mL of 6 N hydrochloric acid, and reflux the mixture for 8–12 h. Remove the hydrochloric acid from the mixture by distillation under reduced pressure until a thick paste remains. Redissolve the resulting paste in water, adjust the solution with 1 N sodium hydroxide to a pH of 3.5 ± 0.1 , and add water to make 1000 mL. Add 20 g of activated charcoal, stir for 1 h, and filter. Repeat the treatment

with activated charcoal. Store under toluene in a cool place at a temperature not below 10°. Filter the solution if a precipitate forms during storage.

Cystine–tryptophan solution: Suspend 4.0 g of L-cystine and 1.0 g of L-tryptophan (or 2.0 g of D,L-tryptophan) in 700–800 mL of water, heat to 70°–80°, and add dilute hydrochloric acid (1 in 2) dropwise, with stirring, until the solids are dissolved. Cool, and add water to make 1000 mL. Store under toluene in a cool place at a temperature not below 10°.

Adenine–guanine–uracil solution: Dissolve 200 mg each of adenine sulfate, guanine hydrochloride, and uracil, with the aid of heat, in 10 mL of 4 N hydrochloric acid. Cool, and add water to make 200 mL. Store under toluene in a refrigerator.

Polysorbate 80 solution: 100 mg/mL of polysorbate 80 in alcohol

Riboflavin–thiamine hydrochloride–biotin solution: 20 µg/mL of riboflavin, 10 µg/mL of thiamine hydrochloride, and 0.04 µg/mL of biotin in 0.02 N acetic acid. Store under toluene, protected from light, in a refrigerator.

***p*-Aminobenzoic acid–niacin–pyridoxine hydrochloride solution:** 10 µg/mL of *p*-aminobenzoic acid, 50 µg/mL of niacin, and 40 µg/mL of pyridoxine hydrochloride in a mixture of neutralized alcohol and water (1:3). Store in a refrigerator.

Salt solution A: Dissolve 25 g of monobasic potassium phosphate and 25 g of dibasic potassium phosphate in water to make 500 mL. Add 5 drops of hydrochloric acid. Store under toluene.

Salt solution B: Dissolve 10 g of magnesium sulfate, 0.5 g of sodium chloride, 0.5 g of ferrous sulfate, and 0.5 g of manganese sulfate in water to make 500 mL. Add 5 drops of hydrochloric acid. Store under toluene.

Basal medium stock solution

Acid-hydrolyzed casein solution	25 mL
Cystine–tryptophan solution	25 mL
Polysorbate 80 solution	0.25 mL
Dextrose, anhydrous	10 g
Sodium acetate, anhydrous	5 g
Adenine–guanine–uracil solution	5 mL
Riboflavin–thiamine hydrochloride–biotin solution	5 mL
<i>p</i> -Aminobenzoic acid–niacin–pyridoxine hydrochloride solution	5 mL
Salt solution A	5 mL
Salt solution B	5 mL

Dissolve the anhydrous dextrose and anhydrous sodium acetate in the solutions previously mixed, and adjust with 1 N sodium hydroxide to a pH of 6.8. Dilute with water to 250 mL.

Stock culture of *Lactobacillus plantarum*: Dissolve 2.0 g of yeast extract in 100 mL of water. Add 500 mg of anhydrous dextrose, 500 mg of anhydrous sodium acetate, and 1.5 g of agar, and heat the mixture on a steam bath, with stirring, until the agar dissolves. Add 10-mL portions of the hot solution to the test tubes, close or cover the tubes, sterilize in an autoclave at 121°, and allow the tubes to cool in an upright position. Prepare stab cultures in three or more of the tubes, using a pure culture of *Lactobacillus plantarum*¹ incubating for 16–24 h at a temperature between 30° and 37° held constant to within $\pm 0.5^\circ$. Store in a refrigerator. Prepare a fresh stab of the stock culture every week, and do not use for *Inoculum* if the culture is more than 1 week old.

Culture medium: To each of a series of test tubes containing 5.0 mL of *Basal medium stock solution* add 5.0 mL of water containing 0.2 µg of calcium pantothenate. Plug the tubes with cotton, sterilize in an autoclave at 121°, and cool.

Inoculum: [NOTE—A frozen suspension of *Lactobacillus plantarum* may be used as the stock culture, provided it yields an *Inoculum* comparable to a fresh culture.] Make a transfer of cells from the *Stock culture of Lactobacillus plantarum* to a sterile tube containing 10 mL of *Culture medium*. Incubate this culture for 16–24 h at a temperature between 30° and 37° held constant to within $\pm 0.5^\circ$. The cell suspension so obtained is the *Inoculum*.

Analysis: To similar separate test tubes add, in duplicate, 1.0 and/or 1.5, 2.0, 3.0, 4.0, and 5.0 mL of the *Standard solution*. To each tube and to four similar empty tubes add 5.0 mL of *Basal medium stock solution* and sufficient water to make 10 mL.

To similar separate test tubes add, in duplicate, volumes of the *Sample solution* corresponding to three or more of the levels specified for the *Standard solution*, including the levels of 2.0, 3.0, and 4.0 mL. To each tube add 5.0 mL of the *Basal medium stock solution* and sufficient water to make 10 mL. Place one complete set of *Standard* and *sample* tubes together in one tube rack and the duplicate set in a second rack or section of a rack, preferably in random order.

Cover the tubes of both series to prevent contamination, and sterilize in an autoclave at 121° for 5 min. Cool. Add 1 drop of *Inoculum* to each tube, except two of the four tubes containing no *Standard solution* (the uninoculated blanks). Incubate the tubes at a temperature between 30° and 37°, held constant to within $\pm 0.5^\circ$ until, following 16–24 h of incubation, there has been no substantial increase in turbidity in the tubes containing the highest level of *Standard* during a 2-h period.

Determine the transmittance of the tubes in the following manner. Mix the contents of each tube, and transfer to an optical container if necessary. Place the container in a spectrophotometer that has been set at a specific wavelength between 540 and 660 nm, and read the transmittance when a steady state is reached. This steady state is observed a few seconds after agitation when the galvanometer reading remains constant for 30 s or more. Allow approximately the same time interval for the reading on each tube.

With the transmittance set at 1.00 for the uninoculated blank, read the transmittance of the inoculated blank. With the transmittance set at 1.00 for the inoculated blank, read the transmittance for each of the remaining tubes. If there is evidence of contamination with a foreign microorganism, disregard the result of the assay.

Calculation: Prepare a standard concentration-response curve as follows. For each level of the *Standard*, calculate the response from the sum of the duplicate values of the transmittance (Σ) as the difference, $y = 2.00 - \Sigma$. Plot this response on the ordinate of cross-section paper against the logarithm of the mL of *Standard solution*/tube on the abscissa, using for the ordinate either an arithmetic or a logarithmic scale, whichever gives the better approximation to a straight line. Draw the straight line or smooth curve that best fits the plotted points.

Calculate the response, y , adding together the two transmittances for each level of the *Sample solution*. Read from the standard curve the logarithm of the volume of the *Standard solution* corresponding to each of those values of y that fall within the range of the lowest and highest points plotted for the *Standard*. Subtract from each logarithm so obtained the logarithm of the volume, in mL, of the *Sample solution* to obtain the difference, X , for each dosage level. Average the values of X for each of three or more dosage levels to obtain \bar{X} , which equals the log-relative

potency, M' , of the *Sample solution*. Determine the quantity, in mg, of USP Calcium Pantothenate RS corresponding to the calcium pantothenate in each mg of the portion of Capsules taken:

$$\text{antilog } M = \text{antilog } (M' + \log R)$$

R = number of mg of calcium pantothenate that was assumed to be present in each mg of the portion of the Capsules taken

Replication: Repeat the entire determination at least once, using separately prepared *Sample solutions*. If the difference between the two log-potencies M is NMT 0.08, their mean, \bar{M} , is the assayed log-potency of the test material (see *Design and Analysis of Biological Assays* (111), *The Confidence Interval and Limits of Potency*). If the two determinations differ by more than 0.08, conduct one or more additional determinations. From the mean of two or more values of M that do not differ by more than 0.15, compute the mean potency of the preparation under assay.

Acceptance criteria: 90.0%–150.0% of the labeled amount of calcium pantothenate ($C_{18}H_{32}CaN_2O_{10}$)

• CALCIUM PANTOTHENATE, Method 3

Buffer solution: Dissolve 10.0 g of monobasic potassium phosphate in 2000 mL of water, and adjust with phosphoric acid to a pH of 3.5.

Mobile phase: Methanol and *Buffer solution* (1:9)

Standard stock solution: 0.25 mg/mL of USP Calcium Pantothenate RS in water. Prepare fresh every 4 weeks. Store in a refrigerator.

Standard solution: 40 μ g/mL of USP Calcium Pantothenate RS from *Standard stock solution* diluted with water

Sample solution: Proceed as directed for the *Sample solution* in the assay for *Ascorbic Acid*, Method 1 through “calculate the average net weight/Capsule.” Transfer a portion of the Capsule contents, equivalent to 10 mg of calcium pantothenate, to a 250-mL volumetric flask. Add 10 mL of methanol, and swirl the flask to disperse the Capsules’ contents. Dilute with water to volume, mix, and filter.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 205 nm

Column: 3.9-mm \times 30-cm; 5- μ m packing L1

Column temperature: 50°

Flow rate: 2 mL/min

Injection size: 25 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas for calcium pantothenate.

Calculate the percentage of the labeled amount of calcium pantothenate ($C_{18}H_{32}CaN_2O_{10}$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area from the *Sample solution*

r_S = peak area from the *Standard solution*

C_S = concentration of USP Calcium Pantothenate RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of calcium pantothenate in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–150.0% of the labeled amount of calcium pantothenate ($C_{18}H_{32}CaN_2O_{10}$)

• **NIACIN OR NIACINAMIDE, PYRIDOXINE HYDROCHLORIDE, RIBOFLAVIN, and THIAMINE, Method 1**

[NOTE—Use low-actinic glassware throughout this procedure.]

Diluent: acetonitrile, glacial acetic acid, and water (5:1:94)

Mobile phase: A mixture of methanol, glacial acetic acid, and water (27:1:73) containing 140 mg of sodium 1-hexanesulfonate per 100 mL

Standard solution: [NOTE—Use USP Niacin RS in place of USP Niacinamide RS for formulations containing Niacin.] Transfer 80 mg of USP Niacinamide RS, 20 mg of USP Pyridoxine Hydrochloride RS, 20 mg of USP Riboflavin RS, and 20 mg of USP Thiamine Hydrochloride RS to a 200-mL volumetric flask, and add 180 mL of *Diluent*. Immerse the flask in a hot water bath maintained at 65°–70° for 10 min with regular shaking or using a vortex mixer, until all the solid materials are dissolved. Chill rapidly in a cold water bath for 10 min to room temperature, and dilute with *Diluent* to volume.

Sample solution: Proceed as directed in the assay for *Ascorbic Acid, Method 1*, through “calculate the average net weight/Capsule.” Transfer a portion of the Capsule contents, equivalent to 10 mg of niacinamide and 2.5 mg each of pyridoxine hydrochloride, riboflavin, and thiamine hydrochloride, to a 50-mL centrifuge tube. Add 25.0 mL of *Diluent*, and mix using a vortex mixer for 30 s to completely suspend the powder. Immerse the centrifuge tube in a hot water bath maintained at 65°–70°, heat for 5 min, and mix on a vortex mixer for 30 s. Return the tube to the hot water bath, heat for another 5 min, and mix on a vortex mixer for 30 s. Filter a portion of the solution, cool to room temperature, and use the clear filtrate. [NOTE—Use the filtrate within 3 h of filtration.]

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 3.9-mm × 30-cm; packing L1

Flow rate: 1 mL/min

Injection size: 10 µL

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for niacinamide, pyridoxine, riboflavin, and thiamine are about 0.3, 0.5, 0.8, and 1.0, respectively.]

Suitability requirements

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas for niacin or niacinamide, pyridoxine, riboflavin, and thiamine. Calculate the percentage of the labeled amount of niacinamide (C₆H₆N₂O) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of niacinamide from the *Sample solution*

r_S = peak area of niacinamide from the *Standard solution*

C_S = concentration of USP Niacinamide RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of niacinamide in the *Sample solution* (mg/mL)

For formulations containing niacin:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of niacin from the *Sample solution*

r_S = peak area of niacin from the *Standard solution*

C_S = concentration of USP Niacin RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of niacin in the *Sample solution* (mg/mL)

Separately calculate the percentage of the labeled amount of pyridoxine hydrochloride (C₈H₁₁NO₃ · HCl), riboflavin (C₁₇H₂₀N₄O₆), and thiamine hydrochloride (C₁₂H₁₇ClN₄OS · HCl) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of the corresponding vitamin from the *Sample solution*

r_S = peak area of the corresponding vitamin from the *Standard solution*

C_S = concentration of the relevant USP Reference Standard in the *Standard solution* (mg/mL)

C_U = nominal concentration of the corresponding vitamin in the *Sample solution* (mg/mL)

For products containing thiamine mononitrate, calculate the percentage of the labeled amount of thiamine mononitrate (C₁₂H₁₇N₅O₄S) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak area of thiamine from the *Sample solution*

r_S = peak area of thiamine from the *Standard solution*

C_S = concentration of USP Thiamine Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of thiamine mononitrate in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of thiamine mononitrate, 327.36

M_{r2} = molecular weight of thiamine hydrochloride, 337.27

Acceptance criteria: 90.0%–150.0% of the labeled amount of niacinamide (C₆H₆N₂O), niacin (C₆H₅NO₂), pyridoxine hydrochloride (C₈H₁₁NO₃ · HCl), riboflavin (C₁₇H₂₀N₄O₆), and thiamine as thiamine hydrochloride (C₁₂H₁₇ClN₄OS · HCl) or thiamine mononitrate (C₁₂H₁₇N₅O₄S)

• **NIACIN, Method 2**

[NOTE—Use low-actinic glassware throughout this procedure.]

Solution A: Transfer 1 mL of glacial acetic acid and 2.5 g of edetate disodium to a 100-mL volumetric flask. Dissolve in and dilute with water to volume.

Extraction solvent: *Solution A* and methanol (3:1)

Mobile phase: 0.1 M sodium acetate solution (13.6 mg/mL of sodium acetate in water). Adjust with acetic acid to a pH of 5.4. [NOTE—A small amount of methanol (up to 1%) may be added to the *Mobile phase* to improve resolution.]

Standard stock solution: 1 mg/mL of USP Niacin RS in *Extraction solvent*

Standard solution: Transfer 5.0 mL of *Standard stock solution* to a 25-mL volumetric flask. Dilute with *Extraction solvent* to volume.

Sample solution: [NOTE—This preparation is suitable for the determination of niacin or niacinamide, pyridoxine hydrochloride, and riboflavin, when present in the formulation.] Weigh NLT 20 Capsules in a tared weighing bottle. Open the Capsules, without loss of shell material, and transfer the contents to a beaker. Remove any contents adhering to the shells by washing with several portions of ether. Discard the washings, and dry the Capsule shells with the aid of a current of dry air. Weigh the empty Capsule shells in the tared weighing bottle, and calculate the net weight of the Capsule contents. Transfer a portion of the Capsule contents, equivalent to 0.02 mg/mL of riboflavin. If riboflavin is not present in the formulation, use a portion equivalent to 0.02 mg/mL of pyridoxine. If pyridoxine is not present in the formulation, use a

portion equivalent to 0.2 mg/mL of niacin or niacinamide in *Extraction solvent*, and mix for 20 min, using a wrist-action shaker. Immerse the flask in a water bath maintained at 70°–75°, and heat for 20 min. Mix on a vortex mixer for 30 s, cool to room temperature, and filter. Use the clear filtrate.

Chromatographic system

[NOTE—If necessary, flush the column with methanol between injections.]

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas for niacin. Calculate the percentage of the labeled amount of niacin (C₆H₅NO₂) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area from the *Sample solution*

r_S = peak area from the *Standard solution*

C_S = concentration of USP Niacin RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of niacin in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–150.0% of the labeled amount of niacin (C₆H₅NO₂)

• NIACINAMIDE, Method 2

[NOTE—Use low-actinic glassware throughout this procedure.]

Extraction solvent, Mobile phase, Standard stock solution, Standard solution, Sample solution, and Chromatographic system: Using USP Niacinamide RS in place of USP Niacin RS, proceed as directed in the assay for *Niacin*, Method 2.

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas for niacinamide. Calculate the percentage of the labeled amount of niacinamide (C₆H₆N₂O) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of niacinamide from the *Sample solution*

r_S = peak area of niacinamide from the *Standard solution*

C_S = concentration of USP Niacinamide RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of niacinamide in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–150.0% of the labeled amount of niacinamide (C₆H₆N₂O)

• PYRIDOXINE HYDROCHLORIDE, Method 2

[NOTE—Use low-actinic glassware throughout this procedure.]

Extraction solvent and Mobile phase: Prepare as directed in the assay for *Niacin*, Method 2.

Standard stock solution: 0.1 mg/mL of USP Pyridoxine Hydrochloride RS in *Extraction solvent*

Standard solution: 20 µg/mL of USP Pyridoxine Hydrochloride RS from *Standard stock solution* diluted with *Extraction solvent*

Sample solution: Prepare as directed for the *Sample solution* in the assay for *Niacin*, Method 2.

Analysis

Samples: *Standard solution* and *Sample solution*
Measure the areas for the major peaks. For products containing thiamine hydrochloride, calculate the percentage of the labeled amount of thiamine hydrochloride ($C_{12}H_{17}ClN_4OS \cdot HCl$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of thiamine from the *Sample solution*

r_S = peak area of thiamine from the *Standard solution*

C_S = concentration of USP Thiamine Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of thiamine hydrochloride in the *Sample solution* (mg/mL)

For products containing thiamine mononitrate, calculate the percentage of the labeled amount of thiamine mononitrate ($C_{12}H_{17}N_5O_4S$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak area of thiamine from the *Sample solution*

r_S = peak area of thiamine from the *Standard solution*

C_S = concentration of USP Thiamine Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of thiamine mononitrate in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of thiamine mononitrate, 327.36

M_{r2} = molecular weight of thiamine hydrochloride, 337.27

Acceptance criteria: 90.0%–150.0% of the labeled amount of thiamine as thiamine hydrochloride ($C_{12}H_{17}ClN_4OS \cdot HCl$) or thiamine mononitrate ($C_{12}H_{17}N_5O_4S$)

• **NIACIN OR NIACINAMIDE, PYRIDOXINE HYDROCHLORIDE, RIBOFLAVIN, and THIAMINE, Method 3**

[NOTE—Use low-actinic glassware throughout this procedure.]

Reagent: 25 mg/mL of edetate disodium in water

Mobile phase: Transfer 0.4 mL of triethylamine, 15.0 mL of glacial acetic acid, and 350 mL of methanol to a 2000-mL volumetric flask. Dilute with 0.008 M sodium 1-hexanesulfonate to volume.

Standard stock solution: 1.5 mg/mL of USP Niacin RS or USP Niacinamide RS, 0.24 mg/mL of USP Pyridoxine Hydrochloride RS, 0.08 mg/mL of USP Riboflavin RS, and 0.24 mg/mL of USP Thiamine Hydrochloride RS in *Reagent*, with heating if necessary

Standard solution: Transfer 5.0 mL of *Standard stock solution* to a stoppered 125-mL flask. Add 10.0 mL of a mixture of methanol and glacial acetic acid (9:1) and 30.0 mL of a mixture of methanol and ethylene glycol (1:1). Insert the stopper, shake for 15 min in a water bath maintained at 60°, and cool. Filter, discarding the first few mL of the filtrate.

Sample solution: Proceed as directed for the *Sample solution* in the assay for *Ascorbic Acid, Method 1*, through “calculate the average net weight/Capsule.” Transfer a portion of the Capsule contents, equivalent to a nominal amount of 7.5 mg of niacin or niacinamide, 1.2 mg of pyridoxine hydrochloride, 0.4 mg of riboflavin, and 1.2 mg of thiamine hydrochloride, to a stoppered 125-mL flask. Add 10.0 mL of a mixture of methanol and glacial acetic acid (9:1), and 30.0 mL of a mixture of methanol and ethylene glycol (1:1). Insert the stopper, shake for 15 min in a water bath maintained at 60°, and cool. Filter, discarding the first few mL of the filtrate.

Use deionized water where water is specified. Where atomic absorption spectrophotometry is specified in the assay, the *Standard solutions* and the *Sample solution* may be diluted quantitatively with the solvent specified, if necessary, to yield solutions of suitable concentrations adaptable to the linear or working range of the instrument.]

• **CALCIUM, Method 1**

Lanthanum chloride solution: 267 mg/mL of lanthanum chloride heptahydrate in 0.125 N hydrochloric acid

Calcium standard solution: 400 µg/mL of calcium. Dissolve 1.001 g of calcium carbonate, previously dried at 300° for 3 h and cooled in a desiccators for 2 h, in 25 mL of 1 N hydrochloric acid. Boil to expel carbon dioxide, and dilute with water to 1000 mL.

Standard stock solution: 100 µg/mL of calcium from *Calcium standard solution* diluted with 0.125 N hydrochloric acid

Standard solutions: Into separate 100-mL volumetric flasks pipet 1.0, 1.5, 2.0, 2.5, and 3.0 mL of the *Standard stock solution*. To each flask add 1.0 mL of *Lanthanum chloride solution*, and dilute with water to volume to obtain concentrations of 1.0, 1.5, 2.0, 2.5, and 3.0 µg/mL of calcium.

Polysorbate 80 solution: Dilute Polysorbate 80 with alcohol (1 in 10).

Sample solution: Transfer 5 Capsules to a 100-mL volumetric flask. [NOTE—For hard gelatin Capsules, weigh NLT 20 Capsules. Open the Capsules, without loss of shell material, and transfer the contents to a suitable container. Remove any contents adhering to the empty shells by washing with several portions of ether. Discard the washings, and allow the Capsule shells to dry. Weigh the empty Capsule shells, calculate the net weight of the Capsule contents, and transfer a portion of the Capsule contents, equivalent to 5 Capsules, to a 100-mL volumetric flask.] Add 15 mL of water, 10 mL of 6 N hydrochloric acid, and 1 mL of *Polysorbate 80 solution* to the flask. Heat on a hot plate

or steam bath, with intermittent swirling, until the Capsules are completely disintegrated or the contents are dissolved. Boil gently for an additional 15 min. Cool, dilute with water to volume, and filter, discarding the first 5 mL of the filtrate. Dilute this solution with 0.125 N hydrochloric acid to obtain a concentration of 2 µg/mL of calcium, adding 1 mL of *Lanthanum chloride solution* per 100 mL of the final volume.

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrometry

Lamp: Calcium hollow-cathode

Flame: Nitrous oxide–acetylene

Analytical wavelength: Calcium emission line at 422.7 nm

Blank: 0.125 N hydrochloric acid containing 1 mL of *Lanthanum chloride solution* per 100 mL

Analysis

Samples: *Standard solutions* and *Sample solution*
 Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in µg/mL, of calcium, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, C, in µg/mL, of calcium in the *Sample solution*.

Calculate the percentage of the labeled amount of calcium (Ca) in the portion of Capsules taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of calcium in the *Sample solution* (µg/mL)

C_U = nominal concentration of calcium in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–125.0% of the labeled amount of calcium (Ca)

• **CHROMIUM, Method 1**

Chromium standard solution: 1000 µg/mL of chromium from potassium dichromate, previously dried at 120° for 4 h in water. Store in a polyethylene bottle.

Standard stock solution: 10 µg/mL of chromium from *Chromium standard solution* diluted with 6 N hydrochloric acid and water (1 in 20)

Standard solutions: Transfer 10.0 and 20.0 mL of the *Standard stock solution* to separate 100-mL volumetric flasks, and transfer 15.0 mL and 20.0 mL of the *Standard stock solution* to separate 50-mL volumetric flasks. Dilute the contents of each of the four flasks with 0.125 N hydrochloric acid to volume to obtain concentrations of 1.0, 2.0, 3.0, and 4.0 µg/mL of chromium.

Sample solution: Proceed as directed for the *Sample solution* in the assay for *Calcium, Method 1*, except to prepare the *Sample solution* to contain 1 µg/mL of chromium and to omit the use of the *Lanthanum chloride solution*.

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrometry

Lamp: Chromium hollow-cathode

Flame: Air–acetylene

Analytical wavelength: Chromium emission line at 357.9 nm

Blank: 0.125 N hydrochloric acid

Analysis

Samples: *Standard solutions* and *Sample solution*
 Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in µg/mL, of chromium, and draw the straight line best fitting the four plotted points. From the graph so obtained, determine the concentration, C, in µg/mL, of chromium in the *Sample solution*.

Calculate the percentage of the labeled amount of chromium (Cr) in the portion of Capsules taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of chromium in the *Sample solution* (μg/mL)

C_U = nominal concentration of chromium in the *Sample solution* (μg/mL)

Acceptance criteria: 90.0%–160.0% of the labeled amount of chromium (Cr)

• **COPPER, Method 1**

Copper standard solution: Dissolve 1.00 g of copper foil in a minimum volume of a 50% (v/v) solution of nitric acid, and dilute with a 1% (v/v) solution of nitric acid to 1000 mL. This solution contains 1000 μg/mL of copper.

Standard stock solution: 100 μg/mL of copper from *Copper standard solution* diluted with 0.125 N hydrochloric acid

Standard solutions: To separate 200-mL volumetric flasks transfer 1.0, 2.0, 4.0, 6.0, and 8.0 mL of the *Standard stock solution*. Dilute with water to volume to obtain concentrations of 0.5, 1.0, 2.0, 3.0, and 4.0 μg/mL of copper.

Sample solution: Proceed as directed for the *Sample solution* in the assay for *Calcium, Method 1*, except to prepare the *Sample solution* to contain 2 μg/mL of copper and to omit the use of the *Lanthanum chloride solution*.

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrometry

Lamp: Copper hollow-cathode

Flame: Air–acetylene

Analytical wavelength: Copper emission line at 324.7 nm

Blank: 0.125 N hydrochloric acid

Analysis

Samples: *Standard solutions* and *Sample solution*
Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in μg/mL, of copper, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, C, in μg/mL, of copper in the *Sample solution*.

Calculate the percentage of the labeled amount of copper (Cu) in the portion of Capsules taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of copper in the *Sample solution* (μg/mL)

C_U = nominal concentration of copper in the *Sample solution* (μg/mL)

Acceptance criteria: 90.0%–125.0% of the labeled amount of copper (Cu)

• **FLUORIDE, Method 1**

[NOTE—Store all solutions in plastic containers.]

3 M sodium acetate solution: 408 mg/mL of sodium acetate in water. Adjust with a few drops of acetic acid to a pH of 7.0. [NOTE—Dissolve in a portion of water and allow the solution to equilibrate to room temperature, then dilute with water to volume and adjust the pH.]

Sodium citrate solution: Dissolve 222 g of sodium citrate in 250 mL of water in a 1000-mL volumetric flask. Add 28 mL of perchloric acid, and dilute with water to volume.

Fluoride standard stock solution: 500 μg/mL of fluoride from a quantity of sodium fluoride, previously dried at 100° for 4 h and cooled in a desiccator in water

Intermediate stock solution A: 100 μg/mL of fluoride from *Fluoride standard stock solution* diluted with water

Intermediate stock solution B: 10 μg/mL of fluoride from *Fluoride standard stock solution* diluted with water

Standard solutions: To five separate 100-mL volumetric flasks transfer 3.0, 5.0, and 10.0 mL of *Intermediate stock solution B* and 5.0 and 10.0 mL of *Intermediate stock solution A*. To each flask add 10.0 mL of 1 N hydrochloric acid, 25 mL of 3 M *sodium acetate solution*, and 25.0 mL of *Sodium citrate solution*. Dilute the contents of each flask with water to volume to obtain concentrations of 0.3, 0.5, 1.0, 5.0, and 10.0 μg/mL of fluoride.

Sample solution: Remove the contents of Capsules by cutting open the Capsules. Mix, and determine the weight of the contents. Transfer a quantity of the mixed Capsule contents, equivalent to 200 mg of fluoride, to a 100-mL volumetric flask. Add 10.0 mL of 1 N hydrochloric acid, 25.0 mL of 3 M *sodium acetate solution*, and 25.0 mL of *Sodium citrate solution*. Dilute with water to volume.

Analysis

Samples: *Standard solutions* and *Sample solution*
To separate plastic beakers, each containing a plastic-coated stirring bar, transfer 50.0 mL each of the *Standard solutions* and the *Sample solution*. Measure the potentials (see pH (791)), in mV, of the *Standard solutions* and the *Sample solution*, with a pH meter capable of a minimum reproducibility of ±0.2 mV and equipped with a fluoride-specific ion-indicating electrode and a calomel reference electrode. [NOTE—When taking measurements, immerse the electrodes in the solution, stir on a magnetic stirrer having an insulated top until equilibrium is attained (1–2 min), and record the potential. Rinse and dry the electrodes between measurements, taking care to avoid damaging the crystal of the specific-ion electrode.] Plot the logarithms of fluoride concentrations, in μg/mL, of the *Standard solutions* versus the potential, in mV. From the standard response curve and the measured potential of the *Sample solution*, determine the concentration, C, in μg/mL, of fluoride in the *Sample solution*.

Calculate the percentage of the labeled amount of fluorine (F) in the portion of Capsules taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of fluoride in the *Sample solution* (μg/mL)

C_U = nominal concentration of fluorine in the *Sample solution* (μg/mL)

Acceptance criteria: 90.0%–160.0% of the labeled amount of fluorine (F)

• **FLUORIDE, Method 2**

[NOTE—Use plastic containers and deionized water throughout this procedure.]

pH 10.0 buffer: Add 214 mL of 0.1 N sodium hydroxide to 1000 mL of 0.05 M sodium bicarbonate.

Mobile phase: Alcohol, 0.1 N sulfuric acid, and water (20:5:175)

Standard stock solution: 220 μg/mL of USP Sodium Fluoride RS in water. This solution contains 100 μg/mL of fluoride.

Standard solution: [NOTE—Condition the solid-phase extraction column specified for use in the *Standard solution* and the *Sample solution* in the following manner. Using a vacuum at a pressure not exceeding 5 mm of mercury, wash the column with one column volume of methanol followed by one column volume of pH 10.0 buffer. Do not allow the column top to dry. If the top of the column becomes dry, recondition the column.] Transfer 10.0 mL of the *Standard stock solution* to a 100-mL volumetric flask. Add 75 mL of water, and adjust with 0.1 N sodium hydroxide to a pH of 10.4 ±

0.1. Dilute with water to volume. Filter, discarding the first 15 mL of the filtrate. Transfer 25.0 mL of the filtrate to a 50-mL volumetric flask. Add 15.0 mL of water, and adjust with 0.1 N sodium hydroxide to a pH of 10.0. Dilute with pH 10.0 buffer to volume. Elute a portion of this solution through a 3-mL, solid-phase extraction column containing L1 packing that is connected through an adaptor to a second solid-phase extraction column containing sulfonpropyl strong cation-exchange packing. Discard the first 3 mL of the eluate, and collect the rest of the eluate in a suitable flask for injection into the chromatograph.

Sample solution: Weigh NLT 20 Capsules in a tared weighing bottle. Open the Capsules, without loss of shell material, and transfer the contents to a 100-mL container. If necessary, remove any contents adhering to the empty shells by washing with several portions of ether. Discard the washings, and dry the Capsule shells with the aid of a current of dry air. Weigh the empty Capsule shells in the tared weighing bottle, and calculate the net weight of the Capsule contents. Transfer a portion of the Capsule contents, equivalent to a nominal amount of 1 mg of fluorine, to a 100-mL volumetric flask. Add 15 mL of water, and shake vigorously. Rinse the sides of the flask with 15 mL of water, and allow to stand for 10 min. Dilute with water to 85 mL, adjust with 1 N sodium hydroxide to a pH of 10.4 ± 0.1 , and dilute with water to 100 mL. Proceed as directed for the *Standard solution*, beginning with "Filter, discarding the first 15 mL of the filtrate."

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: Conductivity detector

Guard column: 4.6-mm \times 3-cm; packing L17

Analytical column: 7.8-mm \times 30-cm; packing L17

Flow rate: 0.5 mL/min

Injection size: 100 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas for fluoride. Calculate the percentage of the labeled amount of fluorine (F) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area from the *Sample solution*

r_S = peak area from the *Standard solution*

C_S = concentration of fluoride in the *Standard solution* (μ g/mL)

C_U = nominal concentration of fluorine in the *Sample solution* (μ g/mL)

Acceptance criteria: 90.0%–160.0% of the labeled amount of fluorine (F)

• IODIDE, Method 1

Bromine water: Bromine and water (1:5). Shake. Allow to stand for 30 min, and use the supernatant.

Analysis: Remove the contents of Capsules by cutting open the Capsules. Mix, and determine the weight of the contents. Transfer a quantity of the contents, equivalent to 3 mg of iodine, to a nickel crucible. Add 5 g of sodium carbonate, 5 mL of 50% (w/v) sodium hydroxide solution, and 10 mL of alcohol, taking care that the entire specimen is moistened. Heat the crucible on a steam bath to evaporate the alcohol, then dry the crucible at 100° for 30 min to prevent spattering upon subsequent heating. Transfer the crucible with its contents to a furnace heated to 500°, and heat the crucible for 15 min. [NOTE—Heating at 500° is necessary to carbonize any organic matter present; a

higher temperature may be used, if necessary, to ensure complete carbonization of all organic matter.]

Cool the crucible, add 25 mL of water, cover the crucible with a watchglass, and boil gently for 10 min. Filter the solution, and wash the crucible with boiling water, collecting the filtrate and washings in a beaker. Add phosphoric acid until the solution is neutral to methyl orange, then add 1 mL excess of phosphoric acid. Add excess of *Bromine water*, and boil the solution gently until colorless and then for 5 min longer. Add a few crystals of salicylic acid, and cool the solution to 20°. Add 1 mL of phosphoric acid and 0.5 g of potassium iodide, and titrate the liberated iodine with 0.005 N sodium thiosulfate VS, adding starch TS when the liberated iodine color has nearly disappeared.

Calculate the percentage of the labeled amount of iodine (I) in the portion of Capsules taken:

$$\text{Result} = V \times N_A \times F \times \text{Ime} \times (Aw/W) \times (100/L)$$

V = volume of sodium thiosulfate consumed (mL)

N_A = actual normality of the sodium thiosulfate solution used (meq/mL)

F = correction factor to convert mg to μ g, 1000 μ g/mg

Ime = milliequivalent of I (21.16 mg/meq)

Aw = average weight of the Capsules' contents

W = weight of the sample of Capsules' contents taken

L = labeled amount of iodine (μ g/Capsule)

Acceptance criteria: 90.0%–160.0% of the labeled amount of iodine (I)

• IODIDE, Method 2: Proceed as directed in *Automated Methods of Analysis* (16), *Assay for Iodide*.

Acceptance criteria: 90.0%–160.0% of the labeled amount of iodine (I)

• IRON, Method 1

Iron standard stock solution: Transfer 100 mg of iron powder to a 1000-mL volumetric flask. Dissolve in 25 mL of 6 N hydrochloric acid, dilute with water to volume, and mix.

Standard solutions: To separate 100-mL volumetric flasks transfer 2.0, 4.0, 5.0, 6.0, and 8.0 mL of *Iron standard stock solution*. Dilute the contents of each flask with water to volume to obtain concentrations of 2.0, 4.0, 5.0, 6.0, and 8.0 μ g/mL of iron.

Polysorbate 80 solution: Prepare as directed in the assay for *Calcium*, *Method 1*.

Sample solution: Proceed as directed for the *Sample solution* in the assay for *Calcium*, *Method 1*, except to prepare the *Sample solution* to contain a nominal concentration of 5 μ g/mL of iron and to omit the use of the *Lanthanum chloride solution*.

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* <851>.)

Mode: Atomic absorption spectrometry

Lamp: Iron hollow-cathode

Flame: Air–acetylene

Analytical wavelength: Iron emission line at 248.3 nm

Blank: 0.125 N hydrochloric acid

Analysis

Samples: *Standard solutions* and *Sample solution*
Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in μ g/mL, of iron, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, C , in μ g/mL, of iron in the *Sample solution*.

Calculate the percentage of the labeled amount of iron (Fe) in the portion of Capsules taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of iron in the *Sample solution* (µg/mL)

C_U = nominal concentration of iron in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–125.0% of the labeled amount of iron (Fe)

• **MAGNESIUM, Method 1**

Lanthanum chloride solution: Prepare as directed in the assay for *Calcium, Method 1*

Magnesium standard solution: 1000 µg/mL of magnesium from magnesium ribbon, in 6 N hydrochloric acid and water (1:19)

Standard stock solution: 20 µg/mL of magnesium from *Magnesium standard solution* diluted with 0.125 N hydrochloric acid

Standard solutions: To separate 100-mL volumetric flasks transfer 1.0, 1.5, 2.0, 2.5, and 3.0 mL of the *Standard stock solution*. To each flask add 1.0 mL of *Lanthanum chloride solution*, and dilute with 0.125 N hydrochloric acid to volume to obtain concentrations of 0.2, 0.3, 0.4, 0.5, and 0.6 µg/mL of magnesium.

Polysorbate 80 solution: Prepare as directed in the assay for *Calcium, Method 1*.

Sample solution: Proceed as directed for the *Sample solution* in the assay for *Calcium, Method 1*, except to prepare the *Sample solution* to contain 0.4 µg/mL of magnesium.

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrometry

Lamp: Magnesium hollow-cathode

Flame: Air–acetylene

Analytical wavelength: Magnesium emission line at 285.2 nm

Blank: 0.125 N hydrochloric acid containing 1 mL of *Lanthanum chloride solution* per 100 mL

Analysis

Samples: *Standard solutions* and *Sample solution*
Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in µg/mL, of magnesium, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, C, in µg/mL, of magnesium in the *Sample solution*.

Calculate the percentage of the labeled amount of magnesium (Mg) in the portion of Capsules taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of magnesium in the *Sample solution* (µg/mL)

C_U = nominal concentration of magnesium in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–125.0% of the labeled amount of magnesium (Mg)

• **MANGANESE, Method 1**

Manganese standard stock solution: 1000 µg/mL of manganese in 6 N hydrochloric acid and nitric acid (49:1). [NOTE—Dissolve the manganese in nitric acid and dilute with 6 N hydrochloric acid to final volume.]

Standard stock solution: 50 µg/mL of manganese from *Manganese standard stock solution* diluted with 0.125 N hydrochloric acid

Standard solutions: To separate 100-mL volumetric flasks transfer 1.0, 1.5, 2.0, 3.0, and 4.0 mL of *Standard stock solution*. Dilute the contents of each flask with 0.125 N hydrochloric acid to volume to obtain solutions with concentrations of 0.5, 0.75, 1.0, 1.5, and 2.0 µg/mL of manganese.

Polysorbate 80 solution: Prepare as directed in the assay for *Calcium, Method 1*.

Sample solution: Proceed as directed for the *Sample solution* in the assay for *Calcium, Method 1*, except to

prepare the *Sample solution* to contain 1 µg/mL of manganese and to omit the use of the *Lanthanum chloride solution*.

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrometry

Lamp: Manganese hollow-cathode

Flame: Air–acetylene

Analytical wavelength: Manganese emission line at 279.5 nm

Blank: 0.125 N hydrochloric acid

Analysis

Samples: *Standard solutions* and *Sample solution*

Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in µg/mL, of manganese, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, C, in µg/mL, of manganese in the *Sample solution*.

Calculate the percentage of the labeled amount of manganese (Mn) in the portion of Capsules taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of manganese in the *Sample solution* (µg/mL)

C_U = nominal concentration of manganese in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–125.0% of the labeled amount of manganese (Mn)

• **MOLYBDENUM, Method 1**

Diluent: 20 mg/mL of ammonium chloride in water

Molybdenum standard solution: Transfer 1.0 g of molybdenum wire to a 1000-mL volumetric flask, and dissolve in 50 mL of nitric acid, warming if necessary. Dilute with water to volume, and mix to obtain a solution with a concentration of 1000 µg/mL of molybdenum.

Standard stock solution: 100 µg/mL of molybdenum from *Molybdenum standard solution* diluted with water

Standard solutions: To separate 100-mL volumetric flasks transfer 2.0, 10.0, and 25.0 mL of the *Standard stock solution*, and add 5.0 mL of perchloric acid to each flask. Gently boil the solution in each flask for 15 min. Cool to room temperature, and dilute each with *Diluent* to volume to obtain concentrations of 5.0, 10.0, and 25.0 µg/mL of molybdenum.

Polysorbate 80 solution: Prepare as directed in the assay for *Calcium, Method 1*.

Sample solution: Proceed as directed for the *Sample solution* in the assay for *Calcium, Method 1*, except to take a number of Capsules or a portion of Capsule contents nominally equivalent to 1000 µg of molybdenum and make appropriate dilutions to obtain a final concentration of 10 µg/mL of molybdenum, omitting the addition of the *Lanthanum chloride solution*.

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrometry

Lamp: Molybdenum hollow-cathode

Flame: Nitrous oxide–acetylene

Analytical wavelength: Molybdenum emission line at 313.3 nm

Blank: *Diluent* and perchloric acid (20:1)

Analysis

Samples: *Standard solutions* and *Sample solution*

Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in µg/mL, of molybdenum, and draw the straight line best fitting the three plotted points. From the graph so obtained, determine the concentration, C, in µg/mL, of molybdenum in the *Sample solution*.

Calculate the percentage of the labeled amount of molybdenum (Mo) in the portion of Capsules taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of molybdenum in the *Sample solution* ($\mu\text{g/mL}$)

C_U = nominal concentration of molybdenum in the *Sample solution* ($\mu\text{g/mL}$)

Acceptance criteria: 90.0%–160.0% of the labeled amount of molybdenum (Mo)

• **MOLYBDENUM, Method 2**

Sodium fluoride solution: Add 200 mL of water to 10 g of sodium fluoride, stir until the solution is saturated, and filter. Store in a polyethylene bottle.

Ferrous sulfate solution: 4.98 mg/mL of ferrous sulfate in water

Potassium thiocyanate solution: 200 mg/mL of potassium thiocyanate in water

20% Stannous chloride solution: 400 mg/mL of stannous chloride in 6.5 N hydrochloric acid solution and water (1:4). [NOTE—Dissolve first in 6.5 N hydrochloric acid, and heat the solution until the stannous chloride is dissolved. Then, dilute with water to volume.]

Diluted stannous chloride solution: 20% *Stannous chloride solution* and water (1:24). Prepare this solution fresh at the time of use.

Standard solution: 20 $\mu\text{g/mL}$ of molybdenum from ammonium molybdate in water

Sample: Remove the contents of a counted number of Capsules by cutting open the Capsules. Mix, and determine the weight of the contents. Transfer a quantity of the Capsule contents, equivalent to a nominal amount of 40 mg of molybdenum, to a 200-mL beaker.

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: UV-Vis

Cell: 1 cm

Analytical wavelength: 465 nm

Blank: Amyl alcohol

Analysis

Samples: *Standard solution* and *Sample*

Transfer the *Sample* and 2.0 mL of the *Standard solution* to separate 200-mL beakers. Add 20 mL of nitric acid to each beaker. Cover each beaker with a watchglass, and boil slowly on a hot plate for 45 min. Cool to room temperature. Add 6 mL of perchloric acid, cover the beakers with a watchglass, and continue the heating until digestion is complete, as indicated when the liquid becomes colorless or pale yellow. Evaporate the solutions in the beakers to dryness. Rinse the sides of the beakers and the watchglasses with water, and add more water to complete 50 mL in each beaker. Gently boil the water solution for a few min. Cool to room temperature. Add 2 drops of methyl orange TS, and neutralize with ammonium hydroxide. Add 8.2 mL of hydrochloric acid. Quantitatively transfer the contents of the beakers to separate 100-mL volumetric flasks, rinse the beakers with water, transfer the rinsings to the corresponding volumetric flasks, and dilute with water to volume. Transfer 50.0 mL of each solution to separatory funnels. To each separatory funnel add 1.0 mL of *Sodium fluoride solution*, 0.5 mL of *Ferrous sulfate solution*, 4.0 mL of *Potassium thiocyanate solution*, 1.5 mL of 20% *Stannous chloride solution*, and 15.0 mL of amyl alcohol, and shake the separatory funnel for 1 min. Allow the layers to separate, and discard the aqueous layers. Add 25 mL of *Diluted stannous chloride solution* to each separatory funnel, and shake gently for 15 s. Allow the layers to separate, and discard the aqueous layers. Transfer the organic layers from each separatory funnel to a centrifuge tube, and centrifuge at 2000 rpm for 10 min. Determine the absorbances of

the organic phases obtained from the *Standard solution* and the *Sample*, and correct with the *Blank*.

Calculate the percentage of the labeled amount of molybdenum (Mo) in the portion of Capsules taken:

$$\text{Result} = (A_U/A_S) \times [(V \times C_S)/M_U] \times 100$$

A_U = absorbance of the *Sample solution*

A_S = absorbance of the *Sample solution*

V = volume of the *Standard solution* analyzed, 2.0 mL

C_S = concentration of molybdenum in the *Standard solution* ($\mu\text{g/mL}$)

M_U = nominal amount of molybdenum in the *Sample* (μg)

Acceptance criteria: 90.0%–160.0% of the labeled amount of molybdenum (Mo)

• **PHOSPHORUS, Method 1**

Sulfuric acid solution: Cautiously add sulfuric acid to water (37.5:100), and mix

Ammonium molybdate solution: 50 mg/mL of ammonium molybdate in *Sulfuric acid solution* and water (2:3). [NOTE—Dissolve in water first, then dilute with *Sulfuric acid solution* to volume.]

Hydroquinone solution: 5 mg/mL of hydroquinone in water. Add one drop of sulfuric acid per 100 mL of solution.

Sodium bisulfite solution: 200 mg/mL of sodium bisulfite in water

Phosphorus standard stock solution: Weigh 4.395 g of monobasic potassium phosphate, previously dried at 105° for 2 h and stored in a desiccator, and transfer to a 1000-mL volumetric flask. Dissolve in water, add 6 mL of sulfuric acid as a preservative, dilute with water to volume, and mix to obtain a solution with a concentration of 1000 $\mu\text{g/mL}$ of phosphorus.

Standard solution: 20 $\mu\text{g/mL}$ of phosphorus from *Phosphorus standard stock solution* diluted with water

Sample solution: Remove the contents of Capsules by cutting open the Capsules. Mix, and determine the weight of the contents. Transfer a quantity of the Capsule contents, nominally equivalent to 100 mg of phosphorus in 25 mL of nitric acid, and digest on a hot plate for 30 min. Add 15 mL of hydrochloric acid, and continue the digestion to the cessation of brown fumes. Cool, and transfer the contents of the flask to a 500-mL volumetric flask with the aid of small portions of water. Dilute with water to volume. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, and dilute with water to volume.

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: UV-Vis

Cell: 1 cm

Analytical wavelength: 650 nm

Analysis

Samples: *Standard solution* and *Sample solution*

To three separate 25-mL volumetric flasks transfer 5.0 mL each of the *Standard solution*, the *Sample solution*, and water to provide the blank. To each of the three flasks add 1.0 mL each of *Ammonium molybdate solution*, *Hydroquinone solution*, and *Sodium bisulfite solution*, and swirl to mix. Dilute the contents of each flask with water to volume, and allow the flasks to stand for 30 min. Determine the absorbances of the solutions, against the *Blank*.

Calculate the percentage of the labeled amount of phosphorus (P) in the portion of Capsules taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

A_U = absorbance of the *Sample solution*

A_S = absorbance of the *Standard solution*

C_S = concentration of phosphorus in the *Standard solution* ($\mu\text{g/mL}$)

C_U = nominal concentration of phosphorus in the
Sample solution ($\mu\text{g/mL}$)

Acceptance criteria: 90.0%–125.0% of the labeled amount of phosphorus (P)

• POTASSIUM

Potassium standard solution: 100 $\mu\text{g/mL}$ of potassium from potassium chloride, previously dried at 105° for 2 h, in water

Standard stock solution: 10 $\mu\text{g/mL}$ of potassium from *Potassium standard solution* diluted with 0.125 N hydrochloric acid

Standard solutions: Transfer 5.0, 10.0, 15.0, 20.0, and 25.0 mL of the *Standard stock solution* to separate 100-mL volumetric flasks. Dilute the contents of each flask with 0.125 N hydrochloric acid to volume to obtain solutions containing 0.5, 1.0, 1.5, 2.0, and 2.5 $\mu\text{g/mL}$ of potassium.

Polysorbate 80 solution: Prepare as directed in the assay for *Calcium, Method 1*.

Sample solution: Proceed as directed for the *Sample solution* in the assay for *Calcium, Method 1* except to prepare the *Sample solution* to contain 1 $\mu\text{g/mL}$ of potassium and to omit the use of the *Lanthanum chloride solution*.

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry

Lamp: Potassium hollow-cathode

Flame: Air–acetylene

Analytical wavelength: Potassium emission line at 766.5 nm

Blank: Water

Analysis

Samples: *Standard solutions* and *Sample solution*
Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in $\mu\text{g/mL}$, of potassium, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, C , in $\mu\text{g/mL}$, of potassium in the *Sample solution*.

Calculate the percentage of the labeled amount of potassium (K) in the portion of Capsules taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of potassium in the
Sample solution ($\mu\text{g/mL}$)

C_U = nominal concentration of potassium in the
Sample solution ($\mu\text{g/mL}$)

Acceptance criteria: 90.0%–125.0% of the labeled amount of potassium (K)

• SELENIUM, Method 1

Diluent: Prepare as directed in the assay for *Molybdenum, Method 1*.

Selenium standard solution: [CAUTION—Selenium is toxic; handle it with care.] Dissolve 1 g of metallic selenium in a minimum volume of nitric acid. Evaporate to dryness. Add 2 mL of water, and evaporate to dryness. Repeat the addition of water and the evaporation to dryness three times. Dissolve the residue in 3 N hydrochloric acid, transfer to a 1000-mL volumetric flask, and dilute with 3 N hydrochloric acid to volume to obtain a concentration of 1000 $\mu\text{g/mL}$ of selenium.

Standard stock solution: 100 $\mu\text{g/mL}$ of selenium from *Selenium standard solution* diluted with water

Standard solutions: To separate 100-mL volumetric flasks transfer 5.0, 10.0, and 25.0 mL of the *Standard stock solution*, and add 5.0 mL of perchloric acid to each flask. Gently boil the solutions for 15 min, cool to room temperature, and dilute each with *Diluent* to volume to obtain solutions containing 5.0, 10.0, and 25.0 $\mu\text{g/mL}$ of selenium.

Sample solution: Remove the contents of Capsules by cutting open the Capsules. Mix, and determine the weight of the contents. Transfer a quantity of the Capsule contents, equivalent to 1000 μg of selenium in 12 mL of nitric acid. [NOTE—The volume of nitric acid may be varied to ensure that the powder is uniformly dispersed.]

Carefully swirl the flask to disperse the sample specimen. Sonicate for 10 min or until the sample specimen is completely dissolved. Gently boil the solution for 15 min, and cool to room temperature. Carefully add 8 mL of perchloric acid to the flask, heat the flask until perchloric acid fumes appear, and swirl the flask to dissipate the fumes. Repeat the heating and swirling until the fumes appear again. Cool to room temperature. Transfer the contents of the flask to a 50-mL volumetric flask with the aid of the *Diluent*, and dilute with *Diluent* to volume.

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry

Lamp: Selenium hollow-cathode

Flame: Air–acetylene

Analytical wavelength: Selenium emission line at 196.0 nm

Blank: *Diluent* and perchloric acid (20:1)

Analysis

Samples: *Standard solutions* and *Sample solution*
Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in $\mu\text{g/mL}$, of selenium, and draw the straight line best fitting the three plotted points. From the graph so obtained, determine the concentration, C , in $\mu\text{g/mL}$, of selenium in the *Sample solution*.

Calculate the percentage of the labeled amount of selenium (Se) in the portion of Capsules taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of selenium in the
Sample solution ($\mu\text{g/mL}$)

C_U = nominal concentration of selenium in the
Sample solution ($\mu\text{g/mL}$)

Acceptance criteria: 90.0%–160.0% of the labeled amount of selenium (Se)

• SELENIUM, Method 2

Hydrochloric acid solution: Hydrochloric acid diluted with water (1 in 10)

50% Ammonium hydroxide solution: Ammonium hydroxide diluted with water (1 in 2)

Reagent A: 9 mg/mL of edetate disodium and 25 mg/mL of hydroxylamine hydrochloride in water. [NOTE—Dissolve edetate disodium in a portion of water first, add hydroxylamine hydrochloride, then dilute with water to volume.]

Reagent B: Transfer 200 mg of 2,3-diaminonaphthalene to a 250-mL separatory funnel, and add 200 mL of 0.1 N hydrochloric acid. Wash the solution with three 40-mL portions of cyclohexane, and discard the cyclohexane layer. Filter the solution into a brown bottle, and cover the solution with a 1-cm layer of cyclohexane. This solution is stable for 1 week if stored in a refrigerator.

Standard stock solution: [CAUTION—Selenium is toxic; handle it with care.] Dissolve 1 g of metallic selenium in a minimum volume of nitric acid. Evaporate to dryness, add 2 mL of water, and evaporate to dryness. Repeat the addition of water and evaporation to dryness three times. Dissolve the residue in 3 N hydrochloric acid, transfer to a 1000-mL volumetric flask, and dilute with 3 N hydrochloric acid to volume to obtain a solution with a concentration of 1000 $\mu\text{g/mL}$ of selenium. Dilute a volume of the solution with 0.125 N hydrochloric

acid, to obtain a concentration of 2.0 µg/mL of selenium.

Standard solution: Transfer 10.0 mL of *Standard stock solution* to a glass stoppered flask. Add 1 mL of perchloric acid, and 1 mL of *Hydrochloric acid solution*, and dilute with water to 20 mL.

Sample solution: Remove the contents of Capsules by cutting open the Capsules. Mix, and determine the weight of the contents. Transfer a quantity of the Capsule contents, equivalent to a nominal amount of 20 µg of selenium to a suitable flask. Add 10 mL of nitric acid, and warm gently on a hot plate. Continue heating until the initial nitric acid reaction has subsided, then add 3 mL of perchloric acid. [CAUTION—Exercise care at this stage because perchloric acid reaction becomes vigorous.] Continue heating on the hot plate until the appearance of white fumes of perchloric acid or until the digest begins to darken. Add 0.5 mL of nitric acid, and resume heating, adding additional amounts of nitric acid if further darkening occurs. Digest for 10 min after the first appearance of perchloric acid fumes or until the digest becomes colorless. Cool the flask. Add 2.5 mL of *Hydrochloric acid solution*, and return the flask to the hot plate to expel residual nitric acid. Heat the mixture for 3 min after it begins to boil. Cool the flask to room temperature, and dilute with water to 20 mL.

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: UV

Cell: 1 cm

Analytical wavelength: 380 nm

Blank: 1 mL of perchloric acid and 1 mL of *Hydrochloric acid solution* diluted with water to 20 mL

Analysis

Samples: *Standard solution* and *Sample solution*
Treat the *Sample solution*, the *Standard solution*, and the *Blank* as follows. Add 5 mL of *Reagent A* to each flask, and swirl gently to mix. Adjust the solution in each flask with 50% *Ammonium hydroxide solution* to a pH of 1.1 ± 0.1 . Add 5 mL of *Reagent B* to each flask, and swirl gently to mix. Place the flasks in a water bath maintained at 50°, and equilibrate for 30 min, taking care that the flasks are covered to protect them from light. Cool to room temperature, and transfer the contents of each flask to separate separatory funnels. Transfer 10.0 mL of cyclohexane to each separatory funnel, and extract vigorously for 1 min. Discard the aqueous layer. Transfer the cyclohexane layer to a centrifuge tube, and centrifuge at 1000 rpm for 1 min to remove any remaining water. Determine the absorbances of the solutions obtained from the *Samples* against the solution obtained from the *Blank*. Calculate the percentage of the labeled amount of selenium (Se) in the portion of Capsules taken:

$$\text{Result} = (A_U/A_S) \times [(V \times C_S)/M_U] \times 100$$

A_U = absorbance of the cyclohexane layer from the *Sample solution*

A_S = absorbance of the cyclohexane layer from the *Standard solution*

V = volume of the *Standard stock solution* used to prepare the *Standard solution*, 10 mL

C_S = concentration of selenium in the *Standard stock solution* (µg/mL)

M_U = nominal amount of selenium in the *Sample solution* (mg)

Acceptance criteria: 90.0%–160.0% of the labeled amount of selenium (Se)

• ZINC, Method 1

Zinc standard solution: 1000 µg/mL of zinc from zinc oxide dissolved in 5 M hydrochloric acid (3.89 mg/mL),

and diluted with water to final volume. [NOTE—Dissolve in 5 M hydrochloric acid by warming, if necessary, cool, and then dilute to final volume.]

Standard stock solution: 50 µg/mL of zinc from *Zinc standard solution* diluted with 0.125 N hydrochloric acid

Standard solutions: Transfer 1.0, 2.0, 3.0, 4.0, and 5.0 mL of *Standard stock solution* to separate 100-mL volumetric flasks. Dilute the contents of each flask with 0.125 N hydrochloric acid to volume to obtain concentrations of 0.5, 1.0, 1.5, 2.0, and 2.5 µg/mL of zinc.

Polysorbate 80 solution: Prepare as directed in the assay for *Calcium*, Method 1.

Sample solution: Proceed as directed for the *Sample solution* in the assay for *Calcium*, Method 1, except to prepare the *Sample solution* to contain 2 µg/mL of zinc and to omit the use of the *Lanthanum chloride solution*.

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry

Lamp: Zinc hollow-cathode

Flame: Air–acetylene

Analytical wavelength: Zinc emission line at 213.8 nm

Blank: 0.125 N hydrochloric acid

Analysis

Samples: *Standard solutions* and *Sample solution*
Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in µg/mL, of zinc, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, C , in µg/mL, of zinc in the *Sample solution*.

Calculate the percentage of the labeled amount of zinc (Zn) in the portion of Capsules taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of zinc in the *Sample solution* (µg/mL)

C_U = nominal concentration of zinc in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–125.0% of the labeled amount of zinc (Zn)

• BORON, NICKEL, TIN, and VANADIUM, Method 1; CALCIUM, CHROMIUM, COPPER, IRON, MAGNESIUM, MANGANESE, PHOSPHORUS, and ZINC, Method 2; MOLYBDENUM and SELENIUM, Method 3

Stock aqua regia solution: Prepare a mixture of hydrochloric acid and nitric acid (3:1) by adding the nitric acid to the hydrochloric acid. [NOTE—Periodically vent the solution in an appropriate fume hood.]

Diluent: Prepare a mixture of *Stock aqua regia solution* and water (1:9) by adding one volume of *Stock aqua regia solution* to two volumes of water. Dilute with additional water to volume, and mix well.

System suitability solution: Prepare a mixture of 1000 mg/L of yttrium in 5% (v/v) nitric acid solution and 1000 mg/L of scandium in 5% (v/v) nitric acid solution with *Diluent*, (1:1:198), and mix.

Standard stock solution 1 (Ca, Cu, Fe, Mg, Mn, P, and Zn): [NOTE—It is only necessary to include the minerals of interest in the solution.] Using commercially available element standard (single- or multi-element) solutions in 5% (v/v) nitric acid solution, pipet the appropriate amount of element standard solution into a volumetric flask, and dilute with 5% (v/v) nitric acid solution to obtain a solution with final concentrations of about 1000 mg/L of calcium, 100 mg/L of copper, 250 mg/L of iron, 500 mg/L of magnesium, 100 mg/L of manganese, 800 mg/L of phosphorus, and 250 mg/L of zinc.

Standard stock solution 2 (B, Cr, Mo, Ni, Se, Sn, and V): [NOTE—It is only necessary to include the minerals of interest in the solution.] Using commercially available element standard (single- or multi-element) solutions in 20% (v/v) hydrochloric acid solution, pipet the appropriate amount of element standard solution into a volumetric flask, and dilute with 20% (v/v) hydrochloric acid solution to obtain a solution with final concentrations of about 200 mg/L of boron, and 100 mg/L of chromium, molybdenum, nickel, selenium, tin, and vanadium each.

Standard solutions: Prepare a mixture of *Standard stock solution 1* and *Standard stock solution 2*, as required, in *Diluent*, to prepare a six-point calibration curve to bracket the concentration range of each mineral of interest.

Sample solution: Weigh, then transfer 5 Capsules to a 250-mL volumetric flask, and heat gently on a hot plate until the contents begin to release. Cautiously add 25 mL of *Stock aqua regia solution* in 5-mL increments, and swirl. Heat, continue to swirl until the Capsules dissolve into the acid, immediately remove from the heat source, and add 150 mL of water. Cool, and dilute with water to volume. Filter about 30 mL into a centrifuge tube, using a 5- μ m pore size nylon syringe filter. If necessary, make any further adjustments using *Diluent*.

Spectrometric conditions

(See *Spectrochemistry* <730>.)

Mode: Inductively coupled plasma spectrometry, using a spectrometer, set to measure the emission of each mineral of interest at about the corresponding wavelength. [NOTE—The operating conditions may be developed and optimized based on the manufacturer's recommendation. The wavelengths selected should be demonstrated experimentally to provide sufficient specificity, sensitivity, linearity, accuracy, and precision.]

System suitability

Sample: *System suitability solution*

[NOTE—Analyze the *System suitability solution* and obtain the response as directed for *Analysis*.]

Suitability requirements

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solutions* and *Sample solution*
Determine the emission of each mineral of interest in the *Standard solutions* and *Sample solution* with an *Inductively coupled plasma system* using the *Diluent* as the blank. Plot the emission of the *Standard solutions* versus the concentration, in mg/L, of the minerals of interest, and draw the straight line best fitting the plotted points. From the graph so obtained, determine the concentration, *C*, in mg/L, for each mineral of interest in the *Sample solution*. Calculate the percentage of the labeled amount for each mineral:

$$\text{Result} = C \times (V/W) \times F \times (C_w/L) \times 100$$

- C* = measured concentration of the relevant element in the *Sample solution* (mg/L)
V = volume of the *Sample solution* (L)
W = sample weight (mg)
F = dilution factor of the *Sample solution*
C_w = average Capsule weight (mg)
L = labeled amount of the relevant element/Capsule (mg/Capsule)

Acceptance criteria: 90.0%–125.0% of the labeled amount of calcium (Ca), copper (Cu), iron (Fe), magnesium (Mg), manganese (Mn), phosphorus (P), potassium (K), and zinc (Zn); and 90.0%–160.0% of the labeled amounts of boron (B), chromium (Cr), fluorine (F), iodine (I), molybdenum (Mo), nickel (Ni), selenium (Se), tin (Sn), and vanadium (V)

PERFORMANCE TESTS

- **DISINTEGRATION AND DISSOLUTION OF DIETARY SUPPLEMENTS** <2040>: Meet the requirements for *Dissolution*
- **WEIGHT VARIATION OF DIETARY SUPPLEMENTS** <2091>: Meet the requirements

SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS—NUTRITIONAL AND DIETARY SUPPLEMENTS** <2021>: The total aerobic microbial count does not exceed 3000 cfu/g, and the combined molds and yeasts count does not exceed 300 cfu/g.
- **ABSENCE OF SPECIFIED MICROORGANISMS—NUTRITIONAL AND DIETARY SUPPLEMENTS** <2022>: Meet the requirements of the tests for absence of *Salmonella* species, *Escherichia coli*, and *Staphylococcus aureus*.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.
- **LABELING:** The label states that the product is Water-Soluble Vitamins with Minerals Capsules. The label also states the quantity of each vitamin and mineral in terms of metric units per dosage unit and where necessary the chemical form in which a vitamin is present and also states the salt form of the mineral used as the source of each element. Where more than one assay method is given for a particular vitamin or mineral, the labeling states with which assay method the product complies only if *Method 1* is not used.
- **USP REFERENCE STANDARDS** <11>
 - USP Biotin RS
 - USP Calcium Pantothenate RS
 - USP Cyanocobalamin RS
 - USP Dexpanthenol RS
 - USP Folic Acid RS
 - USP Niacin RS
 - USP Niacinamide RS

Water-Soluble Vitamins with Minerals Oral Solution

DEFINITION

Water-Soluble Vitamins with Minerals Oral Solution contains one or more of the following water-soluble vitamins: Cyanocobalamin, Niacin or Niacinamide, Dexpanthenol or Panthenol, Pantothenic Acid (as Calcium Pantothenate or Racemic Calcium Pantothenate), Pyridoxine Hydrochloride, Riboflavin or Riboflavin-5'-Phosphate Sodium, and Thiamine Hydrochloride or Thiamine Mononitrate; and one or more minerals derived from substances generally recognized as safe, furnishing one or more of the following elements in ionizable form: iodine, iron, magnesium, manganese, and zinc. It contains NLT 90.0% and NMT 450.0% of the labeled amount of cyanocobalamin (C₆₃H₈₈CoN₁₄O₁₄P); NLT 90.0% and NMT 250.0% of the labeled amount of thiamine (C₁₂H₁₇ClN₄O₅) as thiamine hydrochloride or thiamine mononitrate; NLT 90.0% and NMT 150.0% of the labeled amounts of calcium pantothenate (C₁₈H₃₂CaN₂O₁₀), dexpanthenol (C₉H₁₉NO₄) or panthenol (C₉H₁₉NO₄), niacin (C₆H₅NO₂) or niacinamide (C₆H₆N₂O), pyridoxine hydrochloride (C₈H₁₁NO₃ · HCl), and riboflavin (C₁₇H₂₀N₄O₆) or riboflavin-5'-phosphate sodium (C₁₇H₂₀N₄NaO₉P); NLT 90.0% and NMT 160.0% of the labeled amount of iodine (I); and NLT 90.0% and NMT 125.0% of the labeled amounts of iron (Fe), magnesium (Mg), manganese (Mn), and zinc (Zn).

STRENGTH

[NOTE—In the following assays, where more than one assay method is given for an individual ingredient, the requirements may be met by following any one of the specified methods, the method used being stated in the labeling only if *Method 1* is not used.]

• CYANOCOBALAMIN

[NOTE—Use low-actinic glassware throughout this procedure.]

Standard stock solution: 1.0 µg/mL of cyanocobalamin from USP Cyanocobalamin RS in 25% alcohol. Store in a refrigerator.

Standard solution: Dilute a suitable volume of *Standard stock solution* with water to a measured volume such that after the incubation period as described for *Analysis*, the difference in transmittance between the inoculated blank and the 5.0-mL level of the *Standard solution* is NLT that which corresponds to a difference of 1.25 mg in dried cell weight. This concentration usually falls between 0.01 ng/mL and 0.04 ng/mL of *Standard solution*. Prepare this solution fresh for each assay.

Sample solution: Transfer to an appropriate vessel an accurately measured volume of Oral Solution assumed to contain 1.0 µg of cyanocobalamin for each mL of the Oral Solution taken and 25 mL of an aqueous extracting solution prepared just before use to contain, in each 100 mL, 1.29 g of dibasic sodium phosphate, 1.1 g of anhydrous citric acid, and 1.0 g of sodium metabisulfite. Autoclave the mixture at 121° for 10 min. Allow any undissolved particles of the extract to settle, and filter or centrifuge if necessary. Dilute an aliquot of the clear solution with water to obtain a final solution containing vitamin B₁₂ activity approximately equivalent to that of the *Standard solution*.

Acid-hydrolyzed casein solution: Mix 100 g of vitamin-free casein with 500 mL of 6 N hydrochloric acid, and reflux the mixture for 8–12 h. Remove the hydrochloric acid from the mixture by distillation under reduced pressure until a thick paste remains. Redissolve the resulting paste in water, adjust the solution with 1 N sodium hydroxide to a pH of 3.5 ± 0.1, and add water to make 1000 mL. Add 20 g of activated charcoal, stir for 1 h, and filter. Repeat the treatment with activated charcoal. Store under toluene in a cool place at a temperature not below 10°. Filter the solution if a precipitate forms during storage.

Asparagine solution: Dissolve 2.0 g of L-asparagine in water to make 200 mL. Store under toluene in a refrigerator.

Adenine–guanine–uracil solution: Dissolve 200 mg each of adenine sulfate, guanine hydrochloride, and uracil, with the aid of heat, in 10 mL of 4 N hydrochloric acid. Cool, and add water to make 200 mL. Store under toluene in a refrigerator.

Xanthine solution: Suspend 0.20 g of xanthine in 30–40 mL of water, heat to 70°, add 6.0 mL of 6 N ammonium hydroxide, and stir until the solid is dissolved. Cool, and add water to make 200 mL. Store under toluene in a refrigerator.

Salt solution A: Dissolve 10 g of monobasic potassium phosphate and 10 g of dibasic potassium phosphate in water to make 200 mL, and add 2 drops of hydrochloric acid. Store this solution under toluene.

Salt solution B: Dissolve 4.0 g of magnesium sulfate, 0.20 g of sodium chloride, 0.20 g of ferrous sulfate, and 0.20 g of manganese sulfate in water to make 200 mL, and add 2 drops of hydrochloric acid. Store this solution under toluene.

Polysorbate 80 solution: 20 g of polysorbate 80 in alcohol to make 200 mL. Store in a refrigerator.

Vitamin solution A: 10 mg of riboflavin, 10 mg of thiamine hydrochloride, 100 µg of biotin, and 20 mg of niacin in 0.02 N acetic acid to make 400 mL. Store under toluene, protected from light, in a refrigerator.

Vitamin solution B: 20 mg of *p*-aminobenzoic acid, 10 mg of calcium pantothenate, 40 mg of pyridoxine hydrochloride, 40 mg of pyridoxal hydrochloride, 8 mg of pyridoxamine dihydrochloride, and 2 mg of folic acid in a mixture of water and neutralized alcohol (3:1) to make 400 mL. Store, protected from light, in a refrigerator.

Basal medium stock solution: Prepare the medium according to the following formula and directions. A dehydrated mixture containing the same ingredients may be used provided that, when constituted as directed in the labeling, it yields a medium comparable to that obtained from the formula given herein.

Add the ingredients in the order listed, carefully dissolving cystine and tryptophan in the hydrochloric acid before adding the next eight solutions. To the resulting solution add 100 mL of water, and dissolve the dextrose, sodium acetate, and ascorbic acid. Filter, if necessary, add the *Polysorbate 80 solution*, adjust with 1 N sodium hydroxide to a pH of 5.5–6.0, and add Purified Water to make 250 mL.

L-Cystine	0.1 g
L-Tryptophan	0.05 g
1 N Hydrochloric acid	10 mL
Adenine–guanine–uracil solution	5 mL
Xanthine solution	5 mL
Vitamin solution A	10 mL
Vitamin solution B	10 mL
Salt solution A	5 mL
Salt solution B	5 mL
Asparagine solution	5 mL
Acid-hydrolyzed casein solution	25 mL
Dextrose, anhydrous	10 g
Sodium acetate, anhydrous	5 g
Ascorbic acid	1 g
Polysorbate 80 solution	5 mL

Tomato juice preparation: Centrifuge commercially canned tomato juice so that most of the pulp is removed. Suspend 5 g/L of analytical filter-aid in the supernatant, and filter, with the aid of reduced pressure, through a layer of the filter-aid. Repeat, if necessary, until a clear, straw-colored filtrate is obtained. Store under toluene in a refrigerator.

Culture medium

[NOTE—A dehydrated mixture containing the same ingredients may be used provided that, when constituted as directed in the labeling, it yields a medium equivalent to that obtained from the formula given herein.]

Dissolve 0.75 g of yeast extract, 0.75 g of dried peptone, 1.0 g of anhydrous dextrose, and 0.20 g of monobasic potassium phosphate in 60–70 mL of water. Add 10 mL of *Tomato juice preparation* and 1 mL of *Polysorbate 80 solution*. Adjust with 1 N sodium hydroxide to a pH of 6.8, and add water to make 100 mL. Place 10-mL portions of the solution in test tubes, and plug with cotton. Sterilize the tubes and contents in an autoclave at 121° for 15 min. Cool as rapidly as possible to avoid color formation resulting from overheating the medium.

Suspension medium: Dilute a measured volume of *Basal medium stock solution* with an equal volume of water. Place 10-mL portions of the diluted medium in test tubes. Sterilize, and cool as directed for *Culture medium*.

Stock culture of *Lactobacillus leichmannii*: To 100 mL of *Culture medium* add 1.0–1.5 g of agar, and heat the mixture on a steam bath, with stirring, until the agar dissolves. Place 10-mL portions of the hot solution in test tubes, cover the tubes, sterilize at 121° for 15 min in an autoclave, and allow the tubes to cool in an upright position. Inoculate three or more of the tubes by

stab transfer of a pure culture of *Lactobacillus leichmannii*. [NOTE—Before first using a fresh culture in this assay, make NLT 10 successive transfers of the culture in a 2-week period.]

Incubate for 16–24 h at a temperature between 30° and 40° held constant to within $\pm 0.5^\circ$. Store in a refrigerator.

Prepare fresh stab cultures at least three times each week, and do not use them for preparing the *Inoculum* if more than 4 days old. The activity of the microorganism can be increased by daily or twice-daily transfer of the stab culture to the point where definite turbidity in the liquid *Inoculum* can be observed 2–4 h after inoculation. A slow-growing culture seldom gives a suitable response curve and may lead to erratic results.

Inoculum

[NOTE—A frozen suspension of *Lactobacillus leichmannii* may be used as the stock culture, provided it yields an *Inoculum* comparable to a fresh culture.]

Make a transfer of cells from the *Stock culture* of *Lactobacillus leichmannii* to two sterile tubes each containing 10 mL of the *Culture medium*. Incubate these cultures for 16–24 h at a temperature between 30° and 40° held constant to within $\pm 0.5^\circ$. Under aseptic conditions centrifuge the cultures, and decant the supernatant. Suspend the cells from the culture in 5 mL of sterile *Suspension medium*, and combine. Using sterile *Suspension medium*, adjust the volume so that a 1-in-20 dilution in saline TS produces 70% transmittance when read on a suitable spectrophotometer that has been set at a wavelength of 530 nm, equipped with a 10 mm cell, and read against saline TS set at 100% transmittance. Prepare a 1-in-400 dilution of the adjusted suspension using sterile *Basal medium stock solution*. The cell suspension so obtained is the *Inoculum*.

[NOTE—This dilution may be altered, when necessary, to obtain the desired test response.]

Calibration of spectrophotometer: Check the wavelength of the spectrophotometer periodically, using a standard wavelength cell or other suitable device. Before reading any tests, calibrate the spectrophotometer for 0% and 100% transmittance, using water and with the wavelength set at 530 nm.

Analysis: Because of the high sensitivity of the test organism to minimum amounts of vitamin B₁₂ activity and to traces of many cleansing agents, cleanse meticulously by suitable means, followed preferably by heating at 250° for 2 h, using hard-glass 20-mm \times 150-mm test tubes, and other necessary glassware.

To separate test tubes add, in duplicate, 1.0, 1.5, 2.0, 3.0, 4.0, and 5.0 mL of the *Standard solution*. To each of these tubes and to four similar empty tubes, add 5.0 mL of *Basal medium stock solution* and sufficient water to make 10 mL.

To similar separate test tubes add, in duplicate, 1.0, 1.5, 2.0, 3.0, and 4.0 mL of the *Sample solution*. To each tube add 5.0 mL of *Basal medium stock solution* and sufficient water to make 10 mL. Place one complete set of standard and sample tubes together in one tube rack and the duplicate set in a second rack or section of a rack, preferably in random order.

Cover the tubes to prevent bacterial contamination, and sterilize in an autoclave at 121° for 5 min, arranging to reach this temperature in NMT 10 min by preheating the autoclave if necessary. Cool as rapidly as possible to avoid color formation resulting from overheating the medium. Take precautions to maintain uniformity of sterilizing and cooling conditions throughout the assay, because packing the tubes too closely in the autoclave or overloading it may cause variation in the heating rate.

Aseptically add 0.5 mL of *Inoculum* to each tube so prepared, except two of the four containing no *Standard solution* (the uninoculated blanks). Incubate the tubes at

a temperature between 30° and 40°, held constant to within $\pm 0.5^\circ$, for 16–24 h.

Terminate growth by heating to a temperature NLT 80° for 5 min. Cool to room temperature. After agitating its contents, read the transmittance at 530 nm when a steady state is reached. This steady state is observed a few seconds after agitation when the reading remains constant for 30 s or more. Allow approximately the same time interval for the reading on each tube.

With the transmittance set at 100% for the uninoculated blank, read the transmittance of the inoculated blank. If the difference is greater than 5% or if there is evidence of contamination with a foreign microorganism, disregard the results of the assay.

With the transmittance set at 100% for the uninoculated blank, read the transmittance of each of the remaining tubes. Disregard the results of the assay if the slope of the standard curve indicates a problem with sensitivity.

Calculation: Prepare a standard concentration-response curve by the following procedure. Test for and replace any aberrant individual transmittances. For each level of the Standard, calculate the response from the sum of the duplicate values of the transmittances (Σ_s) as the difference, $y = 2.00 - \Sigma_s$. Plot this response on the ordinate of cross-section paper against the logarithm of the mL of *Standard solution* per tube on the abscissa, using for the ordinate either an arithmetic or a logarithmic scale, whichever gives the better approximation to a straight line. Draw the straight line or smooth curve that best fits the plotted points.

Calculate the response, $y = 2.00 - \Sigma_u$, adding together the two transmittances (Σ_u) for each level of the *Sample solution*. Read from the standard curve the logarithm of the volume of the Standard solution corresponding to each of those values of y that falls within the range of the lowest and highest points plotted for the Standard. Subtract from each logarithm so obtained the logarithm of the volume, in mL, of the *Sample solution* to obtain the difference, X , for each dosage level. Average the values of X for each of three or more dosage levels to obtain \bar{X} , which equals the log-relative potency, M' , of the *Sample solution*. Determine the quantity, in μg , of cyanocobalamin ($\text{C}_{63}\text{H}_{88}\text{CoN}_{14}\text{O}_{14}\text{P}$), in the portion of Oral Solution taken:

$$\text{antilog } M = \text{antilog } (M' + \log R)$$

R = μg of cyanocobalamin assumed to be present in the portion of Oral Solution taken

Calculate the percentage of the labeled amount of cyanocobalamin in the portion of the Oral Solution taken:

$$\text{Result} = [(\text{antilog } M)/N] \times 100$$

N = nominal amount of cyanocobalamin in the portion of Oral Solution taken

Replication: Repeat the entire determination at least once, using separately prepared *Sample solutions*. If the difference between the two log-potencies M is NMT 0.08, their mean, \bar{M} , is the assayed log-potency of the test material (see *Design and Analysis of Biological Assays* (111), *Vitamin B₁₂ Activity*). If the two determinations differ by more than 0.08, conduct one or more additional determinations. From the mean of two or more values of M that do not differ by more than 0.15, compute the mean potency of the preparation under assay.

Acceptance criteria: 90.0%–450.0% of the labeled amount of cyanocobalamin ($\text{C}_{63}\text{H}_{88}\text{CoN}_{14}\text{O}_{14}\text{P}$)

• **CALCIUM PANTOTHENATE, Method 1**

Mobile phase: Methanol and 0.2 M monobasic sodium phosphate (3:97). Adjust with 1.7 M phosphoric acid to a pH of 3.2 ± 0.1 .

Standard solution: 80 µg/mL of USP Calcium Pantothenate RS in *Mobile phase*

System suitability solution: 80 µg/mL of USP Racemic Panthenol RS in *Mobile phase*. Mix the resulting solution and *Standard solution* (1:1).

Sample solution: Equivalent to 80 µg/mL of calcium pantothenate from the Oral Solution, in *Mobile phase*

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 210 nm

Column: 4-mm × 10-cm; packing L1

Flow rate: 1 mL/min

Injection size: 20 µL

System suitability

Samples: *Standard solution* and *System suitability solution*

Suitability requirements

Resolution: NLT 1.5 between panthenol and calcium pantothenate, *System suitability solution*

Tailing factor: NMT 2.0 for both the calcium pantothenate and the panthenol peaks, *System suitability solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of calcium pantothenate ($C_{18}H_{32}CaN_2O_{10}$) in the portion of Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area for calcium pantothenate from the *Sample solution*

r_S = peak area for calcium pantothenate from the *Standard solution*

C_S = concentration of USP Calcium Pantothenate RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–150.0% of the labeled amount of calcium pantothenate ($C_{18}H_{32}CaN_2O_{10}$)

• CALCIUM PANTOTHENATE, Method 2

Standard stock solution: Dissolve 50 mg of USP Calcium Pantothenate RS, previously dried and stored in the dark over phosphorus pentoxide and protected from absorption of moisture while weighing, in 500 mL of water in a 1000-mL volumetric flask. Add 10 mL of 0.2 N acetic acid and 100 mL of sodium acetate solution (1 in 60), and dilute with water to volume to obtain a concentration of 50 µg/mL of USP Calcium Pantothenate RS. Store under toluene in a refrigerator.

Standard solution: On the day of the assay, dilute a volume of *Standard stock solution* with water to obtain a concentration of 0.01–0.04 µg/mL of calcium pantothenate, the exact concentration being such that the responses obtained as directed for *Analysis*, 2.0 and 4.0 mL of the *Standard solution* being used, are within the linear portion of the log-concentration response curve.

Sample solution: Transfer an accurately measured volume of Oral Solution equivalent to 50 mg of calcium pantothenate to a 1000-mL volumetric flask containing 500 mL of water. Add 10 mL of 0.2 N acetic acid and 100 mL of sodium acetate solution (1 in 60), dilute with water to volume, and filter. Dilute a measured volume of this solution quantitatively, and stepwise if necessary, with water to obtain a solution having about the same concentration as that of the *Standard solution*.

Acid-hydrolyzed casein solution: Mix 100 g of vitamin-free casein with 500 mL of 6 N hydrochloric acid, and reflux the mixture for 8–12 h. Remove the hydrochloric acid from the mixture by distillation under reduced pressure until a thick paste remains. Redissolve

the resulting paste in water, adjust the solution with 1 N sodium hydroxide to a pH of 3.5 ± 0.1 , and add water to make 1000 mL. Add 20 g of activated charcoal, stir for 1 h, and filter. Repeat the treatment with activated charcoal. Store under toluene in a refrigerator at a temperature not below 10°. Filter the solution if a precipitate forms during storage.

Cystine-tryptophan solution: Suspend 4.0 g of L-cystine in a solution of 1.0 g of L-tryptophan (or 2.0 g of D,L-tryptophan) in 700–800 mL of water, heat to 70°–80°, and add dilute hydrochloric acid (1 in 2) dropwise, with stirring, until the solids are dissolved. Cool, and add water to make 1000 mL. Store under toluene in a refrigerator at a temperature not below 10°.

Adenine-guanine-uracil solution: Dissolve 200 mg each of adenine sulfate, guanine hydrochloride, and uracil, with the aid of heat, in 10 mL of 4 N hydrochloric acid. Cool, and add water to make 200 mL. Store under toluene in a refrigerator.

Polysorbate 80 solution: 100 mg/mL of polysorbate 80 in alcohol

Riboflavin-thiamine hydrochloride-biotin solution: 20 µg/mL of riboflavin, 10 µg/mL of thiamine hydrochloride, and 0.04 µg/mL of biotin in 0.02 N acetic acid. Store under toluene, protected from light, in a refrigerator.

p-Aminobenzoic acid-niacin-pyridoxine hydrochloride solution: 10 µg/mL of p-aminobenzoic acid, 50 µg/mL of niacin, and 40 µg/mL of pyridoxine hydrochloride in a mixture of neutralized alcohol and water (1:3). Store in a refrigerator.

Salt solution A: Dissolve 25 g of monobasic potassium phosphate and 25 g of dibasic potassium phosphate in water to make 500 mL. Add 5 drops of hydrochloric acid. Store under toluene.

Salt solution B: Dissolve 10 g of magnesium sulfate, 0.5 g of sodium chloride, 0.5 g of ferrous sulfate, and 0.5 g of manganese sulfate in water to make 500 mL. Add 5 drops of hydrochloric acid. Store under toluene.

Basal medium stock solution

Acid-hydrolyzed casein solution	25 mL
Cystine-tryptophan solution	25 mL
Polysorbate 80 solution	0.25 mL
Dextrose, anhydrous	10 g
Sodium acetate, anhydrous	5 g
Adenine-guanine-uracil solution	5 mL
Riboflavin-thiamine hydrochloride-biotin solution	5 mL
p-Aminobenzoic acid-niacin-pyridoxine hydrochloride solution	5 mL
Salt solution A	5 mL
Salt solution B	5 mL

Dissolve the anhydrous dextrose and anhydrous sodium acetate in the solutions previously mixed, and adjust with 1 N sodium hydroxide to a pH of 6.8. Dilute with water to 250 mL.

Stock culture of *Lactobacillus plantarum*: Dissolve 2.0 g of yeast extract in 100 mL of water; add 500 mg of anhydrous dextrose, 500 mg of anhydrous sodium acetate, and 1.5 g of agar; and heat the mixture on a steam bath, with stirring, until the agar dissolves. Add 10-mL portions of the hot solution to the test tubes, close or cover the tubes, sterilize in an autoclave at 121° for 15 min, and allow the tubes to cool in an upright position. Prepare stab cultures in three or more of the tubes, using a pure culture of *Lactobacillus plantarum*, incubating for 1–24 h at a temperature between 30° and 37° held constant to within $\pm 0.5^\circ$. Store in a refrigerator. Prepare a fresh stab of the stock culture every week, and do not use for *Inoculum* if the culture is more than 1 week old.

Culture medium: To each of a series of test tubes containing 5.0 mL of *Basal medium stock solution*, add 5.0 mL of water containing 0.2 µg of calcium pantothenate. Plug the tubes with cotton, sterilize in an autoclave at 121° for 15 min, and cool.

Inoculum

[NOTE—A frozen suspension of *Lactobacillus plantarum* may be used as the stock culture, provided it yields an *Inoculum* comparable to a fresh culture.]

Make a transfer of cells from the *Stock culture* of *Lactobacillus plantarum* to a sterile tube containing 10 mL of *Culture medium*. Incubate this culture for 16–24 h at a temperature between 30° and 37° held constant to within ±0.5°. The cell suspension so obtained is the *Inoculum*.

Analysis: To similar separate test tubes add, in duplicate, 1.0 and/or 1.5, 2.0, 3.0, 4.0, and 5.0 mL of the *Standard solution*. To each tube and to four similar empty tubes, add 5.0 mL of *Basal medium stock solution* and sufficient water to make 10 mL.

To similar separate test tubes add, in duplicate, volumes of the *Sample solution* corresponding to three or more of the levels specified for the *Standard solution*, including the levels of 2.0, 3.0, and 4.0 mL. To each tube add 5.0 mL of the *Basal medium stock solution* and sufficient water to make 10 mL. Place one complete set of standard and sample tubes together in one tube rack and the duplicate set in a second rack or section of a rack, preferably in random order.

Cover the tubes of both series to prevent contamination, and sterilize in an autoclave at 121° for 5 min. Cool, add 1 drop of *Inoculum* to each tube, except two of the four tubes containing no *Standard solution* (the uninoculated blanks). Incubate the tubes at a temperature between 30° and 37°, held constant to within ±0.5° until, following 16–24 h of incubation, there has been no substantial increase in turbidity in the tubes containing the highest level of Standard during a 2-h period.

Determine the transmittance of the tubes in the following manner. Mix the contents of each tube, and transfer to an optical container if necessary. Read the transmittance between 540 and 660 nm when a steady state is reached. This steady state is observed a few seconds after agitation when the galvanometer reading remains constant for 30 s or more. Allow approximately the same time interval for the reading on each tube.

With the transmittance set at 1.00 for the uninoculated blank, read the transmittance of the inoculated blank. With the transmittance set at 1.00 for the inoculated blank, read the transmittance for each of the remaining tubes. If there is evidence of contamination with a foreign microorganism, disregard the result of the assay.

Calculation: Prepare a standard concentration-response curve as follows. For each level of the Standard, calculate the response from the sum of the duplicate values of the transmittance (Σ_s) as the difference, $y = 2.00 - \Sigma_s$. Plot this response on the ordinate of cross-section paper against the logarithm of the mL of *Standard solution* per tube on the abscissa, using for the ordinate either an arithmetic or a logarithmic scale, whichever gives the better approximation to a straight line. Draw the straight line or smooth curve that best fits the plotted points.

Calculate the response, $y = 2.00 - \Sigma_u$, adding together the two transmittances (Σ_u) for each level of the *Sample solution*. Read from the standard curve the logarithm of the volume of the *Standard solution* corresponding to each of those values of y that fall within the range of the lowest and highest points plotted for the Standard. Subtract from each logarithm so obtained the logarithm of the volume, in mL, of the *Sample solution* to obtain the difference, X , for each dosage level. Average the values of X for each of three

or more dosage levels to obtain \bar{X} , which equals the log-relative potency, M' , of the *Sample solution*. Determine the quantity, in mg, of USP Calcium Pantothenate RS corresponding to the calcium pantothenate ($C_{18}H_{32}CaN_2O_{10}$) in the portion of Oral Solution taken:

$$\text{antilog } M = \text{antilog } (M' + \log R)$$

R = mg of calcium pantothenate assumed to be present in the portion of Oral Solution taken
Calculate the percentage of the labeled amount of calcium pantothenate ($C_{18}H_{32}CaN_2O_{10}$) in the portion of Oral Solution taken:

$$\text{Result} = [(\text{antilog } M)/N] \times 100$$

N = nominal amount of calcium pantothenate in the portion of Oral Solution (mg)

Replication: Repeat the entire determination at least once, using separately prepared *Sample solutions*. If the difference between the two log-potencies M is NMT 0.08, their mean, \bar{M} , is the assayed log-potency of the test material (see *Design and Analysis of Biological Assays* (111), *The Confidence Interval and Limits of Potency*). If the two determinations differ by more than 0.08, conduct one or more additional determinations. From the mean of two or more values of M that do not differ by more than 0.15, compute the mean potency of the preparation under assay.

Acceptance criteria: 90.0%–150.0% of the labeled amount of calcium pantothenate ($C_{18}H_{32}CaN_2O_{10}$)

• DEXPANTHENOL OR PANTHENOL, Method 1

Mobile phase and Chromatographic system: Proceed as directed in the assay for *Calcium Pantothenate*, Method 1.

Standard solution: 80 µg/mL of USP Dexpantenol RS or USP Racemic Panthenol RS in *Mobile phase*. [NOTE—Use USP Dexpantenol RS to analyze Oral Solution that contains dexpantenol and use USP Racemic Panthenol RS to analyze Oral Solution that contains panthenol.]

System suitability solution: 80 µg/mL of USP Calcium Pantothenate RS in *Mobile phase*. Mix the resulting solution and *Standard solution* (1:1).

Sample solution: Equivalent to 80 µg/mL of dexpantenol or panthenol from Oral Solution in *Mobile phase*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of dexpantenol or panthenol ($C_9H_{19}NO_4$) in the portion of Oral Solution taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

r_u = peak area for dexpantenol or panthenol from the *Sample solution*

r_s = peak area for dexpantenol or panthenol from the *Standard solution*

C_s = concentration of USP Dexpantenol RS or USP Racemic Panthenol RS in the *Standard solution* (mg/mL)

C_u = concentration of the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–150.0% of the labeled amount of dexpantenol or panthenol ($C_9H_{19}NO_4$)

• DEXPANTHENOL OR PANTHENOL, Method 2

[NOTE—The following procedure is applicable also to the determination of the dextrorotatory component of racemic panthenol in preparations containing panthenol.]

Dehydrated mixtures yielding formulations similar to the media described herein may be used provided that, when constituted as directed, they have growth-promoting properties equal to or superior to those obtained with the media prepared as described herein.

Standard stock solution: 800 µg/mL of USP

Dexpanthenol RS or 1600 µg/mL of USP Racemic Panthenol RS in water. Store in a refrigerator, protected from light, and use within 30 days. [NOTE—Use USP Dexpanthenol RS to analyze Oral Solution that contains dexpanthenol and use USP Racemic Panthenol RS to analyze Oral Solution that contains panthenol.]

Standard solution: On the day of the assay, prepare 1.2 µg/mL of dexpanthenol or 2.4 µg/mL of racemic panthenol from *Standard stock solution* with water.

Sample solution: 1.2 µg/mL of dexpanthenol or 2.4 µg/mL of panthenol from Oral Solution in water

Acid-hydrolyzed casein solution: Mix 100 g of vitamin-free casein with 500 mL of 6 N hydrochloric acid, and reflux the mixture for 8–12 h. Remove the hydrochloric acid from the mixture by distillation under reduced pressure until a thick paste remains. Redissolve the resulting paste in about 500 mL of water, adjust the solution with 1 N sodium hydroxide to a pH of 3.5 ± 0.1 , and add water to make 1000 mL. Add 20 g of activated charcoal, stir for 1 h, and filter. Repeat the treatment with activated charcoal. Store under toluene in a refrigerator at a temperature not below 10°. Filter the solution if a precipitate forms during storage.

Cystine–tryptophan solution: Suspend 4.0 g of L-cystine in a solution of 1.0 g of L-tryptophan (or 2.0 g of D,L-tryptophan) in 700 to 800 mL of water, heat to $75 \pm 5^\circ$, and add 6 M hydrochloric acid dropwise, with stirring, until the solids are dissolved. Cool, add water to make 1000 mL, and mix. Store under toluene in a refrigerator at a temperature not below 10°.

Adenine–guanine–uracil solution: Dissolve 200 mg each of adenine sulfate, guanine hydrochloride, and uracil, with the aid of heat, in 10 mL of 4 N hydrochloric acid. Cool, add water to make 200 mL, and mix. Store under toluene in a refrigerator.

Polysorbate 80 solution: 100 mg/mL of polysorbate 80 in alcohol

Riboflavin–thiamine hydrochloride–biotin solution: Prepare a solution of riboflavin, thiamine hydrochloride, and biotin in 0.02 N acetic acid containing 20 µg/mL of riboflavin, 10 µg/mL of thiamine hydrochloride, and 0.04 µg/mL of biotin. Store under toluene, protected from light, in a refrigerator.

p-Aminobenzoic acid–niacin–pyridoxine hydrochloride solution: Prepare a solution in neutral 25% alcohol containing 10 µg/mL of p-aminobenzoic acid, 50 µg/mL of niacin, and 40 µg/mL of pyridoxine hydrochloride. Store in a refrigerator.

Salt solution 1: Dissolve 25 g of monobasic potassium phosphate and 25 g of dibasic potassium phosphate in water to make 500 mL. Add 5 drops of hydrochloric acid, and mix. Store under toluene.

Salt solution 2: Dissolve 10 g of magnesium sulfate, 0.5 g of sodium chloride, 0.5 g of ferrous sulfate, and 0.5 g of manganese sulfate in water to make 500 mL. Add 5 drops of hydrochloric acid, and mix. Store under toluene.

Pyridoxal–calcium pantothenate solution: Dissolve 40 mg of pyridoxal hydrochloride and 375 µg of calcium pantothenate in 10% alcohol to make 200 mL, and mix. Store in a refrigerator, and use within 30 days.

Polysorbate 40–oleic acid solution: Dissolve 25 g of polysorbate 40 and 0.25 g of oleic acid in 20% alcohol to make 500 mL, and mix. Store in a refrigerator, and use within 30 days.

Modified pantothenate medium

Acid-hydrolyzed casein solution	25 mL
Cystine–tryptophan solution	25 mL
Polysorbate 80 solution	0.25 mL
Dextrose, anhydrous	10 g
Sodium acetate, anhydrous	5 g

Adenine–guanine–uracil solution	5 mL
Riboflavin–thiamine hydrochloride–biotin solution	5 mL
p-Aminobenzoic acid–niacin–pyridoxine hydrochloride solution	5 mL
Salt solution 1	5 mL
Salt solution 2	5 mL
Pyridoxal–calcium pantothenate solution	5 mL
Polysorbate 40–oleic acid solution	5 mL

Dissolve anhydrous dextrose and sodium acetate in the solutions previously mixed, and adjust with 1 N sodium hydroxide to a pH of 6.8. Finally, dilute with water to 250 mL, and mix.

Double-strength modified pantothenate medium:

Prepare as directed under *Modified pantothenate medium*, but make the final dilution to 125 mL instead of 250 mL. Prepare fresh.

Stock culture of *Pediococcus acidilactici*: Dissolve in 800 mL of water, with the aid of heat, 6.0 g of peptone, 4.0 g of pancreatic digest of casein, 3.0 g of yeast extract, 1.5 g of beef extract, 1.0 g of dextrose, and 15.0 g of agar. Adjust with 0.1 N sodium hydroxide or 0.1 N hydrochloric acid to a pH between 6.5 and 6.6, dilute with water to 1000 mL, and mix. Add 10-mL portions of the solution to culture tubes, place caps on the tubes, and sterilize in an autoclave at 121° for 15 min. Cool on a slant, and store in a refrigerator. Prepare a stock culture of *Pediococcus acidilactici*¹ on a slant of this medium. Incubate at 35° for 20–24 h, and store in a refrigerator. Maintain the stock culture by monthly transfer onto fresh slants.

Inoculum: Inoculate three 250-mL portions of *Modified pantothenate medium* from a stock culture slant, and incubate at 35° for 20–24 h. Centrifuge the suspension from the combined portions, and wash the cells with *Modified pantothenate medium*. Resuspend the cells in sufficient *Modified pantothenate medium* so that a 1-in-50 dilution, when tested in a 13-mm diameter test tube, gives 80% light transmission at 530 nm. Transfer 1.2-mL portions of this stock suspension to glass ampuls, seal, freeze in liquid nitrogen, and store in a freezer. On the day of the assay, allow the ampuls to reach room temperature, mix the contents, and dilute 1 mL of thawed culture with sterile saline TS to 150 mL. [NOTE—This dilution may be altered when necessary to obtain the desired test response.]

Analysis: Prepare in triplicate a series of eight culture tubes by adding the following quantities of water to the tubes within a set: 5.0, 4.5, 4.0, 3.5, 3.0, 2.0, 1.0, and 0.0 mL. To these same tubes, and in the same order, add 0.0, 0.5, 1.0, 1.5, 2.0, 3.0, 4.0, and 5.0 mL of the *Standard solution*.

Prepare in duplicate a series of five culture tubes by adding the following quantities of water to the tubes within a set: 4.0, 3.5, 3.0, 2.0, and 1.0 mL. To these same tubes, and in the same order, add 1.0, 1.5, 2.0, 3.0, and 4.0 mL of the *Sample solution*.

Add 5.0 mL of *Double-strength modified pantothenate medium* to each tube, and mix. Cover the tubes with metal caps, and sterilize in an autoclave at 121° for 5 min. Cool to room temperature in a chilled water bath, and inoculate each tube with 0.5 mL of the *Inoculum*. Allow to incubate at 37° for 16 h. Terminate growth by heating to a temperature not below 80°, such as by steaming at atmospheric pressure in a sterilizer for 5 to 10 min. Cool, and concomitantly determine the percentage transmittance of the suspensions, in cells of equal path length, on a suitable spectrophotometer, at a wavelength of 530 nm.

Calculation: Draw a dose-response curve on arithmetic graph paper by plotting the average response, in percent transmittance, for each set of tubes of the

¹ATCC No. 8042 is suitable.

standard curve against the standard level concentrations. The curve is drawn by connecting each adjacent pair of points with a straight line. From this standard curve, determine by interpolation the potency, in terms of dexpanthenol, of each tube containing portions of the *Sample solution*. Divide the potency of each tube by the amount of the *Sample solution* added to it, to obtain the individual responses. Calculate the mean response by averaging the individual responses that vary from their mean by NMT 15%, using NLT half the total number of tubes. Calculate the potency of the portion of the material taken for assay, by multiplying the mean response by the appropriate dilution factor. Calculate the percentage of the labeled amount of dexpanthenol or panthenol in the portion of Oral Solution taken:

$$\text{Result} = (P/N) \times 100$$

P = calculated potency of dexpanthenol or panthenol in the portion of Oral Solution taken (mg)

N = nominal amount of dexpanthenol or panthenol in the portion of Oral Solution taken (mg)

Acceptance criteria: 90.0%–150.0% of the labeled amount of dexpanthenol or panthenol ($\text{C}_9\text{H}_{19}\text{NO}_4$)

• NIACIN OR NIACINAMIDE

[NOTE—Use low-actinic glassware throughout this procedure.]

Diluent: 25 mg/mL of edetate disodium in water

Mobile phase: Methanol, glacial acetic acid, triethylamine, and 0.008 M sodium 1-hexanesulfonate (350:15:0.4:1634.6)

Standard solution: 0.10 mg/mL of USP Niacin RS or USP Niacinamide RS in *Diluent*

[NOTE—Use USP Niacin RS for Oral Solution that contains niacin and use USP Niacinamide RS for Oral Solution that contains niacinamide.]

Sample solution: Dilute an accurately measured volume of Oral Solution with *Diluent* to obtain a solution with a concentration of 0.1 mg/mL of niacin or niacinamide.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 270 nm

Column: 4.6-mm \times 25-cm; packing L7

Flow rate: 2 mL/min

Injection size: 5 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of niacin ($\text{C}_6\text{H}_5\text{NO}_2$) or niacinamide ($\text{C}_6\text{H}_6\text{N}_2\text{O}$) in the portion of Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area for niacin or niacinamide from the *Sample solution*

r_S = peak area for niacin or niacinamide from the *Standard solution*

C_S = concentration of USP Niacin RS or USP Niacinamide RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of niacin or niacinamide in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–150.0% of the labeled amount of niacin ($\text{C}_6\text{H}_5\text{NO}_2$) or niacinamide ($\text{C}_6\text{H}_6\text{N}_2\text{O}$)

• PYRIDOXINE HYDROCHLORIDE

Diluent, Mobile phase, and Chromatographic system:
Proceed as directed in the assay for *Niacin* or *Niacinamide*.

Standard solution: Equivalent to 24 μ g/mL of USP Pyridoxine Hydrochloride RS in *Diluent*

Sample solution: Equivalent to 24 μ g/mL of pyridoxine hydrochloride from Oral Solution in *Diluent*

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of pyridoxine hydrochloride ($\text{C}_8\text{H}_{11}\text{NO}_3 \cdot \text{HCl}$) in the portion of Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area for pyridoxine hydrochloride from the *Sample solution*

r_S = peak area for pyridoxine hydrochloride from the *Standard solution*

C_S = concentration of USP Pyridoxine Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of pyridoxine hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–150.0% of the labeled amount of pyridoxine hydrochloride ($\text{C}_8\text{H}_{11}\text{NO}_3 \cdot \text{HCl}$)

• RIBOFLAVIN-5'-PHOSPHATE SODIUM, Method 1

[NOTE—Riboflavin-5'-phosphate sodium is quantitated against USP Riboflavin RS in this procedure. In the chromatogram of the *Sample solution*, the riboflavin-5'-phosphate peak is the only peak measured for calculation.]

Diluent, Mobile phase, and Chromatographic system:
Proceed as directed in the assay for *Niacin* or *Niacinamide*.

Standard solution: Equivalent to 8 μ g/mL of USP Riboflavin RS in *Diluent*, by heating if necessary

Sample solution: Equivalent to 8 μ g/mL of riboflavin from the Oral Solution in *Diluent*

Analysis

Samples: *Standard solution* and *Sample solution*
[NOTE—The relative retention times for riboflavin-5'-phosphate and riboflavin are about 0.18 and 1.0, respectively.]

Calculate the percentage of the labeled amount of riboflavin ($\text{C}_{17}\text{H}_{20}\text{N}_4\text{O}_6$) in the portion of Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times F \times 100$$

r_U = peak area for riboflavin-5'-phosphate from the *Sample solution*

r_S = peak area for riboflavin from the *Standard solution*

C_S = concentration of USP Riboflavin RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of riboflavin in the *Sample solution* (mg/mL)

F = factor for converting the response obtained for riboflavin-5'-phosphate to riboflavin, 1.493 [NOTE—Riboflavin Phosphate Sodium is a mixture of isomeric monophosphates and diphosphates containing an average amount of 67% of riboflavin-5'-monophosphate, which separates in this chromatographic system. The factor 1.493 assumes 67% of riboflavin-5'-monophosphate.]

Acceptance criteria: 90.0%–150.0% of the labeled amount of riboflavin ($\text{C}_{17}\text{H}_{20}\text{N}_4\text{O}_6$)

- **RIBOFLAVIN OR RIBOFLAVIN-5'-PHOSPHATE SODIUM, Method 2**
[NOTE—Use low-actinic glassware throughout this procedure.]

Solvent blank: 1 N hydrochloric acid, 2.5 M sodium acetate, and water (1:2:97)

Riboflavin stock solution: 0.16 mg/mL of USP Riboflavin RS in 1 N hydrochloric acid, 2.5 M sodium acetate, and water (1:2:97). Mix the resulting solution and water (1:1:9).

Standard solution: *Riboflavin stock solution*, 1 N hydrochloric acid, 2.5 M sodium acetate, and water (1:1:2:96)

Sample solution: Transfer equivalent to 0.8 mg of riboflavin from the Oral Solution to a 100-mL volumetric flask, and dilute with water to volume. Mix the resulting solution, 1 N hydrochloric acid, 2.5 M sodium acetate, and water (2:1:2:95).

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* (851)).

Mode: Fluorescence

Analytical wavelength

Excitation: 440 nm

Emission: 530 nm

Blank: *Solvent blank*

Analysis

Samples: *Standard solution* and *Sample solution*
Determine the maximum fluorescence intensities, I_S and I_U , of the *Standard solution* and the *Sample solution*, respectively. Calculate the percentage of the labeled amount of riboflavin ($C_{17}H_{20}N_4O_6$) in the portion of Oral Solution taken:

$$\text{Result} = (I_U/I_S) \times (C_S/C_U) \times 100$$

I_U = fluorescence value from the *Sample solution*

I_S = fluorescence value from the *Standard solution*

C_S = concentration of USP Riboflavin RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of riboflavin in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–150.0% of the labeled amount of riboflavin ($C_{17}H_{20}N_4O_6$)

- **THIAMINE**

Diluent, Mobile phase, and Chromatographic system:
Proceed as directed in the assay for *Niacin* or *Niacinamide*.

Standard solution: 24 µg/mL of USP Thiamine Hydrochloride RS in *Diluent*

Sample solution: Equivalent to 24 µg/mL of thiamine hydrochloride from the Oral Solution in *Diluent*

Analysis

Samples: *Standard solution* and *Sample solution*
For products containing thiamine hydrochloride, calculate the percentage of the labeled amount of thiamine hydrochloride ($C_{12}H_{17}ClN_4OS \cdot HCl$) in the portion of Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area for thiamine from the *Sample solution*

r_S = peak area for thiamine from the *Standard solution*

C_S = concentration of USP Thiamine Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of thiamine hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–250.0% of the labeled amount of thiamine hydrochloride ($C_{12}H_{17}ClN_4OS \cdot HCl$)

- **IODIDE, Method 1**

Mobile phase: Dissolve 5.15 g of tetrabutylammonium bromide in 320 mL of acetonitrile. Dilute with water to 2000 mL.

Standard stock solution: 1.3 mg/mL of potassium iodide in *Mobile phase*. This solution has a concentration of 1 mg/mL of iodide.

Standard solution: 2.5 µg/mL of iodide from *Standard stock solution* in *Mobile phase*

System suitability solution: Transfer 0.13 g of potassium iodide and 0.5 g of potassium iodate to a 100-mL volumetric flask. Dissolve in *Mobile phase*, using sonication if necessary, dilute with *Mobile phase* to volume, and mix. Transfer 1.0 mL of this solution to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Transfer 25.0 mL of this solution to a 100-mL volumetric flask, and dilute with *Mobile phase* to volume.

Sample solution: Dilute an accurately measured volume of Oral Solution to obtain a solution having a concentration of 2.5 µg/mL of iodine in *Mobile phase*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 225 nm

Column: 4.6-mm × 15-cm; packing L1

Flow rate: 1.5 mL/min

Injection size: 30 µL

System suitability

Samples: *Standard solution* and *System suitability solution*

[NOTE—The relative retention times for iodate and iodide are about 0.32 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 2.5 between iodate and iodide, *System suitability solution*

Relative standard deviation: NMT 2.0% for the iodide peak, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of iodine (I) in the portion of Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area for iodide from the *Sample solution*

r_S = peak area for iodide from the *Standard solution*

C_S = concentration of iodide in the *Standard solution* (µg/mL)

C_U = nominal concentration of iodine in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–160.0% of the labeled amount of iodine (I)

- **IODIDE, Method 2:** Proceed as directed under *Automated Methods of Analysis* (16), *Assay for Iodide*.

- **IRON**

Iron standard stock solution: Transfer 100 mg of iron powder to a 1000-mL volumetric flask, dissolve in 6 N hydrochloric acid, and dilute with water to volume.

Standard solutions: To separate 100-mL volumetric flasks, transfer 2.0, 4.0, 5.0, 6.0, and 8.0 mL of *Iron standard stock solution*. Dilute the contents of each flask with 0.125 N hydrochloric acid to volume to obtain concentrations of 2.0, 4.0, 5.0, 6.0, and 8.0 µg/mL of iron.

Sample solution: 6 µg/mL of iron from Oral Solution in 0.125 N hydrochloric acid

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometer

Lamp: Iron hollow-cathode

Flame: Air–acetylene

Analytical wavelength: 248.3 nm

Blank: 0.125 N hydrochloric acid

Analysis

Samples: *Standard solutions* and *Sample solution*
Determine the absorbances of the solutions, using the *Blank*. Plot the absorbances of the *Standard solutions* versus concentration, in µg/mL, of iron, and draw the

straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, C , in $\mu\text{g/mL}$, of iron in the *Sample solution*. Calculate the percentage of the labeled amount of iron (Fe) in the portion of Oral Solution taken:

$$\text{Result} = (C/C_U) \times 100$$

C = concentration of iron in the *Sample solution* from the graph ($\mu\text{g/mL}$)

C_U = nominal concentration of iron in the *Sample solution* ($\mu\text{g/mL}$)

Acceptance criteria: 90.0%–125.0% of the labeled amount of iron (Fe)

• MAGNESIUM

Magnesium standard solution: Transfer 1.00 g of magnesium ribbon to a 1000-mL volumetric flask. Dissolve in 50 mL of 6 N hydrochloric acid, and dilute with water to volume.

Standard stock solution: 20 $\mu\text{g/mL}$ of magnesium from *Magnesium standard solution* in 0.125 N hydrochloric acid

Standard solutions: To separate 100-mL volumetric flasks transfer 5.0, 7.5, 10.0, 12.5, and 15.0 mL of *Standard stock solution*. Dilute with 0.125 N hydrochloric acid to volume to obtain concentrations of 1.0, 1.5, 2.0, 2.5, and 3.0 $\mu\text{g/mL}$ of magnesium.

Sample solution: 2.5 $\mu\text{g/mL}$ of magnesium from Oral Solution in 0.125 N hydrochloric acid

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometer

Lamp: Magnesium hollow-cathode

Flame: Air–acetylene

Analytical wavelength: 285.2 nm

Blank: 0.125 N hydrochloric acid

Analysis

Samples: *Standard solutions* and *Sample solution*
Determine the absorbances of the solutions, using the *Blank*. Plot the absorbances of the *Standard solutions* versus concentration, in $\mu\text{g/mL}$, of magnesium, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, C , in $\mu\text{g/mL}$, of magnesium in the *Sample solution*. Calculate the percentage of the labeled amount of magnesium (Mg) in the portion of Oral Solution taken:

$$\text{Result} = (C/C_U) \times 100$$

C = concentration of magnesium in the *Sample solution* from the graph ($\mu\text{g/mL}$)

C_U = nominal concentration of magnesium in the *Sample solution* ($\mu\text{g/mL}$)

Acceptance criteria: 90.0%–125.0% of the labeled amount of magnesium (Mg)

• MANGANESE

Manganese standard stock solution: Transfer 1.0 g of manganese to a 1000-mL volumetric flask. Dissolve in 20 mL of nitric acid, and dilute with 6 N hydrochloric acid to volume.

Standard stock solution: 50 $\mu\text{g/mL}$ of manganese from *Manganese standard stock solution* in 0.125 N hydrochloric acid

Standard solutions: To separate 100-mL volumetric flasks transfer 1.0, 1.5, 2.0, 3.0, and 4.0 mL of *Standard stock solution*. Dilute the contents of each flask with 0.125 N hydrochloric acid to volume to obtain solutions having known concentrations of 0.5, 0.75, 1.0, 1.5, and 2.0 $\mu\text{g/mL}$ of manganese.

Sample solution: Dilute an accurately measured volume of the Oral Solution to obtain a solution having a concentration of 1.5 $\mu\text{g/mL}$ of manganese in 0.125 N hydrochloric acid

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometer

Lamp: Manganese hollow-cathode

Flame: Air–acetylene

Analytical wavelength: 279.5 nm

Blank: 0.125 N hydrochloric acid

Analysis

Samples: *Standard solutions* and *Sample solution*
Determine the absorbances of the solutions, using the *Blank*. Plot the absorbances of the *Standard solutions* versus concentration, in $\mu\text{g/mL}$, of manganese, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, C , in $\mu\text{g/mL}$, of manganese in the *Sample solution*. Calculate the percentage of the labeled amount of manganese (Mn) in the portion of Oral Solution taken:

$$\text{Result} = (C/C_U) \times 100$$

C = concentration of manganese in the *Sample solution* from the graph ($\mu\text{g/mL}$)

C_U = nominal concentration of manganese in the *Sample solution* ($\mu\text{g/mL}$)

Acceptance criteria: 90.0%–125.0% labeled amount of manganese (Mn)

• ZINC

Zinc standard solution: Transfer 311 mg of zinc oxide to a 250-mL volumetric flask, and add 80 mL of 6 N hydrochloric acid, warming if necessary to dissolve. Cool, dilute with water to volume, and mix to obtain a solution having a known concentration of 1000 μg of zinc/mL.

Standard stock solution: 50 $\mu\text{g/mL}$ of zinc from *Zinc standard solution* in 0.125 N hydrochloric acid

Standard solutions: Transfer 1.0, 2.0, 3.0, 4.0, and 5.0 mL of *Standard stock solution* to separate 100-mL volumetric flasks. Dilute the contents of each flask with 0.125 N hydrochloric acid to volume to obtain concentrations of 0.5, 1.0, 1.5, 2.0, and 2.5 $\mu\text{g/mL}$ of zinc.

Sample solution: Dilute an accurately measured volume of Oral Solution to obtain a solution having a concentration of 1 $\mu\text{g/mL}$ of zinc in 0.125 N hydrochloric acid

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometer

Lamp: Zinc hollow-cathode

Flame: Air–acetylene

Analytical wavelength: 213.8 nm

Blank: 0.125 N hydrochloric acid

Analysis

Samples: *Standard solutions* and *Sample solution*
Determine the absorbances of the solutions, using the *Blank*. Plot the absorbances of the *Standard solutions* versus concentration, in $\mu\text{g/mL}$, of zinc, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, C , in $\mu\text{g/mL}$, of zinc in the *Sample solution*. Calculate the percentage of the labeled amount of zinc (Zn) in the portion of Oral Solution taken:

$$\text{Result} = (C/C_U) \times 100$$

C = concentration of zinc in the *Sample solution* from the graph ($\mu\text{g/mL}$)

C_U = nominal concentration of zinc in the *Sample solution* ($\mu\text{g/mL}$)

Acceptance criteria: 90.0%–125.0% of the labeled amount of zinc (Zn)

OTHER COMPONENTS

- **ALCOHOL DETERMINATION**, *Method 1* (611) (if present): 90.0%–120.0% of the labeled amount of C_2H_5OH

CONTAMINANTS

- **MICROBIAL ENUMERATION TEST—NUTRITIONAL AND DIETARY SUPPLEMENTS (2021)**: The total aerobic microbial count does not exceed 3000 cfu/mL, and the combined molds and yeasts count does not exceed 300 cfu/mL.
- **MICROBIOLOGICAL PROCEDURES FOR ABSENCE OF SPECIFIED MICROORGANISMS—NUTRITIONAL AND DIETARY SUPPLEMENTS (2022)**: Meets the requirements of the tests for absence of *Salmonella* species, *Escherichia coli*, and *Staphylococcus aureus*.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE**: Preserve in tight, light-resistant containers, under an inert gas or with a minimum of headspace.
- **LABELING**: The label states that the product is Water-Soluble Vitamins with Minerals Oral Solution. The label states the quantity of each vitamin and mineral present in terms of metric units in a given volume of the Oral Solution and, where necessary, the chemical form in which a vitamin is present, and also states the salt form of the mineral used as the source of each element. Where products are labeled to contain panthenol, the label states the equivalent content of dexpanthenol. Where more than one assay method is given for a particular vitamin or mineral, the labeling states with which assay method the product complies only if *Method 1* is not used.
- **USP REFERENCE STANDARDS (11)**
 - USP Calcium Pantothenate RS
 - USP Cyanocobalamin RS
 - USP Dexpanthenol RS
 - USP Niacin RS
 - USP Niacinamide RS
 - USP Pyridoxine Hydrochloride RS
 - USP Racemic Panthenol RS
 - USP Riboflavin RS
 - USP Thiamine Hydrochloride RS

Water-Soluble Vitamins with Minerals Tablets

DEFINITION

Water-Soluble Vitamins with Minerals Tablets contain one or more of the following water-soluble vitamins: Ascorbic Acid or its equivalent as Calcium Ascorbate or Sodium Ascorbate, Biotin, Cyanocobalamin, Folic Acid, Niacin or Niacinamide, Pantothenic Acid (as Calcium Pantothenate or Racemic Calcium Pantothenate), Pyridoxine Hydrochloride, Riboflavin, and Thiamine Hydrochloride or Thiamine Mononitrate; and one or more minerals derived from substances generally recognized as safe, furnishing one or more of the following elements in ionizable form: boron, calcium, chromium, copper, fluorine, iodine, iron, magnesium, manganese, molybdenum, nickel, phosphorus, potassium, selenium, tin, vanadium, and zinc. Tablets contain NLT 90.0% and NMT 150.0% of the labeled amounts of ascorbic acid ($C_6H_8O_6$) or its salts as calcium ascorbate ($C_{12}H_{14}CaO_{12} \cdot 2H_2O$) or sodium ascorbate ($C_6H_7NaO_6$), biotin ($C_{10}H_{16}N_2O_3S$), cyanocobalamin ($C_{63}H_{88}CoN_{14}O_{14}P$), folic acid ($C_{19}H_{19}N_7O_6$), calcium pantothenate ($C_{18}H_{32}CaN_2O_{10}$), niacin ($C_6H_5NO_2$) or niacinamide ($C_6H_6N_2O$), pyridoxine hydrochloride ($C_8H_{11}NO_3 \cdot HCl$), riboflavin ($C_{17}H_{20}N_4O_6$), and thiamine ($C_{12}H_{17}ClN_4OS$) as thiamine hydrochloride or thiamine mononitrate; NLT 90.0% and NMT 125.0% of the labeled amounts of calcium (Ca), copper (Cu), iron (Fe), magnesium (Mg), manganese (Mn), phosphorus (P), potassium (K), and zinc

(Zn); and NLT 90.0% and NMT 160.0% of the labeled amounts of boron (B), chromium (Cr), fluorine (F), iodine (I), molybdenum (Mo), nickel (Ni), selenium (Se), tin (Sn), and vanadium (V).

They do not contain any form of Beta Carotene or Vitamin A, D, E, or K. They may contain other labeled added substances that are generally recognized as safe, in amounts that are unobjectionable.

STRENGTH

[NOTE—In the following assays, where more than one assay method is given for an individual ingredient, the requirements may be met by following any one of the specified methods, the method used being stated in the labeling only if *Method 1* is not used.]

- **ASCORBIC ACID**, *Method 1*

[NOTE—Finely powder NLT 20 Tablets.]

Sample solution: Transfer a portion of powdered Tablets, equivalent to a nominal amount of 100 mg of ascorbic acid, to a 200-mL volumetric flask, and add 75 mL of metaphosphoric–acetic acids TS. Insert a stopper into the flask, and shake by mechanical means for 30 min. Dilute with water to volume. Transfer a portion of the solution to a centrifuge tube, and centrifuge until a clear supernatant is obtained. Pipet 4.0 mL of this solution into a 50-mL conical flask, and add 5 mL of metaphosphoric–acetic acids TS.

Analysis: Titrate with standard dichlorophenol–indophenol solution VS to a rose-pink color that persists for at least 5 s. Correct for the volume of dichlorophenol–indophenol solution consumed by a mixture of 5.5 mL of metaphosphoric–acetic acids TS and 15 mL of water. From the ascorbic acid equivalent of the standard dichlorophenol–indophenol solution, calculate the content of ascorbic acid in each Tablet.

Acceptance criteria: 90.0%–150.0% of the labeled amount of ascorbic acid ($C_6H_8O_6$)

- **ASCORBIC ACID**, *Method 2:* Proceed as directed in *Automated Methods of Analysis (16)*, *Assay for Ascorbic Acid*.

Acceptance criteria: 90.0%–150.0% of the labeled amount of ascorbic acid ($C_6H_8O_6$)

- **CALCIUM ASCORBATE**, *Method 1:* Proceed as directed in the assay for *Ascorbic Acid*, *Method 1*.

Acceptance criteria: 90.0%–150.0% of the labeled amount of calcium ascorbate ($C_{12}H_{14}CaO_{12} \cdot 2H_2O$)

- **CALCIUM ASCORBATE**, *Method 2:* Proceed as directed in *Automated Methods of Analysis (16)*, *Assay for Ascorbic Acid*.

Acceptance criteria: 90.0%–150.0% of the labeled amount of calcium ascorbate ($C_{12}H_{14}CaO_{12} \cdot 2H_2O$)

- **SODIUM ASCORBATE**, *Method 1:* Proceed as directed in the assay for *Ascorbic Acid*, *Method 1*.

Acceptance criteria: 90.0%–150.0% of the labeled amount of sodium ascorbate ($C_6H_7NaO_6$)

- **SODIUM ASCORBATE**, *Method 2:* Proceed as directed in *Automated Methods of Analysis (16)*, *Assay for Ascorbic Acid*.

Acceptance criteria: 90.0%–150.0% of the labeled amount of sodium ascorbate ($C_6H_7NaO_6$)

- **BIOTIN**, *Method 1*

[NOTE—Use low-actinic glassware throughout this procedure.]

Mobile phase: Mix 85 mL of acetonitrile, 1 g of sodium perchlorate, and 1 mL of phosphoric acid, and dilute with water to 1000 mL.

Standard stock solution: 0.333 mg/mL of USP Biotin RS in dimethyl sulfoxide

Standard solution: 5 µg/mL of USP Biotin RS prepared by diluting the *Standard stock solution* in water

Sample solution: Finely powder NLT 20 Tablets. Transfer a portion of powder, equivalent to a nominal amount of 1 mg of biotin, to a 200-mL volumetric flask, add 3 mL of dimethyl sulfoxide, and swirl to wet. Place the flask in a water bath at 60°–70° for 5 min. Sonicate for 5 min, dilute with water to volume, and filter.

Chromatographic system(See *Chromatography* <621>, *System Suitability*.)**Mode:** LC**Detector:** UV 200 nm**Column:** 4.6-mm × 15-cm; 3-μm packing L7**Flow rate:** 1.2 mL/min**Injection size:** 100 μL**System suitability****Sample:** *Standard solution***Suitability requirements****Relative standard deviation:** NMT 3.0%**Analysis****Samples:** *Standard solution* and *Sample solution*

Measure the responses for the biotin peaks. Calculate the percentage of the labeled amount of biotin ($C_{10}H_{16}N_2O_3S$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

 r_U = peak response from the *Sample solution* r_S = peak response from the *Standard solution* C_S = concentration of USP Biotin RS in the *Standard solution* (μg/mL) C_U = nominal concentration of biotin in the *Sample solution* (μg/mL)**Acceptance criteria:** 90.0%–150.0% of the labeled amount of biotin ($C_{10}H_{16}N_2O_3S$)• **BIOTIN, Method 2**

[NOTE—Use low-actinic glassware throughout this procedure.]

Dehydrated mixtures yielding formulations similar to the media described herein may be used provided that, when constituted as directed, they have growth-promoting properties equal to or superior to those obtained with the media prepared as described herein.

Standard stock solution: 50 μg/mL of USP Biotin RS in 50% alcohol. Store this solution in a refrigerator.**Standard solution:** On the day of the assay, dilute the *Standard stock solution* with water to a concentration of 0.1 ng/mL of USP Biotin RS.**Sample solution:** Finely powder NLT 30 Tablets.

Transfer a the portion of powder, equivalent to a nominal amount of 100 μg of biotin, to a 200-mL volumetric flask. Add 3 mL of 50% alcohol, and swirl to wet the contents. Heat the flask in a water bath at 60°–70° for 5 min. Sonicate for 5 min, dilute with diluted alcohol to volume, and filter. Dilute a volume of the filtrate, quantitatively, and stepwise if necessary, with water to obtain a solution with a concentration of 0.1 ng/mL.

Acid-hydrolyzed casein solution: Mix 100 g of vitamin-free casein with 500 mL of 6 N hydrochloric acid, and reflux the mixture for 8–12 h. Remove the hydrochloric acid from the mixture by distillation under reduced pressure until a thick paste remains. Redissolve the resulting paste in water, adjust the solution with 1 N sodium hydroxide to a pH of 3.5 ± 0.1, and add water to make 1000 mL. Add 20 g of activated charcoal, stir for 1 h, and filter. Repeat the treatment with activated charcoal. Store under toluene in a cool place at a temperature not below 10°. Filter the solution if a precipitate forms during storage.

Cystine–tryptophan solution: Suspend 4.0 g of L-cystine in 1.0 g of L-tryptophan (or 2.0 g of D,L-tryptophan) in 700–800 mL of water, heat to 70°–80°, and add dilute hydrochloric acid (1 in 2) dropwise, with stirring, until the solids are dissolved. Cool, and add water to make 1000 mL. Store under toluene in a cool place at a temperature not below 10°.

Adenine–guanine–uracil solution: Dissolve 200 mg each of adenine sulfate, guanine hydrochloride, and uracil, with the aid of heat, in 10 mL of 4 N hydrochloric acid. Cool, and add water to make 200 mL. Store under toluene in a refrigerator.

Polysorbate 80 solution: 100 mg/mL of polysorbate 80 in alcohol

Calcium pantothenate solution: 10 μg/mL of calcium pantothenate in 50% alcohol. Store in a refrigerator.

Riboflavin–thiamine hydrochloride solution: 20 μg/mL of riboflavin and 10 μg/mL of thiamine hydrochloride in 0.02 N acetic acid. Store under toluene, protected from light, in a refrigerator.

p-Aminobenzoic acid–niacin–pyridoxine hydrochloride solution: 10 μg/mL of p-aminobenzoic acid, 50 μg/mL of niacin, and 40 μg/mL of pyridoxine hydrochloride in a mixture of neutralized alcohol and water (1:3). Store in a refrigerator.

Salt solution A: Dissolve 25 g of monobasic potassium phosphate and 25 g of dibasic potassium phosphate in water to make 500 mL. Add 5 drops of hydrochloric acid. Store under toluene.

Salt solution B: Dissolve 10 g of magnesium sulfate, 0.5 g of sodium chloride, 0.5 g of ferrous sulfate, and 0.5 g of manganese sulfate in water to make 500 mL. Add 5 drops of hydrochloric acid, and mix. Store under toluene.

Basal medium stock solution

Acid-hydrolyzed casein solution	25 mL
Cystine–tryptophan solution	25 mL
Polysorbate 80 solution	0.25 mL
Dextrose, anhydrous	10 g
Sodium acetate, anhydrous	5 g
Adenine–guanine–uracil solution	5 mL
Calcium pantothenate solution	5 mL
Riboflavin–thiamine hydrochloride solution	5 mL
p-Aminobenzoic acid–niacin–pyridoxine hydrochloride solution	5 mL
Salt solution A	5 mL
Salt solution B	5 mL

Dissolve the anhydrous dextrose and anhydrous sodium acetate in the solutions previously mixed, and adjust with 1 N sodium hydroxide to a pH of 6.8. Dilute with water to 250 mL.

Stock culture of *Lactobacillus plantarum*: Dissolve 2.0 g of yeast extract in 100 mL of water. Add 500 mg of anhydrous dextrose, 500 mg of anhydrous sodium acetate, and 1.5 g of agar, and heat the mixture on a steam bath, with stirring, until the agar dissolves. Add 10-mL portions of the hot solution to the test tubes, close or cover the tubes, sterilize in an autoclave at 121°, and allow the tubes to cool in an upright position. Prepare stab cultures in three or more of the tubes, using a pure culture of *Lactobacillus plantarum*,¹ incubating for 16–24 h at a temperature between 30° and 37° held constant to within ±0.5°. Store in a refrigerator. Prepare a fresh stab of the stock culture every week, and do not use for *Inoculum* if the culture is more than 1 week old.

Culture medium: To each of a series of test tubes containing 5.0 mL of *Basal medium stock solution*, add 5.0 mL of water containing 0.5 ng of biotin. Plug the tubes with cotton, sterilize in an autoclave at 121°, and cool.

Inoculum: [NOTE—A frozen suspension of *Lactobacillus plantarum* may be used as the stock culture, provided it yields an *Inoculum* comparable to a fresh culture.] Make a transfer of cells from the *Stock culture* of *Lactobacillus plantarum* to a sterile tube containing 10 mL of culture medium. Incubate this culture for 16–24 h at a temperature between 30° and 37° held constant to within ±0.5°. The cell suspension so obtained is the *Inoculum*.

¹ ATCC No. 8014 is suitable. This strain was formerly known as *Lactobacillus arabinosus* 17-5.

Analysis

Samples: *Standard solution* and *Sample solution*

To similar separate test tubes add, in duplicate, 1.0 and/or 1.5, 2.0, 3.0, 4.0, and 5.0 mL of the *Standard solution*. To each tube and to four similar empty tubes, add 5.0 mL of *Basal medium stock solution* and sufficient water to make 10 mL.

To similar test tubes add, in duplicate, volumes of the *Sample solution* corresponding to three or more of the levels specified for the *Standard solution*, including the levels of 2.0, 3.0, and 4.0 mL. To each tube add 5.0 mL of the *Basal medium stock solution* and sufficient water to make 10 mL. Place one complete set of Standard and sample tubes together in one tube rack and the duplicate set in a second rack or section of a rack, preferably in random order.

Cover the tubes of both series to prevent contamination, and sterilize in an autoclave at 121° for 5 min. Cool, and add 1 drop of *Inoculum* to each tube, except two of the four tubes containing no *Standard solution* (the uninoculated blanks). Incubate the tubes at a temperature between 30° and 37° held constant to within ±0.5° until, following 16–24 h of incubation, there has been no substantial increase in turbidity in the tubes containing the highest level of Standard during a 2-h period.

Determine the transmittance of the tubes in the following manner. Mix the contents of each tube, and transfer to a spectrophotometer cell. Place the cell in a spectrophotometer that has been set at a specific wavelength of 540–660 nm, and read the transmittance when a steady state is reached. This steady state is observed a few seconds after agitation when the galvanometer reading remains constant for 30 s or more. Allow approximately the same time interval for the reading on each tube.

With the transmittance set at 1.00 for the uninoculated blank, read the transmittance of the inoculated blank. With the transmittance set at 1.00 for the inoculated blank, read the transmittance for each of the remaining tubes. If there is evidence of contamination with a foreign microorganism, disregard the result of the assay.

Calculation: Prepare a standard concentration-response curve as follows. For each level of the Standard, calculate the response from the sum of the duplicate values of the transmittance (Σ) as the difference, $y = 2.00 - \Sigma$. Plot this response on the ordinate of cross-section paper against the logarithm of the mL of *Standard solution* per tube on the abscissa, using for the ordinate either an arithmetic or a logarithmic scale, whichever gives the better approximation to a straight line. Draw the straight line or smooth curve that best fits the plotted points.

Calculate the response, y , adding together the two transmittances for each level of the *Sample solution*. Read from the standard curve the logarithm of the volume of the *Standard solution* corresponding to each of those values of y that fall within the range of lowest and highest points plotted for the Standard. Subtract from each logarithm so obtained the logarithm of the volume, in mL, of the *Sample solution* to obtain the difference, X , for each dosage level. Average the values of X for each of three or more dosage levels to obtain \bar{X} , which equals the log-relative potency, M' , of the *Sample solution*. Determine the quantity, in μg , of USP Biotin RS corresponding to the biotin in each mg of the portion of Tablets taken:

$$\text{antilog } M = \text{antilog } (M' + \log R)$$

R = number of μg of biotin that was assumed to be present in each mg in the portion of the Tablets taken

Replication: Repeat the entire determination at least once, using separately prepared *Sample solutions*. If the difference between the two log-potencies M is NMT 0.08, their mean, \bar{M} , is the assayed log-potency of the test material (see *Design and Analysis of Biological Assays* (111), *The Confidence Interval and Limits of Potency*). If the two determinations differ by more than 0.08, conduct one or more additional determinations. From the mean of two or more values of M that do not differ by more than 0.15, compute the mean potency of the preparation under assay.

Acceptance criteria: 90.0%–150.0% of the labeled amount of biotin ($\text{C}_{10}\text{H}_{16}\text{N}_2\text{O}_3\text{S}$)

• **BIOTIN, Method 3**

[NOTE—Use low-actinic glassware throughout this procedure.]

Solution A: Transfer 800 mL of water and 100 mL of triethylamine to a 1000-mL volumetric flask. Add 80 mL of 85% phosphoric acid, and dilute with water to volume.

Mobile phase: Transfer 80 mL of acetonitrile and 10 mL of *Solution A* to a 1000-mL volumetric flask. Dilute with water to volume.

Standard solution: 0.6 $\mu\text{g}/\text{mL}$ of USP Biotin RS in water. [NOTE—A portion of the *Standard solution* will be used to determine the percent recovery of biotin from the *Solid-phase extraction* procedure.]

Sample solution: Finely powder NLT 20 Tablets. Transfer an amount of powdered Tablets to a volumetric flask to obtain a nominal concentration of 0.6 $\mu\text{g}/\text{mL}$ of biotin. Add water up to 80% of the flask capacity, sonicate for 30–40 min with occasional mixing to dissolve, dilute with water to volume, and filter. Adjust the pH of the solution with either diluted acetic acid or 0.1 N sodium hydroxide to between 6.0 and 7.0.

Solid-phase extraction

[NOTE—Condition the extraction column specified in this procedure in the following manner. Wash the column with a 2-mL portion of methanol. Equilibrate with a 2-mL portion of water.]

Separately pipet 5.0 mL of the *Sample solution* and *Standard solution* into freshly conditioned solid-phase extraction columns consisting of a mixed-mode packing with a sorbent-mass of 60 mg. [NOTE—The mixed-mode packing consists of anion-exchange and reversed-phase sorbents. The reverse-phase component is a polymer of copolymer *N*-vinylpyrrolidone and divinylbenzene. The anion exchange moiety is a trialkylamino group.²]

Wash the column with 10 mL of 30% methanol in water. Apply an appropriate volume (4.9 mL) of 30% methanol in 0.1 N hydrochloric acid to the column. Collect the eluate in a 5-mL volumetric flask, containing 100 μL of 40% (w/v) sodium acetate in water, and dilute with 30% methanol in 0.1 N hydrochloric acid to volume.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 200 nm

Column: 4.6-mm \times 25-cm; packing L1

Flow rate: 2 mL/min

Injection size: 100 μL

System suitability

Samples: *Standard solution* and a portion of the *Standard solution* that has undergone *Solid-phase extraction*

Suitability requirements

Tailing factor: NMT 1.5, *Standard solution*

Relative standard deviation: NMT 2.0%, *Standard solution* and the *Standard solution* that has undergone *Solid-phase extraction*

² A suitable cartridge is the Waters, Oasis MAX Vac RC cartridge, particle size 30 μm , part 186000371.

Recovery: 95%–100%, *Standard solution* that has undergone *Solid-phase extraction*

Analysis

Samples: *Standard solution* and *Sample solution* that have both undergone *Solid-phase extraction*

Measure the responses for the biotin peak. Calculate the percentage of the labeled amount of biotin ($C_{10}H_{16}N_2O_3S$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Biotin RS in the *Standard solution* ($\mu\text{g/mL}$)

C_U = nominal concentration of biotin in the *Sample solution* ($\mu\text{g/mL}$)

Acceptance criteria: 90.0%–150.0% of the labeled amount of biotin ($C_{10}H_{16}N_2O_3S$)

• CYANOCOBALAMIN, Method 1

[NOTE—Use low-actinic glassware throughout this procedure.]

Mobile phase: Methanol and water (7:13)

Standard stock solution: 10 $\mu\text{g/mL}$ of USP Cyanocobalamin RS in water. [NOTE—Store this stock solution in a dark place, and discard after 1 week.]

Standard solution: 1 $\mu\text{g/mL}$ of USP Cyanocobalamin RS from the *Standard stock solution*, diluted with water

Sample solution: Finely powder NLT 30 Tablets.

Transfer a portion of the powder, equivalent to a nominal amount of 100 μg of cyanocobalamin, to a 250-mL flask. Quantitatively add 100.0 mL of water, and carefully extract for 2 min. Filter 10 mL of the extract, and use the filtrate.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: 550 nm

Column: 4.6-mm \times 15-cm; 5- μm packing L1

Flow rate: 0.5 mL/min

Injection size: 200 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak responses for cyanocobalamin.

Calculate the percentage of the labeled amount of cyanocobalamin ($C_{63}H_{88}CoN_{14}O_{14}P$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of cyanocobalamin from the *Sample solution*

r_S = peak response of cyanocobalamin from the *Standard solution*

C_S = concentration of USP Cyanocobalamin RS in the *Standard solution* ($\mu\text{g/mL}$)

C_U = nominal concentration of cyanocobalamin in the *Sample solution* ($\mu\text{g/mL}$)

Acceptance criteria: 90.0%–150.0% of the labeled amount of cyanocobalamin ($C_{63}H_{88}CoN_{14}O_{14}P$)

• CYANOCOBALAMIN, Method 2

[NOTE—Use low-actinic glassware throughout this procedure.]

Standard cyanocobalamin stock solution: 1.0 $\mu\text{g/mL}$ of USP Cyanocobalamin RS in 25% alcohol. Store in a refrigerator.

Standard solution: Dilute a suitable volume of *Standard cyanocobalamin stock solution* with water to a measured volume such that after the incubation period as directed in the *Analysis*, the difference in transmittance between the inoculated blank and the 5.0-mL level of

the *Standard solution* is NLT that which corresponds to a difference of 1.25 mg in dried cell weight. This concentration usually falls between 0.01 and 0.04 ng/mL of *Standard solution*. Prepare this solution fresh for each assay.

Sample solution: Finely powder NLT 20 Tablets. Transfer a portion of the powdered Tablets, equivalent to a nominal amount of 1.0 μg of cyanocobalamin, to an appropriate vessel containing, for each g of powdered Tablets taken, 25 mL of an aqueous extracting solution prepared just before use to contain, in each 100 mL, 1.29 g of dibasic sodium phosphate, 1.1 g of anhydrous citric acid, and 1.0 g of sodium metabisulfite. Autoclave the mixture at 121° for 10 min. Allow any undissolved particles of the extract to settle, and filter or centrifuge if necessary. Dilute an aliquot of the clear solution with water to obtain a final solution containing vitamin B₁₂ activity equivalent to the nominal activity of the *Standard solution*.

Acid-hydrolyzed casein solution: Prepare as directed in the assay for *Calcium Pantothenate*, Method 2.

Asparagine solution: Dissolve 2.0 g of L-asparagine in water to make 200 mL. Store under toluene in a refrigerator.

Adenine-guanine-uracil solution: Prepare as directed in the assay for *Calcium Pantothenate*, Method 2.

Xanthine solution: Suspend 0.20 g of xanthine in 30–40 mL of water, heat to 70°, add 6.0 mL of 6 N ammonium hydroxide, and stir until the solid is dissolved. Cool, and add water to make 200 mL. Store under toluene in a refrigerator.

Salt solution A: Dissolve 10 g of monobasic potassium phosphate and 10 g of dibasic potassium phosphate in water to make 200 mL, and add 2 drops of hydrochloric acid. Store this solution under toluene.

Salt solution B: Dissolve 4.0 g of magnesium sulfate, 0.20 g of sodium chloride, 0.20 g of ferrous sulfate, and 0.20 g of manganese sulfate in water to make 200 mL, and add 2 drops of hydrochloric acid. Store this solution under toluene.

Polysorbate 80 solution: Dissolve 20 g of polysorbate 80 in alcohol to make 200 mL. Store in a refrigerator.

Vitamin solution A: Dissolve 10 mg of riboflavin, 10 mg of thiamine hydrochloride, 100 μg of biotin, and 20 mg of niacin in 0.02 N glacial acetic acid to make 400 mL. Store under toluene, protected from light, in a refrigerator.

Vitamin solution B: Dissolve 20 mg of *p*-aminobenzoic acid, 10 mg of calcium pantothenate, 40 mg of pyridoxine hydrochloride, 40 mg of pyridoxal hydrochloride, 8 mg of pyridoxamine dihydrochloride, and 2 mg of folic acid in a mixture of water and neutralized alcohol (3:1) to make 400 mL. Store, protected from light, in a refrigerator.

Basal medium stock solution: Prepare the medium according to the following formula and directions. A dehydrated mixture containing the same ingredients may be used provided that, when constituted as directed in the labeling, it yields a medium comparable to that obtained from the formula given herein.

Add the ingredients in the order listed, carefully dissolving cystine and tryptophan in the hydrochloric acid before adding the next eight solutions in the resulting solution. Add 100 mL of water, and dissolve the dextrose, sodium acetate, and ascorbic acid. Filter, if necessary. Add the *Polysorbate 80 solution*, adjust with 1 N sodium hydroxide to a pH of between 5.5 and 6.0, and add Purified Water to make 250 mL.

L-Cystine	0.1 g
L-Tryptophan	0.05 g
1 N hydrochloric acid	10 mL
Adenine-guanine-uracil solution	5 mL

Xanthine solution	5 mL
Vitamin solution A	10 mL
Vitamin solution B	10 mL
Salt solution A	5 mL
Salt solution B	5 mL
Asparagine solution	5 mL
Acid-hydrolyzed casein solution	25 mL
Dextrose, anhydrous	10 g
Sodium acetate, anhydrous	5 g
Ascorbic acid	1 g
Polysorbate 80 solution	5 mL

Tomato juice preparation: Centrifuge commercially canned tomato juice so that most of the pulp is removed. Suspend 5 g/L of analytical filter aid in the supernatant, and pass, with the aid of reduced pressure, through a layer of the filter aid. Repeat, if necessary, until a clear, straw-colored filtrate is obtained. Store under toluene in a refrigerator.

Culture medium: [NOTE—A dehydrated mixture containing the same ingredients may be used provided that, when constituted as directed in the labeling, it yields a medium equivalent to that obtained from the formula given herein.] Dissolve 0.75 g of yeast extract, 0.75 g of dried peptone, 1.0 g of anhydrous dextrose, and 0.20 g of monobasic potassium phosphate in 60–70 mL of water. Add 10 mL of *Tomato juice preparation* and 1 mL of *Polysorbate 80 solution*. Adjust with 1 N sodium hydroxide to a pH of 6.8, and add water to make 100 mL. Place 10-mL portions of the solution in test tubes, and plug with cotton. Sterilize the tubes and contents in an autoclave at 121° for 15 min. Cool as rapidly as possible to avoid color formation resulting from overheating the medium.

Suspension medium: Dilute a measured volume of *Basal medium stock solution* with an equal volume of water. Place 10-mL portions of the diluted medium in test tubes. Sterilize, and cool as directed for *Culture medium*.

Stock culture of *Lactobacillus leichmannii*: To 100 mL of *Culture medium*, add 1.0–1.5 g of agar, and heat the mixture on a steam bath, with stirring, until the agar dissolves. Place 10-mL portions of the hot solution into test tubes, cover the tubes, sterilize at 121° for 15 min in an autoclave (exhaust line temperature), and allow the tubes to cool in an upright position. Inoculate three or more of the tubes by stab transfer of a pure culture of *Lactobacillus leichmannii*.³ [NOTE—Before first using a fresh culture in this assay, make NLT 10 successive transfers of the culture in a 2-week period.] Incubate for 16–24 h at a temperature between 30° and 40° held constant to within $\pm 0.5^\circ$. Store in a refrigerator.

Prepare fresh stab cultures at least three times each week, and do not use them for preparing the *Inoculum* if more than 4 days old. The activity of the microorganism can be increased by daily or twice-daily transfer of the stab culture, to the point where definite turbidity in the liquid *Inoculum* can be observed 2–4 h after inoculation. A slow-growing culture seldom gives a suitable response curve and may lead to erratic results.

Inoculum: [NOTE—A frozen suspension of *Lactobacillus leichmannii* may be used as the stock culture, provided it yields an *Inoculum* comparable to a fresh culture.] Make a transfer of cells from the *Stock culture of Lactobacillus leichmannii* to two sterile tubes containing 10 mL of the *Culture medium* each. Incubate these cultures for 16–24 h at a temperature between 30° and 40° held constant to within $\pm 0.5^\circ$. Under aseptic conditions centrifuge the cultures, and decant the supernatant. Suspend the cells from the culture in 5 mL of sterile *Suspension medium*, and combine. Using sterile

Suspension medium, adjust the volume so that a 1-in-20 dilution in saline TS produces 70% transmittance when read on a suitable spectrophotometer that has been set at a wavelength of 530 nm, equipped with a 10-mm cell, and read against saline TS set at 100% transmittance. Prepare a 1-in-400 dilution of the adjusted suspension using *Basal medium stock solution*. The cell suspension so obtained is the *Inoculum*. [NOTE—This dilution may be altered, when necessary, to obtain the desired test response.]

Calibration of spectrophotometer: Check the wavelength of the spectrophotometer periodically, using a standard wavelength cell or other suitable device.

Before reading any tests, calibrate the spectrophotometer for 0% and 100% transmittance, using water and with the wavelength set at 530 nm.

Analysis

Samples: *Standard solution* and *Sample solution*

Because of the high sensitivity of the test organism to minute amounts of vitamin B₁₂ activity and to traces of many cleansing agents, cleanse meticulously by suitable means, followed preferably by heating at 250° for 2 h, using hard-glass 20-mm \times 150-mm test tubes, and other necessary glassware.

To separate test tubes add, in duplicate, 1.0, 1.5, 2.0, 3.0, 4.0, and 5.0 mL of the *Standard solution*. To each of these tubes and to four similar empty tubes, add 5.0 mL of *Basal medium stock solution* and sufficient water to make 10 mL.

To similar separate test tubes add, in duplicate, 1.0, 1.5, 2.0, 3.0, and 4.0 mL of the *Sample solution*. To each tube add 5.0 mL of *Basal medium stock solution* and sufficient water to make 10 mL. Place one complete set of Standard and sample tubes together in one tube rack and the duplicate set in a second rack or section of a rack, preferably in random order. Cover the tubes to prevent bacterial contamination, and sterilize in an autoclave at 121° for 5 min, arranging to reach this temperature in NMT 10 min by preheating the autoclave if necessary. Cool as rapidly as possible to avoid color formation resulting from overheating the medium. Take precautions to maintain uniformity of sterilizing and cooling conditions throughout the assay, because packing the tubes too closely in the autoclave or overloading it may cause variation in the heating rate.

Aseptically add 0.5 mL of *Inoculum* to each tube so prepared, except two of the four containing no *Standard solution* (the uninoculated blanks). Incubate the tubes at a temperature between 30° and 40°, held constant to within $\pm 0.5^\circ$, for 16–24 h.

Terminate growth by heating to a temperature NLT 80° for 5 min. Cool to room temperature. After agitating its contents, place the container in a spectrophotometer that has been set at a wavelength of 530 nm, and read the transmittance when a steady state is reached. This steady state is observed a few seconds after agitation when the reading remains constant for 30 s or more. Allow approximately the same time interval for the reading on each tube.

With the transmittance set at 100% for the uninoculated blank, read the transmittance of the inoculated blank. If the difference is greater than 5%, or if there is evidence of contamination with a foreign microorganism, disregard the results of the assay.

With the transmittance set at 100% for the uninoculated blank, read the transmittance of each of the remaining tubes. Disregard the results of the assay if the slope of the standard curve indicates a problem with sensitivity.

Calculation: Prepare a standard concentration-response curve by the following procedure. Test for and replace any aberrant individual transmittances. For each level of the Standard, calculate the response from the sum of the duplicate values of the transmittances

³ Pure cultures of *Lactobacillus leichmannii* may be obtained as No. 7830 from ATCC, 10801 University Blvd., Manassas, VA 20110-2209.

(Σ) as the difference, $y = 2.00 - \Sigma$. Plot this response on the ordinate of cross-section paper against the logarithm of the mL of *Standard solution* per tube on the abscissa, using for the ordinate either an arithmetic or a logarithmic scale, whichever gives the better approximation to a straight line. Draw the straight line or smooth curve that best fits the plotted points. Calculate the response, y , adding together the two transmittances for each level of the *Sample solution*. Read from the standard curve the logarithm of the volume of the *Standard solution* corresponding to each of those values of y that falls within the range of the lowest and highest points plotted for the Standard. Subtract from each logarithm so obtained the logarithm of the volume, in mL, of the *Sample solution* to obtain the difference, X , for each dosage level. Average the values of X for each of three or more dosage levels to obtain \bar{X} , which equals the log-relative potency, M' , of the *Sample solution*. Determine the quantity, in μg , of USP Cyanocobalamin RS corresponding to the cyanocobalamin in each mg of the portion of Tablets taken:

$$\text{antilog } M = \text{antilog } (M' + \log R)$$

R = number of μg of cyanocobalamin that was assumed to be present in each mg in the portion of Tablets taken

Replication: Repeat the entire determination at least once, using separately prepared *Sample solutions*. If the difference between the two log-potencies M is NMT 0.08, their mean, \bar{M} , is the assayed log-potency of the test material (see *Design and Analysis of Biological Assays* (111), *Confidence Intervals for Individual Assays*). If the two determinations differ by more than 0.08, conduct one or more additional determinations. From the mean of two or more values of M that do not differ by more than 0.15, compute the mean potency of the preparation under assay.

Acceptance criteria: 90.0%–150.0% of the labeled amount of cyanocobalamin ($\text{C}_{63}\text{H}_{88}\text{CoN}_{14}\text{O}_{14}\text{P}$)

• **Folic Acid, Method 1**

[NOTE—Use low-actinic glassware throughout this procedure.]

Reagent A: 25% solution of tetrabutylammonium hydroxide in methanol

Reagent B: Transfer 5.0 g of pentetic acid to a 50-mL volumetric flask. Using sonication if necessary, dissolve in and dilute with 1 N sodium hydroxide to volume.

Mobile phase: 2 g of monobasic potassium phosphate in 650 mL of water. Add 12.0 mL of *Reagent A*, 7.0 mL of 3 N phosphoric acid, and 240 mL of methanol. Cool to room temperature, adjust with phosphoric acid or ammonia TS to a pH of 7.0, dilute with water to 1000 mL, and filter. Recheck the pH before use.

[NOTE—The methanol and water content may be varied (between 1% and 3%) by adding water or methanol to the prepared *Mobile phase* to obtain baseline separation of folic acid and the internal standard. The pH may be increased up to 7.15 to obtain better separation.]

Internal standard solution: Transfer 40 mg of methylparaben to a 1000-mL volumetric flask, and add 220 mL of methanol to dissolve. Dissolve 2.0 g of monobasic potassium phosphate in 300 mL of water in a separate beaker, quantitatively transfer this solution to the flask containing the methylparaben solution, and add an additional 300 mL of water. Add 19 mL of *Reagent A*, 7 mL of 3 N phosphoric acid, and 30 mL of *Reagent B*. Adjust with ammonia TS to a pH of 9.8,

bubble nitrogen through the solution for 30 min, dilute with water to volume, and mix.

Standard solution: 0.016 mg/mL of USP Folic Acid RS in *Internal standard solution*

Sample solution: Finely powder NLT 30 Tablets.

Transfer a portion of the powder, equivalent to a nominal amount of 0.4 mg of folic acid, to a 50-mL amber-colored centrifuge tube. Add 25.0 mL of *Internal standard solution*, shake by mechanical means for 10 min, and centrifuge. Filter a portion of the clear supernatant, and use the filtrate.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 3.9-mm \times 30-cm; packing L1

Flow rate: 1 mL/min

Injection size: 15 μL

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for folic acid and methylparaben are about 0.8 and 1.0, respectively.]

Suitability requirements

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas for folic acid and methylparaben. Calculate the percentage of the labeled amount of folic acid ($\text{C}_{19}\text{H}_{19}\text{N}_7\text{O}_6$) in the portion of Tablets taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = peak area ratio of folic acid to methylparaben from the *Sample solution*

R_S = peak area ratio of folic acid to methylparaben from the *Standard solution*

C_S = concentration of USP Folic Acid RS in the *Standard solution* ($\mu\text{g/mL}$)

C_U = nominal concentration of folic acid in the *Sample solution* ($\mu\text{g/mL}$)

Acceptance criteria: 90.0%–150.0% of the labeled amount of folic acid ($\text{C}_{19}\text{H}_{19}\text{N}_7\text{O}_6$)

• **Folic Acid, Method 2**

[NOTE—Use low-actinic glassware throughout this procedure.]

Reagent: Dissolve 7.5 g of edetate disodium, with stirring, in 500 mL of water containing 10 mL of ammonium hydroxide.

Diluent: 60 $\mu\text{g/mL}$ of ammonium hydroxide

Mobile phase: Transfer 0.4 mL of triethylamine, 15 mL of glacial acetic acid, and 350 mL of methanol to a 2000-mL volumetric flask, and dilute with 0.008 M sodium 1-hexanesulfonate to volume.

Standard stock solution: 60 $\mu\text{g/mL}$ of USP Folic Acid RS in *Diluent*. Prepare this solution fresh daily.

Standard solution: Mix 5.0 mL of *Standard stock solution* with 10.0 mL of methanol and 35.0 mL of *Reagent*, shake for 15 min in a water bath maintained at 60°, and cool. Filter, discarding the first few mL of the filtrate.

Sample solution: Transfer a portion of finely powdered Tablets, equivalent to a nominal amount of 0.3 mg of folic acid, to a 125-mL stoppered flask. Add 10.0 mL of methanol and 35.0 mL of *Reagent*. Shake for 15 min in a water bath maintained at 60°, and cool. Filter, discarding the first few mL of the filtrate.

Suitability requirements

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the areas of the major peaks. Calculate the percentage of the labeled amount of folic acid ($C_{19}H_{19}N_7O_6$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area from the *Sample solution*

r_S = peak area from the *Standard solution*

C_S = concentration of USP Folic Acid RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of folic acid in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–150.0% of the labeled amount of folic acid ($C_{19}H_{19}N_7O_6$)

• **CALCIUM PANTOTHENATE, Method 1**

Mobile phase: Phosphoric acid and water (1:1000)

Internal standard solution: 80 mg of *p*-hydroxybenzoic acid in 3 mL of alcohol. Add 50 mL of water and 7.1 g of dibasic sodium phosphate, and dilute with water to 1000 mL. Adjust with phosphoric acid to a pH of 6.7.

Standard solution: 0.6 mg/mL of USP Calcium Pantothenate RS in *Internal standard solution*

Sample solution: Finely powder NLT 30 Tablets.

Transfer a portion of the powder, equivalent to a nominal amount of 15 mg of calcium pantothenate, to a centrifuge tube. Add 25.0 mL of the *Internal standard solution*, and shake vigorously for 10 min. Centrifuge, filter, and use the clear filtrate.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 210 nm

Column: 3.9-mm × 15-cm; packing L1

Flow rate: 1.5 mL/min

Injection size: 10 µL

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for calcium pantothenate and *p*-hydroxybenzoic acid are about 0.5 and 1.0, respectively.]

Suitability requirements

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak responses for calcium pantothenate and the internal standard. Calculate the percentage of the labeled amount of calcium pantothenate ($C_{18}H_{32}CaN_2O_{10}$) in the portion of Tablets taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = peak response ratio of calcium pantothenate to *p*-hydroxybenzoic acid from the *Sample solution*

R_S = peak response ratio of calcium pantothenate to *p*-hydroxybenzoic acid from the *Standard solution*

C_S = concentration of USP Calcium Pantothenate RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of calcium pantothenate in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–150.0% of the labeled amount of calcium pantothenate ($C_{18}H_{32}CaN_2O_{10}$)

• **CALCIUM PANTOTHENATE, Method 2**

Standard stock solution: Dissolve 50 mg of USP Calcium Pantothenate RS, previously dried and stored in the dark over phosphorus pentoxide while protected from absorption of moisture during the weighing, in 500 mL of water in a 1000-mL volumetric flask. Add 10 mL of 0.2 N acetic acid and 100 mL of sodium acetate solution (1 in 60), and dilute with water to volume, to obtain a concentration of 50 µg/mL of USP Calcium Pantothenate RS. Store under toluene in a refrigerator.

Standard solution: On the day of the assay, dilute a volume of *Standard stock solution* with water to obtain a concentration of 0.01–0.04 µg/mL of calcium pantothenate, the exact concentration being such that the responses obtained as directed for *Analysis*, 2.0–4.0 mL of the *Standard solution* being used, are within the linear portion of the log-concentration response curve.

Sample solution: Finely powder NLT 30 Tablets.

Transfer a portion of the powder, equivalent to a nominal amount of 50 mg of calcium pantothenate, to a 1000-mL volumetric flask containing 500 mL of water. Add 10 mL of 0.2 N acetic acid and 100 mL of sodium acetate solution (16.66 mg/mL), dilute with water to volume, and filter. Dilute a volume of this solution to obtain a solution having approximately the same concentration as that of the *Standard solution*.

Acid-hydrolyzed casein solution: Mix 100 g of vitamin-free casein with 500 mL of 6 N hydrochloric acid, and reflux the mixture for 8–12 h. Remove the hydrochloric acid from the mixture by distillation under reduced pressure until a thick paste remains. Redissolve the resulting paste in water, adjust the solution with 1 N sodium hydroxide to a pH of 3.5 ± 0.1, and add water to make 1000 mL. Add 20 g of activated charcoal, stir for 1 h, and filter. Repeat the treatment with activated charcoal. Store under toluene in a cool place at a temperature not below 10°. Filter the solution if a precipitate forms during storage.

Cystine–tryptophan solution: Suspend 4.0 g of L-cystine and 1.0 g of L-tryptophan (or 2.0 g of D,L-tryptophan) in 700–800 mL of water, heat to 70°–80°, and add dilute hydrochloric acid (1 in 2) dropwise, with stirring, until the solids are dissolved. Cool, and add water to make 1000 mL. Store under toluene in a cool place at a temperature not below 10°.

Adenine–guanine–uracil solution: Dissolve 200 mg each of adenine sulfate, guanine hydrochloride, and uracil, with the aid of heat, in 10 mL of 4 N hydrochloric acid. Cool, and add water to make 200 mL. Store under toluene in a refrigerator.

Polysorbate 80 solution: 100 mg/mL of polysorbate 80 in alcohol

Riboflavin–thiamine hydrochloride–biotin solution:

20 µg/mL of riboflavin, 10 µg/mL of thiamine hydrochloride, and 0.04 µg/mL of biotin in 0.02 N acetic acid. Store under toluene, protected from light, in a refrigerator.

p-Aminobenzoic acid–niacin–pyridoxine hydrochloride solution: 10 µg/mL of *p*-aminobenzoic acid, 50 µg/mL of niacin, and 40 µg/mL of pyridoxine hydrochloride in a mixture of neutralized alcohol and water (1:3). Store in a refrigerator.

Salt solution A: Dissolve 25 g of monobasic potassium phosphate and 25 g of dibasic potassium phosphate in water to make 500 mL. Add 5 drops of hydrochloric acid. Store under toluene.

Salt solution B: Dissolve 10 g of magnesium sulfate, 0.5 g of sodium chloride, 0.5 g of ferrous sulfate, and 0.5 g of manganese sulfate in water to make 500 mL. Add 5 drops of hydrochloric acid. Store under toluene.

Basal medium stock solution

Acid-hydrolyzed casein solution	25 mL
Cystine-tryptophan solution	25 mL
Polysorbate 80 solution	0.25 mL
Dextrose, anhydrous	10 g
Sodium acetate, anhydrous	5 g
Adenine-guanine-uracil solution	5 mL
Riboflavin-thiamine hydrochloride-biotin solution	5 mL
p-Aminobenzoic acid-niacin-pyridoxine hydrochloride solution	5 mL
Salt solution A	5 mL
Salt solution B	5 mL

Dissolve the anhydrous dextrose and anhydrous sodium acetate in the solutions previously mixed, and adjust with 1 N sodium hydroxide to a pH of 6.8. Dilute with water to 250 mL.

Stock culture of *Lactobacillus plantarum*: Dissolve 2.0 g of yeast extract in 100 mL of water; add 500 mg of anhydrous dextrose, 500 mg of anhydrous sodium acetate, and 1.5 g of agar; and heat the mixture on a steam bath, with stirring, until the agar dissolves. Add 10-mL portions of the hot solution to the test tubes, close or cover the tubes, sterilize in an autoclave at 121°, and allow the tubes to cool in an upright position. Prepare stab cultures in three or more of the tubes, using a pure culture of *Lactobacillus plantarum*⁴ incubating for 16–24 h at a temperature between 30° and 37° held constant to within ±0.5°. Store in a refrigerator. Prepare a fresh stab of the stock culture every week, and do not use for *Inoculum* if the culture is more than 1 week old.

Culture medium: To each of a series of test tubes containing 5.0 mL of *Basal medium stock solution*, add 5.0 mL of water containing 0.2 µg of calcium pantothenate. Plug the tubes with cotton, sterilize in an autoclave at 121°, and cool.

Inoculum: [NOTE—A frozen suspension of *Lactobacillus plantarum* may be used as the stock culture, provided it yields an *Inoculum* comparable to a fresh culture.]

Make a transfer of cells from the *Stock culture* of *Lactobacillus plantarum* to a sterile tube containing 10 mL of *Culture medium*. Incubate this culture for 16–24 h at a temperature between 30° and 37° held constant to within ±0.5°. The cell suspension so obtained is the *Inoculum*.

Analysis

Samples: *Standard solutions* and *Sample solution*
To similar separate test tubes add, in duplicate, 1.0 and/or 1.5, 2.0, 3.0, 4.0, and 5.0 mL of the *Standard solution*. To each tube and to four similar empty tubes add 5.0 mL of *Basal medium stock solution* and sufficient water to make 10 mL.

To similar separate test tubes add, in duplicate, volumes of the *Sample solution* corresponding to three or more of the levels specified for the *Standard solution*, including the levels of 2.0, 3.0, and 4.0 mL. To each tube add 5.0 mL of the *Basal medium stock solution* and sufficient water to make 10 mL. Place one complete set of *Standard* and *sample* tubes together in one tube rack and the duplicate set in a second rack or section of a rack, preferably in random order. Cover the tubes of both series to prevent contamination, and sterilize in an autoclave at 121° for 5 min. Cool, and add 1 drop of *Inoculum* to each tube, except two of the four tubes containing no *Standard solution* (the uninoculated blanks). Incubate the tubes at a temperature between 30° and 37°, held constant to within ±0.5° until, following 16–24 h of incubation, there has been no substantial increase in turbidity in

the tubes containing the highest level of *Standard* during a 2-h period.

Determine the transmittance of the tubes in the following manner. Mix the contents of each tube, and transfer to an optical container if necessary. Place the container in a spectrophotometer that has been set at a specific wavelength between 540 and 660 nm, and read the transmittance when a steady state is reached. This steady state is observed a few seconds after agitation when the galvanometer reading remains constant for 30 s or more. Allow approximately the same time interval for the reading on each tube.

With the transmittance set at 1.00 for the uninoculated blank, read the transmittance of the inoculated blank. With the transmittance set at 1.00 for the inoculated blank, read the transmittance for each of the remaining tubes. If there is evidence of contamination with a foreign microorganism, disregard the result of the assay.

Calculation: Prepare a standard concentration-response curve as follows. For each level of the *Standard*, calculate the response from the sum of the duplicate values of the transmittance (Σ) as the difference, $y = 2.00 - \Sigma$. Plot this response on the ordinate of cross-section paper against the logarithm of the mL of *Standard solution* per tube on the abscissa, using for the ordinate either an arithmetic or a logarithmic scale, whichever gives the better approximation to a straight line. Draw the straight line or smooth curve that best fits the plotted points.

Calculate the response, y , adding together the two transmittances for each level of the *Sample solution*. Read from the standard curve the logarithm of the volume of the *Standard solution* corresponding to each of those values of y that fall within the range of the lowest and highest points plotted for the *Standard*. Subtract from each logarithm so obtained the logarithm of the volume, in mL, of the *Sample solution* to obtain the difference, X , for each dosage level. Average the values of X for each of three or more dosage levels to obtain \bar{X} , which equals the log-relative potency, M' , of the *Sample solution*. Determine the quantity, in mg, of USP Calcium Pantothenate RS corresponding to the calcium pantothenate in each mg of the portion of Tablets taken:

$$\text{antilog } M = \text{antilog } (M' + \log R)$$

R = number of mg of calcium pantothenate that was assumed to be present in each mg in the portion of Tablets taken

Replication: Repeat the entire determination at least once, using separately prepared *Sample solutions*. If the difference between the two log-potencies M is NMT 0.08, their mean, \bar{M} , is the assayed log-potency of the test material (see *Design and Analysis of Biological Assays* (111), *The Confidence Interval and Limits of Potency*). If the two determinations differ by more than 0.08, conduct one or more additional determinations. From the mean of two or more values of M that do not differ by more than 0.15, compute the mean potency of the preparation under assay.

Acceptance criteria: 90.0%–150.0% of the labeled amount of calcium pantothenate ($C_{18}H_{32}CaN_2O_{10}$)

- CALCIUM PANTOTHENATE, Method 3**

Buffer solution: 5.0 mg/mL of monobasic potassium phosphate in water. Adjust with phosphoric acid to a pH of 3.5.

Mobile phase: Methanol and *Buffer solution* (1:9)

Standard stock solution: 0.25 mg/mL of USP Calcium Pantothenate RS in water. Prepare fresh every 4 weeks. Store in a refrigerator.

Standard solution: 40 µg/mL of USP Calcium Pantothenate RS from *Standard stock solution* diluted with water

⁴ ATCC No. 8014 is suitable. This strain was formerly known as *Lactobacillus arabinosus* 17-5.

Sample solution: Finely powder NLT 20 Tablets. Transfer a portion of the powder, equivalent to a nominal amount of 10 mg of calcium pantothenate, to a 250-mL volumetric flask. Add 10 mL of methanol, and swirl the flask to disperse. Dilute with water to volume, mix, and filter.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 205 nm

Column: 3.9-mm × 30-cm; 5-μm packing L1

Column temperature: 50°

Flow rate: 2 mL/min

Injection size: 25 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas for calcium pantothenate.

Calculate the percentage of the labeled amount of calcium pantothenate ($C_{18}H_{32}CaN_2O_{10}$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area from the *Sample solution*

r_S = peak area from the *Standard solution*

C_S = concentration of USP Calcium Pantothenate RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of calcium pantothenate in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–150.0% of the labeled amount of calcium pantothenate ($C_{18}H_{32}CaN_2O_{10}$)

• NIACIN or NIACINAMIDE, PYRIDOXINE HYDROCHLORIDE, RIBOFLAVIN, and THIAMINE, Method 1

[NOTE—Use low-actinic glassware throughout this procedure.]

Diluent: Acetonitrile, glacial acetic acid, and water (5:1:94)

Mobile phase: A mixture of methanol, glacial acetic acid, and water (27:1:73) containing 140 mg of sodium 1-hexanesulfonate per 100 mL

Standard solution: [NOTE—Use USP Niacin RS in place of USP Niacinamide RS for formulations containing niacin.] Transfer 80 mg of USP Niacinamide RS, 20 mg of USP Pyridoxine Hydrochloride RS, 20 mg of USP Riboflavin RS, and 20 mg of USP Thiamine Hydrochloride RS to a 200-mL volumetric flask, and add 180 mL of *Diluent*. Immerse the flask in a hot water bath maintained at 65°–70° for 10 min with regular shaking, or using a vortex mixer, until all the solid materials are dissolved. Chill rapidly in a cold water bath for 10 min to room temperature, and dilute with *Diluent* to volume.

Sample solution: Finely powder NLT 30 Tablets.

Transfer a portion of the powder equivalent a nominal amount of 10 mg of niacinamide and 2.5 mg each of pyridoxine hydrochloride, riboflavin, and thiamine hydrochloride, to a 50-mL centrifuge tube. Add 25.0 mL of *Diluent*, and mix using a vortex mixer for 30 s to completely suspend the powder. Immerse the centrifuge tube in a hot water bath maintained at 65°–70°, heat for 5 min, and mix on a vortex mixer for 30 s. Return the tube to the hot water bath, heat for another 5 min, and mix on a vortex mixer for 30 s. Filter a portion of the solution, cool to room temperature, and use the clear filtrate. [NOTE—Use the filtrate within 3 h of filtration.]

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 3.9-mm × 30-cm; packing L1

Flow rate: 1 mL/min

Injection size: 10 μL

System suitability

Sample: *Standard solution*. [NOTE—Record the peak areas.]

[NOTE—The relative retention times for niacinamide, pyridoxine, riboflavin, and thiamine are about 0.3, 0.5, 0.8, and 1.0, respectively.]

Suitability requirements

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas for niacin or niacinamide, pyridoxine, riboflavin, and thiamine. Calculate the percentage of the labeled amount of niacinamide ($C_6H_6N_2O$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of niacinamide from the *Sample solution*

r_S = peak area of niacinamide from the *Standard solution*

C_S = concentration of USP Niacinamide RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of niacinamide in the *Sample solution* (mg/mL)

For formulations containing niacin:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of niacin from the *Sample solution*

r_S = peak area of niacin from the *Standard solution*

C_S = concentration of USP Niacin RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of niacin in the *Sample solution* (mg/mL)

Separately calculate the percentage of the labeled amount of pyridoxine hydrochloride ($C_8H_{11}NO_3 \cdot HCl$), of riboflavin ($C_{17}H_{20}N_4O_6$), and of thiamine hydrochloride ($C_{12}H_{17}ClN_4OS \cdot HCl$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of the corresponding vitamin from the *Sample solution*

r_S = peak area of the corresponding vitamin from the *Standard solution*

C_S = concentration of the relevant USP Reference Standard in the *Standard solution* (mg/mL)

C_U = nominal concentration of the corresponding vitamin in the *Sample solution* (mg/mL)

For products containing thiamine mononitrate, calculate the percentage of the labeled amount of thiamine mononitrate ($C_{12}H_{17}N_5O_4S$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak area of thiamine from the *Sample solution*

r_S = peak area of thiamine from the *Standard solution*

C_S = concentration of USP Thiamine Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of thiamine mononitrate in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of thiamine mononitrate, 327.36

M_{r2} = molecular weight of thiamine hydrochloride, 337.27

Acceptance criteria: 90.0%–150.0% of the labeled amount of niacinamide ($C_6H_6N_2O$), niacin ($C_6H_5NO_2$), pyridoxine hydrochloride ($C_8H_{11}NO_3 \cdot HCl$), riboflavin ($C_{17}H_{20}N_4O_6$), and thiamine as thiamine hydrochloride ($C_{12}H_{17}ClN_4OS \cdot HCl$) or thiamine mononitrate ($C_{12}H_{17}N_5O_4S$)

• **NIACIN, Method 2**

[NOTE—Use low-actinic glassware throughout this procedure.]

Solution A: Transfer 1 mL of glacial acetic acid and 2.5 g of edetate disodium to a 100-mL volumetric flask. Dissolve in and dilute with water to volume.

Extraction solvent: *Solution A* and methanol (3:1)

Mobile phase: 0.1 M sodium acetate solution (13.6 mg/mL of sodium acetate in water). Adjust with acetic acid to a pH of 5.4. [NOTE—A small amount of methanol (up to 1%) may be added to the *Mobile phase* to improve resolution.]

Standard stock solution: 1 mg/mL of USP Niacin RS in *Extraction solvent*

Standard solution: Transfer 5.0 mL of *Standard stock solution* to a 25-mL volumetric flask, and dilute with *Extraction solvent* to volume.

Sample solution: [NOTE—This preparation is suitable for the determination of niacin or niacinamide, pyridoxine, and riboflavin, when present in the formulation.] Finely powder NLT 20 Tablets. Transfer a portion of the powder, equivalent to a nominal amount of 2 mg of riboflavin, to a 200-mL volumetric flask. If riboflavin is not present in the formulation, transfer a portion of the powder, equivalent to a nominal amount of 2 mg of pyridoxine. If pyridoxine is not present in the formulation, transfer a portion of the powder, equivalent to a nominal amount of 20 mg of niacin or niacinamide. Add 100.0 mL of *Extraction solvent*, and mix for 20 min, using a wrist-action shaker. Immerse the flask in a water bath maintained at 70°–75°, and heat for 20 min. Mix on a vortex mixer for 30 s, cool to room temperature, and filter. Use the clear filtrate.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the areas for the major peaks. For products containing thiamine hydrochloride, calculate the percentage of the labeled amount of thiamine hydrochloride ($C_{12}H_{17}ClN_4OS \cdot HCl$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of thiamine from the *Sample solution*

r_S = peak area of thiamine from the *Standard solution*

C_S = concentration of USP Thiamine Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of thiamine hydrochloride in the *Sample solution* (mg/mL)

For products containing thiamine mononitrate, calculate the percentage of the labeled amount of thiamine mononitrate ($C_{12}H_{17}N_5O_4S$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak area of thiamine from the *Sample solution*

r_S = peak area of thiamine from the *Standard solution*

C_S = concentration of USP Thiamine Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of thiamine mononitrate in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of thiamine mononitrate, 327.36

M_{r2} = molecular weight of thiamine hydrochloride, 337.27

Acceptance criteria: 90.0%–150.0% of the labeled amount of thiamine as thiamine hydrochloride ($C_{12}H_{17}ClN_4OS \cdot HCl$) or thiamine mononitrate ($C_{12}H_{17}N_5O_4S$)

• **NIACIN or NIACINAMIDE, PYRIDOXINE HYDROCHLORIDE, RIBOFLAVIN, and THIAMINE, Method 3**

[NOTE—Use low-actinic glassware throughout this procedure.]

Reagent: 25 mg/mL of edetate disodium in water

Mobile phase: Transfer 0.4 mL of triethylamine, 15.0 mL of glacial acetic acid, and 350 mL of methanol to a 2000-mL volumetric flask. Dilute with 0.008 M sodium 1-hexanesulfonate to volume.

Standard stock solution: 1.5 mg/mL of USP Niacin RS or USP Niacinamide RS, 0.24 mg/mL of USP Pyridoxine Hydrochloride RS, 0.08 mg/mL of USP Riboflavin RS, and 0.24 mg/mL of USP Thiamine Hydrochloride RS in *Reagent*, with heating if necessary

Standard solution: Transfer 5.0 mL of *Standard stock solution* to a stoppered 125-mL flask. Add 10.0 mL of a mixture of methanol and glacial acetic acid (9:1) and 30.0 mL of a mixture of methanol and ethylene glycol (1:1). Insert the stopper, shake for 15 min in a water bath maintained at 60°, and cool. Filter, discarding the first few mL of the filtrate.

Sample solution: Weigh and finely powder NLT 20 Tablets. Transfer a portion of the powder, equivalent to a nominal amount of 7.5 mg of niacin or niacinamide, 1.2 mg of pyridoxine hydrochloride, 0.4 mg of riboflavin, and 1.2 mg of thiamine hydrochloride, to a stoppered 125-mL flask. Add 10.0 mL of a mixture of methanol and glacial acetic acid (9:1) and 30.0 mL of a mixture of methanol and ethylene glycol (1:1). Insert the stopper, shake for 15 min in a water bath maintained at 60°, and cool. Filter, discarding the first few mL of the filtrate.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 270 nm

Column: 4.6-mm × 25-cm; packing L7

Column temperature: 50°

Flow rate: 2 mL/min

Injection size: 5 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the areas of the peaks. Calculate the percentage of the labeled amount of niacin ($C_6H_5NO_2$) or niacinamide ($C_6H_6N_2O$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of niacin or niacinamide from the *Sample solution*

r_S = peak area of niacin or niacinamide from the *Standard solution*

C_S = concentration of USP Niacin RS or USP Niacinamide RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of niacin or niacinamide in the *Sample solution* (mg/mL)

Separately calculate the percentage of the labeled amount of pyridoxine hydrochloride ($C_8H_{11}NO_3 \cdot HCl$), riboflavin ($C_{17}H_{20}N_4O_6$), and thiamine hydrochloride ($C_{12}H_{17}ClN_4OS \cdot HCl$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of the corresponding vitamin from the *Sample solution*

r_S = peak area of the corresponding vitamin from the *Standard solution*

C_S = concentration of the relevant USP Reference Standard in the *Standard solution* (mg/mL)

C_U = nominal concentration of the corresponding vitamin in the *Sample solution* (mg/mL)

For products containing thiamine mononitrate, calculate the percentage of the labeled amount of thiamine mononitrate ($C_{12}H_{17}N_5O_4S$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak area of thiamine from the *Sample solution*

r_S = peak area of thiamine from the *Standard solution*

C_S = concentration of USP Thiamine Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of thiamine mononitrate in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of thiamine mononitrate, 327.36

M_{r2} = molecular weight of thiamine hydrochloride, 337.27

Acceptance criteria: 90.0%–150.0% of the labeled amount of niacin ($C_6H_5NO_2$) or niacinamide ($C_6H_6N_2O$), pyridoxine hydrochloride ($C_8H_{11}NO_3 \cdot HCl$), riboflavin ($C_{17}H_{20}N_4O_6$), and thiamine as thiamine hydrochloride ($C_{12}H_{17}ClN_4OS \cdot HCl$) or thiamine mononitrate ($C_{12}H_{17}N_5O_4S$)

[NOTE—Commercially available atomic absorption standard solutions for the minerals, where applicable, may be used where preparation of a *Standard stock solution* is described in the following assays. Use deionized water where water is specified. Where atomic absorption spectrophotometry is specified in the assay, the *Standard solutions* and the *Sample*

solution may be diluted quantitatively with the solvent specified, if necessary, to yield solutions of suitable concentrations adaptable to the linear or working range of the instrument.]

• **CALCIUM, Method 1**

Lanthanum chloride solution: 267 mg/mL of lanthanum chloride heptahydrate in 0.125 N hydrochloric acid

Calcium standard solution: 400 µg/mL of calcium. Dissolve 1.001 g of calcium carbonate, previously dried at 300° for 3 h and cooled in a desiccator for 2 h, in 25 mL of 1 N hydrochloric acid. Boil to expel carbon dioxide, and dilute with water to 1000 mL.

Standard stock solution: 100 µg/mL of calcium from *Calcium standard solution* diluted with 0.125 N hydrochloric acid

Standard solutions: Into separate 100-mL volumetric flasks pipet 1.0, 1.5, 2.0, 2.5, and 3.0 mL of the *Standard stock solution*. To each flask add 1.0 mL of *Lanthanum chloride solution*, and dilute with water to volume to obtain concentrations of 1.0, 1.5, 2.0, 2.5, and 3.0 µg/mL of calcium.

Sample solution: Finely powder NLT 20 Tablets. Transfer a portion of the powder, equivalent to 5 Tablets, to a porcelain crucible. Heat the crucible in a muffle furnace maintained at 550° for 6–12 h, and cool. Add 60 mL of hydrochloric acid, and boil gently on a hot plate or steam bath for 30 min, intermittently rinsing the inner surface of the crucible with 6 N hydrochloric acid. Cool, and quantitatively transfer the contents of the crucible to a 100-mL volumetric flask. Rinse the crucible with small portions of 6 N hydrochloric acid, and add the rinsings to the flask. Dilute with water to volume, and filter, discarding the first 5 mL of the filtrate. Dilute this solution, quantitatively, with 0.125 N hydrochloric acid to obtain a nominal concentration of 2 µg/mL of calcium, adding 1 mL of *Lanthanum chloride solution* per 100 mL of the final volume.

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry

Lamp: Calcium hollow-cathode

Flame: Nitrous oxide–acetylene

Analytical wavelength: Calcium emission line at 422.7 nm

Blank: 0.125 N hydrochloric acid containing 1 mL of *Lanthanum chloride solution* per 100 mL

Analysis

Samples: *Standard solutions* and *Sample solution*

Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in µg per mL, of calcium, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, C , in µg/mL of calcium in the *Sample solution*.

Calculate the percentage of the labeled amount of calcium (Ca) in the portion of Tablets taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of calcium in the *Sample solution* (µg/mL)

C_U = nominal concentration of calcium in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–125.0% of the labeled amount of calcium (Ca)

• **CHROMIUM, Method 1**

Chromium standard solution: 1000 µg/mL of chromium from potassium dichromate, previously dried at 120° for 4 h, in water. Store in a polyethylene bottle.

Standard stock solution: 10 µg/mL of chromium from *Chromium standard solution* diluted with 6 N hydrochloric acid and water (1 in 20)

Standard solutions: Transfer 10.0 and 20.0 mL of the *Standard stock solution* to separate 100-mL volumetric flasks, and transfer 15.0 and 20.0 mL of the *Standard stock solution* to separate 50-mL volumetric flasks. Dilute the contents of each of the four flasks with 0.125 N hydrochloric acid to volume to obtain concentrations of 1.0, 2.0, 3.0, and 4.0 µg/mL of chromium.

Sample solution: Proceed as directed for the *Sample solution* in the assay for *Calcium, Method 1*, except to prepare the *Sample solution* to contain 1 µg/mL of chromium and to omit the use of the *Lanthanum chloride solution*.

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry

Lamp: Chromium hollow-cathode

Flame: Air-acetylene

Analytical wavelength: Chromium emission line at 357.9 nm

Blank: 0.125 N hydrochloric acid

Analysis

Samples: *Standard solutions* and *Sample solution*

Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in µg/mL, of chromium, and draw the straight line best fitting the four plotted points. From the graph so obtained, determine the concentration, *C*, in µg/mL of chromium in the *Sample solution*.

Calculate the percentage of the labeled amount of chromium (*Cr*) in the portion of Tablets taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of chromium in the *Sample solution* (µg/mL)

C_U = nominal concentration of chromium in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–160.0% of the labeled amount of chromium (*Cr*)

• **COPPER, Method 1**

Copper standard solution: Dissolve 1.00 g of copper foil in a minimum volume of a 50% (v/v) solution of nitric acid, and dilute with a 1% (v/v) solution of nitric acid to 1000 mL. This solution contains 1000 µg/mL of copper.

Standard stock solution: 100 µg/mL of copper from *Copper standard solution* diluted with 0.125 N hydrochloric acid

Standard solutions: To separate 200-mL volumetric flasks transfer 1.0, 2.0, 4.0, 6.0, and 8.0 mL of the *Standard stock solution*. Dilute with water to volume to obtain concentrations of 0.5, 1.0, 2.0, 3.0, and 4.0 µg/mL of copper.

Sample solution: Proceed as directed for the *Sample solution* in the assay for *Calcium, Method 1*, except to prepare the *Sample solution* to contain 2 µg/mL of copper and to omit the use of the *Lanthanum chloride solution*.

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry

Lamp: Copper hollow-cathode

Flame: Air-acetylene

Analytical wavelength: Copper emission line at 324.7 nm

Blank: 0.125 N hydrochloric acid

Analysis

Samples: *Standard solutions* and *Sample solution*

Determine the absorbances of the solutions, using the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration in µg/mL of copper, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the

concentration, *C*, in µg/mL of copper in the *Sample solution*.

Calculate the percentage of the labeled amount of copper (*Cu*) in the portion of Tablets taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of copper in the *Sample solution* (µg/mL)

C_U = nominal concentration of copper in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–125.0% of the labeled amount of copper (*Cu*)

• **FLUORIDE, Method 1**

[NOTE—Store all solutions in plastic containers.]

3 M sodium acetate solution: Dissolve 408 g of sodium acetate in 600 mL of water in a 1000-mL volumetric flask. Allow the solution to equilibrate to room temperature, and dilute with water to volume. Adjust with a few drops of acetic acid to a pH of 7.0.

Sodium citrate solution: Dissolve 222 g of sodium citrate in 250 mL of water in a 1000-mL volumetric flask. Add 28 mL of perchloric acid, and dilute with water to volume.

Fluoride standard stock solution: 500 µg/mL of fluoride from a quantity of sodium fluoride, previously dried at 100° for 4 h and cooled in a desiccator, in water

Intermediate stock solution A: 100 µg/mL of fluoride from *Fluoride standard stock solution* diluted with water

Intermediate stock solution B: 10 µg/mL of fluoride from *Fluoride standard stock solution* diluted with water

Standard solutions: To five separate 100-mL volumetric flasks transfer 3.0, 5.0, and 10.0 mL of *Intermediate stock solution B* and 5.0 and 10.0 mL of *Intermediate stock solution A*. To each flask add 10.0 mL of 1 N hydrochloric acid, 25 mL of 3 M *sodium acetate solution*, and 25.0 mL of *Sodium citrate solution*. Dilute the contents of each flask with water to volume to obtain concentrations of 0.3, 0.5, 1.0, 5.0, and 10.0 µg/mL of fluoride.

Sample solution: Transfer a quantity of the finely powdered Tablets, equivalent to a nominal amount of 200 µg of fluoride, to a 100-mL volumetric flask. Add 10.0 mL of 1 N hydrochloric acid, 25.0 mL of 3 M *sodium acetate solution*, and 25.0 mL of *Sodium citrate solution*, and dilute with water to 100 mL.

Analysis

Samples: *Standard solutions* and *Sample solution*

To separate plastic beakers, each containing a plastic-coated stirring bar, transfer 50.0 mL each of the *Standard solutions* and the *Sample solution*. Measure the potentials (see *pH* (791)), in mV, of the *Standard solutions* and the *Sample solution* with a pH meter capable of a minimum reproducibility of ±0.2 mV and equipped with a fluoride-specific ion-indicating electrode and a calomel reference electrode. [NOTE—When taking measurements, immerse the electrodes in the solution, stir on a magnetic stirrer having an insulated top until equilibrium is attained (1–2 min), and record the potential. Rinse and dry the electrodes between measurements, taking care to avoid damaging the crystal of the specific-ion electrode.] Plot the logarithms of fluoride concentrations, in µg/mL, of the *Standard solutions* versus the potential in mV. From the standard response curve so obtained and the measured potential of the *Sample solution*, determine the concentration, *C*, in µg/mL of fluoride in the *Sample solution*.

Calculate the percentage of the labeled amount of fluorine (*F*) in the portion of Tablets taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of fluoride in the *Sample solution* (µg/mL)

C_U = nominal concentration of fluorine in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–160.0% of the labeled amount of fluorine (F)

• **FLUORIDE, Method 2**

[NOTE—Use plastic containers and deionized water throughout this procedure.]

pH 10.0 buffer: Add 214 mL of 0.1 N sodium hydroxide to 1000 mL of 0.05 M sodium bicarbonate.

Mobile phase: Alcohol, 0.1 N sulfuric acid, and water (20:5:175)

Standard stock solution: 220 µg/mL of USP Sodium Fluoride RS in water. This solution contains 100 µg/mL of fluoride.

Standard solution: [NOTE—Condition the solid-phase extraction column specified for use in the *Standard solution* and the *Sample solution* in the following manner. Using a vacuum at a pressure not exceeding 5 mm of mercury, wash the column with one column volume of methanol followed by one column volume of *pH 10.0 buffer*. Do not allow the column top to dry. If the top of the column becomes dry, recondition the column.] Transfer 10.0 mL of the *Standard stock solution* to a 100-mL volumetric flask. Add 75 mL of water, and adjust with 0.1 N sodium hydroxide to a pH of 10.4 ±0.1. Dilute with water to volume. Filter, discarding the first 15 mL of the filtrate. Transfer 25.0 mL of the filtrate to a 50-mL volumetric flask, add 15.0 mL of water, and adjust with 0.1 N sodium hydroxide to a pH of 10.0. Dilute with *pH 10.0 buffer* to volume. Elute a portion of this solution through a 3-mL solid-phase extraction column containing L1 packing that is connected through an adaptor to a second solid-phase extraction column containing sulfonylpropyl strong cation-exchange packing. Discard the first 3 mL of the eluate, and collect the rest of the eluate in a suitable flask for injection into the chromatograph.

Sample solution: Finely powder NLT 20 Tablets.

Transfer a portion of powdered Tablets, equivalent to a nominal amount of 1 mg of fluorine, to 15 mL of water, and shake vigorously. Rinse the sides of the flask with 15 mL of water, and allow to stand for 10 min. Dilute with water to 85 mL, adjust with 1 N sodium hydroxide to a pH of 10.4 ±0.1, and dilute with water to 100 mL. Proceed as directed for the *Standard solution*, beginning with "Filter, discarding the first 15 mL of the filtrate."

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: Conductivity

Guard column: 4.6-mm × 3-cm; packing L17

Analytical column: 7.8-mm × 30-cm; packing L17

Flow rate: 0.5 mL/min

Injection size: 100 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas for fluoride. Calculate the percentage of the labeled amount of fluorine (F) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area from the *Sample solution*

r_S = peak area from the *Standard solution*

C_S = concentration of fluoride in the *Standard solution* (µg/mL)

C_U = nominal concentration of fluorine in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–160.0% of the labeled amount of fluorine (F)

• **IODIDE, Method 1**

Bromine water: To 20 mL of bromine in a glass-stoppered bottle add 100 mL of water. Insert the stopper into the bottle, and shake. Allow to stand for 30 min, and use the supernatant.

Analysis

Sample: Tablets

Transfer a portion of finely powdered Tablets, equivalent to a nominal amount of 3 mg of iodide, to a nickel crucible. Add 5 g of sodium carbonate, 5 mL of 50% (w/v) sodium hydroxide solution, and 10 mL of alcohol, taking care that the entire specimen is moistened. Heat the crucible on a steam bath to evaporate the alcohol, then dry the crucible at 100° for 30 min to prevent spattering upon subsequent heating. Transfer the crucible with its contents to a furnace heated to 500°, and heat the crucible for 15 min. [NOTE—Heating at 500° is necessary to carbonize any organic matter present; a higher temperature may be used, if necessary, to ensure complete carbonization of all organic matter.] Cool the crucible, add 25 mL of water, cover the crucible with a watchglass, and boil gently for 10 min. Filter the solution, and wash the crucible with boiling water, collecting the filtrate and washings in a beaker. Add phosphoric acid until the solution is neutral to methyl orange, then add 1 mL excess of phosphoric acid. Add excess of *Bromine water*, and boil the solution gently until colorless and then for 5 min longer. Add a few crystals of salicylic acid, and cool the solution to 20°. Add 1 mL of phosphoric acid and 0.5 g of potassium iodide, and titrate the liberated iodine with 0.005 N sodium thiosulfate VS, adding starch TS when the liberated iodine color has nearly disappeared.

Calculate the percentage of the labeled amount of iodine (I) in the portion of Tablets taken:

$$\text{Result} = V \times N_A \times F \times \text{Ime} \times (Aw/W) \times (100/L)$$

V = volume of sodium thiosulfate consumed (mL)

N_A = actual normality of the sodium thiosulfate solution used (meq/mL)

F = correction factor to convert mg to µg, 1000 µg/mg

Ime = milliequivalent of I (21 mg/meq)

Aw = average weight of the Tablets

W = weight of the portion of Tablets taken

L = labeled amount of iodine (µg/Tablet)

Acceptance criteria: 90.0%–160.0% of the labeled amount of iodine (I)

• **IODIDE, Method 2:** Proceed as directed in *Automated Methods of Analysis* (16), *Assay for Iodide*.

Acceptance criteria: 90%–160% of the labeled amount of iodine (I)

• **IRON, Method 1**

Iron standard stock solution: Transfer 100 mg of iron powder to a 1000-mL volumetric flask. Dissolve in 25 mL of 6 N hydrochloric acid, dilute with water to volume, and mix.

Standard solutions: To separate 100-mL volumetric flasks transfer 2.0, 4.0, 5.0, 6.0, and 8.0 mL of *Iron standard stock solution*. Dilute the contents of each flask with water to volume to obtain concentrations of 2.0, 4.0, 5.0, 6.0, and 8.0 µg/mL of iron.

Sample solution: Proceed as directed for the *Sample solution* in the assay for *Calcium, Method 1*, except to prepare the *Sample solution* to contain a nominal concentration of 5 µg/mL of iron and to omit the use of the *Lanthanum chloride solution*.

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* <851>.)

Mode: Atomic absorption spectrophotometry
Lamp: Iron hollow-cathode
Flame: Air–acetylene
Analytical wavelength: Iron emission line at 248.3 nm
Blank: 0.125 N hydrochloric acid

Analysis

Samples: *Standard solutions* and *Sample solution*
 Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in $\mu\text{g/mL}$ of iron, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, C , in $\mu\text{g/mL}$ of iron in the *Sample solution*.

Calculate the percentage of the labeled amount of iron (Fe) in the portion of Tablets taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of iron in the *Sample solution* ($\mu\text{g/mL}$)

C_U = nominal concentration of iron in the *Sample solution* ($\mu\text{g/mL}$)

Acceptance criteria: 90.0%–125.0% of the labeled amount of iron (Fe)

• MAGNESIUM, Method 1

Lanthanum chloride solution: Prepare as directed in the assay for *Calcium, Method 1*.

Magnesium standard solution: Transfer 1.0 g of magnesium ribbon to a 1000-mL volumetric flask, dissolve in 50 mL of 6 N hydrochloric acid, dilute with water to volume, and mix to obtain a solution with a concentration of 1000 μg of magnesium/mL.

Standard stock solution: 20 $\mu\text{g/mL}$ of magnesium from *Magnesium standard solution* diluted with 0.125 N hydrochloric acid

Standard solutions: To separate 100-mL volumetric flasks transfer 1.0, 1.5, 2.0, 2.5, and 3.0 mL of *Standard stock solution*. To each flask add 1.0 mL of *Lanthanum chloride solution* and dilute with 0.125 N hydrochloric acid to volume to obtain concentrations of 0.2, 0.3, 0.4, 0.5, and 0.6 $\mu\text{g/mL}$ of magnesium.

Sample solution: Proceed as directed for the *Sample solution* in the assay for *Calcium, Method 1*, except to prepare the *Sample solution* to contain a nominal concentration of 0.4 $\mu\text{g/mL}$ of magnesium.

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry

Lamp: Magnesium hollow-cathode

Flame: Air–acetylene

Analytical wavelength: Magnesium emission line at 285.2 nm

Blank: 0.125 N hydrochloric acid containing 1 mL of *Lanthanum chloride solution* per 100 mL

Analysis

Samples: *Standard solutions* and *Sample solution*
 Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in $\mu\text{g/mL}$, of magnesium, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, C , in $\mu\text{g/mL}$ of magnesium in the *Sample solution*.

Calculate the percentage of the labeled amount of magnesium (Mg) in the portion of Tablets taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of magnesium in the *Sample solution* ($\mu\text{g/mL}$)

C_U = nominal concentration of magnesium in the *Sample solution* ($\mu\text{g/mL}$)

Acceptance criteria: 90.0%–125.0% of the labeled amount of magnesium (Mg)

• MANGANESE, Method 1

Manganese standard stock solution: Transfer a weighed amount of 1.00 g of manganese to a 1000-mL volumetric flask. Dissolve in 20 mL of nitric acid, dilute with 6 N hydrochloric acid to volume, and mix to obtain a solution with a concentration of 1000 $\mu\text{g/mL}$ of manganese.

Standard stock solution: 50 $\mu\text{g/mL}$ of manganese from *Manganese standard stock solution* diluted with 0.125 N hydrochloric acid

Standard solutions: To separate 100-mL volumetric flasks transfer 1.0, 1.5, 2.0, 3.0, and 4.0 mL of *Standard stock solution*. Dilute the contents of each flask with 0.125 N hydrochloric acid to volume to obtain solutions with concentrations of 0.5, 0.75, 1.0, 1.5, and 2.0 $\mu\text{g/mL}$ of manganese.

Sample solution: Proceed as directed for the *Sample solution* in the assay for *Calcium, Method 1*, except to prepare the *Sample solution* to contain a nominal concentration of 1 $\mu\text{g/mL}$ of manganese and to omit the use of the *Lanthanum chloride solution*.

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry

Lamp: Manganese hollow-cathode

Flame: Air–acetylene

Analytical wavelength: Manganese emission line at 279.5 nm

Blank: 0.125 N hydrochloric acid

Analysis

Samples: *Standard solutions* and *Sample solution*
 Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in $\mu\text{g/mL}$ of manganese, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, C , in $\mu\text{g/mL}$, of manganese (Mn) in the *Sample solution*.

Calculate the percentage of the labeled amount of manganese (Mn) in the portion of Tablets taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of manganese in the *Sample solution* ($\mu\text{g/mL}$)

C_U = nominal concentration of manganese in the *Sample solution* ($\mu\text{g/mL}$)

Acceptance criteria: 90.0%–125.0% of the labeled amount of manganese (Mn)

• MOLYBDENUM, Method 1

Diluent: 20 mg/mL of ammonium chloride in water
Molybdenum standard solution: Transfer 1.0 g of molybdenum wire to a 1000-mL volumetric flask, and dissolve in 50 mL of nitric acid, warming if necessary. Dilute with water to volume, and mix to obtain a solution with a concentration of 1000 $\mu\text{g/mL}$ of molybdenum.

Standard stock solution: 100 $\mu\text{g/mL}$ of molybdenum from *Molybdenum standard solution* diluted with water

Standard solutions: To separate 100-mL volumetric flasks transfer 2.0, 10.0, and 25.0 mL of the *Standard stock solution*, and add 5.0 mL of perchloric acid to each flask. Gently boil the solution in each flask for 15 min, cool to room temperature, and dilute each with *Diluent* to volume to obtain concentrations of 5.0, 10.0, and 25.0 $\mu\text{g/mL}$ of molybdenum.

Sample solution: Transfer a portion of the powder, equivalent to a nominal amount of 1000 μg of molybdenum, to a suitable flask, and add 12 mL of nitric acid. [NOTE—The volume of nitric acid may be varied to ensure that the powder is uniformly dispersed.] Carefully swirl the flask to disperse the test specimen. Sonicate for 10 min, or until the test specimen is completely dissolved. Gently boil the solution for 15 min, and cool to room temperature.

Carefully add 8 mL of perchloric acid, heat until perchloric acid fumes appear, and swirl the flask to dissipate the fumes. Repeat the heating and swirling until no fumes are present. Cool to room temperature. Quantitatively transfer the contents of the flask to a 100-mL volumetric flask with the aid of the *Diluent*, and dilute with *Diluent* to volume.

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry

Lamp: Molybdenum hollow-cathode

Flame: Nitrous oxide-acetylene

Analytical wavelength: Molybdenum emission line at 313.3 nm

Blank: *Diluent* and perchloric acid (20:1)

Analysis

Samples: *Standard solutions* and *Sample solution*

Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in µg/mL of molybdenum, and draw the straight line best fitting the three plotted points. From the graph so obtained, determine the concentration, *C*, in µg/mL of molybdenum in the *Sample solution*.

Calculate the percentage of the labeled amount of molybdenum (Mo) in the portion of Tablets taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of molybdenum in the *Sample solution* (µg/mL)

C_U = nominal concentration of molybdenum in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–160.0% of the labeled amount of molybdenum (Mo)

• MOLYBDENUM, Method 2

Sodium fluoride solution: Add 200 mL of water to 10 g of sodium fluoride, stir until the solution is saturated, and filter. Store in a polyethylene bottle.

Ferrous sulfate solution: 4.98 mg/mL of ferrous sulfate in water

Potassium thiocyanate solution: 200 mg/mL of potassium thiocyanate in water

20% Stannous chloride solution: Transfer 40 g of stannous chloride to a beaker, add 20 mL 6.5 N hydrochloric acid, and heat the solution until the stannous chloride is dissolved. Cool and dilute with water to 100 mL.

Diluted stannous chloride solution: 20% *Stannous chloride solution* diluted with water (1 in 25). Prepare this solution fresh at the time of use.

Standard solution: 20 µg/mL of molybdenum in water.

Sample: A portion of finely powdered Tablets, equivalent to a nominal amount of 40 µg of molybdenum

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: UV-Vis

Cell: 1 cm

Analytical wavelength: 465 nm

Blank: Amyl alcohol

Analysis

Samples: *Standard solution* and *Sample*

Transfer the *Sample* and 2.0 mL of the *Standard solution* to separate 200-mL beakers. Add 20 mL of nitric acid to the each beaker. Cover each beaker with a watchglass, and boil slowly on a hot plate for 45 min. Cool to room temperature. Add 6 mL of perchloric acid, cover the beakers with a watchglass, and continue the heating until digestion is complete, as indicated when the liquid becomes colorless or pale yellow. Evaporate the solutions in the beakers to dryness. Rinse the sides of the beakers and the watchglasses with water, and add more water to

complete 50 mL in each beaker. Gently boil the water solution for a few min. Cool to room temperature.

Add 2 drops of methyl orange TS, and neutralize with ammonium hydroxide. Add 8.2 mL of hydrochloric acid. Quantitatively transfer the contents of the beakers to separate 100-mL volumetric flasks, rinse the beakers with water, transfer the rinsings to the corresponding volumetric flasks, and dilute with water to volume. Transfer 50.0 mL of each solution to separatory funnels. To each separatory funnel add 1.0 mL of *Sodium fluoride solution*, 0.5 mL of *Ferrous sulfate solution*, 4.0 mL of *Potassium thiocyanate solution*, 1.5 mL of 20% *Stannous chloride solution*, and 15.0 mL of amyl alcohol, and shake the separatory funnels for 1 min. Allow the layers to separate, and discard the aqueous layers. Add 25 mL of *Diluted stannous chloride solution* to each separatory funnel, and shake gently for 15 s. Allow the layers to separate, and discard the aqueous layers. Transfer the organic layers from each separatory funnel to a centrifuge tube, and centrifuge at 2000 rpm for 10 min. Determine the absorbances of the organic phases obtained from the *Standard solution* and the *Sample*, and correct with the *Blank*.

Calculate the percentage of the labeled amount of molybdenum (Mo) in the portion of Tablets taken:

$$\text{Result} = (A_U/A_S) \times [(V \times C_S)/M_U] \times 100$$

A_U = absorbance of the solution from Tablets

A_S = absorbance of solution from the *Standard solution*

C_S = concentration of molybdenum in the *Standard solution* (µg/mL)

V = volume of the *Standard solution* analyzed, 2.0 mL

M_U = nominal amount of molybdenum in the *Sample* (µg)

Acceptance criteria: 90.0%–160.0% of the labeled amount of molybdenum (Mo)

• PHOSPHORUS, Method 1

Sulfuric acid solution: Cautiously add sulfuric acid to water (37.5:100), and mix.

Ammonium molybdate solution: 50 mg/mL of ammonium molybdate in *Sulfuric acid solution* and water (2:3). [NOTE—Dissolve in water first, and then dilute with *Sulfuric acid solution* to volume.]

Hydroquinone solution: 5 mg/mL of hydroquinone in water. Add one drop of sulfuric acid per 100 mL of solution.

Sodium bisulfite solution: 200 mg/mL of sodium bisulfite in water

Phosphorus standard stock solution: Weigh 4.395 g of monobasic potassium phosphate, previously dried at 105° for 2 h and stored in a desiccator, and transfer to a 1000-mL volumetric flask. Dissolve in water, add 6 mL of sulfuric acid as a preservative, dilute with water to volume, and mix to obtain a solution with a concentration of 1000 µg/mL of phosphorus.

Standard solution: 20 µg/mL of phosphorus from *Phosphorus standard stock solution* diluted with water

Sample solution: [NOTE—Finely powder and weigh a counted number of Tablets.] Transfer a portion of the powder, equivalent to a nominal amount of 100 mg of phosphorus, to 25 mL of nitric acid, and digest on a hot plate for 30 min. Add 15 mL of hydrochloric acid, and continue the digestion to the cessation of brown fumes. Cool, and transfer the contents of the flask to a 500-mL volumetric flask with the aid of small portions of water. Dilute with water to volume. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, and dilute with water to volume.

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: UV-Vis

Cell: 1 cm

Analytical wavelength: 650 nm

Analysis

Samples: *Standard solution* and *Sample solution*

To three separate 25-mL volumetric flasks transfer 5.0 mL each of the *Standard solution*, the *Sample solution*, and water to provide the blank. To each of the three flasks add 1.0 mL each of *Ammonium molybdate solution*, *Hydroquinone solution*, and *Sodium bisulfite solution*, and swirl to mix. Dilute the contents of each flask with water to volume, and allow the flasks to stand for 30 min. Determine the absorbances of the solutions against the blank.

Calculate the percentage of the labeled amount of phosphorus (P) in the portion of Tablets taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

A_U = absorbance of the *Sample solution*

A_S = absorbance of the *Standard solution*

C_S = concentration of phosphorus in the *Standard solution* ($\mu\text{g/mL}$)

C_U = nominal concentration of phosphorus in the *Sample solution* ($\mu\text{g/mL}$)

Acceptance criteria: 90%–125% of the labeled amount of phosphorus (P)

• POTASSIUM

Potassium standard solution: 100 $\mu\text{g/mL}$ of potassium from potassium chloride, previously dried at 105° for 2 h, in water

Standard stock solution: 10 $\mu\text{g/mL}$ of potassium from *Potassium standard solution* diluted with 0.125 N hydrochloric acid

Standard solutions: Transfer 5.0, 10.0, 15.0, 20.0, and 25.0 mL of the *Standard stock solution* to separate 100-mL volumetric flasks. Dilute the contents of each flask with 0.125 N hydrochloric acid to volume to obtain solutions containing 0.5, 1.0, 1.5, 2.0, and 2.5 $\mu\text{g/mL}$ of potassium.

Sample solution: Proceed as directed for the *Sample solution* in the assay for *Calcium, Method 1*, except to prepare the *Sample solution* to contain a nominal amount of 1 $\mu\text{g/mL}$ of potassium and to omit the use of the *Lanthanum chloride solution*.

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry

Lamp: Potassium hollow-cathode

Flame: Air–acetylene

Analytical wavelength: Potassium emission line at 766.5 nm

Blank: Water

Analysis

Samples: *Standard solutions* and *Sample solution*

Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in $\mu\text{g/mL}$, of potassium, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, C , in $\mu\text{g/mL}$ of potassium in the *Sample solution*.

Calculate the percentage of the labeled amount of potassium (K) in the portion of Tablets taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of potassium in the *Sample solution* ($\mu\text{g/mL}$)

C_U = nominal concentration of potassium in the *Sample solution* ($\mu\text{g/mL}$)

Acceptance criteria: 90.0%–125.0% of the labeled amount of potassium (K)

• SELENIUM, Method 1

Diluent: Prepare as directed in the assay for *Molybdenum, Method 1*.

Selenium standard solution: [**CAUTION**—Selenium is toxic; handle it with care.] Dissolve 1 g of metallic selenium in a minimum volume of nitric acid. Evaporate to dryness, add 2 mL of water, and evaporate to dryness. Repeat the addition of water and the evaporation to dryness three times. Dissolve the residue in 3 N hydrochloric acid, transfer to a 1000-mL volumetric flask, and dilute with 3 N hydrochloric acid to volume to obtain a concentration of 1000 $\mu\text{g/mL}$ of selenium.

Standard stock solution: 100 $\mu\text{g/mL}$ of selenium from *Selenium standard solution* diluted with water

Standard solutions: To separate 100-mL volumetric flasks transfer 5.0, 10.0, and 25.0 mL of the *Standard stock solution*, and add 5.0 mL of perchloric acid to each flask. Gently boil the solutions for 15 min, cool to room temperature, and dilute each with *Diluent* to volume to obtain solutions with concentrations of 5.0, 10.0, and 25.0 $\mu\text{g/mL}$ of selenium.

Sample solution: Transfer a portion of powder, equivalent to a nominal amount of 1000 μg of selenium, to a suitable flask and add 12 mL of nitric acid. [NOTE—The volume of nitric acid may be varied to ensure that the powder is uniformly dispersed.] Carefully swirl the flask to disperse the test specimen. Sonicate for 10 min or until the test specimen is completely dissolved. Gently boil the solution for 15 min, and cool to room temperature. Carefully add 8 mL of perchloric acid to the flask, heat the flask until perchloric acid fumes appear, and swirl the flask to dissipate the fumes. Repeat the heating and swirling until the fumes appear again. Cool to room temperature. Transfer the contents of the flask to a 50-mL volumetric flask with the aid of the *Diluent*, and dilute with *Diluent* to volume.

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry

Lamp: Selenium hollow-cathode

Flame: Air–acetylene

Analytical wavelength: Selenium emission line at 196.0 nm

Blank: *Diluent* and perchloric acid (20:1)

Analysis

Samples: *Standard solutions* and *Sample solution*

Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in $\mu\text{g/mL}$ of selenium, and draw the straight line best fitting the three plotted points. From the graph so obtained, determine the concentration, C , in $\mu\text{g/mL}$ of selenium in the *Sample solution*.

Calculate the percentage of the labeled amount of selenium (Se) in the portion of Tablets taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of selenium in the *Sample solution* ($\mu\text{g/mL}$)

C_U = nominal concentration of selenium in the *Sample solution* ($\mu\text{g/mL}$)

Acceptance criteria: 90.0%–160.0% of the labeled amount of selenium (Se)

• SELENIUM, Method 2

Hydrochloric acid solution: Hydrochloric acid diluted with water (1 in 10)

50% Ammonium hydroxide solution: Ammonium hydroxide diluted with water (1 in 2)

Reagent A: 9 mg/mL of edetate disodium and 25 mg/mL of hydroxylamine hydrochloride in water.

[NOTE—Dissolve edetate disodium in a portion of water first, add hydroxylamine hydrochloride, and then dilute with water to volume.]

Reagent B: Transfer 200 mg of 2,3-diaminonaphthalene to a 250-mL separatory funnel, and add 200 mL of 0.1 N hydrochloric acid. Wash the solution with three 40-mL portions of cyclohexane, and discard the cyclohexane layer. Filter the solution into a brown bottle, and cover the solution with a 1-cm layer of cyclohexane. This solution is stable for 1 week if stored in a refrigerator.

Standard stock solution: [CAUTION—Selenium is toxic; handle it with care.] Dissolve 1 g of metallic selenium in a minimum volume of nitric acid. Evaporate to dryness, add 2 mL of water, and evaporate to dryness. Repeat the addition of water and evaporation to dryness three times. Dissolve the residue in 3 N hydrochloric acid, transfer to a 1000-mL volumetric flask, and dilute with 3 N hydrochloric acid to volume to obtain a solution with a concentration of 1000 µg/mL of selenium. Dilute a volume of the solution with 0.125 N hydrochloric acid to obtain a concentration of 2.0 µg/mL of selenium.

Standard solution: Transfer 10.0 mL of the *Standard stock solution* to a glass-stoppered flask. Add 1 mL of perchloric acid and 1 mL of *Hydrochloric acid solution*, and dilute with water to 20 mL.

Sample solution: Transfer a portion of finely powdered Tablets, equivalent to a nominal amount of 20 µg of selenium, to a suitable flask. Add 10 mL of nitric acid, and warm gently on a hot plate. Continue heating until the initial nitric acid reaction has subsided, then add 3 mL of perchloric acid. [CAUTION—Exercise care at this stage because the perchloric acid reaction becomes vigorous.] Continue heating on the hot plate until the appearance of white fumes of perchloric acid or until the digest begins to darken. Add 0.5 mL of nitric acid and resume heating, adding additional amounts of nitric acid if further darkening occurs. Digest for 10 min after the first appearance of perchloric acid fumes or until the digest becomes colorless. Cool the flask, add 2.5 mL of *Hydrochloric acid solution*, and return the flask to the hot plate to expel residual nitric acid. Heat the mixture for 3 min after it begins to boil. Cool the flask to room temperature, and dilute with water to 20 mL.

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: UV

Cell: 1 cm

Analytical wavelength: 380 nm

Blank: 1 mL of perchloric acid and 1 mL of *Hydrochloric acid solution* diluted with water to 20 mL

Analysis

Samples: *Standard solution* and *Sample solution*

Treat the *Sample solution*, the *Standard solution*, and the *Blank* as follows. Add 5 mL of *Reagent A* to each flask, and swirl gently to mix. Adjust the solution in each flask with 50% *Ammonium hydroxide solution* to a pH of 1.1 ± 0.1. Add 5 mL of *Reagent B* to each flask, and swirl gently to mix. Place the flasks in a water bath maintained at 50°, and equilibrate for 30 min, taking care that the flasks are covered to protect them from light. Cool to room temperature, and transfer the contents of each flask to separate separatory funnels. Transfer 10.0 mL of cyclohexane to each separatory funnel, and extract vigorously for 1 min. Discard the aqueous layer. Transfer the cyclohexane layer to a centrifuge tube, and centrifuge at 1000 rpm for 1 min to remove any remaining water. Determine the absorbances of the solutions obtained from the *Samples* against the solution obtained from the *Blank*. Calculate the percentage of the labeled amount of selenium (Se) in the portion of Tablets taken:

$$\text{Result} = (A_U/A_S) \times [(V \times C_S) / M_U] \times 100$$

A_U = absorbance of the cyclohexane layer from the *Sample solution*

A_S = absorbance of the cyclohexane layer from the *Standard solution*

V = volume of the *Standard stock solution* used to prepare the *Standard solution*, 10 mL

C_S = concentration of selenium in the *Standard stock solution* (µg/mL)

M_U = nominal amount of selenium in the *Sample solution* (µg)

Acceptance criteria: 90.0%–160.0% of the labeled amount of selenium (Se)

• ZINC, Method 1

Zinc standard solution: 1000 µg/mL of zinc from zinc oxide dissolved in 5 M hydrochloric acid (3.89 mg/mL) and diluted with water to final volume. [NOTE—Dissolve 5 M hydrochloric acid by warming if necessary, cool, and then dilute to final volume.]

Standard stock solution: 50 µg/mL of zinc from *Zinc standard stock solution* diluted with 0.125 N hydrochloric acid

Standard solutions: Transfer 1.0, 2.0, 3.0, 4.0, and 5.0 mL of the *Standard stock solution* to separate 100-mL volumetric flasks. Dilute the contents of each flask with 0.125 N hydrochloric acid to volume to obtain concentrations of 0.5, 1.0, 1.5, 2.0, and 2.5 µg/mL of zinc.

Sample solution: Proceed as directed for the *Sample solution* in the assay for *Calcium, Method 1*, except to prepare the *Sample solution* to contain a nominal concentration of 2 µg/mL of zinc and to omit the use of the *Lanthanum chloride solution*.

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry

Lamp: Zinc hollow-cathode

Flame: Air–acetylene

Analytical wavelength: Zinc emission line at 213.8 nm

Blank: 0.125 N hydrochloric acid

Analysis

Samples: *Standard solutions* and *Sample solution*

Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration in µg/mL of zinc, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, C , in µg/mL of zinc in the *Sample solution*.

Calculate the percentage of the labeled amount of zinc (Zn) in the portion of Tablets taken:

$$\text{Result} = (C/C_U) \times 100$$

C = measured concentration of zinc in the *Sample solution* (µg/mL)

C_U = nominal concentration of zinc in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–125.0% of the labeled amount of zinc (Zn)

• BORON, NICKEL, TIN, and VANADIUM, Method 1; CALCIUM, CHROMIUM, COPPER, IRON, MAGNESIUM, MANGANESE, PHOSPHORUS, and ZINC, Method 2; MOLYBDENUM and SELENIUM, Method 3

Stock aqua regia solution: Prepare a mixture of hydrochloric acid and nitric acid (3:1) by adding the nitric acid to the hydrochloric acid. [NOTE—Periodically vent the solution in an appropriate fume hood.]

Diluent: Prepare a mixture of *Stock aqua regia solution* and water (1:9) by adding one volume of *Stock aqua regia solution* to two volumes of water. Dilute with additional water to volume, and mix well.

System suitability solution: Prepare a mixture of 1000 mg/L of yttrium in 5% (v/v) nitric acid solution

and 1000 mg/L of scandium in 5% (v/v) nitric acid solution with *Diluent* (1:1:198), and mix.

Standard stock solution 1 (Ca, Cu, Fe, Mg, Mn, P, and Zn): [NOTE—It is only necessary to include the minerals of interest in the solution.] Using commercially available element standard (single- or multi-element) solutions in 5% (v/v) nitric acid solution, pipet the appropriate amount of element standard solution into a volumetric flask, and dilute with 5% (v/v) nitric acid solution to obtain a solution with final concentrations of about 1000 mg/L of calcium, 100 mg/L of copper, 250 mg/L of iron, 500 mg/L of magnesium, 100 mg/L of manganese, 800 mg/L of phosphorus, and 250 mg/mL of zinc.

Standard stock solution 2 (B, Cr, Mo, Ni, Se, Sn, and V): [NOTE—It is only necessary to include the minerals of interest in the solution.] Using commercially available element standard (single- or multi-element) solutions in 20% (v/v) hydrochloric acid solution, pipet the appropriate amount of element standard solution into a volumetric flask, and dilute with 20% (v/v) hydrochloric acid solution to obtain a solution with final concentrations of about 200 mg/L of boron, and 100 mg/L each of chromium, molybdenum, nickel, selenium, tin, and vanadium.

Standard solutions: Prepare a mixture of *Standard stock solution 1* and *Standard stock solution 2*, as required, in *Diluent* to prepare a six-point calibration curve to bracket the concentration range of each mineral of interest.

Sample solution 1 (for Tablets containing minerals found in *Standard stock solution 1* and *Standard stock solution 2*): Weigh and finely powder NLT than 20 Tablets. Transfer a portion, equal to 3.5 times the average Tablet weight, to a 250-mL volumetric flask. Slowly add 25 mL of *Stock aqua regia solution* in 5-mL increments, followed by mixing. [NOTE—If the sample contains a carbonate, bubbling will occur. Wait until bubbling ends to proceed.] Bring the solution to a boil on a hot plate. Continue to heat gently until fumes cease (about 1 h). [NOTE—If the sample contains selenium, digest for NMT 15 min.] Remove from heat, cool, and dilute with water to volume. Filter about 30 mL into a centrifuge tube, using a 5- μ m pore size nylon syringe filter. If necessary, make any further dilutions using the *Diluent*.

Sample solution 2 (for Tablets containing minerals found only in *Standard stock solution 2*): Weigh and finely powder NLT 20 Tablets. Transfer a portion, equal to 3.5 times the average Tablet weight, to a 250-mL volumetric flask. Slowly add 25 mL of *Stock aqua regia solution* in 5-mL increments, followed by mixing. [NOTE—If the sample contains a carbonate, bubbling will occur. Wait until bubbling ends to proceed.] Bring the solution to a boil on a hot plate. Continue to heat gently until fumes cease (about 1 h). [NOTE—If the sample contains selenium, digest for NMT 15 min.] Remove from heat, cool, and dilute with water to volume. Filter about 30 mL into a centrifuge tube using a 5- μ m pore size nylon syringe filter. If necessary, make any further dilutions using the *Diluent*.]

Sample solution 3 (for Tablets containing minerals found only in *Standard stock solution 1*): Weigh and finely powder NLT 20 Tablets. Transfer a portion, equal to the average Tablet weight, to a 250-mL volumetric flask. Slowly add 25 mL of *Stock aqua regia solution* in 5-mL increments, followed by mixing. [NOTE—If the sample contains a carbonate, bubbling will occur. Wait until bubbling ends to proceed.] Bring the solution to a boil on a hot plate. Continue to heat gently (about 1 h) until fumes cease. Remove from heat, cool, and dilute with water to volume. Filter about 30 mL into a centrifuge tube, using a 5- μ m pore size nylon syringe filter. If necessary, make any further dilutions using the *Diluent*.

Spectrometric conditions

(See *Plasma Spectrochemistry* <730>.)

Mode: Inductively coupled plasma emission spectrometry, using a spectrometer set to measure the emission of each mineral of interest at about the corresponding wavelength. [NOTE—The operating conditions may be developed and optimized based on the manufacturer's recommendation. The wavelengths selected should be demonstrated experimentally to provide sufficient specificity, sensitivity, linearity, accuracy, and precision.]

System suitability

[NOTE—Analyze the *System suitability solution*, and obtain the response as directed for *Analysis*.]

Suitability requirements

Relative standard deviation: NMT 2.0%.

Analysis

Samples: *Standard solutions* and *Sample solution*
Determine the emission of each mineral of interest in the *Standard solutions* and *Sample solution* with an inductively coupled plasma system using the *Diluent* as the blank. Plot the emission of the *Standard solutions* versus the concentration, in mg/L of the minerals of interest, and draw the straight line best fitting the plotted points. From the graph so obtained, determine the concentration, *C*, in mg/L, for each mineral of interest in the *Sample solution*.

Calculate the percentage of the labeled amount for each mineral:

$$\text{Result} = C \times (V/W) \times F \times (C_w/L) \times 100$$

C = measured concentration of the relevant element in the *Sample solution* (mg/L)
V = volume of the *Sample solution* (L)
W = sample weight (mg)
F = dilution factor of the *Sample solution*
C_w = average Tablet weight (mg)
L = labeled amount/Tablet (mg)

Acceptance criteria: 90.0%–125.0% of the labeled amount of calcium (Ca), copper (Cu), iron (Fe), magnesium (Mg), manganese (Mn), phosphorus (P), and zinc (Zn); and 90.0%–160.0% of the labeled amounts of boron (B), chromium (Cr), molybdenum (Mo), nickel (Ni), selenium (Se), tin (Sn), and vanadium (V).

PERFORMANCE TESTS

- **DISINTEGRATION AND DISSOLUTION OF DIETARY SUPPLEMENTS** <2040>: Meet the requirements for *Dissolution*
- **WEIGHT VARIATION OF DIETARY SUPPLEMENTS** <2091>: Meet the requirements

SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS—NUTRITIONAL AND DIETARY SUPPLEMENTS** <2021>: The total aerobic microbial count does not exceed 3000 cfu/g, and the combined molds and yeasts count does not exceed 300 cfu/g.
- **ABSENCE OF SPECIFIED MICROORGANISMS—NUTRITIONAL AND DIETARY SUPPLEMENTS** <2022>: Meet the requirements of the tests for absence of *Salmonella* species, *Escherichia coli*, and *Staphylococcus aureus*

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.
- **LABELING:** The label states that the product is Water-Soluble Vitamins with Minerals Tablets. The label also states the quantity of each vitamin and mineral in terms of metric units per dosage unit and, where necessary, the chemical form in which a vitamin is present, and also states the salt form of the mineral used as the source of each element. Where more than one assay method is given for a particular vitamin, the labeling states which assay method is used only if *Method 1* is not used.

• **USP REFERENCE STANDARDS** (11)

USP Biotin RS
 USP Calcium Pantothenate RS
 USP Cyanocobalamin RS
 USP Folic Acid RS
 USP Niacin RS
 USP Niacinamide RS
 USP Pyridoxine Hydrochloride RS
 USP Riboflavin RS
 USP Sodium Fluoride RS

Add the following:

▲ **meso-Zeaxanthin**

$C_{40}H_{56}O_2$ 568.88
 β,β -Carotene-3,3'-diol (3R,3'S)-;
 (3R,3'S meso)-Zeaxanthin [31272-50-1].

DEFINITION

meso-Zeaxanthin consists chiefly of the 3R,3'S-isomer of zeaxanthin. It contains NLT 80.0% of total carotenoids calculated as zeaxanthin ($C_{40}H_{56}O_2$) and NLT 74.0% of zeaxanthin ($C_{40}H_{56}O_2$), on the anhydrous basis.

IDENTIFICATION

- **A.**
Sample solution: Use the *Sample solution* of the test for *Content of Total Carotenoids*.
Analysis: Record the UV-Vis spectrum from 300 to 600 nm.
Acceptance criteria: The *Sample solution* shows a shoulder at about 427 nm, an absorption maximum at about 453 nm, and another maximum at about 480 nm.
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the test for *Content of Zeaxanthin*.
- **C.** The retention time of the major peak of the *Sample solution* corresponds to that of (3R,3'S meso)-zeaxanthin from the *Standard solution*, as obtained in the test for *Stereoisomeric Composition*.

COMPOSITION

• **CONTENT OF TOTAL CAROTENOIDS**

[NOTE—Use low-actinic glassware.]

Sample stock solution: Transfer 25.0 mg of sample to a 100-mL volumetric flask, add 20 mL of chloroform, and place the flask in an ultrasonic bath at 30° for 2–5 min to obtain a clear solution. Dilute with cyclohexane to volume to obtain a solution containing 250 μ g/mL.

Sample solution: 2.5 μ g/mL of the *Sample stock solution* in cyclohexane

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Analytical wavelength: 453 nm

Cell path: 1 cm

Blank: Cyclohexane

Analysis

Sample: *Sample solution*

Calculate the percentage of total carotenoids as zeaxanthin ($C_{40}H_{56}O_2$):

$$\text{Result} = A/(C \times F)$$

A = absorbance of the *Sample solution*
C = concentration of the *Sample solution* (g/mL)
F = coefficient of extinction ($E^{1\%}$) of zeaxanthin in cyclohexane (100 mL \cdot g⁻¹ \cdot cm⁻¹), 2540

Acceptance criteria: NLT 80.0% of total carotenoids (*T*) as zeaxanthin ($C_{40}H_{56}O_2$) on the anhydrous basis

• **CONTENT OF ZEAXANTHIN**

[NOTE—Use low-actinic glassware.]

Mobile phase: Hexane and ethyl acetate (75:25)

Standard solution: 150 μ g/mL of USP *meso*-Zeaxanthin RS prepared as follows: dissolve 15.0 mg of USP *meso*-Zeaxanthin RS in 10 mL of chloroform, swirling briefly, and dilute with *Mobile phase* to 100 mL.

Sample solution: Transfer 15.0 mg of sample to a 100-mL volumetric flask, add 10 mL of chloroform, and place the flask in an ultrasonic bath at 30° for 2–5 min to obtain a clear solution. Dilute with *Mobile phase* to volume.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: HPLC

Detector: 453 nm

Column: 4.6-mm \times 25-cm; 3- μ m packing L3

Column temperature: 25°

Flow rate: 1.5 mL/min

Injection size: 10 μ L

System suitability

Sample: *Standard solution*

[NOTE—The approximate relative retention times are 0.95 and 1.0 for lutein and zeaxanthin, respectively.]

Suitability requirements

Resolution: NLT 1.0 between zeaxanthin and lutein

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis: Inject the *Sample solution*, and measure the peak areas. [NOTE—The peak area of zeaxanthin is NLT 90.0% of the total peak areas.]

Calculate the percentage of zeaxanthin ($C_{40}H_{56}O_2$) in the sample taken:

$$\text{Result} = (r_U/r_T) \times T$$

r_U = peak area of zeaxanthin

r_T = sum of the areas of all the peaks

T = percentage of total carotenoids as determined in the test for *Content of Total Carotenoids*

Acceptance criteria: NLT 74.0% of $C_{40}H_{56}O_2$ on the anhydrous basis

• **LUTEIN AND OTHER RELATED COMPOUNDS**

[NOTE—Use low-actinic glassware.]

Mobile phase, Standard solution, Sample solution, and Chromatographic system: Proceed as directed in the test for *Content of Zeaxanthin*.

Analysis

Sample: *Sample solution*

[NOTE—The peak area of lutein is NMT 9.0% of the total peak areas.]

Calculate the percentage of lutein in the portion of *meso*-Zeaxanthin taken:

$$\text{Result} = (r_U/r_T) \times T$$

r_U = individual peak area of lutein

r_T = sum of the areas of all the peaks

T = percentage of total carotenoids as determined in the test for *Content of Total Carotenoids*

Calculate the percentage of other related compounds in the portion of *meso*-Zeaxanthin taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = individual peak area of any other peak (excluding zeaxanthin and lutein)

r_T = sum of the areas of all the peaks

Zinc Citrate

$C_{12}H_{10}O_{14}Zn_3 \cdot 2H_2O$ 610.36
2-Hydroxy-1,2,3-propanetricarboxylic acid zinc salt, dihydrate [5990-32-9].
Anhydrous [546-46-3].

DEFINITION

Zinc Citrate contains NLT 31.3% of zinc (Zn), calculated on the dried basis.

IDENTIFICATION

- **A. IDENTIFICATION TESTS—GENERAL, Zinc** (191): A solution (1 in 10) meets the requirements.
- **B. IDENTIFICATION TESTS—GENERAL, Citrate** (191): A solution (1 in 10) meets the requirements.

ASSAY

• PROCEDURE

Sample: 350 mg of Zinc Citrate, previously dried at 105° for 2 h

Blank: 60 mL of water

Titrimetric system

(See *Titrimetry* (541).)

Mode: Direct titration

Titrant: 0.05 M edetate disodium VS

Endpoint detection: Visual

Analysis: Dissolve the *Sample* in 60 mL of water. Add 10 mL of ammonia–ammonium chloride buffer TS and 0.1 mL of eriochrome black TS. Titrate with the *Titrant* to a blue endpoint. Perform a blank determination. Calculate the percentage of zinc (Zn) in the portion of Zinc Citrate taken:

$$\text{Result} = [(V - B) \times M \times F \times 100] / W$$

V = sample titrant volume (mL)

B = blank titrant volume (mL)

M = titrant molarity (mM/mL)

F = equivalency factor, 65.4 mg/mM

W = sample weight (mg)

Acceptance criteria: NLT 31.3% on the dried basis

IMPURITIES

- **CHLORIDE AND SULFATE, Chloride** (221): A 1.0-g portion shows no more chloride than corresponds to 0.7 mL of 0.020 N hydrochloric acid (NMT 0.05%).
- **CHLORIDE AND SULFATE, Sulfate** (221): A 1.8-g portion shows no more sulfate than corresponds to 0.5 mL of 0.020 N sulfuric acid (NMT 0.05%).
- **LIMIT OF ARSENIC, CADMIUM, AND LEAD**
Arsenic standard solution: 1.0 µg/mL in 1% nitric acid, prepared from an arsenic standard solution (10 mg/L)

Cadmium standard solution: 1.0 µg/mL in 1% nitric acid, prepared from a cadmium standard solution (10 mg/L)

Lead standard solution: 1.0 µg/mL in 1% nitric acid, prepared from a lead standard solution (10 mg/L)

Multi-element standard solution: 10 µg/L of lead, 5 µg/L of cadmium, and 3 µg/L of arsenic in 1% nitric acid, prepared from the *Lead standard solution*, *Cadmium standard solution*, and *Arsenic standard solution*, respectively

Sample solution: 2 mg/mL of Zinc Citrate in 1% nitric acid

Instrumental conditions

(See *Plasma Spectrochemistry* (730).)

Mode: ICP-MS

Radio frequency: 1350 Watts

Nebulizer flow rate: 0.9 L/min

[NOTE—The radio frequency and nebulizer flow rate settings may be developed and optimized based on the manufacturer's recommendation.]

Detection atomic masses: As, Cd, and Pb

Blank: 1% nitric acid solution

Analysis

Samples: *Multi-element standard solution*, *Sample solution*, and *Blank*

Determine the responses of the *Multi-element standard solution*, *Sample solution*, and *Blank* at the masses indicated above.

Calculate the content of each element, in µg/g, in the portion of Zinc Citrate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U)$$

r_U = peak response of the corresponding element from the *Sample solution*

r_S = peak response of the corresponding element from the *Multi-element standard solution*

C_S = concentration of the corresponding element in the *Multi-element standard solution* (µg/L)

C_U = concentration of Zinc Citrate in the *Sample solution* (g/L)

Acceptance criteria

Arsenic: NMT 3 µg/g

Cadmium: NMT 5 µg/g

Lead: NMT 10 µg/g

SPECIFIC TESTS

- **LOSS ON DRYING** (731): Dry a sample at 105° for 2 h: it loses NMT 1.0% of its weight.
- **MICROBIAL ENUMERATION TESTS** (2021): The total aerobic microbial count does not exceed 10³ cfu/g. The total combined yeasts and molds count does not exceed 10² cfu/g.
- **MICROBIOLOGICAL PROCEDURES FOR ABSENCE OF SPECIFIED MICROORGANISMS** (2022): It meets the requirements of the test for absence of *Escherichia coli*.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.

Zinc Citrate Tablets

DEFINITION

Zinc Citrate Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of zinc (Zn).

IDENTIFICATION

- **A.** The *Sample solution* for *Strength* produces line emissions or absorptions at the characteristic wavelengths for zinc.

• **B. IDENTIFICATION TESTS—GENERAL, Citrate (191)**

Sample solution: Transfer a quantity of powdered Tablets, equivalent to about 15 mg of zinc, to a centrifuge tube. Add 2–5 mL of water, sonicate for 1 min, shake, and centrifuge.

Acceptance criteria: Meets the requirements

STRENGTH

• **CONTENT OF ZINC**

Method 1

[NOTE—A standard stock solution is commercially available at different zinc concentrations, which may be used for preparation of the *Standard stock solution*. Necessary volumetric adjustment can be made in the *Standard solution*. Concentrations of the *Standard solution* and the *Sample solution* may be modified to fit the linear or working range of the instrument.]

Standard stock solution: Dissolve 625 mg of zinc oxide, weighed, and previously ignited to constant weight, in 10 mL of nitric acid, and add water to make 500.0 mL. This solution contains 1000 mg/L of zinc.

Standard solution: To a 500-mL volumetric flask add 200 mL of water and 10 mL of nitric acid, and mix thoroughly. Pipette 10.0 mL of the *Standard stock solution* into the volumetric flask, and dilute with water to volume to obtain a solution having a known concentration of about 20 mg/L of zinc.

Sample solution: Weigh and finely powder NLT 20 Tablets. Transfer weighed portion of the powdered Tablets, equivalent to about 0.1 g of zinc, to a 50-mL flask. Add 10 mL of nitric acid, and heat the solution on a hot plate to boil gently, during which process fuming evolves. Boil the solution for an additional 30 min with constant swirling, during which no fuming should be observed. Cool the solution to room temperature, quantitatively transfer all of the solution to a 500-mL volumetric flask, dilute with water to volume, and mix. Pipette 25.0 mL of this solution into a 250-mL volumetric flask, add 5 mL of nitric acid, dilute with water to volume, mix, and filter.

Inductively coupled plasma system

(See *Plasma Spectrochemistry* (730).)

Mode: Atomic emission spectroscopy

Analytical wavelength: 206.20 nm. [NOTE—The operating conditions may be developed and optimized based on the manufacturer's recommendation. A typical setting includes radio frequency (RF) power of about 1300 watts, argon torch flow of about 15 L/min, argon auxiliary flow of about 0.2 L/min, and a nebulizer flow rate of about 0.8 L/min.]

Blank: 2% nitric acid solution

Analysis

Samples: *Standard solutions*, *Sample solution*, and *Blank*

Calculate the percentage of the labeled amount of zinc (Zn) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = response from the *Sample solution*

r_S = response from the *Standard solution*

C_S = concentration of the *Standard solution* (mg/L)

C_U = nominal concentration of zinc in the *Sample solution* (mg/L)

Acceptance criteria: 90.0%–110.0%

Method 2

Standard stock solution A: 1000 µg/mL of zinc from zinc oxide in 5 M hydrochloric acid (3.89 mg/mL) and diluted with water to final volume. [NOTE—Dissolve in 5 M hydrochloric acid by warming, if necessary. Cool, and then dilute to final volume.]

Standard stock solution B: 50 µg/mL of zinc from *Standard stock solution A* diluted with 0.125 N hydrochloric acid

Standard solutions: Transfer 1.0, 2.0, 3.0, 4.0, and 5.0 mL of *Standard stock solution B* to separate 100-mL volumetric flasks. Dilute the contents of each flask with 0.125 N hydrochloric acid to volume to obtain concentrations of 0.5, 1.0, 1.5, 2.0, and 2.5 µg/mL of zinc.

Sample solution: Finely powder NLT 20 tablets. Transfer an equivalent to 5 tablets to a porcelain crucible. Heat the crucible in a muffle furnace maintained at 550° for 6–12 h, and cool. Add 60 mL of hydrochloric acid, and boil gently on a hot plate or steam bath for 30 min, intermittently rinsing the inner surface of the crucible with 6 N hydrochloric acid. Cool, and quantitatively transfer the contents of the crucible to a 100-mL volumetric flask. Rinse the crucible with small portions of 6 N hydrochloric acid, and add the rinsings to the flask. Dilute with water to volume, and filter, discarding the first 5 mL of the filtrate. Dilute this solution quantitatively, with 0.125 N hydrochloric acid to obtain a nominal concentration of 2 µg/mL of zinc.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry

Analytical wavelength: 213.8 nm

Lamp: Zinc hollow-cathode

Flame: Air–acetylene

Blank: 0.125 N hydrochloric acid

Analysis

Samples: *Standard solutions* and *Sample solution*

Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in µg/mL, of zinc, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, C , in µg/mL, of zinc in the *Sample solution*.

Calculate the percentage of the labeled amount of zinc (Zn) in the portion of Tablets taken:

$$\text{Result} = (C/C_U) \times 100$$

C = determined concentration of zinc in the *Sample solution* (µg/mL)

C_U = nominal concentration of zinc in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

• **DISINTEGRATION AND DISSOLUTION (2040)**

Medium: Water; 900 mL

Apparatus 2: 75 rpm

Time: 60 min

Analysis: Proceed as directed in *Method 1* or *Method 2* for *Strength*, making any necessary volumetric adjustments.

Sample solution: If *Method 1* is used, pipet 10.0 mL of the filtered pooled solution under test to a 50-mL volumetric flask, and dilute with 2% nitric acid solution to 50 mL. If *Method 2* is used, dilute the filtered pooled solution under test with 0.125 N hydrochloric acid to a concentration falling within the range of the *Standard solutions*.

Calculate the percentage of the labeled amount of zinc (Zn) dissolved:

$$\text{Result} = C \times (V_M/a) \times (D/L) \times 100$$

C = concentration of zinc in the *Sample solution* (mg/L)

V_M = volume of *Medium*, 900 mL

a = aliquot of solution under test (mL)

D = dilution factor to prepare the *Sample solution* from the aliquot taken

L = label claim (mg/Tablet)

Tolerances: NLT 75% of the labeled amount of zinc is dissolved.

- **WEIGHT VARIATION (2091):** Meet the requirements

SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS (2021):** The total aerobic microbial count does not exceed 10^3 cfu/g, and the total combined yeast and mold count does not exceed 10^2 cfu/g.
- **ABSENCE OF SPECIFIED MICROORGANISMS (2022):** It meets the requirements of the test for absence of *Escherichia coli*.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **LABELING:** The label states the quantity of zinc in terms of mg/Tablet.

Zinc and Vitamin C Lozenges

DEFINITION

Zinc and Vitamin C Lozenges contain NLT 90.0% and NMT 110.0% of the labeled amount of zinc (Zn) derived from substances generally recognized as safe and furnishing an ionizable form of zinc; and NLT 90.0% and NMT 120.0% of the labeled amount of vitamin C, as ascorbic acid ($C_6H_8O_6$), sodium ascorbate ($C_6H_7NaO_6$), or calcium ascorbate dihydrate ($C_{12}H_{14}CaO_{12} \cdot 2H_2O$). It contains no other vitamins or minerals for which nutritional value is claimed. It may contain other labeled added substances or additional ingredients in amounts that are unobjectionable.

IDENTIFICATION

- **A.**
Analysis: Proceed as directed in *Strength for Content of Zinc*.
Acceptance criteria: The *Sample solution* produces line emissions or absorptions at the characteristic wavelengths for zinc.
- **B.**
Analysis: Triturate a quantity of finely powdered Lozenges with sufficient alcohol to obtain a solution containing the equivalent of 20 mg/mL of ascorbic acid, sodium ascorbate, or calcium ascorbate dihydrate, and filter. Add 1 mL of 0.1 N hydrochloric acid to 4 mL of the filtrate from Lozenges containing sodium ascorbate or calcium ascorbate.
Acceptance criteria: A portion of the filtrate reduces alkaline cupric tartrate TS slowly at room temperature but more readily upon heating.

STRENGTH

• CONTENT OF ZINC

Procedure 1

[NOTE—A standard stock solution is commercially available at different zinc concentrations, which may be used for preparation of *Standard stock solution*. Necessary volumetric adjustment can be made in the *Standard solution*. Concentrations of the *Standard solution* and the *Sample solution* may be modified to fit the linear or working range of the instrument.]

Standard stock solution: Dissolve 625 mg of zinc oxide, weighed, and previously ignited to constant weight, in 10 mL of nitric acid, and add water to make 500.0 mL. This solution contains 1000 µg/mL of zinc.

Standard solution: To a 500-mL volumetric flask add 200 mL of water and 10 mL of nitric acid, and mix thoroughly. Pipet 10.0 mL of the *Standard stock solution* into the volumetric flask, and dilute with water to

volume to obtain a solution having a known concentration of about 20 µg/mL of zinc.

Sample solution: Weigh and finely powder NLT 20 Lozenges. Transfer an accurately weighed portion of the powdered Lozenges, equivalent to about 0.1 g of zinc, to a 50-mL flask. Add 10 mL of nitric acid, and heat the solution on a hot plate to boil gently, during which process fuming evolves. Boil the solution for an additional 30 min with constant swirling, during which no fuming should be observed. Cool the solution to room temperature, quantitatively transfer all of the solution to a 500-mL volumetric flask, dilute with water to volume, and mix. Pipet 25.0 mL of this solution into a 250-mL volumetric flask, add 5 mL of nitric acid, dilute with water to volume, mix, and filter.

Inductively coupled plasma system

(See *Plasma Spectrochemistry* (730).)

Mode: Atomic emission spectroscopy

Analytical wavelength: 206.20 nm

[NOTE—The operating conditions may be developed and optimized based on the manufacturer's recommendation. A typical setting includes radio frequency (RF) power of about 1300 watts, argon torch flow of about 15 L/min, argon auxiliary flow of about 0.2 L/min, and a nebulizer flow rate of about 0.8 L/min.]

Blank: 2% nitric acid solution

Analysis

Samples: *Standard solutions*, *Sample solution*, and *Blank*

Calculate the percentage of the labeled amount of zinc (Zn) in the portion of Lozenges taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = response from the *Sample solution*

r_S = response from the *Standard solution*

C_S = concentration of zinc in the *Standard solution* (µg/mL)

C_U = nominal concentration of zinc in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–110.0% of the labeled amount of zinc

Procedure 2

Standard stock solution A: Dissolve zinc oxide in 5 M hydrochloric acid with warming, if necessary, to obtain a solution with a concentration of 3.89 mg/mL. Dilute with water to obtain a solution with a concentration of 1000 µg/mL of zinc.

Standard stock solution B: 50 µg/mL of zinc from

Standard stock solution A in 0.125 N hydrochloric acid

Standard solutions: Transfer 1.0, 2.0, 3.0, 4.0, and 5.0 mL of *Standard stock solution B* to separate 100-mL volumetric flasks. Dilute the contents of each flask with 0.125 N hydrochloric acid to volume to obtain solutions containing 0.5, 1.0, 1.5, 2.0, and 2.5 µg/mL of zinc.

Sample solution: Finely powder NLT 20 Lozenges.

Transfer an equivalent to 5 Lozenges to a porcelain crucible. Heat the crucible in a muffle furnace maintained at 550° for 6–12 h, and cool. Add 60 mL of hydrochloric acid, and boil gently on a hot plate or steam bath for 30 min, intermittently rinsing the inner surface of the crucible with 6 N hydrochloric acid. Cool, and quantitatively transfer the contents of the crucible to a 100-mL volumetric flask. Rinse the crucible with small portions of 6 N hydrochloric acid, and add the rinsings to the flask. Dilute with water to volume, and filter, discarding the first 5 mL of the filtrate. Dilute this solution quantitatively with 0.125 N hydrochloric acid to obtain a nominal concentration of 2 µg/mL of zinc.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry

Analytical wavelength: 213.8 nm

Lamp: Zinc hollow-cathode

Flame: Air–acetylene

Blank: 0.125 N hydrochloric acid

Analysis

Samples: *Standard solutions* and *Sample solution*

Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the *Standard solutions* versus the concentration, in $\mu\text{g/mL}$, of zinc, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, C , in $\mu\text{g/mL}$, of zinc in the *Sample solution*.

Calculate the percentage of the labeled amount of zinc (Zn) in the portion of Lozenges taken:

$$\text{Result} = (C/C_U) \times 100$$

C = determined concentration of zinc in the *Sample solution* ($\mu\text{g/mL}$)

C_U = nominal concentration of zinc in the *Sample solution* ($\mu\text{g/mL}$)

Acceptance criteria: 90.0%–110.0% of the label claim

• CONTENT OF VITAMIN C

Sample solution: Transfer NLT 20 Lozenges to a 1000-mL volumetric flask containing 250 mL of metaphosphoric–acetic acids TS. Insert the stopper in the flask, and shake by mechanical means for 30 min or until the lozenges have disintegrated completely. Dilute with water to volume. Transfer a portion of the solution to a centrifuge tube, and centrifuge until a clear supernatant is obtained. Quantitatively dilute the clear supernatant with water, if necessary, to obtain a solution containing 0.5 mg/mL of ascorbic acid.

Blank: A mixture of 5.5 mL of metaphosphoric–acetic acids TS and 15 mL of water

Titrimetric system

(See *Titrimetry* (541).)

Mode: Direct titration

Titrant: Standard dichlorophenol–indophenol VS

Endpoint detection: Visual, a rose-pink color that persists for at least 5 s

Analysis: Transfer a volume of the *Sample solution*, equivalent to 2 mg of ascorbic acid, into a 50-mL conical flask. Add 5 mL of metaphosphoric–acetic acids TS, and titrate with *Titrant*. Correct for the volume of the *Titrant* consumed by the *Blank*.

Calculate the percentage of the labeled amount of ascorbic acid ($\text{C}_6\text{H}_8\text{O}_6$) in the portion of the Lozenges taken:

$$\text{Result} = \{[(V_S - V_B) \times F]/W\} \times 100$$

V_S = *Titrant* volume consumed by the *Sample solution* (mL)

V_B = *Titrant* volume consumed by the *Blank* (mL)

F = ascorbic acid equivalent of the *Titrant* (mg/mL)

W = nominal weight of ascorbic acid taken for *Analysis* (mg)

Acceptance criteria: 90.0%–120.0% of the labeled amount

SPECIFIC TESTS

• **MICROBIAL ENUMERATION TESTS (2021):** The total aerobic microbial count does not exceed 10^3 cfu/g, and the total combined yeasts and molds count does not exceed 10^2 cfu/g.

• **ABSENCE OF SPECIFIED MICROORGANISMS (2022):** It meets the requirements of the test for absence of *Escherichia coli*.

PERFORMANCE TESTS

• DISINTEGRATION AND DISSOLUTION (2040)

Medium: 0.1 N hydrochloric acid; 900 mL

Apparatus 2: 75 rpm

Time: 60 min

Analysis: Determine the amount of zinc (Zn) and vitamin C dissolved, using the procedures in *Strength for Content of Zinc* and *Content of Vitamin C*, making any necessary volumetric adjustments. [NOTE—Proceed without delay in the vitamin C determination.]

Calculate the percentage of the labeled amount of zinc (Zn) dissolved:

$$\text{Result} = C \times (V_M/a) \times (D/L) \times 100$$

C = measured concentration of Zinc in the *Sample solution* (mg/mL)

V_M = volume of *Medium*, 900 mL

a = aliquot of solution under test taken (mL)

D = dilution factor to prepare the *Sample solution* from the aliquot taken

L = labeled amount of zinc (mg/Tablet)

Calculate the percentage of the labeled amount of vitamin C, as ascorbic acid ($\text{C}_6\text{H}_8\text{O}_6$), dissolved:

$$\text{Result} = (V_S - V_B) \times F \times [(V_M/a)/L] \times 100$$

V_S = *Titrant* volume consumed by the *Sample solution* (mL)

V_B = *Titrant* volume consumed by the *Blank* (mL)

F = concentration of the *Titrant* in terms of the equivalent of ascorbic acid (mg/mL)

V_M = volume of *Medium*, 900 mL

a = volume of the aliquot taken for *Analysis*

L = labeled amount of ascorbic acid (mg/Tablet)

Tolerances: NLT 75% of the labeled amount of zinc (Zn) and vitamin C is dissolved.

• **WEIGHT VARIATION (2091):** Meet the requirements

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed containers.

• **LABELING:** The label states the quantity of zinc and vitamin C as ascorbic acid in mg per Lozenge, and the salt form of zinc and the chemical form of vitamin C present in the Lozenges.

Admissions

Articles Admitted to *NF 31* by Supplement

First Supplement (August 1, 2012)

Betadex Sulfobutyl Ether Sodium

Second Supplement (December 1, 2012)

Ferrosoferric Oxide
Polyoxyl Stearate
Pregelatinized Hydroxypropyl Corn Starch

Pregelatinized Hydroxypropyl Pea Starch
Pregelatinized Hydroxypropyl Potato Starch

New Articles Appearing in *NF 31* That Were Not Included in *NF 30* Including Supplements

[NOTE—The articles included in this list are noted in the book with the following symbols ▲ ▲ *NF31*. This applies to new articles as well as sections of existing items that have been revised.]

New Articles Appearing in *NF 31*

Caprylic Acid
Diethyl Sebacate

Glyceryl Tristearate

ANNOTATED LIST

General Notices, Monographs, General Chapters, Reagents, and Tables Affected by Changes Appearing in NF 31

Page citations refer to the pages of NF 31. Note—In the list below, if a section is new or if a subsection is added to or deleted from an existing section, it is labeled as such in parentheses after the section or subsection name. Items on this list that appear without the designation “new,” “added,” or “deleted” are items in which changes have been made to existing official text.

Excipients

Excipients

USP and NF Excipients, Listed by Category

In the following reference table, the grouping of excipients by functional category is intended to summarize the most typically identified purpose that these excipients serve in drug product formulations. The list of substances included in each category is not comprehensive. The statement of category is intended neither to limit in any way the choice or use of the substance nor to indicate that it has no other utility.

Acidifying Agent

Acetic Acid
Acetic Acid, Glacial
Citric Acid, Anhydrous
Citric Acid Monohydrate
Fumaric Acid
Hydrochloric Acid
Hydrochloric Acid, Diluted
Malic Acid
Nitric Acid
Phosphoric Acid
Phosphoric Acid, Diluted
Propionic Acid
Sulfuric Acid
Tartaric Acid

Aerosol Propellant

Butane
Dichlorodifluoromethane
Dichlorotetrafluoroethane
Isobutane
Propane
Trichloromonofluoromethane

Air Displacement

Carbon Dioxide
Nitrogen

Alcohol Denaturant

Denatonium Benzoate
Methyl Isobutyl Ketone
Sucrose Octaacetate

Alkalizing Agent

Ammonia Solution, Strong
Ammonium Carbonate
Diethanolamine
Potassium Hydroxide
Sodium Bicarbonate
Sodium Borate
Sodium Carbonate
Sodium Hydroxide
Trolamine

Anticaking Agent (See *Glidant*)

Antifoaming Agent

Dimethicone
Myristic Acid
Palmitic Acid
Simethicone

Antimicrobial Preservative

Benzalkonium Chloride
Benzalkonium Chloride Solution

Benzethonium Chloride
Benzoic Acid
Benzyl Alcohol
Butylparaben
Calcium Propionate
Cetrimonium Bromide
Cetylpyridinium Chloride
Chlorobutanol
Chlorocresol
Cresol
Dehydroacetic Acid
Erythorbic Acid
Ethylparaben
Methylparaben
Methylparaben Sodium
Phenol
Phenoxyethanol
Phenylethyl Alcohol
Phenylmercuric Acetate
Phenylmercuric Nitrate
Potassium Benzoate
Potassium Sorbate
Propylparaben
Propylparaben Sodium
Sodium Benzoate
Sodium Dehydroacetate
Sodium Propionate
Sorbic Acid
Thimerosal
Thymol

Antioxidant

Ascorbic Acid
Ascorbyl Palmitate
Butylated Hydroxyanisole
Butylated Hydroxytoluene
Erythorbic Acid
Hypophosphorous Acid
Lactobionic Acid
Monothioglycerol
Potassium Metabisulfite
Propyl Gallate
Racemethionine
Sodium Bisulfite
Sodium Formaldehyde Sulfoxylate
Sodium Metabisulfite
Sodium Sulfite
Sodium Thiosulfate
Stannous Chloride
Sulfur Dioxide
Tocopherols Excipient

Buffering Agent

Acetic Acid
Adipic Acid
Ammonium Carbonate
Ammonium Phosphate
Boric Acid
Citric Acid, Anhydrous

Citric Acid Monohydrate
 Alpha-Lactalbumin
 Lactic Acid
 Phosphoric Acid
 Potassium Citrate
 Potassium Metaphosphate
 Potassium Phosphate, Dibasic
 Potassium Phosphate, Monobasic
 Racemethionine
 Sodium Acetate
 Sodium Citrate
 Sodium Lactate Solution
 Sodium Phosphate, Dibasic
 Sodium Phosphate, Monobasic
 Succinic Acid

Bulking Agent for Freeze-Drying

Creatinine
 Alpha-Lactalbumin
 Mannitol
 Polydextrose
 Polydextrose, Hydrogenated
 Pullulan
 Trehalose

Capsule Lubricant (See *Tablet and/or Capsule Lubricant*)**Chelating Agent**

Edetate Calcium Disodium
 Edetate Disodium
 Edetic Acid

Coating Agent

Amino Methacrylate Copolymer
 Ammonio Methacrylate Copolymer
 Ammonio Methacrylate Copolymer Dispersion

Acacia

DEFINITION

Acacia is the dried gummy exudate from the stems and branches of *Acacia senegal* (L.) Willd. or of other related African species of *Acacia* (Fam. Leguminosae).

IDENTIFICATION

- **A.**
Analysis: To 10 mL of a cold solution (1 in 50) add 0.2 mL of diluted lead subacetate TS.
Acceptance criteria: A flocculent, or curdy, white precipitate is formed immediately.

IMPURITIES

- **ARSENIC**, *Method II* <211>: NMT 3 ppm
- **LEAD** <251>: NMT 10 ppm
- **HEAVY METALS**, *Method II* <231>: NMT 40 ppm

SPECIFIC TESTS

- **BOTANIC CHARACTERISTICS**
Acacia: Spheroidal tears up to 32 mm in diameter or in angular fragments of white to yellowish white color. It is translucent or somewhat opaque from the presence of numerous minute fissures; very brittle, the fractured surface glassy and occasionally iridescent. It is almost odorless and produces a mucilaginous sensation on the tongue.
Flake Acacia: White to yellowish white, thin flakes, appearing under the microscope as colorless, striated fragments
Powdered Acacia: White to yellowish white, angular microscopic fragments with only traces of starch or vegetable tissues present
Granular Acacia: White to pale yellowish white, fine granules. Under the microscope it appears as colorless, glassy, irregularly angular fragments up to 100 µm in thickness, some of which exhibit parallel linear streaks.
Spray-dried Acacia: White to off-white compacted microscopic fragments or whole spheres
- **MICROBIAL ENUMERATION TESTS** <61> and **TESTS FOR SPECIFIED MICROORGANISMS** <62>: Meets the requirements of the tests for absence of *Salmonella* species
- **WATER DETERMINATION**, *Method III (Gravimetric)* <921>
Analysis: For unground Acacia, crush in a mortar until it passes through a No. 40 sieve, and mix the ground material before weighing the test specimen. Dry a sample at 105° for 5 h.
Acceptance criteria: NMT 15.0% of its weight
- **ARTICLES OF BOTANICAL ORIGIN**, *Acid-Insoluble Ash* <561>: NMT 0.5%
- **ARTICLES OF BOTANICAL ORIGIN**, *Total Ash* <561>: NMT 4.0%
- **INSOLUBLE RESIDUE**
Sample solution: Dissolve 5.0 g of powdered or finely ground Acacia in 100 mL of water. Add 10 mL of 3 N hydrochloric acid.
Analysis: Boil the *Sample solution* gently for 15 min. Pass by suction, while hot, through a tared filtering crucible. Wash thoroughly with hot water, dry at 105° for 1 h, and weigh.

Acceptance criteria: The weight of the residue thus obtained does not exceed 50 mg.

- **STARCH OR DEXTRIN**
Sample solution: A solution (1 in 50)
Analysis: Boil the *Sample solution* cool, and add iodine TS.
Acceptance criteria: No bluish or reddish color is produced.
- **SOLUBILITY AND REACTION**
Sample: 1 g
Analysis: Dissolve the *Sample* in 2 mL of water.
Acceptance criteria: The resulting solution flows readily and is acid to litmus.
- **TANNIN-BEARING GUMS**
Sample solution: A solution (1 in 50)
Analysis: To 10 mL of the *Sample solution* add 0.1 mL of ferric chloride TS.
Acceptance criteria: No blackish coloration or blackish precipitate is produced.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.

Acacia Syrup

DEFINITION

Prepare Acacia Syrup as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* <795>).

Acacia, granular or powdered	100 g
Sodium Benzoate	1 g
Vanilla Tincture	5 mL
Sucrose	800 g
Purified Water, a sufficient quantity to make	1000 mL

Mix *Acacia*, *Sodium Benzoate*, and *Sucrose*. Add 425 mL of *Purified Water*, and mix. Heat the mixture on a steam bath until dissolved. When cool, remove the scum, add *Vanilla Tincture* and sufficient *Purified Water* to make the product measure 1000 mL, and strain, if necessary.

SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS** <61> and **TESTS FOR SPECIFIED MICROORGANISMS** <62>: Meets the requirements of the test for absence of *Salmonella* species

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Package in tight containers, and prevent exposure to excessive heat.
- **LABELING:** The label states the Latin binomial name and, following the official name, the part of the plant source from which the article was derived.

Acesulfame Potassium

$C_4H_4NO_4SK$ 201.24
6-Methyl-1,2,3-oxathiazine-4(3H)-one-2,2-dioxide potassium salt;
3,4-Dihydro-6-methyl-1,2,3-oxathiazine-4-one-2,2-dioxide potassium salt [55589-62-3].

DEFINITION

Acesulfame Potassium contains NLT 99.0% and NMT 101.0% of $C_4H_4NO_4SK$, calculated on the dried basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)
- **B. IDENTIFICATION TESTS—GENERAL**, Potassium (191)
Sample solution: 100 mg/mL
Acceptance criteria: Meets the requirements

ASSAY

PROCEDURE

Sample: 150 mg

Titrimetric system

(See *Titrimetry* (541))

Mode: Direct titration

Titrant: 0.1 N perchloric acid VS

Blank: 50 mL of glacial acetic acid

Endpoint detection: Potentiometric

Analysis: Dissolve the Sample in 50 mL of glacial acetic acid. Titrate with 0.1 N perchloric acid VS. Perform a blank determination.

Calculate the percentage of acesulfame potassium ($C_4H_4NO_4SK$) in the Sample:

$$\text{Result} = [(V - B) \times N \times F \times 100] / W$$

V = titrant volume consumed by the Sample (mL)

B = titrant volume consumed by the Blank (mL)

N = titrant actual normality (mEq/mL)

F = equivalency factor, 201.2 mg/mEq

W = weight of Sample (mg)

Acceptance criteria: 99.0%–101.0% on the dried basis

IMPURITIES

LIMIT OF FLUORIDE

[NOTE—Use plasticware throughout this test.]

Solution A: Dissolve 210 g of citric acid monohydrate in 400 mL of water. Adjust with concentrated ammonia to a pH of 7.0, and dilute with water to 1000 mL.

Solution B: 132 mg/mL of dibasic ammonium phosphate

Solution C: To a suspension of 292 g of edetic acid in 500 mL of water, add 200 mL of ammonium hydroxide, adjust with ammonium hydroxide to a pH between 6 and 7, and dilute with water to make 1000 mL.

Buffer solution: Mix equal volumes of Solution A, Solution B, and Solution C, and adjust with ammonium hydroxide to a pH of 7.5.

Standard stock solution: Weigh 0.442 g of sodium fluoride, previously dried at 300° for 12 h, into a 1-L volumetric flask, and dilute with water to volume. Store the solution in a closed plastic container. Immediately before use, pipet 5 mL of this solution into a 100-mL volumetric flask, and dilute with water to volume. Each mL of this solution contains 10 µg of fluoride ion.

Standard solution A: Mix 0.5 mL of Standard stock solution and 15.0 mL of Buffer solution, and dilute with water to 50 mL.

Standard solution B: Mix 1.0 mL of Standard stock solution and 15.0 mL of Buffer solution, and dilute with water to 50 mL.

Standard solution C: Mix 1.5 mL of Standard stock solution and 15.0 mL of Buffer solution, and dilute with water to 50 mL.

Standard solution D: Mix 3.0 mL of Standard stock solution and 15.0 mL of Buffer solution, and dilute with water to 50 mL.

Sample solution: To a 50-mL volumetric flask add 3 g of Acesulfame Potassium. Dissolve in water, add 15.0 mL of Buffer solution, and dilute with water to volume.

Analysis

Samples: Standard solution A, Standard solution B, Standard solution C, Standard solution D, and Sample solution

Concomitantly measure the potential (see *Titrimetry* (541)), in mV, of the Standard solutions and the Sample solution, with a suitable pH meter equipped with a fluoride-specific ion electrode and a silver-silver chloride reference electrode. When taking the measurements, transfer the solution to a 25-mL beaker, and immerse the electrodes. Insert a polytetrafluoroethylene-coated stirring bar into the beaker, place the beaker on a magnetic stirrer having an insulated top, and allow to stir until equilibrium is attained (1–2 min). Rinse, and dry the electrodes between measurements, taking care not to scratch the crystal in the fluoride-specific ion electrode. Measure the potential of each Standard solution, and plot the fluoride concentration, in µg/mL, versus the potential, in mV, on semilogarithmic paper. Measure the potential of the Sample solution, and determine the fluoride concentration from the standard curve, in µg/mL.

Calculate the content, in ppm, of fluoride in the portion of Acesulfame Potassium taken:

$$\text{Result} = (V \times C / W)$$

V = volume of the Sample solution (mL)

C = concentration of fluoride in the Sample solution, from the standard curve (mg/mL)

W = weight of Acesulfame Potassium taken to prepare the Sample solution (g)

Acceptance criteria: NMT 3 ppm

HEAVY METALS, Method I (231): NMT 10 ppm

CHROMATOGRAPHIC PURITY

Solution A: 3.3 mg/mL of tetrabutylammonium hydrogen sulfate

Mobile phase: Acetonitrile and Solution A (2:3)

System suitability solution: 2 µg/mL each of USP Acesulfame Potassium RS and ethylparaben

Standard solution: 0.2 µg/mL of USP Acesulfame Potassium RS

Sample solution: 10 mg/mL

Chromatographic system

(See *Chromatography* (621), System Suitability.)

Mode: LC

Detector: UV 227 nm

Column: 4.6-mm × 25-cm; 5-µm packing L1

Flow rate: 1 mL/min

Injection size: 20 µL

System suitability

Sample: System suitability solution

Suitability requirements

Resolution: NLT 2 between acesulfame potassium and ethylparaben

Analysis

Samples: Standard solution and Sample solution

Record the chromatograms for a run time NLT 3 times the retention time of the acesulfame potassium peak, and measure the area responses of the peaks.

Acceptance criteria: The response of any peak at a retention time other than that of acesulfame potassium

from the *Sample solution* does not exceed the response of the acesulfame potassium peak from the *Standard solution* (0.002%).

SPECIFIC TESTS

• ACIDITY OR ALKALINITY

Sample solution: 4.0 g in 20 mL of carbon dioxide-free water

Analysis: Add 0.1 mL of bromothymol blue TS. If the solution is yellow, titrate with 0.01 N sodium hydroxide to produce a blue color. If the solution is blue, titrate with 0.01 N hydrochloric acid to produce a yellow color.

Acceptance criteria: NMT 0.2 mL of 0.01 N sodium hydroxide or NMT 0.2 mL of 0.01 N hydrochloric acid is required.

- **LOSS ON DRYING** (731): Dry a sample at 105° for 3 h: it loses NMT 1.0% of its weight.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in a well-closed container, and protect from light. Store at room temperature.
- **USP REFERENCE STANDARDS** (11)
USP Acesulfame Potassium RS

Acetic Acid

Acetic acid;
Acetic acid [64-19-7].

DEFINITION

Acetic Acid is a solution containing NLT 36.0% and NMT 37.0%, by weight, of C₂H₄O₂.

IDENTIFICATION

- **A. IDENTIFICATION TESTS—GENERAL, Acetate** (191): Meets the requirements

ASSAY

• PROCEDURE

Analysis: Place 6 mL in a tared, glass-stoppered flask, and weigh. Add 40 mL of water, then add phenolphthalein TS. Titrate with 1 N sodium hydroxide VS. Each mL of 1 N sodium hydroxide is equivalent to 60.05 mg of C₂H₄O₂.

Acceptance criteria: 36.0%–37.0%

IMPURITIES

• NONVOLATILE RESIDUE

Analysis: Evaporate 20 mL in a tared porcelain dish on a steam bath, and dry at 105° for 1 h.

Acceptance criteria: The weight of the residue does not exceed 1.0 mg (0.005%).

• CHLORIDE

Sample solution: Acetic acid (1 in 10) in water

Analysis: To 10 mL of the *Sample solution* add 5 drops of silver nitrate TS.

Acceptance criteria: No opalescence is produced.

• SULFATE

Sample solution: Acetic acid (1 in 10) in water

Analysis: To 10 mL of the *Sample solution* add 5 drops of barium chloride TS.

Acceptance criteria: No turbidity is produced.

• HEAVY METALS (231)

Sample solution: To the residue obtained in the test for *Nonvolatile Residue* add 8 mL of 0.1 N hydrochloric acid, warm gently until completely dissolved, and dilute with water to 100 mL. Use 10 mL of this solution.

Acceptance criteria: NMT 10 ppm

• READILY OXIDIZABLE SUBSTANCES

Analysis: Dilute 4.0 mL in a glass-stoppered vessel with 20 mL of water, and add 0.30 mL of 0.10 N potassium permanganate.

Acceptance criteria: The pink color is not changed to brown at once, and the liquid does not become entirely brown or free from a pink tint in less than 30 s.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.

Diluted Acetic Acid

DEFINITION

Diluted Acetic Acid is a solution containing, in each 100 mL, NLT 5.7 g and NMT 6.3 g of acetic acid (C₂H₄O₂).

Prepare Diluted Acetic Acid as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* (795)).

Acetic Acid	158 mL
Purified Water, a sufficient quantity to make	1000 mL

Mix the ingredients.

IDENTIFICATION

- **A. IDENTIFICATION TESTS—GENERAL, Acetate** (191): Meets the requirements

ASSAY

• PROCEDURE

Sample: 25 mL

Analysis: To the *Sample* add 15 mL of carbon dioxide-free water. Add phenolphthalein TS, and titrate with 1 N sodium hydroxide VS. Each mL of 1 N sodium hydroxide is equivalent to 60.05 mg of acetic acid (C₂H₄O₂).

Acceptance criteria: 5.7–6.3 g of acetic acid per 100 mL of Diluted Acetic Acid

IMPURITIES

• HEAVY METALS, Method I (231)

Test preparation: Evaporate 5 mL in a porcelain dish on a steam bath to dryness. Warm the residue with 2 mL of 1 N acetic acid, and dilute with water to 50 mL. Dilute 20 mL of this solution with water to 25 mL.

Acceptance criteria: NMT 10 ppm

• LIMIT OF CHLORIDE

Sample solution: A solution of Diluted Acetic Acid in water (6 in 10)

Analysis: Add 5 drops of silver nitrate TS to 10 mL of the *Sample solution*.

Acceptance criteria: No opalescence is found.

• LIMIT OF SULFATE

Sample solution: A solution of Diluted Acetic Acid in water (6 in 10)

Analysis: Add 5 drops of barium chloride TS to 10 mL of the *Sample solution*.

Acceptance criteria: No turbidity is produced.

• LIMIT OF NONVOLATILE RESIDUE

Sample: 20 mL

Analysis: Evaporate the *Sample* in a tared porcelain dish on a steam bath, and dry it at 105° for 1 h.

Acceptance criteria: The weight of the residue does not exceed 1.0 mg (NMT 0.005%).

SPECIFIC TESTS

• READILY OXIDIZABLE SUBSTANCES

Sample: 20 mL in a glass-stoppered flask

Analysis: Add 0.30 mL of 0.10 N potassium permanganate to the *Sample*.

Acceptance criteria: The pink color is not changed to brown immediately, and the liquid does not become entirely brown or free from a pink tint in less than 30 s.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.

Acetic Acid, Glacial—see *Glacial Acetic Acid General Monographs*

Acetone

C₃H₆O 58.08
2-Propanone;
Acetone [67-64-1].

DEFINITION

Acetone contains NLT 99.0% of C₃H₆O, calculated on the anhydrous basis.

[**CAUTION**—Acetone is very flammable. Do not use where it may be ignited.]

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197F)
- **B.** The retention time of the *Sample* corresponds to that of USP Acetone RS, as obtained in the Assay.

ASSAY

PROCEDURE

Sample: Acetone

System suitability solution: Dilute 1.0 mL of USP Methyl Alcohol RS and 1.0 mL of USP Acetone RS with tetrahydrofuran to 50 mL.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 0.32-mm × 30-m fused-silica capillary; 1.8-μm of phase G43

Temperature

Column: See *Table 1*.

Table 1

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
40	0	40	5
40	20	240	—

Injector: 200°

Detector: 280°

Carrier gas: Helium

Flow rate: 35 cm/s (linear velocity)

Split ratio: 400:1

Injection volume: 1 μL

System suitability

Sample: *System suitability solution*

[NOTE—The relative retention times for methyl alcohol, acetone, and tetrahydrofuran are about 0.6, 1.0, and 1.9, respectively.]

Suitability requirements

Resolution: NLT 15 between the methyl alcohol and acetone peaks

Analysis

Sample: *Sample*

Calculate the percentage of acetone (C₃H₆O) in the portion of Acetone taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = peak area due to the acetone peak in the *Sample*

r_T = sum of the areas of all the peaks in the *Sample*

[NOTE—No separate correction is applied for water content, because water does not respond to the flame-ionization detector.]

Acceptance criteria: NLT 99.0% on the anhydrous basis

SPECIFIC TESTS

- **SPECIFIC GRAVITY** (841): NMT 0.789

- **NONVOLATILE RESIDUE:** Evaporate 50 mL in a tared porcelain dish on a steam bath, and dry at 105° for 1 h. **Acceptance criteria:** The weight of the residue does not exceed 2 mg (0.004%).

WATER

Sample: Acetone

Standard solution: Transfer 0.50 mL of water to a dry 100-mL volumetric flask, dilute with dehydrated isopropyl alcohol to volume, and mix.

Blank: Dehydrated isopropyl alcohol

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: GC

Detector: Thermal conductivity

Column: 0.32-mm × 50-m capillary; 5.0-μm layer of support S2

Temperature

Column: See *Table 2*.

Table 2

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
100	25	190	—

Injector: 250°

Detector: 250°

Carrier gas: Helium

Flow rate: 11 mL/min

Split ratio: 4.5:1

Injection size: 1.0 μL

Analysis

Samples: Acetone, *Standard solution*, and *Blank*

[NOTE—Identify the peaks based on their relative retention times, which are 1.0 for water and about 1.9 for isopropyl alcohol.]

Acceptance criteria: The area of the water peak for Acetone is NMT that from the *Standard solution*, corrected for the area of the water peak from the *Blank* (0.5%).

READILY OXIDIZABLE SUBSTANCES

Analysis: Mix 20 mL with 0.10 mL of 0.10 N potassium permanganate in a glass-stoppered bottle.

Acceptance criteria: The permanganate color of the mixture does not completely disappear within 15 min.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, remote from fire.

- **USP REFERENCE STANDARDS** (11)

USP Acetone RS

USP Methyl Alcohol RS

Acetylcysteine—see Acetylcysteine General Monographs

Acetyltributyl Citrate

C₂₀H₃₄O₈

402.48

DEFINITION

Acetyltributyl Citrate contains NLT 99.0% of C₂₀H₃₄O₈, calculated on the anhydrous basis.

IDENTIFICATION

- A. INFRARED ABSORPTION** (197F)
- B.** The retention time of the *Sample solution* corresponds to that of a similar preparation of USP Acetyltriethyl Citrate RS, as obtained in the Assay.

ASSAY

PROCEDURE

System suitability solution: 30 mg/mL each of USP Acetyltributyl Citrate RS and USP Tributyl Citrate RS in toluene

Sample solution: 30 mg/mL of Acetyltributyl Citrate in toluene

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 0.32-mm × 30-m, bonded with a 0.5-μm layer of phase G42

Temperature

Injector: 240°

Detector: 280°

Column: See the temperature program table below.

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
80	—	80	0
80	20	230	15

Flow rate: 1.9 mL/min

Carrier gas: Helium

Injection type: Split, 30:1

Injection size: 1 μL

System suitability

Sample: *System suitability solution*

[NOTE—The relative retention times for tributyl citrate and acetyl tributyl citrate are 0.9 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 1.5 between tributyl citrate and acetyl tributyl citrate

Relative standard deviation: NMT 2.0% determined from both the tributyl citrate and acetyl tributyl citrate peaks, based on area percent calculation

Analysis

Sample: *Sample solution*

[NOTE—Measure all of the peak areas, excluding the solvent peak.]

Calculate the percentage of C₂₀H₃₄O₈ in the portion of Acetyltributyl Citrate taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = peak area of the *Sample solution*

r_T = sum of all the peak areas

Acceptance criteria: NLT 99.0% on the anhydrous basis

IMPURITIES

Inorganic Impurities

- HEAVY METALS**, *Method II* (231): NMT 10 ppm

SPECIFIC TESTS

- SPECIFIC GRAVITY** (841): 1.045–1.055
- REFRACTIVE INDEX** (831): 1.4410–1.4425
- ACIDITY**

Neutralized isopropyl alcohol: To a suitable quantity of isopropyl alcohol add 2–3 drops of bromothymol blue TS and just sufficient 0.10 N sodium hydroxide dropwise to produce a faint blue color. [NOTE—Prepare *Neutralized isopropyl alcohol* just before use.]

Sample solution: 32.0 g of Acetyltributyl Citrate in 30 mL of *Neutralized isopropyl alcohol*

Analysis: Add bromothymol blue TS. Titrate with 0.10 N sodium hydroxide to a faint blue endpoint.

Acceptance criteria: NMT 1.0 mL of 0.10 N sodium hydroxide is required.

- WATER DETERMINATION**, *Method I* (921): NMT 0.25%

ADDITIONAL REQUIREMENTS

Activated Charcoal—see Activated Charcoal General Monographs**Adipic Acid**C₆H₁₀O₄

Hexanedioic acid;

1,4-Butanedicarboxylic acid [124-04-9].

146.14

DEFINITIONAdipic Acid contains NLT 99.0% and NMT 101.0% of C₆H₁₀O₄, calculated on the dried basis.**IDENTIFICATION**

- **A. INFRARED ABSORPTION (197K)**

ASSAY• **PROCEDURE**

Sample: 60 mg

Titrimetric system

(See *Titrimetry* (541).)

Mode: Direct titration

Titrant: 0.1 N sodium hydroxide VS

Blank: 50.0 mL of water

Endpoint detection: Colorimetric

Analysis: Dissolve the Sample in 50 mL of water. Add 0.2 mL of phenolphthalein TS, and titrate with 0.1 N sodium hydroxide VS to a permanent pale pink endpoint. Perform a blank determination. Calculate the percentage of adipic acid (C₆H₁₀O₄) in the Sample taken:

$$\text{Result} = [(V - B) \times N \times F \times 100]/W$$

 V = titrant volume consumed by the Sample (mL) B = titrant volume consumed by the Blank (mL) N = titrant actual normality (mEq/mL) F = equivalency factor, 73.1 mg/mEq W = weight of the Sample (mg)**Acceptance criteria:** 99.0%–101.0% on the dried basis**IMPURITIES**

- **RESIDUE ON IGNITION (281):** NMT 0.1%

• **LIMIT OF NITRATES****Standard stock solution:** 1.63 mg/mL of potassium nitrate**Standard solution:** Dilute 1 mL of the Standard stock solution with water to 10 mL. Dilute 1 mL of this solution with water to 50 mL to obtain a solution containing 2 µg/mL of nitrate.**Sample solution:** Transfer 5 g of Adipic Acid to a 50-mL volumetric flask. Dissolve in water, with heating, and dilute with water to volume. Allow to cool and crystallize, then pass through a sintered-glass filter. Wash the filter with water, and collect the filtrate and washings until a volume of 50 mL is obtained. [NOTE—This solution is also to be used for Chloride, Sulfate, Iron, and Heavy Metals.]**Control:** 2 mg/L of potassium permanganate**Analysis:** Transfer 1.0 mL of the Sample solution, 1.5 mL of the Standard solution, and 1 mL of water (blank) to three separate flasks. To each flask add 2 mL of concentrated ammonia, 0.5 mL of 10 mg/mL manganese sulfate, and 1 mL of 10 mg/mL sulfanilamide, and dilute each solution with water to 20 mL. Add 100 mg of zinc powder to each of the three flasks, and cool in an ice bath for 30 min, shaking the solutions periodically. Separately filter 10 mL of

each solution, cool in an ice bath, and then add 2.5 mL of hydrochloric acid and 1 mL of 10 mg/mL of naphthylethylenediamine dihydrochloride. Allow the solutions to stand at room temperature for 15 min.

System suitability: The test is invalid if the concomitantly prepared blank solution is darker than the *Control*.

Acceptance criteria: The color of the solution containing the *Sample solution* is not darker than the concomitantly prepared solution containing the *Standard solution* (NMT 30 ppm).

- **HEAVY METALS, Method I (231):** NMT 10 ppm

- **CHLORIDE AND SULFATE, Chloride (221)**

Sample: A 5-mL portion of the *Sample solution* from *Limit of Nitrates*

Analysis: Proceed as directed in the chapter.

Acceptance criteria: The *Sample* shows no more chloride than a corresponding 0.14-mL portion of 0.020 N hydrochloric acid (NMT 0.02%).

- **CHLORIDE AND SULFATE, Sulfate (221)**

Sample: A 5-mL portion of the *Sample solution* from *Limit of Nitrates*

Analysis: Proceed as directed in the chapter.

Acceptance criteria: The *Sample* shows no more sulfate than a corresponding 0.26-mL portion of 0.020 N sulfuric acid (NMT 0.05%).

- **IRON (241)**

Sample: A 10-mL portion of the *Sample solution* from *Limit of Nitrates*

Analysis: Proceed as directed in the chapter.

Acceptance criteria: NMT 10 ppm

SPECIFIC TESTS

- **MELTING RANGE OR TEMPERATURE (741):** 151°–154°
- **LOSS ON DRYING (731):** Dry a sample at 105° to constant weight; it loses NMT 0.2% of its weight.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in a tight containers. No storage requirements specified.
- **USP REFERENCE STANDARDS (11)**
USP Adipic Acid RS

Agar

[9002-18-0].

DEFINITION

Agar is the dried, hydrophilic, colloidal substance consisting of the polysaccharides extracted from *Gelidium cartilagineum* (Linné) Gaillon (Fam. Gelidiaceae), *Gracilaria confervoides* (Linné) Greville (Fam. Sphaerococcaceae), and related red algae (Class Rhodophyceae).

IDENTIFICATION

- **A. INFRARED ABSORPTION (197K)**
- **B.** Iodine TS colors some of the fragments of Agar bluish black, with some areas reddish to violet.
- **C.**
Analysis: Boil a sample with 65 times its weight of water for 10 min, with constant stirring, and subsequently adjust with hot water to a concentration of 1.5%, by weight.
Acceptance criteria: Agar forms a clear liquid that congeals at 30°–39° to form a firm resilient gel, which does not liquefy below 80°.

IMPURITIES

Inorganic Impurities

- **ARSENIC, Method II (211):** NMT 3 ppm
- **LEAD (251):** NMT 10 ppm
- **HEAVY METALS, Method II (231):** NMT 40 ppm

- **ARTICLES OF BOTANICAL ORIGIN, Acid-Insoluble Ash (561):** NMT 0.5%, on a dry-weight basis

Organic Impurities

- **PROCEDURE 1: LIMIT OF GELATIN**

Sample solution: Dissolve 1 g of sample in 100 mL of boiling water. Allow to cool to about 50°.

Analysis: To 5 mL of the *Sample solution* add 2–3 drops of a mixture of 0.2 M potassium dichromate solution and 3 N hydrochloric acid (4:1).

Acceptance criteria: No yellow precipitate is formed.

- **PROCEDURE 2: LIMIT OF FOREIGN STARCH**

Sample solution: Boil 0.10 g in 100 mL of water.

Acceptance criteria: The *Sample solution* does not, upon cooling, produce a blue color upon the addition of iodine TS.

- **PROCEDURE 3: LIMIT OF FOREIGN INSOLUBLE MATTER**

Sample dispersion: Add sufficient water to 7.5 g of sample to make 500 g, boil for 15 min, and readjust to the original 500 g.

Analysis: To 100 g of the uniformly mixed *Sample dispersion* add hot water to make 200 mL. Heat almost to boiling, filter while hot through a tared filtering crucible. Rinse the container with several portions of hot water, and pass these rinsings through the crucible. Dry the crucible and its contents at 105° to a constant weight.

Acceptance criteria: NMT 15 mg (1.0%) remains in the crucible.

- **PROCEDURE 4: ARTICLES OF BOTANICAL ORIGIN, Foreign Organic Matter (561):** NMT 1.0%

SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS (61) and TESTS FOR SPECIFIED MICROORGANISMS (62):** The total aerobic microbial count does not exceed 10³ cfu/g, and the total combined molds and yeasts count does not exceed 10² cfu/g. It meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*.

- **WATER DETERMINATION, Method III (921)**

Analysis: If necessary, cut a sample into pieces from a 2- to 5-mm square, and dry at 105° for 5 h.

Acceptance criteria: The sample loses NMT 20.0% of its weight.

- **ARTICLES OF BOTANICAL ORIGIN, Total Ash (561):** NMT 6.5%, on a dry-weight basis

- **WATER ABSORPTION**

Sample: 5.0 g

Analysis: Place the *Sample* in a 100-mL graduated cylinder, fill to the mark with water, mix, and allow to stand at 25° for 24 h. Pour the contents of the cylinder through moistened glass wool, allowing the water to drain into a second 100-mL graduated cylinder.

Acceptance criteria: NMT 75 mL of water is obtained.

- **BOTANIC CHARACTERISTICS**

Agar: Usually occurs in bundles consisting of thin, membranous, agglutinated strips or in cut, flaked, or granulated forms. It may be colored weak yellowish orange, yellowish gray to pale yellow, or colorless. It is tough when damp, brittle when dry.

Histology: When mounted in water, Agar appears granular and somewhat filamentous; a few fragments of the spicules of sponges and a few frustules of diatoms may be present. In Japanese Agar, the frustules of *Arachnoidiscus ehrenbergii* Baillon often occur, being disk-shaped and 100–300 µm in diameter.

Powdered agar: White to yellowish white or pale yellow; in chloral hydrate TS, its fragments are transparent, more or less granular, striated, and angular, and occasionally they contain frustules of diatoms.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers. No storage requirements are specified.
- **USP REFERENCE STANDARDS (11)**

C₂₉₃₆H₄₆₂₄N₇₈₆O₈₈₉S₄₁ 66,438 Da

DEFINITION

Recombinant Albumin Human (rAlbumin Human or rHA) is produced by recombinant DNA expression in *Saccharomyces cerevisiae*. Structural equivalence (primary, secondary, and tertiary) between rHA and human serum albumin (HSA) has been demonstrated. It consists of three domains composed of 585 amino acids containing a single tryptophan (Trp₂₁₄), one free thiol (Cys₃₄), and 17 disulfide bridges. It is presented as a sterile and nonpyrogenic aqueous liquid consisting of a 10% (w/v) or 20% (w/v) solution in Water for Injection. No human- or animal-derived raw material is involved in its manufacture. It contains NLT 95% and NMT 105% of the labeled amount and NLT 99% of its total protein is albumin. It contains no added antimicrobial agents, but it may contain appropriate stabilizing agents. The presence of process-related impurities, host cell DNA, and host cell proteins is process specific; suitable limits should be determined by appropriately validated methods. However, the limit for host cell proteins should be NMT 0.15 µg/g.

IDENTIFICATION

A. PEPTIDE MAPPING

[NOTE—See *Biotechnology-Derived Articles—Peptide Mapping* (1055) for guidance.]
Tris buffer: 0.1 M tris(hydroxymethyl)aminomethane. Adjust with hydrochloric acid to a pH of 8.0.
Dilute Tris buffer: Tris buffer and water (50:50)
Solution A: Trifluoroacetic acid and water (1:1000)
Solution B: To 350 mL of acetonitrile add 150 mL of water and 425 µL of trifluoroacetic acid.
Dithiothreitol solution: 0.1 M dithiothreitol
Iodoacetamide solution: 0.1 M iodoacetamide in Tris buffer
Trypsin solution: 1 mg/mL of trypsin in 10 mM hydrochloric acid
EDTA solution: 0.1 M ethylenediaminetetraacetic acid (EDTA) in water
Diluent: To 5.76 g of guanidine hydrochloride add 5 mL of Dilute Tris buffer and 200 µL of EDTA solution. Dilute with Dilute Tris buffer to a final volume of 10 mL.
Standard solution: Add 20 µL of USP rAlbumin Human RS to 80 µL of Diluent. Add 5 µL of Dithiothreitol solution, and incubate at 37° for 75 min. Add 10 µL of Iodoacetamide solution, and incubate for an additional 75 min at 37° in the dark. Add 100 µL of Dilute Tris buffer, 400 µL of water, and 10 µL of Trypsin solution, and incubate at 37° with shaking for 24 h. Centrifuge, and dilute a portion of the supernatant in Solution A (50:50).

Sample solution: 50 mg/mL of rAlbumin Human in water. To 20 µL of this solution add 80 µL of Diluent. Add 5 µL of Dithiothreitol solution, and incubate at 37° for 75 min. Add 10 µL of Iodoacetamide solution, and incubate for an additional 75 min at 37° in the dark. Add 100 µL of Dilute Tris buffer, 400 µL of water, and 10 µL of Trypsin solution, and incubate at 37° with shaking for 24 h. Pulse centrifuge, and dilute a portion of the supernatant in Solution A (50:50).
Mobile phase: See Table 1.

Table 1

Time (min)	Solution A (%)	Solution B (%)	Flow Rate (mL/min)
0	95	5	0.5
5	95	5	0.5
75	60	40	0.5
100	40	60	0.5
104	0	100	0.5
108	0	100	0.5
109	95	5	1.0
115	95	5	1.0
116	95	5	0.5
120	95	5	0.5

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC
Detector: UV 214 nm
Column: 4.6-mm × 25-cm; 5-µm packing L1
Column temperature: 35°
Flow rate: See Table 1.
Injection volume: 100 µL

Analysis

Samples: Standard solution and Sample solution
Acceptance criteria: The peptide map chromatographic profiles of the Sample solution are similar to those of the Standard solution.

B. ELECTROSPRAY MASS SPECTROMETRY

Solution A: Trifluoroacetic acid and water (1:1000)
Solution B: To 140 mL of acetonitrile add 60 mL of water and 180 µL of trifluoroacetic acid.
Solution C: Acetonitrile and water (50:50)
Solution D: To 5 mL of Solution C add 10 µL of formic acid.
System suitability solution: Dissolve 2 mg of horse heart myoglobin in 589 µL of Water for Injection. Dilute 25 µL of this solution with 475 µL of Solution D.
Sample solution: 10 mg/mL of rAlbumin Human in water
Mobile phase: See Table 2.

Table 2

Time (min)	Solution A (%)	Solution B (%)
0	95	5
5	95	5
10	0	100
15	0	100

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC
Detector: UV 280 nm
Column: 2.1-mm × 3-cm; desalting cartridge, equilibrated with Solution C¹

¹ A suitable reverse-phase desalting column is available from Perkin Elmer (No. 0711-0056).

Flow rate: 0.2 mL/min

Injection volume: 20 µL of the *Sample solution*

Analysis: Desalt the *Sample solution*, and collect the eluate. Ensure that a single protein peak elutes.

Spectrometric system

(See *Mass Spectrometry* (736).)

Mode: LC/MS (using infusion pump)

[NOTE—The infusion system flow rate can be adjusted as needed. To assist in nebulization, the infusion system can contain a sheathing gas fluid.]

Mobile phase: *Solution C*

Detector: Electrospray in the positive ion mode

Injection volume: 50 µL of desalted *Sample solution*

System suitability

Sample: *System suitability solution*

Suitability requirements

Peak position: A single peak in the 16,949–16,953 Da range is found.

Analysis: Obtain and transform the spectrogram for the desalted *Sample solution*.

Acceptance criteria: The mass is within 20 Da of the theoretical mass.

ASSAY

• **ALBUMIN CONTENT**

Stock sample buffer:² Mix 4 mL of 0.5 M Tris hydrochloride pH 8.6, 0.5 mL of 0.1% bromophenol blue, 2.0 mL of glycerol, and dilute with water to 1000 mL.

Diluted sample buffer: *Stock sample buffer* and water (1:1)

Native stock running buffer:³ 29 mg/mL of Tris base and 144 mg/mL of glycerol

Running buffer: *Native stock running buffer* and water (1:9)

Gel-staining solution: A suitable Coomassie G-250-based solution⁴

Native PAGE gel: Prepare a 14% Tris-Glycine gel.⁵

Sample solution: 4 mg/mL of rAlbumin Human in water. Dilute this solution with *Stock sample buffer* to 2 mg/mL.

Calibration solutions: Dilute the *Sample solution* quantitatively, and stepwise if necessary, with *Diluted sample buffer* to 100, 20, 15, 10, 5, 2, and 1 µg/mL of rAlbumin Human.

Electrophoretic system

(See *Electrophoresis* (726).)

Run buffer: *Running buffer*

Voltage: 125 V

Amperage: 35 mA

Wattage: 5.0 W

Run time: Approximately 2 h

Loading volume: 10 µL

Analysis

Samples: *Sample solution* and *Calibration solutions*

Gel loading scheme

Lane 1: 1 µg/mL *Calibration solution*

Lane 2: 2 µg/mL *Calibration solution*

Lane 3: 5 µg/mL *Calibration solution*

Lane 4: 10 µg/mL *Calibration solution*

Lane 5: 15 µg/mL *Calibration solution*

Lane 6: 20 µg/mL *Calibration solution*

Lane 7: *Diluted sample buffer*

Lane 8: *Sample solution*

Lane 9: *Sample solution*

Lane 10: *Diluted sample buffer*

Gel staining: Place the gel in 100 mL of water, and shake gently with circumgyration for about 30 min. Pour approximately 50 mL of *Gel-staining solution* into a staining container. Place the gel into the staining container, and allow the stain to completely cover

the gel. Place the staining container on an orbital shaker, and stain the gel for 120 min with gentle shaking.

Destaining: Drain the *Gel-staining solution*, and add 100 mL of water to the container to cover the gel. Place the container on an orbital shaker, and shake at low speed for about 60 min. Change the water, and repeat for a total of two washes.

Gel scan procedure: Set up a gel scanner according to the manufacturer's instructions. Place the gel in the detector, and obtain a single image of all 10 lanes of the gel.

Data analysis: Perform image analysis of *Lanes 1–6* to generate a linear calibration curve. Determine the linear regression equation of the standards by the least-squares method, with standard concentrations, in ng, as the dependent variable (*x*), and the sample band intensity (optical density) as the independent variable (*y*). Record the linear regression equation and the correlation coefficient, *r*. A suitable system is one that yields a line having an *r*² of NLT 0.990.

Examine *Lanes 8* and *9* (the *Sample solution* lanes) for the presence of bands below the main albumin band. If bands are present below the main albumin band in either or both lanes, quantify the relative amount, in ng, of protein present in each band against the calibration curve. Convert the quantified value to a contaminant level in percentage by dividing the quantified value by a factor of 200.

Calculate the purity of the *Sample solution*:

$$\text{Result} = 100 - C_i$$

C_i = mean of the percentages of contaminant levels found in *Lanes 8* and *9* (all the bands other than the albumin band), disregarding any band due to the *Diluted sample buffer*

Acceptance criteria: *Sample solution* purity is NLT 99.0%. [NOTE—The main albumin band is not quantitated. See the test for *Total Protein*.]

• **TOTAL PROTEIN**

Sodium chloride solution: 0.15 M sodium chloride in water

Copper sulfate solution: 60 mg/mL of copper sulfate pentahydrate and 600 mg/mL of potassium sulfate⁶ in sulfuric acid low in nitrogen

Sample solution: Dilute 0.5 g of rAlbumin Human with 2.5 mL of *Sodium chloride solution* (equivalent to about 3.3 mg/mL of total protein).

Blank: 33.3 mg/mL of glycine in *Sodium chloride solution*

Analysis: To 3.0 mL of the *Sample solution* and the *Blank*, in suitable distillation tubes, add 5 mL of *Copper sulfate solution*. Incubate at 420° for a minimum of 2 h, or until the residues appear white. When the solutions are cool, transfer the residues quantitatively with a minimum quantity of water to a micro-Kjeldahl flask, and determine the residues, using *Nitrogen Determination* (461), *Method II*. Multiply the result, corrected for the *Blank* and for the specific gravity of the *Sample solution*, by 6.25 to calculate the quantity of protein.

Acceptance criteria: 95%–105% of the quantity of protein stated on the label

OTHER COMPONENTS

• **SODIUM CONTENT**

Diluent: 1.0 mg/mL of cesium chloride in water

Standard solutions: Prepare 0.5, 1.00, 1.50, and 2.00 mg/mL of sodium chloride in *Diluent*.

Sample solution: 80 µg/mL of rAlbumin Human in *Diluent*

² Available from Invitrogen (No. LC2673).

³ Available from Invitrogen (No. LC2672).

⁴ A suitable Coomassie stain is available from Pierce (No. 24890 or No. 24592).

⁵ Alternatively, a precast 14% Tris-Glycine gel is available from Invitrogen (No. EC6485).

⁶ Copper sulfate pentahydrate and potassium sulfate tablets (each tablet with 1.5 g of K₂SO₄ + 0.15 g of CuSO₄ · 5H₂O) are available from Foss (No. 15270054).

Apparatus**Mode:** Atomic absorption**Emission wavelength:** 589 nm**Analysis:** [NOTE—Use peak area measurements for quantitation.]**Samples:** *Diluent* (as blank), *Standard solutions*, and *Sample solution*

Introduce a blank solution (*Diluent*) into the atomic generator, and adjust the instrument reading to zero. Determinations are made by comparison with the *Standard solutions* of known concentration. If the *Sample solution* emission exceeds that of the *Standard solutions* with the highest concentration, dilute the *Sample solution* with *Diluent*. Introduce the most concentrated *Standard solution* into the instrument, and adjust the sensitivity to obtain a suitable reading. Introduce the *Sample solution* and *Standard solutions* into the instrument at least three times, and record the steady reading. Rinse the apparatus with blank solution each time, and ascertain that the reading returns to its initial blank value. Plot the mean of the readings obtained for the *Standard solutions* against their respective sodium concentrations. From the standard curve, calculate the sodium concentration content in the *Sample solution*, and adjust for the specific gravity of the rAlbumin Human (see *Total Protein*).

Acceptance criteria: 120–160 mM sodium**IMPURITIES****• LIMIT OF HIGH MOLECULAR WEIGHT PROTEINS****Solution A:** 200 mg/mL of sodium azide**Buffer:** Dissolve 54.2 g of dibasic sodium phosphate dihydrate, 30.0 g of monobasic sodium phosphate dihydrate, and 284.0 g of anhydrous sodium sulfate in 1600 mL of water. Add 50 mL of *Solution A*, and dilute with water to 2000 mL.**Mobile phase:** *Buffer* and water (10:90)**Sample solution:** 40 mg/mL of rAlbumin Human Chromatographic system(See *Chromatography* <621>, *System Suitability*.)**Mode:** LC**Detector:** UV 280 nm**Column:** 7.8-mm × 30-cm; 5-μm packing L59**Flow rate:** 1.0 mL/min**Injection volume:** 50 μL. [NOTE—The peak due to high molecular weight impurities, such as the polymer of albumin, appears in the void volume of the chromatogram.]**Analysis****Sample:** *Sample solution*

Calculate the percentage of albumin polymer in the sample:

$$\text{Result} = (r_U/r_T) \times 100$$

 r_U = peak response of albumin polymer r_T = sum of all rAlbumin Human related peak responses**Acceptance criteria****Individual impurities:** NMT 1.0%**SPECIFIC TESTS****• PH <791>****Sample solution:** 1% (w/v) protein solution diluted with 0.9% (w/v) sodium chloride**Acceptance criteria:** 6.4–7.4**• STERILITY TESTS <71>:** Meets the requirements**• BACTERIAL ENDOTOXINS TEST <85>:** NMT 0.5 USP Endotoxin Unit/mL of rAlbumin Human**ADDITIONAL REQUIREMENTS****• PACKAGING AND STORAGE:** Preserve in tight glass containers, and store at 2°–8°. USP Endotoxin RS

Alcohol—see *Alcohol General Monographs***Diluted Alcohol****DEFINITION**

Diluted Alcohol is a mixture of Alcohol and water containing NLT 41.0% and NMT 42.0% by weight, corresponding to NLT 48.4% and NMT 49.5% by volume, at 15.56°, of C₂H₅OH.

Diluted Alcohol may be prepared as follows.

Alcohol	500 mL
Purified Water	500 mL

Measure the *Alcohol* and the *Purified Water* separately at the same temperature, and mix. If the water and the *Alcohol* and the resulting mixture are measured at 25°, the volume of the mixture will be 970 mL.

SPECIFIC TESTS**• SPECIFIC GRAVITY <841>:** 0.935–0.937 at 15.56°, indicating 41.0%–42.0% by weight, or between 48.4% and 49.5% by volume, of C₂H₅OH**• OTHER REQUIREMENTS:** In other respects, it meets the requirements in *Alcohol*, allowance being made for the difference in alcohol concentration.**ADDITIONAL REQUIREMENTS****• PACKAGING AND STORAGE:** Preserve in tight containers, remote from fire.**• USP REFERENCE STANDARDS <11>**

USP Alcohol RS

Alfadex(C₆H₁₀O₅)₆

Alpha cyclodextrin [10016-20-3].

972.84

DEFINITION

Alfadex is composed of six alpha-(1-4) linked D-glucopyranosyl units. It contains NLT 98.0% and NMT 101.0% of alfadex (C₆H₁₀O₅)₆, calculated on the anhydrous basis.

IDENTIFICATION

- A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- B.** It meets the requirements of the test for *Optical Rotation* <781S>, *Specific Rotation*.

• **C.**

Sample: 0.2 g

Analysis: Mix the *Sample* with 2 mL of iodine TS, warm in a water bath to dissolve, and allow to stand at room temperature.

Acceptance criteria: A yellow-brown precipitate is formed.

ASSAY

• **PROCEDURE**

Mobile phase: Methanol and water (7:93)

System suitability solution: 0.5 mg/mL of USP Alpha Cyclodextrin RS, 0.5 mg/mL of USP Beta Cyclodextrin RS, and 0.5 mg/mL of USP Gamma Cyclodextrin RS

Standard solution: 1.0 mg/mL of USP Alpha Cyclodextrin RS

Sample stock solution: Transfer 250 mg of Alfadex to a 25-mL volumetric flask, and dissolve in water with the aid of heat. Cool, and dilute with water to volume.

Sample solution: 1.0 mg/mL of Alfadex, diluted from the *Sample stock solution*

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: Refractive index

Column: 4.6-mm × 15-cm; 5-μm packing L1

Temperature

Column: 30°

Detector: 40°

Flow rate: 1.5 mL/min

Injection volume: 50 μL

System suitability

Sample: *System suitability solution*

[NOTE—The relative retention times for gamma cyclodextrin, alpha cyclodextrin, and beta cyclodextrin are 0.8, 1.0, and 2.0, respectively.]

Suitability requirements

Resolution: NLT 1.5 between the gamma cyclodextrin and alpha cyclodextrin peaks

Tailing factor: 0.8–2.0 for the three cyclodextrins

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of alfadex ($C_6H_{10}O_5$)₆ in the portion of the sample taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of alpha cyclodextrin from the *Sample solution*

r_S = peak response of alpha cyclodextrin from the *Standard solution*

C_S = concentration of alpha cyclodextrin in the *Standard solution* (mg/mL)

C_U = concentration of alpha cyclodextrin in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–101.0% on the anhydrous basis

IMPURITIES

• **RESIDUE ON IGNITION** <281>

Sample: 1.0 g

Acceptance criteria: NMT 0.1%

• **HEAVY METALS, Method II** <231>: NMT 10 μg/g

• **LIMIT OF LIGHT-ABSORBING SUBSTANCES**

Sample solution: 10 mg/mL of Alfadex, calculated on the anhydrous basis, in water that has been previously boiled and cooled to room temperature. Pass through a filter of 0.2-μm pore size.

Analysis: Determine the absorbance of the *Sample solution* in a 1-cm cell with a suitable spectrophotometer, after correcting for the blank.

Acceptance criteria: Between 230 and 350 nm, the absorbance is NMT 0.10; and between 350 and 750 nm, the absorbance is NMT 0.05.

• **LIMIT OF BETADEx, GAMMA CYCLODEXTRIN, AND OTHER RELATED SUBSTANCES**

System suitability solution, Chromatographic system, and System suitability: Proceed as directed in the *Assay*.

Standard solution: *System suitability solution* and water (1:9)

Sample solution: Use the *Sample stock solution* prepared as directed in the *Assay*.

Analysis

Samples: *Standard solution* and *Sample solution*

Acceptance criteria

Beta cyclodextrin: The area of any peak corresponding to beta cyclodextrin is NMT 0.5 times the area of the corresponding peak from the *Standard solution* (0.25%).

Gamma cyclodextrin: The area of any peak corresponding to gamma cyclodextrin is NMT 0.5 times the area of the corresponding peak from the *Standard solution* (0.25%).

Other related substances: The sum of all of the peak areas, excluding the alpha cyclodextrin, beta cyclodextrin, and gamma cyclodextrin is NMT the area of the peak due to alpha cyclodextrin from the *Standard solution* (0.5%).

• **LIMIT OF REDUCING SUGARS**

Cupric solution: 150 mg/mL of cupric sulfate

Tartrate solution: 25 mg/mL of anhydrous sodium carbonate, 25 mg/mL of potassium sodium tartrate, 20 mg/mL of sodium bicarbonate, and 200 mg/mL of anhydrous sodium sulfate

Cupric-tartrate solution: Immediately before use, mix *Cupric solution* with *Tartrate solution* (1:25).

Ammonium molybdate reagent: Mix 10 mL of disodium arsenate solution (6 in 100), 50 mL of a solution of ammonium molybdate (1 in 10), and 90 mL of diluted sulfuric acid, and dilute with water to 200 mL.

Sample solution: 1.0 g of Alfadex, calculated on the anhydrous basis, in 100 mL of water that has been previously boiled and cooled to room temperature. To 1 mL of this solution add 1 mL of *Cupric-tartrate solution*. Heat on a water bath for 10 min, then cool to room temperature. Add 10 mL of *Ammonium molybdate reagent*, and allow to stand for 15 min.

Standard stock solution: 20 mg/L of USP Dextrose RS

Standard solution: Prepare as directed for the *Sample solution*, at the same time, except use 1 mL of *Standard stock solution* in place of 1 mL of 10 mg/mL of Alfadex solution.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* <851>.)

Mode: Vis

Analytical wavelength: 740 nm

Blank: Water

Analysis

Samples: *Sample solution* and *Standard solution*
Measure the *Samples* at the analytical wavelengths against the *Blank*.

Acceptance criteria: The absorbance of the *Sample solution* is NMT that of the *Standard solution* (0.2%).

SPECIFIC TESTS

• **CLARITY OF SOLUTION**

Sample: 10 mg/mL in previously boiled and cooled water

Acceptance criteria: The resulting solution is clear.

• **MICROBIAL ENUMERATION TESTS** <61> and **TESTS FOR SPECIFIED MICROORGANISMS** <62>: The total aerobic bacterial count does not exceed 10^3 cfu/g, the total combined molds and yeasts count does not exceed 10^2 cfu/g, and it meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*.

- **OPTICAL ROTATION, Specific Rotation (781S)**
Sample solution: 10 mg/mL
Acceptance criteria: +147° to +152°, determined at 20°
- **pH (791)**
Diluent: 224 g/L of potassium chloride
Sample solution: 30 mL of its aqueous solution (1 in 100) and 1 mL of *Diluent*
Acceptance criteria: 5.0–8.0
- **WATER DETERMINATION, Method I (921):** NMT 11.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers. No storage requirements specified.
- **USP REFERENCE STANDARDS (11)**
 USP Alpha Cyclodextrin RS
 USP Beta Cyclodextrin RS
 USP Dextrose RS
 USP Gamma Cyclodextrin RS

Alginate Acid

(C₆H₈O₆)_n

Alginate acid [9005-32-7].

DEFINITION

Alginate Acid is a hydrophilic colloidal carbohydrate extracted with dilute alkali from various species of brown seaweeds (Phaeophyceae).

IDENTIFICATION

- **A.**
Analysis: To 5 mL of a 1-in-150 solution in 0.1 N sodium hydroxide add 1 mL of calcium chloride TS.
Acceptance criteria: A voluminous, gelatinous precipitate is formed.
- **B.**
Analysis: To 5 mL of a 1-in-150 solution in 0.1 N sodium hydroxide add 1 mL of 4 N sulfuric acid.
Acceptance criteria: A heavy, gelatinous precipitate is formed.
- **C.**
Analysis: To 5 mg in a test tube add 5 mL of water, 1 mL of a freshly prepared 1-in-100 solution of 1,3-naphthalenediol in alcohol, and 5 mL of hydrochloric acid. Heat the mixture to boiling, boil gently for 3 min, then cool to 15°. Transfer the contents of the test tube to a 30-mL separator with the aid of 5 mL of water, and extract with 15 mL of isopropyl ether.
Acceptance criteria: The isopropyl ether extract exhibits a deeper purplish hue than that from a blank, similarly prepared.

IMPURITIES

- **ARSENIC, Method II (211):** NMT 3 ppm
- **LEAD (251)**
Standard solution: 5 mL of *Diluted Standard Lead Solution*
Test preparation: Add 1.0 g to 20 mL of nitric acid in a 250-mL conical flask, mix, and heat carefully until the Alginate Acid is dissolved. Continue heating until the volume is reduced to 7 mL. Cool rapidly to room temperature, transfer to a 100-mL volumetric flask, and dilute with water to volume.

Analysis: Use 50.0 mL of the *Test preparation*, and proceed as directed in the chapter, using 15 mL of ammonium citrate solution, 3 mL of potassium cyanide solution, and 0.5 mL of hydroxylamine hydrochloride solution. After the first dithizone extraction, wash the combined chloroform layers with 5 mL of water, discarding the water layer and continuing in the usual manner by extracting with 20 mL of 0.2 N nitric acid.

Acceptance criteria: NMT 5 µg of lead (corresponding to NMT 10 ppm)

- **HEAVY METALS, Method II (231)**

Analysis: Use a platinum crucible for the ignition, and use nitric acid in place of sulfuric acid to wet the test specimen.

Acceptance criteria: NMT 40 ppm

SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS (61) and TESTS FOR SPECIFIED MICROORGANISMS (62):** The total aerobic microbial count does not exceed 2×10^2 cfu/g, and the tests for *Salmonella* species and *Escherichia coli* are negative.
- **pH (791):** 1.5–3.5, in a 3-in-100 dispersion in water
- **LOSS ON DRYING (731):** Dry a sample at 105° for 4 h: it loses NMT 15.0% of its weight.
- **ARTICLES OF BOTANICAL ORIGIN, Total Ash (561)**
Sample: 4 g of Alginate Acid
Analysis: Proceed as directed in the chapter, carefully igniting the *Sample* in a tared platinum dish, until the residue is thoroughly carbonized (5 min). Then ignite in a muffle furnace at a temperature of $800 \pm 25^\circ$ until the carbon is completely burned off (20–35 min).
Acceptance criteria: NMT 4.0% of ash
- **FATS AND FIXED OILS, Acid Value (401)**

Sample: 1 g of Alginate Acid

Analysis: Suspend the *Sample* in a mixture of 50 mL of water and 30.0 mL of calcium acetate solution (11 in 250). Shake thoroughly, allow the mixture to stand for 1 h, and add phenolphthalein TS. Titrate the liberated acetic acid with 0.1 N sodium hydroxide VS. Perform a blank determination, and calculate the *Acid Value*:

$$\text{Result} = [(V_S - V_B) \times N \times F] / W$$

V_S = volume of 0.1 N sodium hydroxide VS consumed in the titration of the *Sample* (mL)

V_B = volume of 0.1 N sodium hydroxide VS consumed in the titration of the blank (mL)

N = normality of sodium hydroxide VS (mEq/mL)

F = equivalency factor of potassium hydroxide, 56.11 (mg/mEq)

W = weight of Alginate Acid taken (g)

Acceptance criteria: NLT 230 on the dried basis

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.

Alkyl (C12–15) Benzoate

C₂₀H₃₂O₂

Benzoic acid, C12–15 alkyl ester [68411-27-8].

304.47 (average)

DEFINITION

Alkyl (C12–15) Benzoate consists of esters of a mixture of C12 to C15 primary and branched alcohols and benzoic acid.

IDENTIFICATION

- **A.** Infrared absorption spectrum, obtained by spreading a capillary film of it between sodium chloride plates, exhibits maxima at 2800 cm⁻¹ (broad); 2950 cm⁻¹ (broad); 1730 cm⁻¹ (medium, sharp); 1270 cm⁻¹ (medium, sharp); and 710 cm⁻¹ (medium, sharp).

IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.5%

SPECIFIC TESTS

- **WATER DETERMINATION**, *Method I* (921): NMT 0.3%
- **SPECIFIC GRAVITY** (841): 0.915–0.935
- **FATS AND FIXED OILS**, *Acid Value* (401): NMT 0.5
- **REFRACTIVE INDEX** (831): 1.483–1.487 at 20°
- **FATS AND FIXED OILS**, *Saponification Value* (401)
Sample: 2 g of Alkyl (C12–15) Benzoate
Analysis: Transfer the *Sample* to a 200-mL flask. Proceed as directed in the chapter, except use 50.0 mL of 0.5 N alcoholic potassium hydroxide VS instead of 25.0 mL, maintaining reflux for 2 h instead of 30 min, and rinsing the reflux condenser with 25 mL of water after the reflux period.
Acceptance criteria: 169–182
- **ROTATIONAL RHEOMETER METHODS** (912)
Sample: 500 mL
Analysis: Transfer the *Sample* to a 600-mL tall-form beaker, and adjust the temperature to 25 ± 0.1°. Using a suitable rotational viscometer with a spindle having a cylinder 5.63 cm in diameter and 2.25 cm in height attached to a shaft 0.32 cm in diameter, the distance from the top of the cylinder to the lower tip of the shaft being 2.91 cm, and the immersion depth being 6.11 cm (No. 1 spindle), operate the viscometer at 100 rpm for 60 s, accurately timed, and record the scale reading. Convert the scale reading to centipoises by multiplying by the constant for the spindle and speed used.
Acceptance criteria: The average of three viscosities obtained is NMT 100 centipoises.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.

Almond Oil

Almond Oil [8007-69-0].

DEFINITION

Almond Oil is the refined fixed oil obtained by expression from the kernels of varieties of *Prunus dulcis* (Miller) D.A. Webb (formerly known as *Prunus amygdalus* Batsch) (Fam. Rosaceae), except for *Prunus dulcis* (Miller) D.A. Webb var. *amara* (De Candolle) Focke. It may contain suitable antioxidants.

IDENTIFICATION

- **A.** It meets the requirements in *Specific Tests for Fats and Fixed Oils, Fatty Acid Composition* (401).

SPECIFIC TESTS

- **FATS AND FIXED OILS**, *Acid Value* (401): NMT 0.5
- **FATS AND FIXED OILS**, *Fatty Acid Composition* (401): Almond Oil exhibits the following composition profiles of fatty acids.

Carbon-Chain Length	Number of Double Bonds	Percentage (%)
<16	0	≤0.1
16	0	4.0–9.0

Carbon-Chain Length	Number of Double Bonds	Percentage (%)
17	0	≤0.2
18	0	≤3.0
20	0	≤0.2
22	0	≤0.2
24	0	≤0.2
16	1	≤0.8
17	1	≤0.2
18	1	62.0–76.0
18	2	20.0–30.0
18	3	≤0.4
20	1	≤0.3
22	1	≤0.1

- **FATS AND FIXED OILS**, *Peroxide Value* (401): NMT 5.0
- **FATS AND FIXED OILS**, *Unsaponifiable Matter* (401): NMT 0.9%
- **SPECIFIC GRAVITY** (841): 0.910–0.915
- **STEROL COMPOSITION**

Separation of the sterols fraction

Reference solution A: 5% (w/v) of cholesterol in chloroform

Developing solvent system: Toluene and acetone (19:1) or hexane and ether (13:7)

Sample solution A: Weigh 5 g of Almond Oil into a 250-mL flask. Add 50 mL of 2 N alcoholic potassium hydroxide, and heat to gentle boiling with continuous vigorous stirring until saponification takes place (the solution becomes clear). Continue heating for an additional 20 min, and add 50 mL of water from the top of the condenser. Cool the flask to approximately 30°. Transfer the contents of the flask to a 500-mL separating funnel with several rinses of water, amounting in all to 50 mL. Add approximately 80 mL of ether, shake vigorously for approximately 30 s, and allow to settle. [NOTE—Any emulsion can be destroyed by adding small quantities of ethyl or methyl alcohol by means of a spray.]

Separate the lower aqueous phase, and collect it into a second separating funnel. Perform two further extractions on the water–alcohol phase in the same way, using 60–70 mL of ether on each occasion. Pool the ether extracts into a single separating funnel, and wash with water, 50 mL at a time, until the wash water is no longer alkaline to phenolphthalein. Dry the ether phase with anhydrous sodium sulfate, and filter on anhydrous sodium sulfate into a previously weighed 250-mL flask, washing the funnel and filter with small quantities of ether. Distill the ether down to a few mL, and bring to dryness under a slight vacuum or in a stream of nitrogen. Completely dry at 100° for approximately 15 min, and then weigh after cooling in a desiccator. Dissolve the unsaponifiables so obtained in chloroform to prepare a solution having a concentration of approximately 5%.

Sample solution B: Treat 5 g of canola oil in the same way as prescribed for Almond Oil in *Sample solution A*, beginning with “Add 50 mL of 2 N alcoholic potassium hydroxide”.

Sample solution C: Treat 5 g of sunflower oil in the same way as prescribed for Almond Oil in *Sample solution A*, beginning with “Add 50 mL of 2 N alcoholic potassium hydroxide”.

Analysis: Precondition the thin-layer chromatographic plate (see *Chromatography* (621)), 20-cm × 20-cm silica gel on polyester with a layer thickness of 200 μm and particle size of 5–17 μm, by immersing completely in the 0.2 N alcoholic potassium hydroxide for 10 s, then allow to dry in a fume cupboard for 2 h, and finally place at 100° for 1 h.

Remove from the validated heating device, and keep the plate in a desiccator until required for use. The plates must be used within 15 days. [NOTE—Thin-layer chromatographic plates without requiring the preconditioning are also commercially available.] Use a separate plate for each *Sample solution*.

Place the *Developing solvent system* in the chamber to a depth of approximately 1 cm. Close the chamber with the appropriate cover, and leave for at least 30 min. Strips of filter paper dipping into the eluant may be placed on the internal surfaces of the chamber. The *Developing solvent system* should be replaced for every test to ensure reproducible elution conditions.

Apply 0.3 mL of *Sample solution A* approximately 2 cm from the lower edge in a streak that is as thin and as uniform as possible. In line with the streak, place 2–3 μ L of *Reference solution A* at one end of the plate. Develop the chromatograms in an equilibrated chamber with a *Developing solvent system* until the solvent front reaches approximately 1 cm from the upper edge of the plate. Remove the plate from the developing chamber, and evaporate the solvent under a current of hot air (avoid excessive heat), or by leaving the plate for a short while under a hood. Spray the plate with a 0.2% alcoholic solution of 2,7-dichlorofluorescein, and examine in UV light at 254 nm.

[NOTE—The plates pretreated with UV indicator are also commercially available and used equivalently.]

In each of the plates, mark the limits of the sterol band identified through being aligned with the stain of *Reference solution A* along the edges of the fluorescence, and additionally include the area of the zones 2–3 mm above and below the visible zones corresponding to *Reference solution A*. Remove the silica gel in the marked area into a filter funnel with a G3 porous septum. Add 10 mL of hot chloroform, mix carefully with the metal spatula, filter under vacuum, and collect the filtrate in the conical flask attached to the filter funnel. Wash the residue in the funnel three times with ether, 10 mL each time, and collect the filtrate in the same flask attached to the funnel. Evaporate the filtrate to a volume of 4–5 mL, transfer the residual solution to a previously weighed 10-mL test tube with a tapering bottom and a sealing stopper, and evaporate to dryness by mild heating in a gentle stream of nitrogen. Dissolve the residue in a few drops of acetone, and evaporate again to dryness. Place at 105° for approximately 10 min, allow to cool in a desiccator, and weigh.

Treat *Sample solution B* and *Sample solution C* the same way as prescribed for *Sample solution A*.

Determination of the sterols

Sample solution D: To the test tube containing the sterol fraction separated from Almond Oil by thin-layer chromatography add a freshly prepared mixture of anhydrous pyridine, hexamethyldisilazane, and chlorotrimethylsilane (9:3:1) in the ratio of 50 μ L for every mg of sterols, avoiding any uptake of moisture.

[NOTE—This reagent is also commercially available and used equivalently.] Stopper the test tube, and shake carefully until the sterols are completely dissolved. Allow it to stand for at least 15 min at ambient temperature, and centrifuge for a few min if necessary. Use the supernatant. The slight opalescence that may form is normal and does not cause an anomaly. However, the formation of a white floc or the appearance of a pink color is indicative of the presence of moisture or deterioration of the reagent. If these occur, repeat the test.

Reference solution E: To 9 parts of the sterols separated from canola oil by thin-layer chromatography add 1 part of cholesterol. Treat the mixture in the same way as prescribed in *Sample solution D*.

Reference solution F: Treat the sterols separated from sunflower oil by thin-layer chromatography in the same way as prescribed in *Sample solution D*.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: Glass or fused-silica capillary column of length 20–30 m, internal diameter 0.25–0.32 mm, coated with a 0.10–0.30- μ m layer of stationary phase G27 or G36

Temperatures

Column: 260 \pm 5°

Detector: 290°

Injection port: 280°

Carrier gas: Either helium with a linear velocity of 20–35 cm/s or hydrogen with a linear velocity of 30–50 cm/s

Injection volume: 1 μ L

Injection type: Split, 50:1 to 100:1

System suitability

Samples: *Reference solution E* and *Reference solution F*

Suitability requirements

The retention time for β -sitosterol is 20 \pm 5 min, and all of the sterols present must be separated.

[NOTE—For peak identification purposes, the chromatogram *Reference solution E* shows four principal peaks corresponding to cholesterol, brassicasterol, campesterol, and β -sitosterol; the chromatogram obtained with *Reference solution F* shows four principal peaks corresponding to campesterol, stigmastanol, β -sitosterol, and Δ 7-stigmastanol. The retention times of the sterols with reference to β -sitosterol are given in *Table 1*.]

Table 1. Relative Retention Times of Sterols for Two Different Columns

Identification	G36 Column	G27 Column
Cholesterol	0.67	0.63
Brassicasterol	0.73	0.71
24-Methylene-cholesterol	0.82	0.80
Campesterol	0.83	0.81
Campestanol	0.85	0.82
Stigmastanol	0.88	0.87
Δ 7-Campesterol	0.93	0.92
Δ 5,23-Stigmastadienol	0.95	0.95
Clerosterol	0.96	0.96
β -Sitosterol	1.00	1.00
Sitostanol	1.02	1.02
Δ 5-Avenasterol	1.03	1.03
Δ 5,24-Stigmastadienol	1.08	1.08
Δ 7-Stigmastanol	1.12	1.12
Δ 7-Avenasterol	1.16	1.16

Analysis

Samples: *Sample solution D*, *Reference solution E*, and *Reference solution F*

Calculate the percentage of each individual sterol in the sterol fraction of Almond Oil taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = peak area due to the sterol component to be determined

r_T = sum of the peak areas due to the components indicated in *Table 1*

Acceptance criteria: Almond Oil exhibits the composition profiles of sterols given in *Table 2*.

Table 2

Component	Percentage (%)
Cholesterol	≤0.7
Brassicasterol	≤0.3
Campesterol	≤5.0
Stigmasterol	≤4.0
β-Sitosterol	73.0–87.0
Δ5-Avenasterol	≥5.0
Δ7-Stigmasterol	≥3.0
Δ7-Avenasterol	≤3.0

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant, and well-filled containers. No storage requirements specified.
- **LABELING:** Label it to indicate the name and quantity of any added antioxidants.

Aluminum Monostearate

Aluminum, dihydroxy(octadecanoato-O-)-;
Dihydroxy(stearato)aluminum [7047-84-9].

DEFINITION

Aluminum Monostearate is a compound of aluminum with a mixture of solid organic acids obtained from fats, and consists chiefly of variable proportions of aluminum monostearate and aluminum monopalmitate. It contains the equivalent of NLT 14.5% and NMT 16.5% of aluminum monostearate (Al_2O_3), calculated on the dried basis.

IDENTIFICATION

- **A. IDENTIFICATION TESTS—GENERAL, Aluminum (191)**

Sample: 1 g

Analysis: Heat the *Sample* with a mixture of 25 mL of water and 5 mL of hydrochloric acid for 1 h, replacing the water as it evaporates.

Acceptance criteria: Fatty acids are liberated, floating as an oily layer on the surface of the liquid, and the water layer meets the requirements.

- **B. FATS AND FIXED OILS, Solidification Temperature of Fatty Acids (401)**

Sample: 25 g

Analysis: Mix intimately the *Sample* with 100 mL of ether in a 500-mL flask. Add 150 mL of 3 N hydrochloric acid, attach a water-cooled condenser, and heat on a steam bath under reflux for 15 min. Cool, and transfer both layers to a separator with the aid of an additional 100 mL of ether. Shake vigorously, and allow the layers to separate. Remove the water layer, and wash the ether layer with three 30-mL portions of water. Transfer the ether layer to a small beaker, warm on a steam bath until the ether has evaporated and the fatty acids are clear, and dry the acids at 105° for 20 min.

Acceptance criteria: NLT 54°

ASSAY

- **PROCEDURE**

Sample: 5 g

Analysis

Sample: *Sample*

Weigh the *Sample* in a covered platinum crucible that previously has been ignited for 20 min, cooled over anhydrous magnesium perchlorate, and weighed. Heat the open crucible gently, without allowing the *Sample* to burst into flame, and gradually increase the heat until the ash is white. Ignite the ash for 20 min after the organic matter is removed, and cool. Add 15 mL

of water, cover the crucible with a small watch glass, and boil gently for 5 min, using a small stirring rod to break up any large lumps of ash. Decant the solution through ashless filter paper, retaining most of the ash in the crucible. Repeat the extraction with water twice, passing the solutions through the same filter. Transfer the ash to the filter by means of a fine stream of water, and wash the crucible and the residue three times with warm water. Transfer the filter paper and the residue to the crucible, dry, and ignite for 20 min after the filter paper has burned away. Following the ignition period, cover the crucible, cool over anhydrous magnesium perchlorate for 15 min, and weigh the residue of Al_2O_3 rapidly. Repeat the ignition until constant weight is attained, using 20-min ignition periods and 15-min cooling periods. From the weight of the residue remaining in the crucible, calculate the content of Al_2O_3 .

Acceptance criteria: 14.5%–16.5% on the dried basis

IMPURITIES

- **ARSENIC, Method I (211)**

Test preparation: To 3.75 g add 12.5 mL of hydrochloric acid and 0.5 mL of bromine TS, and heat on a steam bath until a transparent layer of melted fatty acid forms. Add 50 mL of water, heat on a hot plate until the volume is about 25 mL, and filter while hot. Cool, dilute the filtrate with water to 50 mL, and to a 10-mL aliquot of this solution add 2.5 mL of hydrochloric acid, then dilute with water to 55 mL.

Acceptance criteria: NMT 4 µg/g; the *Test preparation* meets the requirements, omitting the addition of 20 mL of 7 N sulfuric acid specified for *Procedure*.

- **HEAVY METALS (231)**

Test preparation: To 2 g contained in a 250-mL flask add 20 mL of water and 10 mL of hydrochloric acid. Place a small funnel in the neck of the flask, and boil gently, replacing the water as it evaporates, until the fatty acids separate in a clear layer. Cool rapidly by rotating under a stream of cold water until the fatty acids solidify. Decant through a filter previously washed with 3 N hydrochloric acid, wash until the combined filtrate and washings measure 50 mL, and mix.

Standard solution: To 10 mL of the *Test preparation* add 2 mL of *Standard Lead Solution*, and dilute with water to 20 mL.

Analysis: To 20 mL of the *Test preparation* and the *Standard solution* add 6 N ammonium hydroxide, dropwise, until a permanent turbidity forms. Add 1 N acetic acid until the precipitate just dissolves, then add 2 mL in excess, and add water to make 40 mL. Add 1.2 mL of thioacetamide–glycerin base TS and 2 mL of pH 3.5 *Acetate Buffer*, and allow to stand for 5 min.

Acceptance criteria: NMT 50 µg/g; any brown color produced in the *Test preparation* is not darker than that of the *Standard solution*.

SPECIFIC TESTS

- **LOSS ON DRYING (731)**

Analysis: Dry at 80° for 16 h.

Acceptance criteria: NMT 2.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.

Aluminum Oxide

Al_2O_3
[1344-28-1].

101.96

DEFINITION

Aluminum Oxide contains NLT 47.0% and NMT 60.0% of Al_2O_3 .

IDENTIFICATION

- IDENTIFICATION TESTS—GENERAL, Aluminum <191>**

Sample: 2.5 g

Analysis: Dissolve the *Sample* in 15 mL of hydrochloric acid on a heated water bath. Dilute with water to 100 mL.

Acceptance criteria: Meets the requirements

ASSAY

- PROCEDURE**

Sample: 800 mg

Analysis: Add the *Sample* to 10 mL of 2 M hydrochloric acid on a heated water bath. Cool, and dilute with water to 50.0 mL. To 10.0 mL of the solution, add dilute ammonia solution (460 mL of strong ammonia solution/L) until a precipitate begins to appear. Add the smallest quantity of 0.6 M hydrochloric acid needed to dissolve the precipitate, and dilute with water to 20 mL. Transfer 20 mL of the *Sample* to a 500-mL conical flask, add 25.0 mL of 0.1 M edetate disodium and 10 mL of a mixture of equal volumes of a 155 g/L solution of ammonium acetate and 2 N acetic acid. Boil for 2 min, then cool. Add 50 mL of ethanol and 3 mL of a freshly prepared 250 mg/L solution of dithizone in alcohol. Titrate (see *Titrimetry* (541)) the excess of edetate sodium with 0.1 M zinc sulfate until the color changes from greenish-blue to reddish-violet. Each mL of 0.1 M edetate sodium is equivalent to 5.098 mg of Al_2O_3 .

Acceptance criteria: 47.0%–60.0% of Al_2O_3

IMPURITIES**Inorganic Impurities**

- ARSENIC, Method I <211>**

Sample solution: Dissolve 2.5 g of Aluminum Oxide in 15 mL of hydrochloric acid on a heated water bath. Dilute with water to 100 mL. Use 30 mL of this solution for the test.

Acceptance criteria: NMT 4 ppm

- HEAVY METALS**

Standard lead solution: Prepare as directed under *Heavy Metals* (231), *Special Reagents*.

Standard solution: On the day of use, dilute 1.0 mL of the *Standard lead solution* with water to 100.0 mL. Each mL of the *Standard solution* contains the equivalent of 1 ppm of lead.

Sample solution: Dissolve 2.5 g of Aluminum Oxide in 15 mL of hydrochloric acid on a heated water bath. Dilute with water to 100 mL. Neutralize 20 mL of the resultant solution with strong ammonia solution, using metanil yellow solution (1 mg/mL in methanol) as an indicator. Filter, if necessary, and dilute with water to 30 mL.

Analysis: To 12 mL of the *Sample solution*, add 2.0 mL of pH 3.5 acetate buffer to 1.2 mL of thioacetamide–glycerin base TS. To 10 mL of the *Standard solution* add 2.0 mL of the *Sample solution*, and add 2.0 mL of pH 3.5 acetate buffer to 1.2 mL of thioacetamide–glycerin base TS. Prepare a blank, using a mixture of 10 mL of water and 2.0 mL of the *Sample solution*. Compared to the blank, the *Standard solution* shows a light brown color.

Acceptance criteria: Any brown color from the *Sample solution* is not darker than that of the *Standard solution* (NMT 60 ppm).

- CHLORIDE AND SULFATE, Chloride <221>**

Chloride solution: 0.824 mg/mL of sodium chloride

Standard solution: On the day of use, dilute 1.0 mL of *Chloride solution* with water to 100 mL. Mix 10 mL of this solution (5 ppm Cl) with 5 mL of water.

Sample solution: Dissolve 0.1 g of Aluminum Oxide with heating in 10 mL of dilute nitric acid and dilute with water to 100 mL. Dilute 5 mL of the solution with water to 15 mL.

Analysis: Proceed as directed.

Acceptance criteria: The *Sample solution* shows no more chloride than the *Standard solution* (NMT 10,000 ppm).

- CHLORIDE AND SULFATE, Sulfate <221>**

Sulfate stock solution: 1.8 mg/mL of potassium sulfate

Sulfate solution: On the day of use, dilute 1.0 mL of *Sulfate stock solution* with water to 100 mL (10 ppm SO_4).

Standard solution: Add 3 mL of a 250 mg/mL solution of barium chloride to 4.5 mL of *Sulfate solution*. Shake and allow to stand for 1 min.

Sample solution: Dissolve 2.5 g of Aluminum Oxide in 15 mL of hydrochloric acid on a heated water bath. Dilute with water to 100 mL. Dilute 4 mL of this solution with water to 100 mL.

Analysis: To two separate glass cylinders, add 2.5 mL of *Standard solution*. Then to cylinder 1, add 15 mL of the *Sample solution* and 0.5 mL of acetic acid. To cylinder 2 add 15 mL of the *Sulfate solution* and 0.5 mL of acetic acid.

Acceptance criteria: After 5 min, any opalescence in cylinder 1 containing the *Sample solution* is not more intense than that of cylinder 2 containing the *Sulfate solution* (NMT 10,000 ppm).

SPECIFIC TESTS

- MICROBIAL ENUMERATION TESTS <61> and TESTS FOR SPECIFIED MICROORGANISMS <62>**: The total aerobic bacterial count is NMT 1000 cfu/g and the total combined molds and yeasts count is NMT 100 cfu/g. It also meets the requirements of the tests for absence of *Escherichia coli* and bile-tolerant Gram-negative bacteria.

- APPEARANCE OF SOLUTION**

Dilute hydrochloric acid: 10 mg/mL

Control solution: [NOTE—Prepare immediately before use.] Mix 9.6 mL of ferric chloride CS, 0.2 mL of cobaltous chloride CS, and 0.2 mL of cupric sulfate CS with *Dilute hydrochloric acid* to make 10 mL, and dilute 1.5 mL of this solution with the *Dilute hydrochloric acid* to 100 mL.

Sample solution: 2.5 g of Aluminum Oxide in 15 mL of hydrochloric acid on a heated water bath. Dilute with water to 100 mL.

Analysis: Make the comparison by viewing 2.0 mL of *Sample solution* and 2.0 mL of *Control solution* downward in matched color-comparison tubes against a white surface (see *Color and Achromicity* (631)).

Acceptance criteria: The *Sample solution* is not more intensely colored than the *Control solution*.

- CLARITY OF SOLUTION**

Hydrazine sulfate solution: 10 mg/mL of hydrazine sulfate. Allow to stand for 4–6 h before use. [**CAUTION**—Hydrazine sulfate is highly toxic. Avoid skin contact.]

Methenamine solution: 2.5 g of methenamine to a 100-mL glass-stoppered flask, add 25.0 mL of water, insert the glass stopper, and mix to dissolve.

Primary opalescent mixture: To the flask containing *Methenamine solution*, add 25.0 mL of *Hydrazine sulfate solution*, mix, and allow to stand for 24 h. [NOTE—This suspension is stable for 2 months. Mix before use, and do not use if it adheres to the container.]

Opalescent standard: Dilute 15.0 mL of the *Primary opalescent mixture* with water to 1000.0 mL. [NOTE—Use this suspension within 24 h after preparation.]

Reference suspension: Transfer 30.0 mL of *Opalescence standard* to a 100-mL volumetric flask, and dilute with water to volume.

Sample solution: Use the *Sample solution* from the test for *Appearance of Solution*.

Analysis: Transfer a sufficient portion of the *Sample solution* to a test tube of colorless, transparent, neutral glass with a flat base and an internal diameter of 15–25 mm to obtain a depth of 40 mm. Similarly transfer a portion of the *Reference suspension* to a separate matching test tube. Compare the *Sample solution* and the *Reference suspension* in diffused daylight, viewing vertically against a black background (see *Spectrophotometry and Light-Scattering, Visual Comparison* (851)). [NOTE—The *Sample solution* is to be compared to the *Reference suspension* 5 min after preparation of the *Reference suspension*.]

Acceptance criteria: The *Sample solution* is not more opalescent than the *Reference suspension*.

• **ALKALINE IMPURITIES**

Sample: 1.0 g

Analysis: Shake the *Sample* with 20 mL of carbon dioxide-free water for 1 min and filter. To 10 mL of the filtrate add 0.1 mL of phenolphthalein TS.

Acceptance criteria: Any pink color disappears with the addition of 0.3 mL of 0.1 M hydrochloric acid.

- **NEUTRALIZING CAPACITY:** Carry out the test at 37°. Disperse 0.5 g of aluminum oxide in 100 mL of water, heat, add 100.0 mL of 0.1 M hydrochloric acid, previously heated, and stir continuously: the pH of the solution after 10, 15, and 20 min is NLT 1.8, 2.3, and 3.0 respectively and is at no time greater than 4.5. Add 10.0 mL of 0.5 M hydrochloric acid, previously heated, stir continuously for 1 h, and titrate with 0.1 M sodium hydroxide to pH 3.5: NMT 35.0 mL of 0.1 M sodium hydroxide is required.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in a tight container at a temperature not exceeding 30°.

Amino Methacrylate Copolymer

Ratio: $\text{CH}_2\text{CH}_2\text{N}(\text{CH}_3)_2 : \text{C}_4\text{H}_9 : \text{CH}_3 = 2:1:1$
 Poly((2-dimethylaminoethyl) methacrylate, butyl methacrylate, methyl methacrylate) (2:1:1);
N,N-Dimethylaminoethyl methacrylate–butyl methacrylate–methyl methacrylate copolymer (2:1:1) [24938-16-7].

DEFINITION

Amino Methacrylate Copolymer is a polymerized copolymer of (2-dimethylaminoethyl) methacrylate, butyl methacrylate, and methyl methacrylate. It contains NLT 20.8% and NMT 25.5% of dimethylaminoethyl groups ($\text{C}_4\text{H}_{10}\text{N}$), calculated on the dried basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)

• **B.**

Sample solution: 1 mL of the *Sample solution* in the test for *Viscosity*

Analysis: Pour the *Sample solution* onto a glass plate, and allow the solvent to evaporate.

Acceptance criteria: A clear, colorless film results.

ASSAY

• **PROCEDURE**

Sample: 200 mg

Blank: 4 mL of water and 96 mL of glacial acetic acid

Titrimetric system

(See *Titrimetry* (541).)

Mode: Direct titration

Titrant: 0.1 N perchloric acid VS

Endpoint detection: Potentiometric

Analysis: Dissolve the *Sample* in a mixture of 4 mL of water and 96 mL of glacial acetic acid. Titrate with the *Titrant* to a potentiometric endpoint. Perform a blank determination.

Calculate the percentage of dimethylaminoethyl groups ($\text{C}_4\text{H}_{10}\text{N}$) in the portion of the sample taken:

$$\text{Result} = \frac{(V_S - V_B) \times N \times F}{W} \times 100$$

V_S = *Titrant* volume consumed by the *Sample* (mL)

V_B = *Titrant* volume consumed by the *Blank* (mL)

N = actual normality of the *Titrant* (mEq/mL)

F = equivalency factor, 72.1 mg/mEq

W = *Sample* weight (mg)

Acceptance criteria: 20.8%–25.5% on the dried basis

IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.1%

- **LIMIT OF BUTYL METHACRYLATE AND METHYL METHACRYLATE**

Buffer: 8.9 g/L of anhydrous dibasic sodium phosphate and 8.5 g/L of monobasic potassium phosphate. Adjust with phosphoric acid to a pH of 2.0. This is pH 2.0 phosphate buffer (0.0625 M).

Mobile phase: Methanol and *Buffer* (55:45)

Diluent: Acetonitrile and *Buffer* (40:60)

Standard solution: Dissolve 20 mg of butyl methacrylate and 10 mg of methyl methacrylate in 3 mL of *n*-butanol. Dilute with *Diluent* to 10 mL. Dilute 1.0 mL of this solution with *Diluent* to 250.0 mL, and mix. This solution contains about 8 µg/mL of butyl methacrylate and 4 µg/mL of methyl methacrylate.

Sample solution: 20 mg/mL of Amino Methacrylate Copolymer in *Diluent*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 205 nm

Column: 4.6-mm × 12-cm; packing L1

Flow rate: 2 mL/min

Injection volume: 50 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Resolution: NLT 10 between butyl methacrylate and methyl methacrylate

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each monomer in the portion of Amino Methacrylate Copolymer taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times F \times 100$$

r_U = peak response of each monomer (butyl methacrylate or methyl methacrylate) from the *Sample solution*

r_S = peak response of each monomer (butyl methacrylate or methyl methacrylate) from the *Standard solution*

C_S = concentration of each monomer (butyl methacrylate or methyl methacrylate) in the *Standard solution* (µg/mL)

C_U = concentration of Amino Methacrylate Copolymer in the *Sample solution* (mg/mL)

F = conversion factor, 10^{-3} mg/µg

- Acceptance criteria:** NMT 0.1% for each monomer
- **LIMIT OF 2-DIMETHYLAMINOETHYL METHACRYLATE**
Buffer: 3.4 g/L of monobasic potassium phosphate. This is the monobasic potassium phosphate solution (0.025 M).
Mobile phase: Tetrahydrofuran and *Buffer* (75:25)
Standard solution: 8 µg/mL of 2-dimethylaminoethyl methacrylate in tetrahydrofuran
Sample solution: 20 mg/mL of Amino Methacrylate Copolymer in tetrahydrofuran
Chromatographic system
 (See *Chromatography* <621>, *System Suitability*).
Mode: LC
Detector: UV 215 nm
Column: 4.6-mm × 12-cm; packing L8
Flow rate: 2 mL/min
Injection volume: 50 µL
System suitability
Sample: *Standard solution*
Suitability requirements
Relative standard deviation: NMT 2.0%
Analysis
Samples: *Standard solution* and *Sample solution*
 Calculate the percentage of 2-dimethylaminoethyl methacrylate in the portion of Amino Methacrylate Copolymer taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times F \times 100$$

- r_U = peak response of 2-dimethylaminoethyl methacrylate from the *Sample solution*
 r_S = peak response of 2-dimethylaminoethyl methacrylate from the *Standard solution*
 C_S = concentration of 2-dimethylaminoethyl methacrylate in the *Standard solution* (µg/mL)
 C_U = concentration of Amino Methacrylate Copolymer in the *Sample solution* (mg/mL)
 F = conversion factor, 10^{-3} mg/µg
Acceptance criteria: NMT 0.1%

SPECIFIC TESTS

• ROTATIONAL RHEOMETER METHODS (912)

Sample solution: Dissolve 12.5 g in a mixture of 35.0 g of acetone and 52.5 g of isopropyl alcohol. [NOTE—Reserve a portion of this solution for the *Color of Solution* test.]

Analysis: Equip a suitable rotational viscometer with an adapter comprising a cylindrical spindle rotating within an accurately machined chamber (or tube).¹ Pipet the *Sample solution* in the specified volume, which is recommended by the instrument manufacturer, into the chamber (or tube), and ensure that the temperature of the test specimen is at $20 \pm 0.1^\circ$. The cylindrical spindle rotates at the value of rpm, which corresponds to a rate of shear of approximately 37 s^{-1} .² Measure the apparent viscosity following the instrument manufacturer's directions.

Acceptance criteria: Viscosity, 3–6 mPa · s

• COLOR OF SOLUTION

Sample solution: Use the *Sample solution* prepared in the test for *Viscosity*.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* <851>.)

¹ A commercial device is available from Brookfield as an ultra-low (UL) viscosity adapter. The adapter comprises a 0.4-cm diameter shaft, an accurately machined chamber (or tube) with an internal diameter of 2.8 cm and a depth of 13.5 cm, and a cylindrical spindle 2.5 cm in diameter and 9.1 cm in height.

² For the Brookfield UL adapter, the cylindrical spindle rotates at 30 rpm, which corresponds to a rate of shear of approximately 37 s^{-1} .

Mode: Vis
Analytical wavelength: 420 nm
Cell: 1 cm

Analysis: Determine the absorbance of the *Sample*, using water as the blank.

Acceptance criteria: NMT 0.300

• LOSS ON DRYING (731)

Analysis: Dry a sample at 110° for 3 h.

Acceptance criteria: NMT 2.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, and store at a temperature below 30° .
- **USP REFERENCE STANDARDS** <11>
 USP Amino Methacrylate Copolymer RS

Strong Ammonia Solution

NH₃ 17.03
 Ammonia [7664-41-7].

DEFINITION

Strong Ammonia Solution is a solution of NH₃, containing NLT 27.0% and NMT 31.0% (w/w) of NH₃. On exposure to air, it loses ammonia rapidly.

[**CAUTION**—Use care in handling Strong Ammonia Solution because of the caustic nature of the Solution and the irritating properties of its vapor. Cool the container well before opening, and cover the closure with a cloth or similar material while opening. Do not taste Strong Ammonia Solution, and avoid inhalation of its vapor.]

IDENTIFICATION

• A.

Analysis: Hold a glass rod moistened with hydrochloric acid near the surface of the Solution.

Acceptance criteria: Dense, white fumes are produced.

ASSAY

• PROCEDURE

Sample: Transfer quickly a portion of Strong Ammonia Solution to a stoppered, thick-walled container (a pressure bottle is suitable) to obtain a column height of about 20 cm, insert the stopper, and cool the container and contents to 10° or lower. Accurately weigh a glass-stoppered, 125-mL conical flask containing 35.0 mL of 1 N sulfuric acid VS. Insert a graduated 10-mL measuring pipet into the cooled solution, allow the liquid to rise in the pipet without vacuum, remove the pipet, wipe off adhering liquid, and discard the first mL of the solution permitted to run from the pipet. Hold the pipet just above the surface of the 1 N sulfuric acid VS in the conical flask, and transfer about 2 mL of the solution into the flask. Insert the stopper, and again weigh to obtain the weight of the portion taken of the *Sample*.

Titrimetric system

(See *Titrimetry* <541>.)

Mode: Residual titration

Titrant: 1 N sulfuric acid VS

Back titrant: 1 N sodium hydroxide VS

Blank: Proceed as directed for the *Sample*, omitting the Strong Ammonia Solution

Endpoint detection: Colorimetric

Analysis

Calculate the percentage of NH₃ in the portion of the *Sample* taken:

$$\text{Result} = [(B - V) \times N \times F \times 100]/W$$

B = 1 N sodium hydroxide VS consumed by the *Blank* (mL)

V = 1 N sodium hydroxide VS consumed by the *Sample* (mL)
 N = actual normality of the *Back titrant* (mEq/mL)
 F = equivalency factor, 17.03 mg/mEq
 W = weight of the *Sample* (mg)

Titrate the excess acid with 1 N sodium hydroxide VS, using methyl red TS as the indicator. Perform a blank determination. Each mL of 1 N sulfuric acid is equivalent to 17.03 mg of NH_3 .

Acceptance criteria: 27.0%–31.0%

IMPURITIES

• HEAVY METALS, *Method I* (231)

Test preparation: Evaporate 1.7 mL on a steam bath to dryness, add to the residue 1 mL of 3 N hydrochloric acid, and evaporate to dryness. Dissolve the residue in 2 mL of 1 N acetic acid, and dilute with water to 25 mL.

Analysis: Proceed as directed in the chapter.

Acceptance criteria: NMT 13 ppm

• LIMIT OF NONVOLATILE RESIDUE

Sample: 10 mL

Analysis: Evaporate the *Sample* in a tared platinum or porcelain dish to dryness, and dry at 105° for 1 h.

Acceptance criteria: NMT 5 mg of residue remains (0.05%).

• READILY OXIDIZABLE SUBSTANCES

Sample solution: 4 mL of Strong Ammonia Solution

Analysis: Mix the *Sample solution* with 6 mL of water, and add a slight excess of 2 N sulfuric acid and 0.10 mL of 0.1 N potassium permanganate.

Acceptance criteria: The pink color does not completely disappear within 10 min.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, at a temperature not above 25°.

Ammonio Methacrylate Copolymer

$\text{R}_1 = \text{CH}_3$; $\text{R}_2 = \text{CH}_3$ or

$\text{R}_1 = \text{H}$; $\text{R}_2 = \text{C}_2\text{H}_5$ or

Ratio of ethyl acrylate groups to methyl methacrylate groups to trimethylammonioethyl methacrylate groups is about 1: 2: 0.2 as being Type A or 1: 2: 0.1 as being Type B.
 Poly(ethyl acrylate, methyl methacrylate, trimethylammonioethyl methacrylate chloride) (1: 2: 0.2);
 Ethyl acrylate–methyl methacrylate–trimethylammonioethyl methacrylate chloride copolymer (1: 2: 0.2);
 Poly(ethyl acrylate, methyl methacrylate, trimethylammonioethyl methacrylate chloride) (1: 2: 0.1);
 Ethyl acrylate–methyl methacrylate–trimethylammonioethyl methacrylate chloride copolymer (1: 2: 0.1) [33434-24-1].

DEFINITION

Ammonio Methacrylate Copolymer is a polymerized copolymer of ethyl acrylate, methyl methacrylate, and a low content of methacrylic acid ester with quaternary ammonium groups (trimethylammonioethyl methacrylate chloride). The *Assay* requirements differ for the two types as set forth in the accompanying table.

Ammonio Methacrylate Units, Dried Basis (%)		
Type	Min.	Max.
A	8.85	11.96
B	4.48	6.77

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)
- **B.** Meets the requirements of the *Assay*

ASSAY

• PROCEDURE

Sample: 1 g of Ammonio Methacrylate Copolymer Type A, or 2 g of Type B, previously dried

Titrimetric system

(See *Titrimetry* (541).)

Mode: Direct titration

Titrant: 0.1 N perchloric acid VS

Endpoint detection: Potentiometric

Analysis

Sample: *Sample*

Dissolve the *Sample* in 75 mL of glacial acetic acid at about 50° within 30 min. After the solution cools down to room temperature, add 25 mL of 0.6% cupric acetate in glacial acetic acid. Titrate this solution and a blank, and make any necessary corrections. Each mL of 0.1 N perchloric acid is equivalent to 20.772 mg of ammonio methacrylate ($\text{C}_9\text{H}_{18}\text{ClNO}_2$) units.

Acceptance criteria

Type A: 8.85%–11.96%

Type B: 4.48%–6.77%

IMPURITIES

Inorganic Impurities

- **RESIDUE ON IGNITION** (281): NMT 0.1%
- **HEAVY METALS, *Method II*** (231): NMT 20 ppm

Organic Impurities

• PROCEDURE: LIMIT OF MONOMERS

Sodium perchlorate solution: 35 mg/mL of sodium perchlorate ($\text{NaClO}_4 \cdot \text{H}_2\text{O}$)

Mobile phase: Dilute phosphoric acid with water to obtain a solution with a pH of 2.0. Mix 4 volumes of this solution with 1 volume of methanol.

Standard stock solution: 1.6 mg/mL of ethyl acrylate and 0.2 mg/mL of methyl methacrylate in methanol

Standard solution: Dilute 1 mL of the *Standard stock solution* with methanol to 100 mL. Add 10 mL of this solution to 5 mL of the *Sodium perchlorate solution*. This solution contains about 10.67 $\mu\text{g/mL}$ of ethyl acrylate and 1.33 $\mu\text{g/mL}$ of methyl methacrylate.

Sample solution: Dissolve 5 g of Ammonio Methacrylate Copolymer in methanol, and dilute with the same solvent to 50 mL. Add 5 mL of the *Sodium perchlorate solution* dropwise to 10 mL of this solution while continuously stirring. Remove the precipitated polymer by centrifugation. Use the clear supernatant. Calculate the concentration of Ammonio Methacrylate Copolymer, in mg/mL, as C_u .

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 202 nm

Column: 4.6-mm \times 12-cm; packing L1

Flow rate: 2 mL/min

Injection size: 50 μL

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for ethyl acrylate and methyl methacrylate are 1.00 and 1.14, respectively.]

Suitability requirements

Resolution: NLT 1.0 between the pair of analytes
Relative standard deviation: NMT 5.0% for each analyte

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of ethyl acrylate (or methyl methacrylate) in the portion of Ammonio Methacrylate Copolymer taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times F \times 100$$

- r_U = peak response of ethyl acrylate (or methyl methacrylate) from the *Sample solution*
 r_S = peak response of ethyl acrylate (or methyl methacrylate) from the *Standard solution*
 C_S = concentration of ethyl acrylate (or methyl methacrylate) in the *Standard solution* (µg/mL)
 C_U = concentration of Ammonio Methacrylate Copolymer in the *Sample solution* (mg/mL)
 F = conversion factor, 10^{-3} mg/µg

Acceptance criteria

Ethyl acrylate: NMT 100 ppm
Methyl methacrylate: NMT 50 ppm

SPECIFIC TESTS

- **LOSS ON DRYING (731):** Dry a sample in a vacuum at 80° for 5 h: it loses NMT 3.0% of its weight.

- **ROTATIONAL RHEOMETER METHODS (912)**

Sample solution: Place 52.5 g of isopropyl alcohol and 35.0 g of acetone in a conical flask with a ground-glass joint. Add a quantity of Ammonio Methacrylate Copolymer, equivalent to 12.5 g of solids on the dried basis, while stirring until the polymer has dissolved completely.

Analysis: Equip a suitable rotational viscometer with an adapter comprising a cylindrical spindle rotating within an accurately machined chamber (or tube).¹ Pipet the *Sample solution* in the specified volume, which is recommended by the instrument manufacturer, into the chamber (or tube), and ensure that the temperature of the test specimen is at $20 \pm 0.1^\circ$. The cylindrical spindle rotates at the value of rpm, which corresponds to a rate of shear of approximately 37 s^{-1} .² Measure the apparent viscosity following the instrument manufacturer's directions.

Acceptance criteria: 1–15 mPa · s

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, and store at a temperature not exceeding 30°.
- **LABELING:** Label it to state whether it is Type A or Type B.
- **USP REFERENCE STANDARDS (11)**
 - USP Ammonio Methacrylate Copolymer, Type A RS Poly(ethyl acrylate, methyl methacrylate, trimethylammonioethyl methacrylate chloride) (1: 2: 0.2);
 - Ethyl acrylate–methyl methacrylate–trimethylammonioethyl methacrylate chloride copolymer (1: 2: 0.2).
 - USP Ammonio Methacrylate Copolymer, Type B RS Poly(ethyl acrylate, methyl methacrylate, trimethylammonioethyl methacrylate chloride) (1: 2: 0.1);
 - Ethyl acrylate–methyl methacrylate–trimethylammonioethyl methacrylate chloride copolymer (1: 2: 0.1).

¹ A commercial device is available from Brookfield as an ultra-low (UL) viscosity adapter. The adapter comprises a 0.4-cm diameter shaft, an accurately machined chamber (or tube) with an internal diameter of 2.8 cm and a depth of 13.5 cm, and a cylindrical spindle 2.5 cm in diameter and 9.1 cm in height.

² For the Brookfield UL adapter, the cylindrical spindle rotates at 30 rpm, which corresponds to a rate of shear of approximately 37 s^{-1} .

Ammonio Methacrylate Copolymer Dispersion

DEFINITION

Ammonio Methacrylate Copolymer Dispersion is an aqueous dispersion of Ammonio Methacrylate Copolymer Type A or B in water. It may contain suitable antimicrobial preservatives and alkalizing agents. The Assay requirements differ for the two types, as set forth in the accompanying table.

Type	Ammonio Methacrylate Units, Dried Basis (%)	
	Min.	Max.
A	10.18	13.73
B	6.11	8.26

IDENTIFICATION

- **A. INFRARED ABSORPTION (197K)**

Sample: Residue obtained in the test for *Loss on Drying*
Acceptance criteria: Meets the requirements

ASSAY

- **PROCEDURE**

Sample: Dry under vacuum 2 g of Ammonio Methacrylate Copolymer Dispersion Type A, or 4 g of Ammonio Methacrylate Copolymer Dispersion Type B, at 90° for 30 min.

Blank: 75 mL of glacial acetic acid

Titrimetric system

(See *Titrimetry* (541).)

Mode: Direct titration

Titrant: 0.1 N perchloric acid VS

Endpoint detection: Potentiometric

Analysis: Dissolve the *Sample* in 75 mL of glacial acetic acid at about 50°, within about 30 min. After the solution has cooled down, add 25 mL of 0.6% cupric acetate solution in glacial acetic acid. Titrate this solution with the *Titrant*. Perform a blank determination.

Calculate the percentage of ammonio methacrylate ($\text{C}_9\text{H}_{18}\text{ClNO}_2$) units in the portion of the *Sample* taken:

$$\text{Result} = [(V_S - V_B) \times N \times F/W] \times 100$$

V_S = *Titrant* volume consumed by the *Sample* (mL)

V_B = *Titrant* volume consumed by the *Blank* (mL)

N = actual normality of the *Titrant* (mEq/mL)

F = equivalency factor, 207.72 mg/mEq

W = *Sample* weight (mg)

Acceptance criteria

Type A: 10.18%–13.73%

Type B: 6.11%–8.26%

IMPURITIES

- **RESIDUE ON IGNITION (281)**

Analysis: Using mild heating conditions (e.g., steam bath, sand bath, etc.) to avoid loss of material, evaporate the dispersion to dryness before ignition.

Acceptance criteria: NMT 0.5% calculated on the undried dispersion basis

- **LIMIT OF MONOMERS**

Sodium perchlorate solution: 35 mg/mL of sodium perchlorate ($\text{NaClO}_4 \cdot \text{H}_2\text{O}$)

Mobile phase: Dilute phosphoric acid with water to obtain a solution having a pH of 2.0. Mix four volumes of this solution with one volume of methanol, filter, and degas.

Standard stock solution: 1.6 mg/mL of ethyl acrylate and 0.2 mg/mL of methyl methacrylate in methanol

Standard solution: Dilute 1 mL of the *Standard stock solution* with methanol to 100 mL. Add 10 mL of this solution to 5 mL of *Sodium perchlorate solution*.

Sample solution: Dissolve 5 g of Dispersion in methanol, and dilute with the same solvent to 50 mL. Add 5 mL of *Sodium perchlorate solution* dropwise to 10 mL of this solution while continuously stirring. Remove the precipitated polymer by centrifugation. Use the clear supernatant. Calculate the concentration of Dispersion, in mg/mL, as C_U .

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 202 nm

Column: 4.6-mm × 12-cm; packing L1

Flow rate: 2 mL/min

Injection volume: 50 µL

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for ethyl acrylate and methyl methacrylate are 1.00 and 1.14, respectively.]

Suitability requirements

Resolution: NLT 1.0 between the pair of analytes

Relative standard deviation: NMT 5.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of ethyl acrylate and methyl methacrylate in the portion of Dispersion taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times F \times 100$$

r_U = peak response of ethyl acrylate or methyl methacrylate from the *Sample solution*

r_S = peak response of ethyl acrylate or methyl methacrylate from the *Standard solution*

C_S = concentration of ethyl acrylate or methyl methacrylate in the *Standard solution* (µg/mL)

C_U = nominal concentration of Dispersion in the *Sample solution* (mg/mL)

F = conversion factor, 10^{-3} mg/µg

Acceptance criteria: NMT 0.002% of methyl methacrylate and NMT 0.008% of ethyl acrylate

SPECIFIC TESTS

• ROTATIONAL RHEOMETER METHODS (912)

Analysis: Use a viscometer equipped with a spindle having a cylinder 1.88 cm in diameter and 6.51 cm high attached to a shaft 0.32 cm in diameter. The distance from the top of the cylinder to the lower tip of the shaft is 0.75 cm, and the immersion depth is 8.15 cm. Adjust the temperature to $20 \pm 0.10^\circ$. With the spindle rotating at 30 rpm, immediately record the scale reading. Multiply the scale reading by the constant for the viscometer spindle and speed used to obtain the viscosity in centipoises.

Acceptance criteria: NMT 100 mPa · s

• LOSS ON DRYING (731)

Analysis: Dry a sample at 110° for 6 h.

Acceptance criteria: 68.5%–71.5%

• COAGULUM CONTENT

Sample: 100 g

Analysis: Weigh a stainless steel sieve having 125-µm openings, and filter the *Sample* through it. Wash the sieve with distilled water until a clear filtrate is obtained, and dry the sieve to constant weight at 105° .

Acceptance criteria: The weight of the residue does not exceed 1000 mg, corresponding to NMT 1%.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, at a temperature not exceeding 25° for Type A and not exceeding 30° for Type B. Protect from freezing.
- **LABELING:** Label it to state whether it is Type A or Type B. Label it to indicate the name and quantity of any added antimicrobial preservative or alkalizing agent.

• USP REFERENCE STANDARDS <11>

USP Ammonio Methacrylate Copolymer, Type A RS

USP Ammonio Methacrylate Copolymer, Type B RS

Ammonium Carbonate

Carbonic acid, monoammonium salt mixture with ammonium carbamate;

Monoammonium carbonate mixture with ammonium carbamate [8000-73-5].

DEFINITION

Ammonium Carbonate consists of ammonium bicarbonate (NH_4HCO_3) and ammonium carbamate ($\text{NH}_2\text{COONH}_4$) in varying proportions. It yields NLT 30.0% and NMT 34.0% of ammonia (NH_3).

IDENTIFICATION

- **A.** When heated, it is volatilized without charring, and the vapor is alkaline to moistened litmus paper. A solution (1 in 20) effervesces with acids.

ASSAY

• PROCEDURE

Sample solution: Place 10 mL of water in a weighing bottle, tare the bottle and its contents, add 2 g of Ammonium Carbonate, and weigh.

Titrimetric system

(See *Titrimetry* <541>.)

Mode: Residual titration

Titrant: 1 N sulfuric acid VS

Back-titrant: 1 N sodium hydroxide VS

Blank: 50.0 mL of 1 N sulfuric acid VS, accurately measured

Endpoint detection: Colorimetric

Analysis: Transfer the *Sample solution* to a 250-mL flask, add 50.0 mL of 1 N sulfuric acid VS, and when the solution has been effected, add methyl orange TS. Titrate the excess acid with 1 N sodium hydroxide VS. Perform a blank determination. Calculate the percentage of ammonia (NH_3) in the sample taken.

$$\text{Result} = [(B - V) \times N \times F \times 100] / W$$

B = 1 N sodium hydroxide VS consumed by the *Blank* (mL)

V = 1 N sodium hydroxide VS consumed by the sample (mL)

N = actual normality of the *Back-titrant* (mEq/mL)

F = equivalency factor, 17.03 mg/mEq

W = weight of the sample (mg)

Acceptance criteria: 30.0%–34.0%

IMPURITIES

- **RESIDUE ON IGNITION** <281>: NMT 0.1%
- **CHLORIDE AND SULFATE, Chloride** <221>: A 2.0-g portion shows no more chloride than corresponds to 0.10 mL of 0.020 N hydrochloric acid (0.0035%).
- **CHLORIDE AND SULFATE, Sulfate** <221>: A 2.0-g portion shows no more sulfate than corresponds to 0.10 mL of 0.020 N sulfuric acid (0.005%).
- **HEAVY METALS, Method I** <231>
Test preparation: Reduce to a coarse powder, and volatilize 2 g on a steam bath. Add 1 mL of 3 N hydrochloric acid, and evaporate to dryness. Dissolve the residue in 2 mL of 1 N acetic acid, and add water to make 25 mL.
Acceptance criteria: NMT 10 ppm

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, and store at a temperature not above 30° .

Ammonium Phosphate

(NH₄)₂HPO₄ 132.06
Phosphoric acid, diammonium salt;
Diammonium phosphate [7783-28-0].

DEFINITION

Ammonium Phosphate contains NLT 96.0% and NMT 102.0% of (NH₄)₂HPO₄.

IDENTIFICATION

- **A. IDENTIFICATION TESTS—GENERAL**, *Ammonium* <191>: A solution (1 in 20) meets the requirements.
- **B. IDENTIFICATION TESTS—GENERAL**, *Phosphate* <191>: A solution (1 in 20) meets the requirements.

ASSAY

• PROCEDURE

Sample: 600 mg of Ammonium Phosphate
Titrimetric system

(See *Titrimetry* <541>.)

Mode: Direct titration

Titrant: 0.1 N sulfuric acid VS

Endpoint detection: potentiometric

Analysis: Dissolve the *Sample* in 40 mL of water, and titrate with 0.1 N sulfuric acid VS to a pH of 4.6. Each mL of 0.1 N sulfuric acid is equivalent to 13.21 mg of (NH₄)₂HPO₄.

Acceptance criteria: 96.0%–102.0%

IMPURITIES

- **CHLORIDE AND SULFATE**, *Chloride* <221>: A 1.0-g portion shows no more chloride than corresponds to 0.40 mL of 0.020 N hydrochloric acid (0.03%).
- **CHLORIDE AND SULFATE**, *Sulfate* <221>: A 0.20-g portion shows no more sulfate than corresponds to 0.30 mL of 0.020 N sulfuric acid (0.15%).
- **ARSENIC**, *Method I* <211>: NMT 3 ppm
- **HEAVY METALS** <231>
Test preparation: Dissolve 2.0 g in 25 mL of water.
Acceptance criteria: NMT 10 ppm

SPECIFIC TESTS

- **pH** <791>: 7.6–8.2, in a solution (1 in 100)

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.

Ammonium Sulfate

(NH₄)₂SO₄ 132.14
Ammonium sulfate [7783-20-2].

DEFINITION

Ammonium Sulfate contains NLT 99.0% and NMT 100.5% of (NH₄)₂SO₄.

IDENTIFICATION

- **A. IDENTIFICATION TESTS—GENERAL**, *Ammonium* <191>: A solution (1 in 20) meets the requirements.
- **B. IDENTIFICATION TESTS—GENERAL**, *Sulfate* <191>: A solution (1 in 20) meets the requirements.

ASSAY

• PROCEDURE

Sample: 2.5 g of Ammonium Sulfate

Titrimetric system

(See *Titrimetry* <541>.)

Mode: Residual titration

Titrant: 1 N sodium hydroxide VS

Back titrant: 1 N sulfuric acid VS

Endpoint detection: Colorimetric

Blank: 50.0 mL of 1 N sodium hydroxide VS, accurately measured

Analysis: Add the *Sample* to a 500-mL conical flask and dissolve in 50 mL of water. Add 50.0 mL of 1 N sodium hydroxide VS, place a filter funnel loosely in the neck of the flask, and boil until ammonia is expelled (about 10–15 min), as determined with litmus paper. Cool, add 0.15 mL of thymol blue TS, and titrate the excess sodium hydroxide with 1 N sulfuric acid VS. Perform a blank determination.

Calculate the percentage of ammonium sulfate [(NH₄)₂SO₄] in the *Sample* taken:

$$\text{Result} = [(B - V) \times N \times F \times 100] / W$$

B = 1 N sulfuric acid VS consumed by the *Blank* (mL)

V = 1 N sulfuric acid VS consumed by the *Sample* (mL)

N = actual normality of the *Back titrant* (mEq/mL)

F = equivalency factor, 66.07 mg/mEq

W = weight of the *Sample* (mg)

Acceptance criteria: 99.0%–100.5%

IMPURITIES

• RESIDUE ON IGNITION <281>

Sample: 20 g

Acceptance criteria: NMT 0.005%

• LIMIT OF INSOLUBLE MATTER

Sample: 20 g

Analysis: Transfer the *Sample* to a covered beaker, and dissolve in 200 mL of water. Heat to boiling, and warm on a steam bath for 1 h. Filter the hot solution through a tared sintered-glass crucible of medium porosity (10–15 μm). Wash the beaker and the filter with hot water, dry the crucible at 105°, cool in a desiccator, and weigh.

Acceptance criteria: NMT 1 mg of insoluble matter is found (0.005%).

• LIMIT OF PHOSPHATE

Standard phosphate solution, Phosphate reagent A, and Phosphate reagent B: Prepare as directed for *Phosphate in Reagents under Reagents, Indicators, and Solutions—General Tests for Reagents*.

Sample: 4.0 g

Control: 0.2 mL of *Standard phosphate solution*

Analysis

[NOTE—The tests for the *Sample* and the *Control* are made preferably in matched color-comparison tubes.] Dissolve the *Sample* in 25 mL of 0.5 N sulfuric acid, add 1 mL each of *Phosphate reagent A* and *Phosphate reagent B*, and allow to stand at room temperature for 2 h. Proceed with the *Control* using the same quantities of the same reagents as in the test for the *Sample*.

Acceptance criteria: Any blue color obtained from the *Sample* should not exceed that produced from the *Control* (NMT 5 ppm).

• CHLORIDE AND SULFATE, *Chloride* <221>

Standard chloride solution: Transfer 165 mg of sodium chloride to a 100-mL volumetric flask. Dissolve in and dilute with water to volume. Transfer 10.0 mL to a 1000-mL volumetric flask, and dilute with water to volume to obtain a solution having a concentration of 10 μg/mL of chloride.

Acceptance criteria: A 2-g portion shows no more chloride than corresponds to 1.0 mL of *Standard chloride solution* (NMT 5 ppm).

Change to read:• **LIMIT OF NITRATE**

Standard nitrate solution and Brucine sulfate solution: Prepare as directed for Nitrate in *Reagents under Reagents, Indicators, and Solutions—General Tests for Reagents*.

Sample solution: Dissolve 1.0 g in 3 mL of water by heating in a boiling water bath, and add *Brucine sulfate solution* to make 50 mL.

Control solution: To 1.0 mL of *Standard nitrate solution* add 1.0 g ammonium sulfate, (ERR 1-Jul-2012) then add *Brucine sulfate solution* to make 50 mL.

Blank: 50 mL of *Brucine sulfate solution*

Analysis: Heat the *Sample solution*, *Control solution*, and *Blank* in a boiling water bath for 15 min with periodic gentle swirling, then cool rapidly in an ice bath to room temperature. Adjust a suitable spectrophotometer with the *Blank* to zero absorbance at 410 nm. Determine the absorbance of the *Sample solution*, note the result, and adjust the instrument with the *Sample solution* to zero absorbance. Determine the absorbance of the *Control solution*.

Acceptance criteria: The absorbance reading for the *Sample solution* does not exceed that for the *Control solution* (NMT 10 ppm).

• **IRON <241>**

Sample solution: Dissolve 2.0 g in 40 mL of water, and add 2 mL of hydrochloric acid.

Acceptance criteria: NMT 5 ppm

SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS <61> and TESTS FOR SPECIFIED MICROORGANISMS <62>:** The total aerobic microbial count does not exceed 1000 cfu/g, and the total combined molds and yeasts count does not exceed 10 cfu/g.

- **PH <791>:** 5.0–6.0 in a solution (1 in 20)

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers. No storage requirements are specified.

Amylene Hydrate

C₅H₁₂O 88.15
2-Butanol, 2-methyl-;
tert-Pentyl alcohol [75-85-4].

DEFINITION

Amylene Hydrate contains NLT 99.0% and NMT 100.0% of C₅H₁₂O.

IDENTIFICATION

- **A. INFRARED ABSORPTION <197F>**
- **B. PROCEDURE**

Sample solution: 1 in 10

Analysis: To 10 mL of the *Sample solution* quickly add 5 mL of a 1-in-100 solution of vanillin in sulfuric acid.

Acceptance criteria: A violet-red color is produced.

ASSAY• **PROCEDURE**

Sample solution: Amylene Hydrate

Chromatographic system

Mode: GC

Detector: Thermal conductivity

Column: 4-mm × 2-cm glass column; packed with chromatographic support S2 (under typical conditions)

Temperature

Column: 190°

Injector: 200°

Detector block: 200°

Carrier gas: Helium

Flow rate: 50 mL/min

Injection size: 0.4 µL

Analysis

Sample: *Sample solution*

From the area under the curve, calculate the percentage (a/a) of C₅H₁₂O in the Amylene Hydrate taken.

Acceptance criteria: 99.0%–100.0%

IMPURITIES**Inorganic Impurities**• **LIMIT OF NONVOLATILE RESIDUE**

Sample: 10 mL

Analysis: Evaporate the *Sample* in a tared porcelain dish on a steam bath to a volume of about 1 mL, and allow it to evaporate spontaneously to dryness while protected from dust.

Acceptance criteria: The residue, if any, is colorless, and when dried at 105° for 1 h, weighs NMT 2 mg (0.02%).

• **HEAVY METALS, Method I <231>**

Sample solution: Evaporate 5.0 mL (4 g) on a steam bath to dryness, warm the residue gently with 1 mL of dilute hydrochloric acid (1 in 120), add water to make 25 mL, and filter, if necessary.

Acceptance criteria: NMT 5 ppm

Organic Impurities• **PROCEDURE**

Sample solution: 1 in 20

Analysis: To 10 mL of the *Sample solution* add 0.10 mL of 0.10 N potassium permanganate.

Acceptance criteria: The pink color does not completely disappear within 10 min.

SPECIFIC TESTS

- **SPECIFIC GRAVITY <841>:** 0.803–0.807

- **DISTILLING RANGE, Method I <721>:** It distills completely at between 97° and 103°, a correction factor of 0.037°/mm being applied as necessary.

- **WATER:** The relative retention time of water on the gas chromatographic column used in the *Assay* is approximately 0.2 times that of Amylene Hydrate. From the area under the curve obtained in the *Assay*, calculate the percentage (a/a) of water in the Amylene Hydrate taken: NMT 0.5% is found.

• **ALDEHYDE**

Sample solution: 1 in 20

Analysis: To 10 mL of the *Sample solution* add 1 mL of silver-ammonium nitrate TS, and heat the mixture on a water bath at 60° for 10 min.

Acceptance criteria: No darkening occurs.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.

Anethole

C₁₀H₁₂O
Benzene, 1-methoxy-4-(1-propenyl)-, (*E*)-;
(*E*)-*p*-Propenylanisole [4180-23-8].
Synthetic [104-46-1].

148.20

DEFINITION

Anethole is obtained from Anise Oil and other sources, or it is prepared synthetically.

IMPURITIES

- **HEAVY METALS**, *Method II* (231): NMT 20 ppm

- **LIMIT OF PHENOLS**

Sample: 1 mL

Analysis: Shake the *Sample* with 20 mL of water, and allow the liquids to separate. Pass the water layer through a filter paper previously moistened with water, and to 10 mL of the filtrate add 3 drops of ferric chloride TS.

Acceptance criteria: No purple or purplish color is produced.

- **ALDEHYDES AND KETONES**

Sample: 10 mL

Analysis: Shake the *Sample* with 50 mL of a saturated solution of sodium bisulfite in a graduated cylinder, and allow the mixture to stand for 6 h.

Acceptance criteria: No appreciable diminution in the volume of Anethole occurs, and no crystalline deposit separates.

SPECIFIC TESTS

- **SPECIFIC GRAVITY** (841): 0.983–0.988
- **CONGEALING TEMPERATURE** (651): NLT 20°
- **DISTILLING RANGE**, *Method I* (721): 231°–237°, a correction factor of 0.063°/mm being applied as necessary
- **OPTICAL ROTATION**, *Angular Rotation* (781A): –0.15° to +0.15°
- **REFRACTIVE INDEX** (831): 1.557–1.561

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.
- **LABELING:** Label to indicate whether it is of natural sources or is prepared synthetically.

Anise Oil

DEFINITION

Anise Oil is the volatile oil distilled with steam from the dried, ripe fruit of *Pimpinella ansium* L. (Fam. Apiaceae) or from the dried ripe fruit of *Illicium verum* Hook. f. (Fam. Illiciaceae).

[NOTE—If solid material has separated, carefully warm the Anise Oil until it is completely liquefied, and mix before using.]

IMPURITIES

- **HEAVY METALS**, *Method II* (231): NMT 40 ppm

- **LIMIT OF PHENOLS**

Sample solution: Recently distilled Anise Oil in 90% alcohol (1 in 3)

Acceptance criteria: The *Sample solution* is neutral to moistened litmus paper, and develops no blue or brownish color upon the addition of 1 drop of ferric chloride TS to 5 mL of the solution.

SPECIFIC TESTS

- **SOLUBILITY IN 90% ALCOHOL:** One volume dissolves in 3 volumes of 90% alcohol.
- **SPECIFIC GRAVITY** (841): 0.978–0.988
- **CONGEALING TEMPERATURE** (651): NLT 15°
- **OPTICAL ROTATION**, *Angular Rotation* (781A): –2° to +1°
- **REFRACTIVE INDEX** (831): 1.553–1.560 at 20°

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-filled, tight containers, and avoid exposure to excessive heat.
- **LABELING:** The label states the Latin binomial name and, following the official name, the part of the plant source

from which the article was derived. The label also states that if solid material has separated, carefully warm the oil until it is completely liquefied, and mix before using.

Arginine—see Arginine General Monographs

Aromatic Elixir

DEFINITION

Prepare Aromatic Elixir as follows.

Suitable essential oil(s)	
Syrup	375 mL
Talc	30 g
Alcohol, Purified Water, each a sufficient quantity to make	1000 mL

Dissolve the oil(s) in *Alcohol* to make 250 mL. To this solution add the *Syrup* in several portions, agitating vigorously after each addition. Then add the required quantity of *Purified Water* in the same manner. Mix *Talc* with the liquid, and pass through a filter, dampened with *Diluted Alcohol*, and return the filtrate until a clear liquid is obtained.

OTHER COMPONENTS

- **ALCOHOL DETERMINATION**, *Method II* (611): 21.0%–23.0% of C₂H₅OH, with acetone being used as the internal standard

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Package in tight containers.

Ascorbic Acid—see Ascorbic Acid General Monographs

Ascorbyl Palmitate

C₂₂H₃₈O₇

414.53

L-Ascorbic acid, 6-hexadecanoate;

L-Ascorbic acid 6-palmitate [137-66-6].

DEFINITION

Ascorbyl Palmitate contains NLT 95.0% and NMT 100.5% of C₂₂H₃₈O₇, calculated on the dried basis.

IDENTIFICATION

- **A. PROCEDURE**

Sample solution: 40 mg/mL in alcohol

Analysis: To 25 mL of *Sample solution* add 1 mL of a 1-in-1000 solution of 2,6-dichlorophenol-indophenol sodium in alcohol.

Acceptance criteria: The blue color of the 2,6-dichlorophenol-indophenol sodium solution is discharged immediately.

• **B. INFRARED ABSORPTION** (197K)

ASSAY

• **PROCEDURE**

Sample solution: Dissolve 300 mg of Ascorbyl Palmitate in 50 mL of alcohol, and add 30 mL of water.

Analysis: Immediately titrate the *Sample solution* with 0.1 N iodine VS to a yellow color that persists for NLT 30 s. Each mL of 0.1 N iodine is equivalent to 20.73 mg of C₂₂H₃₈O₇.

Acceptance criteria: 95.0%–100.5% on the dried basis

IMPURITIES

Inorganic Impurities

- **RESIDUE ON IGNITION** (281): NMT 0.1%
- **HEAVY METALS**, *Method II* (231): NMT 10 ppm

SPECIFIC TESTS

- **MELTING RANGE OR TEMPERATURE** (741): 107°–117°
- **OPTICAL ROTATION**, *Specific Rotation* (781S): +21° to +24°
Sample solution: 100 mg/mL, in methanol
- **LOSS ON DRYING** (731): Dry a sample in vacuum at 60° for 1 h: it loses NMT 2.0% of its weight.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, in a cool, dry place.
- **USP REFERENCE STANDARDS** (11)
USP Ascorbyl Palmitate RS

Asparagine

C₄H₈N₂O₃ · H₂O 150.13

C₄H₈N₂O₃ 132.12

L-Asparagine;

L-α-Aminosuccinamic acid, monohydrate [5794-13-8].
Anhydrous [70-47-3].

DEFINITION

Asparagine is anhydrous, or contains one molecule of water of hydration. It contains NLT 98.0% and NMT 101.5% of C₄H₈N₂O₃, as L-asparagine, calculated on the dried basis.

IDENTIFICATION

• **A. INFRARED ABSORPTION** (197K)

[NOTE—Use USP Asparagine Anhydrous RS and USP Asparagine Monohydrate RS for the evaluation of the anhydrous and monohydrate forms of Asparagine, respectively.]

ASSAY

• **PROCEDURE**

Sample: 130 mg

Titrimetric system

(See *Titrimetry* (541).)

Mode: Direct titration

Titrant: 0.1 N perchloric acid VS

Blank: 3 mL of formic acid in 50 mL of glacial acetic acid

Endpoint detection: Potentiometrically

Analysis: Dissolve the *Sample* with 3 mL of formic acid in 50 mL of glacial acetic acid. Perform a blank determination.

Calculate the percentage of asparagine (C₄H₈N₂O₃) in the *Sample* taken:

$$[(V - B) \times N \times F \times 100] / W$$

V = volume of *Titrant* consumed by the *Sample* (mL)

B = volume of *Titrant* consumed by the *Blank* (mL)

N = actual normality of the *Titrant* (mEq/mL)

F = equivalency factor for asparagine, 132.1 mg/mEq

W = weight of the *Sample* (mg)

Acceptance criteria: 98.0%–101.5% on the dried basis

IMPURITIES

• **RESIDUE ON IGNITION** (281)

Sample: 1.0 g

Acceptance criteria: NMT 0.1%

• **LEAD** (251)

Sample: 1 g

Control: 5 mL of *Diluted Standard Lead Solution* (5 µg of Pb)

Acceptance criteria: NMT 5 ppm

• **CHROMATOGRAPHIC PURITY**

Standard solution: 0.05 mg/mL of USP Asparagine

Anhydrous RS or USP Asparagine Monohydrate RS

[NOTE—Use USP Asparagine Anhydrous RS and USP Asparagine Monohydrate RS for the evaluation of the anhydrous and monohydrate forms of Asparagine, respectively.]

Sample solution: 10 mg/mL

Chromatographic system

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture

Application volume: 5 µL

Developing solvent system: Butyl alcohol, glacial acetic acid, and water (3:1:1)

Spray reagent: 2 mg/mL of ninhydrin in butyl alcohol and glacial acetic acid (19:1)

Analysis

Samples: *Standard solution* and *Sample solution*

Proceed as directed in the general test chapter, and then dry the plate at 80° for 30 min. Spray the plate with the *Spray reagent*, heat at 80° for 10 min, and examine under white light.

Acceptance criteria: No secondary spot from the *Sample solution* is larger or more intense than the principal spot from the *Standard solution* (0.5%), and NMT 1.0% of total impurities is found.

SPECIFIC TESTS

• **OPTICAL ROTATION**, *Specific Rotation* (781S)

Sample solution: 10 mg/mL, in 6 N hydrochloric acid

Acceptance criteria: +33.0° to +36.5°, measured at 20°

• **MICROBIAL ENUMERATION TESTS** (61) and **TESTS FOR SPECIFIED MICROORGANISMS** (62):

The total aerobic microbial count does not exceed 1000 cfu/g, and the total combined molds and yeasts count does not exceed 100 cfu/g.

- **LOSS ON DRYING** (731): Dry a sample at 130° for 3 h: the anhydrous form loses NMT 1.0% of its weight, and the monohydrate loses between 11.5% and 12.5% of its weight.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed, light-resistant containers. Store at room temperature.
- **LABELING:** Label it to indicate whether it is anhydrous or the monohydrate.
- **USP REFERENCE STANDARDS** (11)
USP Asparagine Anhydrous RS
USP Asparagine Monohydrate RS

Aspartame

$C_{14}H_{18}N_2O_5$ 294.30
L-Phenylalanine, *N*-L-α-aspartyl-, 1-methyl ester;
3-Amino-*N*-(α-carboxyphenethyl)succinamic acid *N*-methyl
ester [22839-47-0].

DEFINITION

Aspartame contains NLT 98.0% and NMT 102.0% of $C_{14}H_{18}N_2O_5$, calculated on the dried basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197M)
[NOTE—Do not dry specimens.]

ASSAY

• PROCEDURE

Sample: 300 mg

Titrimetric system

(See *Titrimetry* (541).)

0.1 N Perchloric acid: Use perchloric acid, tenth-normal (0.1 N) in glacial acetic acid as specified for *Reagents, Indicators, and Solutions—Volumetric Solutions*, but in the standardization, titrate to a green endpoint.

Mode: Direct titration

Titrant: Use 0.1 N Perchloric acid

Blank: 1.5 mL of anhydrous formic acid and 60 mL of glacial acetic acid

Endpoint detection: Visual

Analysis: Dissolve the *Sample* in 1.5 mL of anhydrous formic acid, and add 60 mL of glacial acetic acid. Add crystal violet, and immediately titrate with the *Titrant* to a green endpoint. Perform a blank determination.

[NOTE—A blank titration exceeding 0.1 mL may be due to excessive water content, and may cause loss of visual endpoint sensitivity.]

Calculate the percentage of Aspartame ($C_{14}H_{18}N_2O_5$) in the *Sample* taken:

$$\text{Result} = [(V - B) \times N \times F \times 100] / W$$

V = volume of the *Titrant* consumed by the *Sample* (mL)

B = volume of the *Titrant* consumed by the *Blank* (mL)

N = actual normality of the *Titrant* (mEq/mL)

F = equivalency factor, 294.3 mg/mEq

W = weight of the *Sample* (mg)

Acceptance criteria: 98.0%–102.0% on the dried basis

IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.2%
- **HEAVY METALS**, *Method II* (231): NMT 10 ppm
- **LIMIT OF 5-BENZYL-3,6-DIOXO-2-PIPERAZINEACETIC ACID**

Diluent: Methanol and water (1:9)

Mobile phase: Dissolve 5.6 g of monobasic potassium phosphate in 820 mL of water in a 1-L volumetric flask, adjust with phosphoric acid to a pH of 4.3, and dilute with methanol to volume.

Standard solution: 75 µg/mL of USP Aspartame Related Compound A RS in *Diluent*

Sample solution: 5 mg/mL of Aspartame in *Diluent*
[NOTE—Avoid heat and excessive holding times.]

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 210 nm

Column temperature: 40°

Flow rate: 2 mL/min

Injection size: 20 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 4.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of aspartame related compound A in the portion of Aspartame taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of aspartame related

compound A from the *Sample solution*

r_S = peak response of aspartame related

compound A from the *Standard solution*

C_S = concentration of 5-benzyl-3,6-dioxo-2-piperazineacetic acid in the *Standard solution* (mg/mL)

C_U = concentration of Aspartame in the *Sample solution* (mg/mL)

Acceptance criteria: NMT 1.5%

• CHROMATOGRAPHIC PURITY

Diluent, Mobile phase, and Chromatographic system:

Proceed as directed in *Limit of 5-Benzyl-3,6-dioxo-2-piperazineacetic Acid*.

Sample stock solution: Proceed as directed for *Sample solution* under *Limit of 5-Benzyl-3,6-dioxo-2-piperazineacetic Acid*.

Sample solution: 0.1 mg/mL of Aspartame from the *Sample stock solution* in *Diluent*

Analysis

Samples: *Sample stock solution* and *Sample solution*

[NOTE—Continue the elution of *Sample stock solution* for twice the retention time of the aspartame peak.]

Acceptance criteria: The sum of the responses of all the peaks in the chromatogram of the *Sample stock solution*, excluding the 5-benzyl-3,6-dioxo-2-piperazineacetic acid and aspartame peak responses, is not greater than the aspartame peak response of the *Sample solution*, corresponding to NMT 2.0% of chromatographic impurities.

SPECIFIC TESTS

• TRANSMITTANCE

Sample solution: 10 mg/mL of Aspartame in 2 N hydrochloric acid, prepared by means of sonication

Analysis: Determine the transmittance in a 1-cm cell at 430 nm with a suitable spectrophotometer.

Acceptance criteria: Transmittance of NLT 0.95, corresponding to an absorbance of NMT about 0.022

• OPTICAL ROTATION, *Specific Rotation* (781S)

Sample solution: 40 mg/mL in 15 N formic acid

Acceptance criteria: +14.5° to +16.5°, determined at 20° within 30 min after preparation of the *Sample solution*

• LOSS ON DRYING (731):

Dry a sample at 105° for 4 h: it loses NMT 4.5% of its weight.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.

• USP REFERENCE STANDARDS (11)

USP Aspartame RS

USP Aspartame Related Compound A RS

5-Benzyl-3,6-dioxo-2-piperazineacetic acid.

$C_{13}H_{14}N_2O_4$ 262.27

Aspartame Acesulfame

$C_{18}H_{23}O_9N_3S$ 457.45
 Aspartame acesulfame salt;
 [2-Carboxy- β -(*N*-b-methoxycarbonyl-2-phenyl)ethyl-carbamoyl]jethanaminium 6-methyl-4-oxo-1,2,3-oxathiazin-3-ide-2,2-dioxide;
 L-Phenylalanine, L- α -aspartyl-2-methyl ester compound with 6-methyl-1,2,3-oxathiazin-4(3*H*)-one 2,2-dioxide (1:1) [106372-55-8].

DEFINITION

Aspartame Acesulfame contains NLT 63.0% and NMT 66.0% of aspartame, calculated on the dried basis. It contains NLT 34.0% and NMT 37.0% of acesulfame, calculated as the acid form on the dried basis.

IDENTIFICATION

 [NOTE—Do not dry specimens.]

ASSAY

• PROCEDURE

Sample: 0.150 g

Analysis: Dissolve the *Sample* in 50 mL of dehydrated alcohol. Titrate with 0.1 N tetrabutylammonium hydroxide in methanol/isopropyl alcohol VS. Potentiometrically determine the volumes of titrant, in mL, at the first equivalence point (V_1) and at the second equivalence point (V_2). Perform a blank titration with 50 mL of dehydrated alcohol, and designate the volume of titrant, in mL, as V_B .

Calculate the percentage of acesulfame (*Result 1*) and aspartame (*Result 2*) in the portion of Aspartame Acesulfame taken:

$$\text{Result 1} = 163N(V_1 - V_B)/10W$$

$$\text{Result 2} = 294N(V_2 - V_1)/10W$$

N = normality of the titrant

W = weight of Aspartame Acesulfame taken (g)

Acceptance criteria: Aspartame, 63.0%–66.0% on the dried basis; acesulfame, 34.0%–37.0% as the acid form on the dried basis

IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 1.1%
- **HEAVY METALS**, *Method II* (231): NMT 10 ppm
- **LIMIT OF POTASSIUM**

Potassium stock solution: 19.0 $\mu\text{g/mL}$ of potassium chloride, previously dried at 105° for 2 h, in water. This solution contains 10 μg of potassium/mL.

Standard solution A: Transfer 10.0 mL of *Potassium stock solution* to a 100-mL volumetric flask. Add 2.0 mL of sodium chloride solution (1 in 5) and 1.0 mL of hydrochloric acid, and dilute with water to volume (1.0 $\mu\text{g/mL}$ of potassium).

Standard solution B: Transfer 15.0 mL of *Potassium stock solution* to a 100-mL volumetric flask. Add 2.0 mL of sodium chloride solution (1 in 5) and 1.0 mL of hydrochloric acid, and dilute with water to volume (1.5 $\mu\text{g/mL}$ of potassium).

Standard solution C: Transfer 20.0 mL of *Potassium stock solution* to a 100-mL volumetric flask. Add 2.0 mL of sodium chloride solution (1 in 5) and 1.0 mL of

hydrochloric acid, and dilute with water to volume (2.0 $\mu\text{g/mL}$ of potassium).

Sample stock solution: 3.0 mg/mL of Aspartame Acesulfame

Sample solution: Transfer 10 mL of *Sample stock solution* to a 100-mL volumetric flask. Add 2.0 mL of sodium chloride solution (1 in 5) and 1.0 mL of hydrochloric acid, and dilute with water to volume. Filter the solution.

Behenoyl Polyoxylglycerides

DEFINITION

Behenoyl Polyoxylglycerides is a mixture of monoesters, diesters, and triesters of glycerol and monoesters and diesters of polyethylene glycols. The polyethylene glycols used have a mean molecular weight of 400. It is produced by esterification of glycerol and polyethylene glycols with behenic acid.

IDENTIFICATION

• **A. INFRARED ABSORPTION (197K)**

• **B. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST (201)**

Standard solution: 50 mg/mL of USP Behenoyl Polyoxylglycerides RS in methylene chloride

Sample solution: 50 mg/mL of Behenoyl Polyoxylglycerides in methylene chloride

Chromatographic system

Application volume: 10 µL

Developing solvent system: Ether and hexanes (70:30)

Spray reagent: 0.1-mg/mL solution of rhodamine B in alcohol

Analysis: Proceed as directed in the chapter. Then spray the plate with Spray reagent, and locate the spots on the plate by examination under UV light at a wavelength of 365 nm.

Acceptance criteria: The R_f values of the principal spots of the Sample solution correspond to those of the Standard solution.

• **C.** It meets the requirements in *Specific Tests for Fats and Fixed Oils, Fatty Acid Composition* (401).

IMPURITIES

• **ARTICLES OF BOTANICAL ORIGIN, Total Ash (561)**

Sample solution: 2.0 g

Acceptance criteria: NMT 0.1%

• **HEAVY METALS, Method II (231):** NMT 10 µg/g

• **ALKALINE IMPURITIES**

Sample: 5.0 g

Analysis: Heat the Sample slightly until it melts. Add 10 mL of alcohol and 0.05 mL of bromophenol blue TS, and mix well. While the solution is still warm, titrate with 0.01 N hydrochloric acid VS to change the color to yellow.

Acceptance criteria: NMT 1.0 mL of 0.01 N hydrochloric acid

• **LIMIT OF FREE ETHYLENE OXIDE AND DIOXANE**

[CAUTION—Perform all determinations three times. Ethylene oxide is toxic and flammable. Prepare all solutions in a well-ventilated hood. The operator must protect hands and face by wearing polyethylene protective gloves and an appropriate face mask. Store all solutions in hermetic containers, and refrigerate at a temperature between 4° and 8°.]

Ethylene oxide stock solution: Into a dry, clean test tube that has been cooled in a mixture of 1 part of sodium chloride and 3 parts of crushed ice, introduce a slow current of ethylene oxide gas, allowing condensation onto the inner wall of the test tube. Using a glass syringe, previously cooled to −10°, transfer 300 µL of liquid ethylene oxide, equivalent to about 0.25 g, to 50 mL of polyethylene glycol 200. Determine the absorbed quantity of ethylene oxide by weighing before and after absorption. Dilute with polyethylene glycol 200 to 100.0 mL, and mix. This is the *Ethylene oxide stock solution*.

Transfer 10.0 mL of magnesium chloride solution, prepared by adding 5 g of magnesium chloride to 10 mL of alcohol, to a volumetric flask. Add 20.0 mL of 0.1 M alcoholic hydrochloric acid VS. Insert the stopper, shake to obtain a saturated solution, and allow to equilibrate overnight. Transfer 5.00 mL of *Ethylene oxide stock solution* to the flask, and allow to stand for 30 min. Titrate with 0.1 M alcoholic potassium hydroxide VS, determining the endpoint potentiometrically. Perform a blank titration, using the same quantity of polyethylene glycol 200 instead of *Ethylene oxide stock solution*, and note the difference in volumes required. Each mL of the difference in volumes of 0.1 M alcoholic potassium hydroxide VS consumed is equivalent to 4.404 mg of ethylene oxide. Calculate the concentration of ethylene oxide in the *Ethylene oxide stock solution*.

Ethylene oxide solution: Prepare immediately before use. Quantitatively dilute a volume of *Ethylene oxide stock solution*, measured, with polyethylene glycol 200 to obtain a solution containing about 50 µg/g of ethylene oxide. Dilute 1.0 mL of this solution with water to 5.0 mL to obtain a solution having a known concentration of about 10 µg/mL of ethylene oxide.

Dioxane solution: 500 µg/mL of dioxane

Standard solution 1: Transfer 1.0 g of Behenoyl Polyoxylglycerides to a 10-mL vial. Add 1.0 mL of *N,N*-dimethylacetamide, 0.1 mL of *Ethylene oxide solution*, and 0.1 mL of *Dioxane solution*. Close the vial, and mix to obtain a homogeneous solution. Allow to stand at 90° for 45 min.

Standard solution 2: Transfer 0.1 mL of *Ethylene oxide solution* to a 10-mL vial. Add 0.1 mL of a freshly prepared solution of about 10 mg/L of acetaldehyde, and add 0.1 mL of *Dioxane solution*. Close the vial, and mix to obtain a homogeneous solution.

Sample solution: Transfer 1.0 g of Behenoyl Polyoxylglycerides to a 10-mL vial, and add 1.0 mL of *N,N*-dimethylacetamide and 0.2 mL of water. Close the vial, and mix to obtain a homogeneous solution. Allow to stand at 90° for 45 min.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

[NOTE—Headspace apparatus that automatically transfers a measured amount of headspace may be used.]

Mode: GC

Detector: Flame ionization

Column: 0.32-mm × 30-m glass or quartz capillary; 1.0-µm layer of phase G1

Temperatures

Injection port: 150°

Detector: 250°

Column: See Table 1.

Table 1

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
50	—	50	5
50	5	180	—
180	30	230	—
230	—	230	5

Carrier gas: Helium

Flow rate: 1 mL/min

Injection volume: 1 mL (the gaseous headspace), using a heated, gas-tight syringe

System suitability

Sample: *Standard solution 2*

Adjust the sensitivity of the system so that the peak heights of the two principal peaks are NLT 15% of the full scale of the recorder.

[NOTE—The relative retention times for acetaldehyde and ethylene oxide are 0.94 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 2.0 between acetaldehyde and ethylene oxide

Relative standard deviation: NMT 15.0%

Analysis

Samples: *Standard solution 1* and *Sample solution*

Calculate the content of ethylene oxide in the portion of Behenoyl Polyoxylglycerides taken:

$$\text{Result} = C_E \times r_U / [(r_S \times W_U) - (r_U \times W_S)]$$

C_E = concentration of ethylene oxide added in *Standard solution 1* (µg/mL)

r_U = peak response of ethylene oxide from the *Sample solution*

r_S = peak response of ethylene oxide from *Standard solution 1*

W_U = weight of Behenoyl Polyoxylglycerides taken to prepare the *Sample solution* (g)

W_S = weight of Behenoyl Polyoxylglycerides taken to prepare *Standard solution 1* (g)

Calculate the content of dioxane in the portion of Behenoyl Polyoxylglycerides taken:

$$\text{Result} = C_D \times r_U / [5 \times (r_S \times W_U) - (r_U \times W_S)]$$

C_D = concentration of dioxane added to *Standard solution 1* (µg/mL)

r_U = peak response of dioxane from the *Sample solution*

r_S = peak response of dioxane from *Standard solution 1*

W_U = weight of Behenoyl Polyoxylglycerides taken to prepare the *Sample solution* (g)

W_S = weight of Behenoyl Polyoxylglycerides taken to prepare *Standard solution 1* (g)

Acceptance criteria

Ethylene oxide: NMT 1 µg/g

Dioxane: NMT 10 µg/g

• LIMIT OF FREE GLYCEROL

Sample: 1.2 g

Periodic acetic acid solution: Dissolve 0.446 g of sodium periodate in 2.5 mL of a 25% (v/v) solution of sulfuric acid, and dilute with glacial acetic acid to 100.0 mL.

Potassium iodide solution: 75 mg/mL of potassium iodide

Titrimetric system

(See *Titrimetry* (541).)

Mode: Direct titration

Titrant: 0.1 M sodium thiosulfate VS

Endpoint detection: Visual

Analysis: Dissolve the *Sample* in 25 mL of methylene chloride, heating if necessary. Cool, and add 100 mL of water and 25.0 mL of *Periodic acetic acid solution*. Shake, and allow to stand for 30 min. Add 40 mL of *Potassium iodide solution*, and allow to stand for 1 min. Add 1 mL of starch TS, and titrate the liberated iodine with *Titrant*. Perform a blank determination, and make any necessary correction. Each mL of *Titrant* is equivalent to 2.3 mg of glycerin.

Acceptance criteria: NMT 3.0%

SPECIFIC TESTS

• FATS AND FIXED OILS, Acid Value (401)

Sample: 2.0 g

Acceptance criteria: NMT 4.0

• FATS AND FIXED OILS, Fatty Acid Composition (401):

Behenoyl Polyoxylglycerides exhibits the composition profile of fatty acids in Table 2.

Table 2

Carbon-Chain Length	No. of Double Bonds	Percentage (%)
12	0	≤1.0
14	0	≤1.0
16	0	≤3.0
18	0	≤5.0
20	0	≤10.0
22	0	≥83.0
22	1	≤3.0
24	0	≤3.0

• FATS AND FIXED OILS, Hydroxyl Value (401)

Sample: 1.0 g

Analysis: Proceed as directed in the chapter. If the volume of 0.5 N sodium hydroxide VS required for the

titration is less than 2 mL, a more dilute titrant may be used.

Acceptance criteria: 30–50

• **FATS AND FIXED OILS, Peroxide Value (401)**

Sample: 2.0 g

Acceptance criteria: NMT 6.0

• **FATS AND FIXED OILS, Saponification Value (401)**

Sample: 2.0 g

Acceptance criteria: 120–140

• **WATER DETERMINATION, Method I (921)**

Sample: 1.0 g

Analysis: Use anhydrous pyridine as the solvent.

Acceptance criteria: NMT 1.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, protected from heat and moisture. Store at NMT 35°.
- **LABELING:** Label it to indicate the average nominal molecular weight of polyethylene glycols used as part of the official title.
- **USP REFERENCE STANDARDS (11)**
USP Behenoyl Polyoxylglycerides RS

Bentonite

Bentonite [1302-78-9].

DEFINITION

Bentonite is a native, colloidal, hydrated aluminum silicate.

IDENTIFICATION

• **A. X-RAY DIFFRACTION (941)**

Sample A: Add 2 g in small portions to 100 mL of water, with intense agitation. Allow to stand for 12 h to ensure complete hydration. Place 2 mL of the mixture so obtained on a suitable glass slide, and allow to air-dry at room temperature to produce an oriented film. Place the slide in a vacuum desiccator over a free surface of ethylene glycol. Evacuate the desiccator, and close the stopcock so that the ethylene glycol saturates the desiccator chamber. Allow to stand for 12 h.

Sample B: Prepare a random powder specimen of Bentonite.

Analysis

Samples: *Sample A* and *Sample B*

Record the X-Ray diffraction pattern of the samples, and determine the *d* values

Acceptance criteria: The largest peak in the pattern of *Sample A* corresponds to a *d* value between 15.0 and 17.2 Å. The major peak in the region between 1.48 and 1.54 Å from the pattern of *Sample B* is 1.492 and 1.504 Å.

IMPURITIES

• **ARSENIC, Method I (211)**

Test preparation: Transfer 8.0 g to a 250-mL beaker containing 100 mL of dilute hydrochloric acid (1 in 25), mix, and cover with a watch glass. Boil gently, with occasional stirring, for 15 min without allowing excessive foaming. Pass the hot supernatant through a rapid-flow filter paper into a 200-mL volumetric flask, and wash with four 25-mL portions of hot dilute hydrochloric acid (1 in 25), collecting the washings in the volumetric flask. Cool the combined filtrates to room temperature, and add dilute hydrochloric acid (1 in 25) to volume. Transfer 25 mL of this solution to a generator flask, and dilute with water to 35 mL.

Standard preparation: Transfer 5 mL of Standard Arsenic Solution (5 µg) to a generator flask, and dilute with water to 35 mL.

Analysis: Proceed as directed in the chapter, determining the absorbances.

Acceptance criteria: The absorbance due to any red color from the *Test preparation* does not exceed that produced by the *Standard preparation* (NMT 5 ppm).

• **LEAD**

[NOTE—The *Standard solution* and the *Sample solution* may be modified, if necessary, to obtain solutions of suitable concentrations, adaptable to the linear or working range of the instrument. It may be necessary to correct the value obtained for the *Sample solution* for interference from the sample specimen matrix.]

Standard solution: On the day of use, dilute 3.0 mL of *Lead Nitrate Stock Solution* (see *Heavy Metals* (231)) with water to 100 mL. Each mL of the *Standard solution* contains the equivalent of 3 µg of lead.

Sample solution: Transfer 3.75 g to a 250-mL beaker containing 100 mL of dilute hydrochloric acid (1 in 25), stir, and cover with a watch glass. Boil for 15 min, then cool to room temperature, and pass through a rapid-flow filter paper into a 400-mL beaker. Wash the filter with four 25-mL portions of hot water, collecting the washings in the 400-mL beaker. Concentrate the combined extracts by gentle boiling to approximately 20 mL. If a precipitate appears, add 2–3 drops of nitric acid, heat to boiling, and cool to room temperature. Pass the concentrated extracts through a rapid-flow filter paper into a 50-mL volumetric flask. Transfer the remaining contents of the 400-mL beaker through the filter paper and into the flask with water. Dilute with water to volume.

Instrumental conditions

Mode: Atomic absorption spectrophotometry

Analytical wavelength: 283.3 nm

Lamp: Lead hollow cathode with deuterium arc background correction

Flame: Air and acetylene

Analysis: Determine the absorbances of the *Standard solution* and the *Sample solution*.

Acceptance criteria: The absorbance of the *Sample solution* is NMT that of the *Standard solution* (40 ppm).

SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS (61) and TESTS FOR SPECIFIED MICROORGANISMS (62):** Meets the requirements of the test for absence of *Escherichia coli*
- **pH (791):** 9.5–10.5. Disperse 4.0 g in 200 mL of water, mixing vigorously to facilitate wetting.
- **LOSS ON DRYING (731):** Dry a sample at 105° for 2 h: it loses 5.0%–8.0% of its weight.
- **GEL FORMATION:** Mix 6 g with 300 mg of magnesium oxide. Add the mixture, in several divided portions, to 200 mL of water contained in a blender of approximately 500-mL capacity. Blend thoroughly for 5 min at high speed, transfer 100 mL of the mixture to a 100-mL graduated cylinder, and allow to remain undisturbed for 24 h: NMT 2 mL of supernatant appears on the surface.
- **SWELLING POWER:** To 100 mL of water contained in a glass-stoppered cylinder of 100-mL capacity add 2 g in portions, dropping it upon the surface of the water, and allow each portion to settle before adding the next. The mass at the bottom gradually swells until it occupies an apparent volume of NLT 24 mL at the end of a 2-h period.
- **FINESS OF POWDER:** Sprinkle 2 g on 20 mL of water contained in a mortar. Allow to swell, disperse evenly with a pestle, and dilute with water to 100 mL. Pour the suspension through a No. 200 standard sieve, and wash the sieve thoroughly with water. No grit is felt when the fingers are rubbed over the wire mesh of the sieve.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **LABELING:** Label it to indicate that absorption of atmospheric moisture should be avoided following the opening of the original package, preferably by storage of the remainder of the contents in a tight container.

Purified Bentonite

DEFINITION

Purified Bentonite is a colloidal montmorillonite that has been processed to remove grit and nonswellable ore components.

IDENTIFICATION

• A. X-RAY DIFFRACTION (941)

Sample A: Add 2 g in small portions to 100 mL of water, with intense agitation. Allow to stand for 12 h to ensure complete hydration. Place 2 mL of the mixture so obtained on a suitable glass slide, and allow to air-dry at room temperature to produce an oriented film. Place the slide in a vacuum desiccator over a free surface of ethylene glycol. Evacuate the desiccator, and close the stopcock so that the ethylene glycol saturates the desiccator chamber. Allow to stand for 12 h.

Sample B: Prepare a random powder specimen of Purified Bentonite.

Analysis

Samples: *Sample A* and *Sample B*

Record the X-ray diffraction pattern of the samples, and determine the *d* values.

Acceptance criteria: The largest peak in the pattern of *Sample A* corresponds to a *d* value between 15.0 and 17.2 Å. The major peak in the region between 1.48 and 1.54 Å from the pattern of *Sample B* is 1.492 and 1.504 Å.

ASSAY

• ALUMINUM CONTENT AND MAGNESIUM CONTENT

[NOTE—The *Standard solutions* and the *Sample solution* may be diluted quantitatively with water, if necessary, to obtain solutions of suitable concentrations adaptable to the linear or working range of the instrument.]

Aluminum content

Aluminum standard stock solution: Dissolve 1.000 g of aluminum in a mixture of 10 mL of hydrochloric acid and 10 mL of water by gentle heating. Transfer the solution to a 1000-mL volumetric flask, and dilute with water to volume. This solution contains the equivalent of 1 mg/mL of aluminum.

Aluminum standard solutions: Transfer 2-, 5-, and 10-mL aliquots of the *Aluminum standard stock solution* to separate 100-mL volumetric flasks containing 200 mg of sodium chloride, and dilute each with water to volume.

Sample stock solution: Transfer 0.200 g of Purified Bentonite to a 25-mL platinum crucible containing 1.0 g of lithium metaborate, and mix. Using a muffle furnace or a suitable burner, heat slowly at first, and ignite at 1000°–1200° for 15 min. Cool, place the crucible in a 100-mL beaker containing 25 mL of dilute nitric acid (50 mg/mL), and add an additional 50 mL of the dilute acid, filling and submerging the upright crucible. Place a polyfluorocarbon-coated magnetic stirring bar into the crucible, and stir gently with a magnetic stirrer to dissolve. Pour the contents into a 250-mL beaker, and remove the crucible. Warm the solution, transfer through a rapid-flow filter paper with the aid of water into a 200-mL volumetric flask, and dilute with water to volume.

Sample solution: Pipet 20 mL of the *Sample stock solution* into a 100-mL volumetric flask. Add 20 mL of sodium chloride solution (10 mg/mL), and dilute with water to volume.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometer equipped with a single-slot burner

Analytical wavelength: 309 nm

Lamp: Aluminum hollow-cathode

Flame: Oxidizing acetylene–air–nitrous oxide

Analysis

Samples: *Aluminum standard solutions* and *Sample solution*

Determine the aluminum content of the purified bentonite in the *Sample solution* from the linear regression equation calculated from the absorbances and concentrations of the *Aluminum standard solutions*.

Magnesium content

Lanthanum solution: Stir 88.30 g of lanthanum chloride (LaCl₃) with 500 mL of 6 N hydrochloric acid to dissolve, transfer with the aid of water to a 1000-mL volumetric flask, and dilute with water to volume.

Magnesium standard stock solution: Place 1.000 g of magnesium in a 250-mL beaker containing 20 mL of water, and carefully add 20 mL of hydrochloric acid, warming, if necessary, to complete the reaction. Transfer the solution to a 1000-mL volumetric flask, and dilute with water to volume. This solution contains the equivalent of 1 mg/mL of magnesium. Transfer 10.0 mL of this solution to a 1000-mL volumetric flask, and dilute with water to volume.

Magnesium standard solutions: Transfer 5-, 10-, 15-, and 20-mL aliquots of the *Magnesium standard stock solution* to separate 100-mL volumetric flasks. To each flask add 20.0 mL of *Lanthanum solution*, and dilute with water to volume.

Sample stock solution: Use the *Sample stock solution* prepared as directed for *Aluminum content*.

Sample solution: Transfer 25 mL of the *Sample stock solution* to a 50-mL volumetric flask, and dilute with water to volume. Transfer 5.0 mL of this solution to a 100-mL volumetric flask, add 20.0 mL of *Lanthanum solution*, and dilute with water to volume.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometer equipped with a single-slot burner

Analytical wavelength: 285 nm

Lamp: Magnesium hollow-cathode

Flame: Reducing flame of acetylene–air

Analysis

Samples: *Magnesium standard solutions* and *Sample solution*

Determine the magnesium content of the purified bentonite in the *Sample solution* from the linear regression equation calculated from the absorbances and concentrations of the *Magnesium standard solutions*.

Acceptance criteria: The ratio of the aluminum content to the magnesium content is 3.5–5.5.

IMPURITIES

• ARSENIC, Method I (211)

Standard solution: 5 mL of *Standard Arsenic Solution* (5 µg of As)

Sample solution: Transfer 13.3 g to a 250-mL beaker containing 100 mL of dilute hydrochloric acid (1 in 25), mix, cover with a watch glass, and boil gently, with occasional stirring, for 15 min without allowing excessive foaming. Allow the insoluble material to settle, and decant the hot supernatant through a rapid-flow filter paper into a 200-mL volumetric flask, retaining as much sediment as possible in the beaker. Add 25 mL of hot dilute hydrochloric acid (1 in 25) to the residue in the beaker, stir, heat to boiling, allow the insoluble material to settle, and decant the supernatant through the filter into the 200-mL volumetric flask. Repeat the extraction with four additional 25-mL portions of hot dilute hydrochloric acid (1 in 25), decanting each hot supernatant through the filter into the volumetric flask. At the last extraction, transfer as much of the insoluble material as possible onto the filter. Cool the combined filtrates to

room temperature, and add dilute hydrochloric acid (1 in 25) to volume.

Analysis: Using a 25-mL aliquot of *Sample solution* and the *Standard solution*, treat them as directed in the *Procedure*.

Acceptance criteria: NMT 3 µg/g; the absorbance due to any red color from the *Sample solution* does not exceed that produced by the *Standard solution*.

• LEAD

[NOTE—The *Standard solution* and the *Sample solution* may be modified, if necessary, to obtain solutions of suitable concentrations, adaptable to the linear or working range of the instrument.]

Standard solution: On the day of use, dilute 3.0 mL of *Lead Nitrate Stock Solution* (see *Heavy Metals* (231)) to 100 mL. Each mL of the *Standard solution* contains the equivalent of 3 µg of lead.

Sample solution: Transfer 10.0 g of Purified Bentonite to a 250-mL beaker containing 100 mL of dilute hydrochloric acid (1 in 25), stir, cover with a watch glass, and boil for 15 min. Cool to room temperature, and allow the insoluble matter to settle. Decant the supernatant through a rapid-flow filter paper into a 400-mL beaker. Add 25 mL of hot water to the insoluble matter in the 250-mL beaker, stir, allow the insoluble matter to settle, and decant the supernatant through the filter into the 400-mL beaker. Repeat the extraction with two additional 25-mL portions of water, decanting each supernatant portion through the filter into the 400-mL beaker. Wash the filter with 25 mL of hot water, collecting this filtrate in the 400-mL beaker. Concentrate the combined extracts by gentle boiling to approximately 20 mL. If a precipitate appears, add 2–3 drops of nitric acid, heat to boiling, and cool to room temperature. Filter the concentrated extracts through a rapid-flow filter paper into a 50-mL volumetric flask. Transfer the remaining contents of the 400-mL beaker through the filter paper and into the flask with water. Dilute to volume.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometer equipped with a deuterium arc background correction and a single-slot burner

Analytical wavelength: 284 nm

Lamp: Lead hollow-cathode

Flame: Air-acetylene

Analysis: Determine the absorbances of the *Standard solution* and the *Sample solution*.

Acceptance criteria: 15 µg/g; the absorbance of the *Sample solution* is NMT that of the *Standard solution*.

SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS** (61) and **TESTS FOR SPECIFIED MICROORGANISMS** (62): Its total aerobic microbial count does not exceed 1×10^3 cfu/g, and it meets the requirements of the test for absence of *Escherichia coli*.

• pH (791)

Sample suspension: 50 mg/mL

Acceptance criteria: 9.0–10.0

• LOSS ON DRYING (731)

Analysis: Dry at 110° to constant weight.

Acceptance criteria: NMT 8.0%

• VISCOSITY

Analysis: After determining *Loss on Drying* (731), weigh a quantity of Purified Bentonite equivalent to 25.0 g on the dried basis. Over a period of a few s, transfer the undried sample specimen to a suitable 1-L blender jar containing an amount of water, maintained at a temperature of $25 \pm 2^\circ$, that is sufficient to produce a mixture weighing 500 g. Blend for 3 min, accurately timed, at 14,000–15,000 rpm (high speed). [NOTE—Heat generated during blending causes a temperature rise to above 30°.] Transfer the contents of the blender to a 600-mL beaker, allow to stand for 5 min, and adjust, if

necessary, to a temperature of $33 \pm 3^\circ$. Using a suitable rotational viscometer equipped with a spindle having a cylinder 1.87 cm in diameter and 0.69 cm high attached to a shaft 0.32 cm in diameter, the distance from the top of the cylinder to the lower tip of the shaft being 2.54 cm, and the immersion depth being 5.00 cm (No. 2 spindle), operate the viscometer at 60 rpm for 6 min, accurately timed, and record the scale reading.

Acceptance criteria: 40–200 centipoises

• ACID DEMAND

Sample: After determining *Loss on Drying* (731), weigh a quantity of Purified Bentonite equivalent to 5.00 g.

Analysis: Disperse the *Sample* in 500 mL of water with the aid of a suitable blender fitted with a 1-L jar. Using a stopwatch, designate zero time. With constant mixing, add 3.0-mL portions of 0.100 N hydrochloric acid at 5, 65, 125, 185, 245, 305, 365, 425, 485, 545, 605, 665, and 725 s, and add a 1.0-mL portion at 785 s. Determine the pH potentiometrically at 840 s.

Acceptance criteria: NMT 4.0

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.

Bentonite Magma

DEFINITION

Prepare Bentonite Magma as follows.

Bentonite	50 g
Purified Water, a sufficient quantity to make	1000 g

Sprinkle the *Bentonite*, in portions, upon 800 g of hot *Purified Water*, allowing each portion to become thoroughly wetted without stirring. Allow it to stand with occasional stirring for 24 h. Stir until a uniform magma is obtained, add *Purified Water* to make 1000 g, and mix.

The Magma may also be prepared by mechanical means such as by use of a blender, as follows. Place 500 g of *Purified Water* in the blender, and while the machine is running, add the *Bentonite*. Add *Purified Water* to make up to 1000 g or up to the operating capacity of the blender. Blend the mixture for 5–10 min, add *Purified Water* to make 1000 g, and mix.

SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS** (61) and **TESTS FOR SPECIFIED MICROORGANISMS** (62): It meets the requirements of the tests for absence of *Escherichia coli*.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Package in tight containers.

Injection volume: 10 μL

System suitability

Samples: System suitability solution and Standard solution

Suitability requirements

Resolution: NLT 2.0 between benzoic acid and methylparaben, System suitability solution

Tailing factor: NMT 2.0 for benzoic acid and methylparaben, System suitability solution

Relative standard deviation: NMT 2.0% for benzaldehyde, Standard solution

Analysis

Samples: Standard solution and Sample solution

Calculate the percentage of benzaldehyde (C₇H₆O) in the portion of Benzaldehyde taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of benzaldehyde from the Sample solution

r_S = peak response of benzaldehyde from the Standard solution

C_S = concentration of USP Benzaldehyde RS in the Standard solution (mg/mL)

C_U = concentration of Benzaldehyde in the Sample solution (mg/mL)

Acceptance criteria: 98.0%–102.0% Δ NF31

IMPURITIES**• LIMIT OF HYDROCYANIC ACID**

Sample solution: Shake 0.5 mL of Benzaldehyde with 5 mL of water, add 0.5 mL of 1 N sodium hydroxide and 0.1 mL of ferrous sulfate TS, and warm the mixture gently.

Acceptance criteria: Upon the addition of a slight excess of hydrochloric acid, no greenish-blue color or blue precipitate is produced within 15 min.

• LIMIT OF NITROBENZENE

Sample solution: Dissolve 1 mL of Benzaldehyde in 20 mL of alcohol, and mix with 10 mL of water.

Analysis: Add 1-g portions of zinc and 1-mL portions of 2 N sulfuric acid, as needed, to maintain a brisk evolution of hydrogen for 1 h. Filter, evaporate the liquid to 20 mL, and boil 10 mL of the concentrated liquid with 1 drop of potassium dichromate TS.

Acceptance criteria: No purplish color is produced.

• CHLORINATED COMPOUNDS

Analysis: Wind a strip of 20-mesh copper gauze 1.5 cm wide and 5 cm long around the end of a copper wire. Heat the gauze in the nonluminous flame of a Bunsen burner until it glows without coloring the flame green. Permit the gauze to cool, and heat several times until a thick coat of oxide has formed. With a medicine dropper, apply 2 drops of Benzaldehyde to the cooled gauze, ignite, and permit it to burn freely in the air. Again cool the gauze, add 2 more drops of Benzaldehyde, and burn as before. Repeat this process until a total of 6 drops have been added and ignited. Then hold the gauze in the outer edge of the Bunsen flame, adjusted to a height of 4 cm.

Acceptance criteria: Not even a transient green color is imparted to the flame.

Add the following:**▲ • LIMIT OF ETHYLBENZENE, CYCLOHEXYLMETHANOL, BENZYL ALCOHOL, AND BENZOIC ACID**

Sample solution: Neat Benzaldehyde

Standard solution: 0.1% of USP Ethylbenzene RS, 0.1% of USP Cyclohexylmethanol RS, 0.2% of USP Benzoic Acid RS, and 0.2% of USP Benzaldehyde RS in USP Benzyl Alcohol RS

Benzalkonium Chloride

Ammonium, alkyldimethyl(phenylmethyl)-, chloride;
 Alkylbenzyltrimethylammonium chloride [8001-54-5].

DEFINITION

Benzalkonium Chloride is a mixture of alkylbenzyltrimethylammonium chlorides of the general formula:

in which R represents a mixture of alkyls, including all or some of the group beginning with *n*-C₈H₁₇ and extending through higher homologs, with *n*-C₁₂H₂₅, *n*-C₁₄H₂₉, and *n*-C₁₆H₃₃ composing the major portion. On the anhydrous basis, the content of the *n*-C₁₂H₂₅ homolog is NLT 40.0%, and the content of the *n*-C₁₄H₂₉ homolog is NLT 20.0% of the total alkylbenzyltrimethylammonium chloride content. The amount of the *n*-C₁₂H₂₅ and *n*-C₁₄H₂₉ homolog components together is NLT 70.0% of the total alkylbenzyltrimethylammonium chloride content. The total alkylbenzyltrimethylammonium chloride content, calculated on the anhydrous basis, with allowance made for the amount of residue on ignition, is NLT 97.0% and NMT 103.0% of [C₆H₅CH₂N(CH₃)₂R]Cl.

IDENTIFICATION**A. PROCEDURE**

Analysis: To 2 mL of a solution (1 in 100) add 1 mL of 2 N nitric acid.

Acceptance criteria: A white precipitate is formed, and it is dissolved after adding 5 mL of alcohol.

B. PROCEDURE

Analysis: Dissolve 200 mg in 1 mL of sulfuric acid, add 100 mg of sodium nitrate, and heat on a steam bath for 5 min. Cool, dilute with water to 10 mL, add 500 mg of zinc dust, and warm for 5 min on a steam bath. To 2 mL of the clear supernatant, add 1 mL of sodium nitrite solution (1 in 20), cool in ice water, and then add 3 mL of a solution of 500 mg of 2-naphthol in 10 mL of 6 N ammonium hydroxide.

Acceptance criteria: An orange-red color is produced.

- **C. IDENTIFICATION TESTS—GENERAL, Chloride** (191): The solution in a mixture of equal volumes of water and alcohol meets the requirements of the tests.
- **D.** The retention times of the major peaks for benzalkonium chloride in the Sample solution correspond to those of the Standard solution, as obtained in the test for Ratio of Alkyl Components.

ASSAY**• RATIO OF ALKYL COMPONENTS**

Solution A: Adjust a 0.1 M solution of sodium acetate with glacial acetic acid to a pH of 5.0.

Mobile phase: Acetonitrile and Solution A (9:11). Acetonitrile and Solution A may be adjusted from (2:3) to (3:2) to meet system suitability requirements.

Standard solution: 4 mg/mL of Benzalkonium Chloride, prepared from USP Benzalkonium Chloride RS and water.

Sample solution: 4 mg/mL of Benzalkonium Chloride Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 3.9-mm × 30-cm; packing L10, or 4.6-mm × 25-cm; 10-μm packing L10

Flow rate: 2 mL/min

Injection size: 20 μL

System suitability

Sample: *Standard solution*

[NOTE—See the relative retention times in the table below. Relative retention times are provided for information only, and the standard should be used to ensure appropriate peak identification.]

Name	Relative Retention Time
C ₁₀ homolog	0.9
C ₁₂ homolog	1.0
C ₁₄ homolog	1.3
C ₁₆ homolog	1.7

Suitability requirements

Resolution: NLT 1.5 between the C₁₂ and C₁₄ peaks

Relative standard deviation: NMT 2.0% from the C₁₂ peak

Analysis

Samples: *Standard solution* and *Sample solution*

Identify the homolog peaks by comparison of the retention times with those from the *Standard solution*.

Calculate the percentage of each quaternary ammonium homolog taken:

$$\text{Result} = \frac{r_U \times M_r}{\sum (r_U \times M_r)} \times 100$$

r_U = area of the peak due to a given homolog in the chromatogram from the *Sample solution*

M_r = molecular weight of a given homolog. The molecular weights of C₁₀, C₁₂, C₁₄, and C₁₆ homologs are 312, 340, 368, and 396, respectively.

Acceptance criteria: On the anhydrous basis, the content of the *n*-C₁₂H₂₅ homolog is NLT 40.0%, and the content of the *n*-C₁₄H₂₉ homolog is NLT 20.0% of the total alkylbenzyltrimethylammonium chloride content. The amount of the *n*-C₁₂H₂₅ and *n*-C₁₄H₂₉ homolog components together is NLT 70.0% of the total alkylbenzyltrimethylammonium chloride content.

• TOTAL ALKYL BENZYL DIMETHYLAMMONIUM CHLORIDES

Sample: Weigh a quantity of Benzalkonium Chloride equivalent to 500 mg of anhydrous benzalkonium chloride.

Analysis: Transfer the *Sample*, with the aid of 35 mL of water, to a glass-stoppered, 250-mL conical separator containing 25 mL of methylene chloride. Add 10 mL of 0.1 N sodium hydroxide, and 10.0 mL of freshly prepared potassium iodide solution (1 in 20), insert the stopper into the separator, shake, allow the layers to separate, and discard the methylene chloride layer. Wash the aqueous layer with three 10-mL portions of methylene chloride, and discard the washings. Transfer the aqueous layer to a glass-stoppered, 250-mL conical flask, and rinse the separator with three 5-mL portions of water, adding the washings to the flask. Add 40 mL of cold hydrochloric acid to the flask, mix, and titrate with 0.05 M potassium iodate VS until the solution becomes light brown in color. Add 5 mL of methylene

chloride, insert the stopper into the flask, and shake vigorously. Continue the titration, dropwise, with shaking after each addition, until the methylene chloride layer becomes colorless and the aqueous layer is clear yellow. Record the titrant volume, V_t (mL). Perform a blank determination, using 20 mL of water as the sample, and record the titrant volume, V_b (mL). [NOTE— $V_b > V_t$.] The difference between the two titrations represents the amount of potassium iodate equivalent to the weight of benzalkonium chloride in the sample. Each mL of 0.05 M potassium iodate is equivalent to $x/10$ mg of benzalkonium chloride, where x represents the average molecular weight of the sample, derived by summing, for all homologs, the products:

$$\text{Result (x)} = \sum_i [(r_i/r_t) \times M_i]$$

r_U = area of the peak produced by a given homolog in the chromatogram from the *Ratio of Alkyl Components* test

r_T = sum of the peak areas for all homologs in the chromatogram from the *Ratio of Alkyl Components* test

M_r = molecular weight of a given homolog. The molecular weights of the C₁₀, C₁₂, C₁₄, and C₁₆ homologs are 312, 340, 368, and 396, respectively.

Acceptance criteria: 97.0%–103.0% on the anhydrous basis

IMPURITIES

Inorganic Impurities

• **RESIDUE ON IGNITION** (281): NMT 2.0%

Organic Impurities

• PROCEDURE 1: LIMIT OF AMINES AND AMINE SALTS

Sample: 5.0 g of Benzalkonium Chloride

Analysis and Acceptance criteria: Dissolve the *Sample* with heating carefully e.g., on top of a steam bath with water as the steam source in 20 mL of a mixture of methanol and 1 N hydrochloric acid VS (97:3).

[NOTE—However, the mixed solution must not reach the boiling point.] Add 100 mL of isopropyl alcohol. Pass a stream of nitrogen slowly through the solution. Gradually add 12.0 mL of 0.1 N tetrabutylammonium hydroxide VS, while recording the potentiometric titration curve. If the curve shows two inflection points, the volume of titrant added between the two points is NMT 5.0 mL, corresponding to NMT 0.1 mmol/g of amines and amine salts. If the curve shows no point of inflection, the substance being examined does not comply with the test. If the curve shows one point of inflection, repeat the test, but add 3.0 mL of a 25.0 mg/mL solution of dimethyldecylamine in isopropyl alcohol before the titration. If after addition of 12.0 mL of the titrant, the titration curve shows only one point of inflection, the substance being examined does not comply with the test.

• PROCEDURE 2: LIMIT OF BENZYL ALCOHOL, BENZALDEHYDE, AND (CHLOROMETHYL)BENZENE

[NOTE—Prepare the solutions immediately before use.]

Solution A: Dissolve 1.09 g of sodium 1-hexanesulfonate and 6.9 g of monobasic sodium phosphate in water in a 1000-mL volumetric flask, adjust with phosphoric acid to a pH of 3.5, and dilute with water to volume.

Solution B: Methanol

Mobile phase: See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)
0	80	20
10	80	20

Time (min)	Solution A (%)	Solution B (%)
14	50	50
35	50	50
36	20	80
55	20	80
56	80	20
65	80	20

Standard solution A: 0.25 mg/mL of USP Benzyl Alcohol RS in methanol

Standard solution B: 0.075 mg/mL of USP Benzaldehyde RS in methanol

Standard solution C: 0.025 mg/mL of USP Benzyl Alcohol RS in methanol, prepared from *Standard solution A* and methanol

Sample solution: 50 mg/mL of Benzalkonium Chloride in methanol

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 210 nm for benzyl alcohol and (chloromethyl)benzene; UV 257 nm for benzaldehyde

Column: 4.6-mm × 15-cm analytical column; 5-μm packing L1

Column temperature: 30°

Flow rate: 1.0 mL/min

Injection size: 20 μL

System suitability

Samples: *Standard solution A*, *Standard solution B*, *Standard solution C*, and *Sample solution*

[NOTE—See the relative retention times in the table below.]

Name	Relative Retention Time
Benzyl alcohol	1.0
Benzaldehyde	1.3
(Chloromethyl)benzene	2.4

Suitability requirements

Relative standard deviation: NMT 5.0% for the benzyl alcohol peak, *Standard solution A*

Signal-to-noise ratio: NLT 10 for the principal peak in the chromatogram, *Standard solution C*

Analysis

Samples: *Standard solution A*, *Standard solution B*, *Standard solution C*, and *Sample solution*

To calculate the content of (chloromethyl)benzene, multiply the peak area of (chloromethyl)benzene by 1.3. [NOTE—The correction factor is used due to baseline shift.]

Acceptance criteria

Benzyl alcohol: The response of the benzyl alcohol peak from the *Sample solution* is NMT that of the benzyl alcohol peak from the *Standard solution A*, corresponding to NMT 0.5%.

Benzaldehyde: The response of the benzaldehyde peak from the *Sample solution* is NMT that of the benzaldehyde peak from *Standard solution B*, corresponding to NMT 0.15%.

(Chloromethyl)benzene: The response of the (chloromethyl)benzene peak from the *Sample solution* is NMT 0.1 times that of the principal peak in the chromatogram from *Standard solution A*, corresponding to NMT 0.05%.

SPECIFIC TESTS

• ACIDITY OR ALKALINITY

Sample: 0.5 g of Benzalkonium Chloride

Analysis: Dissolve the *Sample* in water, dilute with water to 50 mL, and mix. Add 0.1 mL of bromocresol purple TS.

Acceptance criteria: NMT 0.1 mL of 0.1 N hydrochloric acid or 0.1 N sodium hydroxide is required to change the color of the indicator.

• WATER DETERMINATION, *Method I* <921>: NMT 15.0%

WATER-INSOLUBLE MATTER: A solution (1 in 10) is free from turbidity and insoluble matter.

ADDITIONAL REQUIREMENTS

• PACKAGING AND STORAGE: Preserve in tight containers. No storage requirements specified.

• USP REFERENCE STANDARDS <11>

USP Benzalkonium Chloride RS

USP Benzyl Alcohol RS

USP Benzaldehyde RS

Benzalkonium Chloride Solution

DEFINITION

Benzalkonium Chloride Solution contains NLT 95.0% and NMT 105.0% of the labeled amount of benzalkonium chloride in a solution that has a concentration of 1.0% or more; and NLT 93.0% and NMT 107.0% of the labeled amount in a solution that has a concentration of less than 1.0%. It may contain a suitable coloring agent and may contain NMT 10% of alcohol.

[CAUTION—Mixing Benzalkonium Chloride Solution with ordinary soaps and with anionic detergents may decrease or destroy the bacteriostatic activity of the Solution.]

IDENTIFICATION

• A. PROCEDURE

Analysis: Add 1 mL of 2 N nitric acid to 2 mL of a solution having an equivalent to 10 mg/mL of benzalkonium chloride.

Acceptance criteria: A white precipitate is formed, and it is dissolved after adding 5 mL of alcohol.

• B. IDENTIFICATION TESTS—GENERAL, Chloride <191>: A solution of it in a mixture of equal volumes of water and alcohol meets the requirements.

• C. PROCEDURE

Analysis: Dissolve the residue obtained by evaporating on a steam bath, a volume of Solution equivalent to 200 mg of benzalkonium chloride in 1 mL of sulfuric acid, add 100 mg of sodium nitrate, and heat on a steam bath for 5 min. Cool, dilute with water to 10 mL, add 500 mg of zinc dust, and warm for 5 min on a steam bath. To 2 mL of the clear supernatant add 1 mL of sodium nitrite solution (1 in 20), cool in ice water, then add 3 mL of a solution of 500 mg of 2-naphthol in 10 mL of 6 N ammonium hydroxide.

Acceptance criteria: An orange-red color is produced.

• D. The retention times of the major peaks for benzalkonium chloride in the *Sample solution* correspond to those of the *Standard solution*, as obtained in the test for *Ratio of Alkyl Components*.

ASSAY

• RATIO OF ALKYL COMPONENTS

Solution A: Adjust a 0.1 M solution of sodium acetate with glacial acetic acid to a pH of 5.0.

Mobile phase: Acetonitrile and *Solution A* (9:11). Acetonitrile and *Solution A* may be adjusted from (2:3) to (3:2) to meet system suitability requirements.

Standard solution: 4 mg/mL of benzalkonium chloride, prepared from USP Benzalkonium Chloride RS and water

Sample solution: Transfer a volume of Solution, equivalent to 400 mg of benzalkonium chloride, to a 100-mL volumetric flask, and dilute with water to volume.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 3.9-mm × 30-cm; packing L10, or 4.6-mm × 25-cm; 10-μm packing L10

Flow rate: 2 mL/min

Injection size: 20 μL

System suitability

Sample: *Standard solution*

[NOTE—The relative retention time table below. Relative retention times are provided for information only, and the standard should be used to ensure appropriate peak identification.]

Name	Relative Retention Time
C ₁₀ homolog	0.9
C ₁₂ homolog	1.0
C ₁₄ homolog	1.3
C ₁₆ homolog	1.7

Suitability requirements

Resolution: NLT 1.5 between the C₁₂ and C₁₄ peaks

Relative standard deviation: NMT 2.0% for the C₁₂ peak

Analysis

Samples: *Standard solution* and *Sample solution*

Identify the homolog peaks by comparison of the retention times with those from the *Standard solution*.

Calculate the percentage of each quaternary ammonium homolog taken:

$$\text{Result} = \frac{r_u \times M_r}{\sum (r_i \times M_i)} \times 100$$

r_u = area of the peak due to a given homolog in the chromatogram from the *Sample solution*

M_r = molecular weight of a given homolog. The molecular weights of the C₁₀, C₁₂, C₁₄, and C₁₆ homologs are 312, 340, 368, and 396, respectively.

Acceptance criteria: On the anhydrous basis, the content of the *n*-C₁₂H₂₅ homolog is NLT 40.0%, and the content of the *n*-C₁₄H₂₉ homolog is NLT 20.0% of the total alkylbenzyltrimethylammonium chloride content. The amount of the *n*-C₁₂H₂₅ and *n*-C₁₄H₂₉ homolog components together is NLT 70.0% of the total alkylbenzyltrimethylammonium chloride content.

• **TOTAL ALKYL BENZYL DIMETHYLAMMONIUM CHLORIDES**

Sample solution: Evaporate or dilute with water to 30 mL a volume of Solution, equivalent to 500 mg of benzalkonium chloride.

Analysis: Transfer the *Sample solution* with the aid of a minimum quantity of water to a glass-stoppered, 250-mL conical separator. Transfer 25 mL of methylene chloride. Add 10 mL of 0.1 N sodium hydroxide, and 10.0 mL of freshly prepared potassium iodide solution (1 in 20), insert the stopper in the separator, shake, allow the layers to separate, and discard the methylene chloride layer. Wash the aqueous layer with three 10-mL portions of methylene chloride, and discard the washings. Transfer the aqueous layer to a glass-stoppered, 250-mL conical flask, and rinse the separator with three 5-mL portions of water, adding the washings to the flask. Add 40 mL of cold hydrochloric acid to the flask, mix, and titrate with 0.05 M potassium iodate VS until the solution becomes light brown in color. Add

5 mL of methylene chloride, insert the stopper into the flask, and shake vigorously. Continue the titration, dropwise, with shaking after each addition, until the methylene chloride layer becomes colorless and the aqueous layer is clear yellow. Record the titrant volume, V_t (mL). Perform a blank determination, using 20 mL of water as the sample, and record the titrant volume, V_b (mL). [NOTE— $V_b > V_t$.] The difference between the two titrations represents the amount of potassium iodate equivalent to the weight of benzalkonium chloride in the sample. Each mL of 0.05 M potassium iodate is equivalent to x/10 mg of benzalkonium chloride, where x represents the average molecular weight of the sample, derived by summing, for all homologs, the products:

$$\text{Result (x)} = \sum_i [(r_i/r_t) \times M_i]$$

r_u = area of the peak produced by a given homolog in the chromatogram from the *Ratio of Alkyl Components* test

r_T = sum of the peak areas for all homologs in the chromatogram from the *Ratio of Alkyl Components* test

M_r = molecular weight of a given homolog. The molecular weights of the C₁₀, C₁₂, C₁₄, and C₁₆ homologs are 312, 340, 368, and 396, respectively.

Acceptance criteria

For labeled concentrations of NLT 1%:

95.0%–105.0%

For labeled concentrations less than 1%:

93.0%–107.0%

OTHER COMPONENTS

• **ALCOHOL CONTENT (IF ADDED)**

Internal standard solution: 0.06 mL/mL of tertiary butyl alcohol in water

Alcohol stock solution: 0.03 mL/mL of C₂H₅OH in water, using USP Alcohol RS

Standard solutions: Introduce 5 mL, 10 mL, and 20 mL, respectively, of *Alcohol stock solution* into three separate identical 50-mL volumetric flasks. To each flask, add a 5-mL portion of the *Internal standard solution*. Dilute with water to volume, and mix thoroughly. *Standard solutions* contain alcohol content of 0.003 mL/mL, 0.006 mL/mL, and 0.012 mL/mL, respectively.

Sample solution: Weigh an appropriate amount of Benzalkonium Chloride Solution into a 50-mL volumetric flask, and pipet 5 mL of *Internal standard solution*. Dilute with water to volume, and mix thoroughly to obtain a solution containing an alcohol content of between 0.003 mL/mL and 0.012 mL/mL.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 0.25-mm × 30-m glass or quartz capillary; 1.4-μm layer of phase G43

Temperature

Detector: 250°

Injection port: 250°

Column: See the temperature program table below.

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
40	—	40	7
40	30	250	15

Run time: 29 min

Carrier gas: Helium or nitrogen

Flow rate: See the ramped flow program table below.

Initial Flow (mL/min)	Flow Ramp (mL/min ²)	Final Flow (mL/min)	Hold Time at Final Flow (min)
1	—	1	8
1	10	3	21

Injection size: 1 µL

Injection mode: Split 75:1

System suitability

Sample: Standard solution containing alcohol content of 0.006 mL/mL

[NOTE—The relative retention times for alcohol and tertiary butyl alcohol are 0.7 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 2.0, between alcohol and tertiary butyl alcohol

Relative standard deviation: NMT 10%

Analysis

Samples: Standard solutions and Sample solution
Plot the peak response ratios of the alcohol to tertiary butyl alcohol in the Standard solutions versus the content, in mL/mL, of alcohol, and draw the straight line best fitting the plotted points. From the graph obtained, determine the content, C, in mL/mL, of alcohol in the Sample solution. Calculate the percentage of alcohol in the portion of Benzalkonium Chloride Solution (v/v) taken:

$$\text{Result} = V \times (C \times D/W) \times 100$$

V = volume of the Sample solution, 50 mL

D = density of Benzalkonium Chloride Solution (g/mL)

W = weight of Benzalkonium Chloride Solution taken to prepare the Sample solution (g)

Acceptance criteria: If present, between 95.0% and 105.0% of the labeled amount of C₂H₅OH

IMPURITIES

Organic Impurities

• PROCEDURE 1: LIMIT OF AMINES AND AMINE SALTS

Sample: A quantity of Solution, equivalent to 5.0 g of benzalkonium chloride

Analysis and Acceptance criteria: Dissolve the Sample with heating carefully e.g., on top of a steam bath with water as the steam source in 20 mL of a mixture of methanol and 1 N hydrochloric acid VS (97:3).

[NOTE—However, the mixed solution must not reach the boiling point.] Add 100 mL of isopropyl alcohol. Pass a stream of nitrogen slowly through the solution. Gradually add 12.0 mL of 0.1 N tetrabutylammonium hydroxide VS, while recording the potentiometric titration curve. If the curve shows two inflection points, the volume of titrant added between the two points is NMT 5.0 mL, corresponding to NMT 0.1 mmol/g of amines and amine salts. If the curve shows no point of inflection, the substance being examined does not comply with the test. If the curve shows one point of inflection, repeat the test, but add 3.0 mL of a 25.0 mg/mL solution of dimethyldecylamine in isopropyl alcohol before the titration. If after addition of 12.0 mL of the titrant, the titration curve shows only one point of inflection, the substance being examined does not comply with the test.

• PROCEDURE 2: LIMIT OF BENZYL ALCOHOL, BENZALDEHYDE, AND (CHLOROMETHYL)BENZENE

[NOTE—Prepare the solutions immediately before use.]

Solution A: Dissolve 1.09 g of sodium 1-hexanesulfonate and 6.9 g of monobasic sodium phosphate in water in a 1000-mL volumetric flask, adjust with

phosphoric acid to a pH of 3.5, and dilute with water to volume.

Solution B: Methanol

Mobile phase: See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)
0	80	20
10	80	20
14	50	50
35	50	50
36	20	80
55	20	80
56	80	20
65	80	20

Standard solution A: 0.25 mg/mL of USP Benzyl

Alcohol RS in methanol

Standard solution B: 0.075 mg/mL of USP

Benzaldehyde RS in methanol

Standard solution C: 0.025 mg/mL of USP Benzyl

Alcohol RS in methanol, prepared from Standard solution A and methanol

Sample solution: Determine the density of the Benzalkonium Chloride Solution. Dilute a quantity of the Solution equivalent to 2.5 g of benzalkonium chloride with methanol to 50.0 mL. This solution contains 50 mg/mL of benzalkonium chloride.

Chromatographic system

(See Chromatography <621>, System Suitability.)

Mode: LC

Detector: UV 210 nm for benzyl alcohol and

(chloromethyl)benzene; UV 257 nm for benzaldehyde

Column: 4.6-mm × 15-cm analytical column; 5-µm packing L1

Column temperature: 30°

Flow rate: 1.0 mL/min

Injection size: 20 µL

System suitability

Samples: Standard solution A, Standard solution B,

Standard solution C, and Sample solution

[NOTE—See the relative retention times in the table below.]

Name	Relative Retention Time
Benzyl alcohol	1.0
Benzaldehyde	1.3
(Chloromethyl)benzene	2.4

Suitability requirements

Relative standard deviation: NMT 5.0% for the benzyl alcohol peak, Standard solution A

Signal-to-noise ratio: NLT 10 for the principal peak in the chromatogram, Standard solution C

Analysis

Samples: Standard solution A, Standard solution B, Standard solution C, and Sample solution

To calculate the content of (chloromethyl)benzene, multiply the peak area of (chloromethyl)benzene by 1.3. [NOTE—The correction factor is used due to baseline shift.]

Acceptance criteria

Benzyl alcohol: The response of the benzyl alcohol peak from the Sample solution is NMT that of the benzyl alcohol peak from Standard solution A, corresponding to NMT 0.5%.

Benzaldehyde: The response of the benzaldehyde peak from the Sample solution is NMT that of the benzaldehyde peak from Standard solution B, corresponding to NMT 0.15%.

(Chloromethyl)benzene: The response of the (chloromethyl)benzene peak from the *Sample solution* is NMT 0.1 times that of the principal peak in the chromatogram from *Standard solution A*, corresponding to NMT 0.05%.

SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS** (61) and **TESTS FOR SPECIFIED MICROORGANISMS** (62): Solution containing less than 5.0% of benzalkonium chloride meets the requirements of the test for absence of *Pseudomonas aeruginosa*.
- **ACIDITY OR ALKALINITY**
Sample solution: An appropriate quantity of the Solution, equivalent to 500 mg of benzalkonium chloride solid, prepared from Benzalkonium Chloride Solution and carbon dioxide-free water
Analysis: To the *Sample solution* add 0.1 mL of bromocresol purple TS.
Acceptance criteria: NMT 0.1 mL of 0.1 N hydrochloric acid or 0.1 N sodium hydroxide is required to change the color of the indicator.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, and prevent contact with metals.
- **LABELING:** Label it to indicate the concentration of benzalkonium chloride, and to indicate the name and quantity of coloring agent added. The labeling also indicates the concentration of alcohol added.
- **USP REFERENCE STANDARDS** (11)
 USP Alcohol RS
 USP Benzyl Alcohol RS
 USP Benzaldehyde RS
 USP Benzalkonium Chloride RS

Benzethonium Chloride—see
Benzethonium Chloride General Monographs

Benzoic Acid—see *Benzoic Acid General Monographs*

Benzyl Alcohol

Portions of the monograph text that are national *USP* text, and are not part of the harmonized text, are marked with symbols (♦) to specify this fact.

C₇H₈O 108.14
 Phenylmethanol [100-51-6].

DEFINITION

Benzyl Alcohol contains NLT 98.0% and NMT the equivalent of 100.5% of phenylmethanol (C₇H₈O).

IDENTIFICATION

- **♦A. INFRARED ABSORPTION** (197F): On undried specimen♦

ASSAY

• PROCEDURE

Phenolphthalein solution: Dissolve 0.1 g of phenolphthalein in 80 mL of ethanol (96%), and dilute with

water to 100.0 mL. To test for sensitivity, add 100 mL of carbon dioxide-free water to 0.1 mL of the *Phenolphthalein solution*. The solution is colorless. NMT 0.2 mL of 0.02 M sodium hydroxide is required to change the color to pink.

Sample: 0.900 g

Analysis: To the *Sample* add 15 mL of a freshly prepared mixture of dried pyridine and acetic anhydride (7:1), and heat under a reflux condenser on a boiling water bath for 30 min. Cool, and add 25 mL of water. Using 0.25 mL of *Phenolphthalein solution* as the indicator, titrate with 1 M sodium hydroxide VS. Carry out a blank titration.

Calculate the percentage content of phenylmethanol (C₇H₈O):

$$\text{Result} = 10.81 \times (n_1 - n_2)/m$$

n_1 = amount of 1 M sodium hydroxide used for the blank (mL)

n_2 = amount of 1 M sodium hydroxide used for the sample (mL)

m = amount of sample taken (g)

Acceptance criteria: 98.0%–100.5%

IMPURITIES

- **FATS AND FIXED OILS**, *Peroxide Value* (401): NMT 5

• RESIDUE ON EVAPORATION

Analysis: After ensuring that the Benzyl Alcohol complies with the test for *Fats and Fixed Oils, Peroxide Value*, evaporate 10.0 g to dryness in a tared quartz or porcelain crucible or platinum dish on a hot plate at a temperature not exceeding 200°. Ensure that the Benzyl Alcohol does not boil during evaporation. Dry the residue on the hot plate for 1 h, and allow to cool in a desiccator.

Acceptance criteria: The residue weighs NMT 5 mg, corresponding to NMT 0.05%.

• ORGANIC IMPURITIES, BENZALDEHYDE, AND OTHER RELATED SUBSTANCES

Sample solution: Use the Benzyl Alcohol sample under examination.

Standard solution A: Dissolve 0.100 g of ethylbenzene in 10.0 mL of the *Sample solution*. Dilute 2.0 mL of this solution with the *Sample solution* to 20.0 mL.

Standard solution B: Dissolve 2.000 g of dicyclohexyl in 10.0 mL of the *Sample solution*. Dilute 2.0 mL of this solution with the *Sample solution* to 20.0 mL.

Reference solution A (for use in nonparenteral applications): Dissolve 0.750 g of benzaldehyde and 0.500 g of cyclohexylmethanol in the *Sample solution*, and dilute with the *Sample solution* to 25.0 mL. Add 1.0 mL of this solution to a mixture of 2.0 mL of *Standard solution A* and 3.0 mL of *Standard solution B*, and dilute with the *Sample solution* to 20.0 mL.

Reference solution B (for use in parenteral applications): Dissolve 0.250 g of benzaldehyde and 0.500 g of cyclohexylmethanol in the *Sample solution*, and dilute with the *Sample solution* to 25.0 mL. Add 1.0 mL of this solution to a mixture of 2.0 mL of *Standard solution A* and 2.0 mL of *Standard solution B*, and dilute with the *Sample solution* to 20.0 mL.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: GC

Detector: Flame ionization

Carrier: Helium, chromatography grade

Carrier linear velocity: 25 cm/s, at 50°

Detector temperature: 310°

Column: 30-m × 0.32-mm; 0.5-μm film thickness, G16

Temperature
Injector: 200°
Column: See Table 1.

Table 1

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
50	5	220	35

System suitability

Sample: For nonparenteral applications, use *Reference solution A*. For parenteral applications, use *Reference solution B*.

[NOTE—The retention time of benzyl alcohol is about 26 min. The relative retention times for ethylbenzene, dicyclohexyl, benzaldehyde, cyclohexylmethanol, and benzyl alcohol are about 0.28, 0.59, 0.68, 0.71, and 1.0, respectively.]

Injection volume: 0.1 µL without air plug

Suitability requirements

Sensitivity: Adjust the sensitivity of the detector so that the height of the peak due to ethylbenzene is NLT 30% of the full scale of the recorder.

Resolution: NLT 3.0 between the peaks corresponding to benzaldehyde and cyclohexylmethanol

Analysis

Samples: *Sample solution* and *Reference solution A* for nonparenteral applications and *Reference solution B* for parenteral applications

Acceptance criteria (nonparenteral applications): If any peaks are present in the chromatogram obtained with the *Sample solution* that have the same retention times as the peaks due to ethylbenzene and dicyclohexyl, subtract the areas of any such peaks from the peak areas at these retention times in the chromatograms of *Reference solution A* or *Reference solution B* (corrected peak areas of ethylbenzene and dicyclohexyl). Any such peaks in the *Sample solution* should be included in the assessments for the total of other peaks.

In the chromatogram obtained with the *Sample solution*, the area of any peak corresponding to benzaldehyde is NMT the difference between the area of the peak due to benzaldehyde in the chromatogram obtained with *Reference solution A* (0.15%) and the area of the peak due to benzaldehyde in the chromatogram obtained with the *Sample solution*.

In the chromatogram obtained with the *Sample solution*, the area of any peak corresponding to cyclohexylmethanol is NMT the difference between the area of the peak due to cyclohexylmethanol in the chromatogram obtained with *Reference solution A* (0.10%) and the area of the peak due to cyclohexylmethanol in the chromatogram obtained with the *Sample solution*.

In the chromatogram obtained with the *Sample solution*, the sum of the areas of any peak with a relative retention time less than that of benzyl alcohol and apart from the peaks due to benzaldehyde and cyclohexylmethanol is NMT four times the area of ethylbenzene in *Reference solution A*, corrected if necessary as described above (0.04%).

In the chromatogram obtained with the *Sample solution*, the sum of the areas of any peak with a relative retention time greater than that of benzyl alcohol is NMT the area of dicyclohexyl in *Reference solution A*, corrected if necessary as described above (0.3%).

Disregard any peak with an area less than 0.01 times that of the peak due to ethylbenzene in the chromatogram of *Reference solution A*, corrected if necessary as described above.

Acceptance criteria (parenteral applications): If any peaks are present in the chromatogram obtained with

the *Sample solution* that have the same retention times as the peaks due to ethylbenzene and dicyclohexyl, subtract the areas of any such peaks from the peak areas at these retention times in the chromatograms of *Reference solution A* or *Reference solution B* (corrected peak areas of ethylbenzene and dicyclohexyl). Any such peaks in the *Sample solution* should be included in the assessments for the total of other peaks.

In the chromatogram obtained with the *Sample solution*, the area of any peak corresponding to benzaldehyde is NMT the difference between the area of the peak due to benzaldehyde in the chromatogram obtained with *Reference solution B* (0.05%) and the area of the peak due to benzaldehyde in the chromatogram obtained with the *Sample solution*.

In the chromatogram obtained with the *Sample solution*, the area of any peak corresponding to cyclohexylmethanol is NMT the difference between the area of the peak due to cyclohexylmethanol in the chromatogram obtained with *Reference solution B* (0.10%) and the area of the peak due to cyclohexylmethanol in the chromatogram obtained with the *Sample solution*.

In the chromatogram obtained with the *Sample solution*, the sum of the areas of any peak with a relative retention time less than that of benzyl alcohol and apart from the peaks due to benzaldehyde and cyclohexylmethanol is NMT two times the area of ethylbenzene in *Reference solution B*, corrected if necessary as described above (0.02%).

In the chromatogram obtained with the *Sample solution*, the sum of the areas of any peak with a relative retention time greater than that of benzyl alcohol is NMT the area of dicyclohexyl in *Reference solution B*, corrected if necessary as described above (0.2%).

Disregard any peak with an area less than 0.01 times that of the peak due to ethylbenzene in the chromatogram of *Reference solution B*, corrected if necessary as described above.

SPECIFIC TESTS**• ACIDITY**

Phenolphthalein solution: Prepare as directed in the Assay.

Analysis: To 10 mL of Benzyl Alcohol add 10 mL of ethanol (96%) and 1 mL of *Phenolphthalein solution*.

Acceptance criteria: NMT 1 mL of 0.1 M sodium hydroxide is required to change the color of the indicator to pink.

• CLARITY OF SOLUTION

[NOTE—The *Sample solution* is to be compared to *Reference suspension 1* in diffused daylight 5 min after preparation of *Reference suspension 1*.]

Hydrazine solution: Transfer 1.0 g of hydrazine sulfate to a 100-mL volumetric flask, dissolve in and dilute with water to volume, and mix. Allow to stand 4–6 h before use.

Methenamine solution: Transfer 2.5 g of methenamine to a 100-mL glass-stoppered flask, add 25.0 mL of water, insert the glass stopper, and mix to dissolve.

Primary opalescent suspension: [NOTE—This suspension is stable for 2 months, provided it is stored in a glass container free from surface defects. The suspension must not adhere to the glass and must be well mixed before use.] Transfer 25.0 mL of *Hydrazine solution* to the *Methenamine solution* in the 100-mL glass-stoppered flask. Mix, and allow to stand for 24 h.

Opalescence standard: [NOTE—This suspension should not be used beyond 24 h after preparation.] Transfer 15.0 mL of the *Primary opalescent suspension* to a 1000-mL volumetric flask, dilute with water to volume, and mix.

Reference suspension 1: Transfer 5.0 mL of the *Opalescence standard* to a 100-mL volumetric flask, and dilute with water to volume.

Reference suspension 2: Transfer 10.0 mL of the *Opalescence standard* to a second 100-mL volumetric flask, and dilute with water to volume.

Sample solution: Dissolve 2.0 g of Benzyl Alcohol in 60 mL of water.

Analysis: Transfer a sufficient portion of the *Sample solution* to a test tube of colorless, transparent, neutral glass with a flat base and an internal diameter of 15–25 mm, to obtain a depth of 40 mm. Similarly transfer portions of *Reference suspension 1*, *Reference suspension 2*, and water to separate matching test tubes. Compare the *Sample solution*, *Reference suspension 1*, *Reference suspension 2*, and water in diffused daylight, viewing vertically against a black background (see *Spectrophotometry and Light-Scattering* (851), *Visual Comparison*). [NOTE—The diffusion of light must be such that *Reference suspension 1* can readily be distinguished from water, and that *Reference suspension 2* can readily be distinguished from *Reference suspension 1*.]

Acceptance criteria: The *Sample solution* shows the same clarity as that of water, or its opalescence is not more pronounced than that of *Reference suspension 1*.♦

♦ **COLOR OF SOLUTION**

Sample solution: Use the *Sample solution* prepared in the test for *Clarity of Solution*.

Analysis: Transfer a sufficient portion of the *Sample solution* to a test tube of colorless, transparent, neutral glass with a flat base and an internal diameter of 15–25 mm, to obtain a depth of 40 mm. Similarly transfer a portion of water to a separate matching test tube. Compare the color of the *Sample solution* with that of water in diffused daylight, viewing vertically against a white background (see *Spectrophotometry and Light-Scattering* (851), *Visual Comparison*).

Acceptance criteria: The *Sample solution* has the color of water.♦

♦ **REFRACTIVE INDEX (831):** 1.538–1.541 at 20°

ADDITIONAL REQUIREMENTS

- ♦ **LABELING:** Where Benzyl Alcohol is intended for use in the manufacture of parenteral applications, it is so labeled.♦
- ♦ **PACKAGING AND STORAGE:** Preserve in tight containers, protected from light.♦
- ♦ **USP REFERENCE STANDARDS**
USP Benzyl Alcohol RS.♦

Benzyl Benzoate—see *Benzyl Benzoate General Monographs*

Betadex

Beta Cyclodextrin [7585-39-9].

DEFINITION

Betadex is a nonreducing cyclic compound composed of seven alpha-(1–4) linked D-glucopyranosyl units. It contains NLT 98.0% and NMT 102.0% of betadex (C₆H₁₀O₅)₇, calculated on the anhydrous basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION (197K):** On undried specimen
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- **C.** It meets the requirements of the test for *Optical Rotation*.

• **D.**

Sample: 0.2 g

Analysis: Mix the *Sample* with 2 mL of iodine TS, warm in a water bath to dissolve, and allow to stand at room temperature.

Acceptance criteria: A yellow-brown precipitate is formed.

ASSAY

• **PROCEDURE**

Mobile phase: Methanol and water (7:93)

System suitability solution: 0.5 mg/mL of USP Alpha Cyclodextrin RS, 0.5 mg/mL of USP Beta Cyclodextrin RS, and 0.5 mg/mL of USP Gamma Cyclodextrin RS

Standard solution: 1.0 mg/mL of USP Beta Cyclodextrin RS

Sample stock solution: Transfer 250 mg of Betadex to a 25-mL volumetric flask, and dissolve in water with the aid of heat if necessary. Cool, and dilute with water to volume.

Sample solution: 1 mg/mL of Betadex, prepared from the *Sample stock solution*, diluted with water

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: Refractive index

Column: 4.6-mm × 15-cm; 5-μm packing L1

Temperatures

Column: 30°

Detector: 40°

Flow rate: 1.5 mL/min

Injection volume: 50 μL

System suitability

Sample: *System suitability solution*

[NOTE—The relative retention times for gamma cyclodextrin, alpha cyclodextrin, and beta cyclodextrin are 0.4, 0.5, and 1.0, respectively.]

Suitability requirements

Resolution: NLT 1.5 between the gamma cyclodextrin and alpha cyclodextrin peaks

Tailing factor: 0.8–2.0 for the three cyclodextrins

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of betadex (C₆H₁₀O₅)₇ in the portion of sample taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Beta Cyclodextrin RS in the *Standard solution* (mg/mL)

C_U = concentration of Beta Cyclodextrin in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0% on the anhydrous basis

IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.1%
- **HEAVY METALS**, *Method II* (231): NMT 5 µg/g
- **LIMIT OF REDUCING SUGARS**
Cupric solution: 150 mg/mL of cupric sulfate
Tartrate solution: 25 mg/mL of anhydrous sodium carbonate, 25 mg/mL of potassium sodium tartrate, 20 mg/mL of sodium bicarbonate, and 20 mg/mL of anhydrous sodium sulfate
Cupric–tartaric solution: Immediately before use, mix 1 part of *Cupric solution* with 25 parts of *Tartrate solution*.

Ammonium molybdate solution: 100 mg/mL of ammonium molybdate

Disodium arsenate solution: 60 mg/mL of disodium arsenate

Ammonium molybdate reagent: Mix 10 mL of *Disodium arsenate solution*, 50 mL of *Ammonium molybdate solution*, and 90 mL of diluted sulfuric acid, and dilute with water to 200 mL.

Sample solution: Transfer 1.0 g of Betadex (as calculated on the anhydrous basis) to a 100-mL volumetric flask. Dissolve in and dilute with water that has been previously boiled and cooled to room temperature to volume, and mix. To 1 mL of this solution add 1 mL of *Cupric–tartaric solution*. Heat on a water bath for 10 min, then cool to room temperature. Add 10 mL of *Ammonium molybdate reagent*, and allow to stand for 15 min.

Standard stock solution: 20 mg/L of USP Dextrose RS

Standard solution: Prepare at the same time as the *Sample solution*. To 1 mL of the *Standard stock solution* add 1 mL of *Cupric–tartaric solution*. Heat on a water bath for 10 min, then cool to room temperature. Add 10 mL of *Ammonium molybdate reagent*, and allow to stand for 15 min.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Vis

Analytical wavelength: 740 nm

Blank: Water

Analysis

Samples: *Sample solution* and *Standard solution*

Acceptance criteria: 0.2%; the absorbance of the *Sample solution* is NMT that of the *Standard solution*.

- **LIMIT OF LIGHT-ABSORBING IMPURITIES**

Sample solution: Transfer 1.0 g of Betadex (as calculated on the anhydrous basis) to a 100-mL volumetric flask. Dissolve in and dilute with water that has been previously boiled and cooled to room temperature to volume. Mix, and pass through a filter of 0.2-µm pore size.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: UV/Vis

Analytical wavelength: 230–750 nm

Cell: 1 cm

Blank: Water

Analysis

Sample: *Sample solution*

Acceptance criteria

Absorbance:

NMT 0.10, 230–350 nm

NMT 0.05, 350–750 nm

- **RELATED COMPOUNDS**

Mobile phase, System suitability solution, Chromatographic system, and System suitability: Proceed as directed in the Assay.

Standard solution: 0.05 mg/mL each of USP Alpha Cyclodextrin RS, USP Beta Cyclodextrin RS, and USP Gamma Cyclodextrin RS from the *System suitability solution*, diluted with water

Sample solution: Use the *Sample stock solution* from the Assay.

Analysis

Samples: *Standard solution* and *Sample solution*

Acceptance criteria

Alpha cyclodextrin: 0.25%; the area of any peak corresponding to alpha cyclodextrin is NMT 0.5 times the area of the corresponding peak from the *Standard solution*.

Gamma cyclodextrin: 0.25%; the area of any peak corresponding to gamma cyclodextrin is NMT 0.5 times the area of the corresponding peak from the *Standard solution*.

Other related substances: 0.5%; the sum of all of the peak areas, excluding the alpha cyclodextrin, beta cyclodextrin, gamma cyclodextrin, and artifact peaks is NMT the area of the peak due to betadex (beta cyclodextrin) from the *Standard solution*.

SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS** (61) and **TESTS FOR SPECIFIED MICROORGANISMS** (62): The total aerobic microbial count does not exceed 10³ cfu/g, and the total combined molds and yeasts count does not exceed 10² cfu/g. It meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*.

- **OPTICAL ROTATION**, *Specific Rotation* (781S)

Sample solution: 10 mg/mL in water

Acceptance criteria: +160° to +164°, determined at 20°

- **WATER DETERMINATION**, *Method I* (921): NMT 14.0%

- **COLOR AND CLARITY OF SOLUTION**

Sample solution: Dissolve 0.2 g in 20.0 mL of freshly boiled and cooled water.

Acceptance criteria: The resulting solution is clear and colorless.

- **pH** (791)

Sample solution: Add 0.1 mL of a saturated solution of potassium chloride to 10 mL of a 10 mg/mL aqueous solution of Betadex.

Acceptance criteria: 5.0–8.0

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers. No storage requirements specified.

USP Dextrose RS

Betadex Sulfobutyl Ether Sodium

$C_{42}H_{70-n}O_{35} \cdot (C_4H_8SO_3Na)_n$ 2163 when $n = 6.5$

Beta cyclodextrin sulfobutyl ethers, sodium salts;

Beta cyclodextrin sulfobutyl ether sodium [182410-00-0].

DEFINITION

Betadex Sulfobutyl Ether Sodium is prepared by alkylation of betadex using 1,4-butane sultone under basic conditions.

The average degree of substitution in betadex is NLT 6.2 and NMT 6.9. It contains NLT 95.0% and NMT 105.0% of $C_{42}H_{70-n}O_{35} \cdot (C_4H_8SO_3Na)_n$ ($n = 6.2-6.9$), calculated on the anhydrous basis.

IDENTIFICATION

- A. INFRARED ABSORPTION** (197K)
- B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- C.** It meets the requirements of the test for *Average Degree of Substitution*.
- D. IDENTIFICATION TESTS—GENERAL, Sodium** (191)

ASSAY

PROCEDURE

Mobile phase: 0.1 M potassium nitrate in a mixture of acetonitrile and water (1:4)

Standard solution: 10 mg/mL of USP Betadex Sulfobutyl Ether Sodium RS in *Mobile phase*

Sample solution: 10 mg/mL of Betadex Sulfobutyl Ether Sodium in *Mobile phase*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: Refractive index

Detector temperature: $35 \pm 2^\circ$

Column: 7.8-mm \times 30-cm analytical column; packing L37. [NOTE—Rinse the column with a solution of acetonitrile and water (1:9) at the completion of the run series.]

Flow rate: 1.0 mL/min

Injection size: 20 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of betadex sulfobutyl ether sodium $[C_{42}H_{70-n}O_{35} \cdot (C_4H_8SO_3Na)_n]$ in the portion of Betadex Sulfobutyl Ether Sodium taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response for betadex sulfobutyl ether sodium from the *Sample solution*

r_S = peak response for betadex sulfobutyl ether sodium from the *Standard solution*

C_S = concentration of USP Betadex Sulfobutyl Ether Sodium RS in the *Standard solution* (mg/mL)

C_U = concentration of Betadex Sulfobutyl Ether Sodium in the *Sample solution* (mg/mL)

Acceptance criteria: 95.0%–105.0% on the anhydrous basis

IMPURITIES

Suitability requirements

Relative standard deviation: NMT 5.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of beta cyclodextrin (betadex) in the portion of Betadex Sulfobutyl Ether Sodium taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times F \times 100$$

r_U = peak response for beta cyclodextrin from the *Sample solution*

r_S = peak response for beta cyclodextrin from the *Standard solution*

C_S = concentration of USP Beta Cyclodextrin RS in the *Standard solution* (μ g/mL)

C_U = concentration of Betadex Sulfobutyl Ether Sodium in the *Sample solution* (mg/mL)

F = conversion factor (10^{-3} mg/ μ g)

Acceptance criteria: NMT 0.1%

LIMIT OF 1,4-BUTANE SULTONE

Internal standard solution: 0.25 μ g/mL of diethyl sulfone

Standard stock solution A: 0.5 μ g/mL of 1,4-butane sultone

Standard stock solution B: 1.0 μ g/mL of 1,4-butane sultone

Standard stock solution C: 2.0 μ g/mL of 1,4-butane sultone

Sample stock solution: 250 mg/mL of Betadex Sulfobutyl Ether Sodium in the *Internal standard solution*

Blank solution, and Sample solutions A, B, C, and D: Follow *Table 3* to place the quantities of *Internal standard solution*, each *Standard stock solution*, *Sample stock solution*, water, or methylene chloride in each glass test tube with a stopper. [NOTE—A screw-capped, 10-mL test tube is suitable.] Mix on a vortex mixer each test tube for 30 s, and allow it stand for at least 5 min

or until complete separation of the phase. Extract the organic phase into a GC vial and seal. [NOTE—With great care take the minimum possible amount of aqueous phase.] Added quantities of 1,4-butane sultone in *Sample solutions A, B, C, and D* are 0.5, 1.0, 2.0, and 0 µg, respectively.

Table 3

Sample Name	Solution 1 Added (mL)	Solution 2 Added (mL)	Methylene Chloride Added (mL)
Blank solution	Internal standard solution, 4.0	Water, 1.0	1.0
Sample solution A	Sample stock solution, 4.0	Standard stock solution A, 1.0	1.0
Sample solution B	Sample stock solution, 4.0	Standard stock solution B, 1.0	1.0
Sample solution C	Sample stock solution, 4.0	Standard stock solution C, 1.0	1.0
Sample solution D	Sample stock solution, 4.0	Water, 1.0	1.0

[NOTE—Prepare immediately before use.]

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 0.32-mm × 25-m fused-silica capillary column; 0.5-µm layer of phase G46

Temperature

Detector: 270°

Injection port: 200°

Column: See the temperature program in *Table 4*.

Table 4

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
100	10	200	—
200	35	270	5

Carrier gas: Helium, typically at 12 psi inlet pressure

Injection size: 1.0 µL

Injection type: Splitless injection for 0.5 min, then split at 50 mL/min. [NOTE—The use of an appropriate splitless injection liner is recommended.]

System suitability

Sample: *Sample solution B*

[NOTE—The relative retention times for diethyl sulfone and 1,4-butane sultone are 0.7 and 1.0, respectively.]

Suitability requirements

Relative standard deviation: NMT 10.0%

Analysis

Samples: *Blank solution, Sample solutions A, B, C, and D*

Correct the ratio of peak responses of the 1,4-butane sultone to diethyl sulfone in *Sample solution A, B, C, or D* by subtracting the ratio of peak responses of the 1,4-butane sultone to ethyl sulfone in the *Blank solution*. Plot the corrected ratio of peak response of 1,4-butane sultone to peak response of diethyl sulfone in *Sample solution A, B, C or D*, versus the added quantity, in µg, of 1,4-butane sultone. Extrapolate the line joining the

points on the graph until it meets the quantity axis. The distance between this point and the intersection of the axes represents the quantity of 1,4-butane sultone, *A*, in µg, in the 4-mL portion of *Sample stock solution*. Calculate the content of 1,4-butane sultone in the portion of Betadex Sulfobutyl Ether Sodium taken:

$$\text{Result} = A / (V_{\text{Ext}} \times C_U \times F)$$

A = determined above

*V*_{Ext} = volume of the *Sample stock solution* used in the extraction step, 4.0 mL

*C*_U = concentration of Betadex Sulfobutyl Ether Sodium in the *Sample stock solution* (mg/mL)

F = conversion factor (10⁻³ g/mg)

Acceptance criteria: NMT 0.5 ppm

• LIMIT OF SODIUM CHLORIDE, 4-HYDROXYBUTANE-1-SULFONIC ACID, AND BIS(4-SULFOBUTYL) ETHER DISODIUM

Solution A: 5 mM sodium hydroxide, degas in a closed vessel for 15 min

Solution B: 25 mM sodium hydroxide, degas in a closed vessel for 15 min

Mobile phase: See *Table 5*.

Table 5

Time (min)	Solution A (%)	Solution B (%)

4	100	0
10	70	30
24	70	30
25	100	0
40	100	0

Column wash solution A: 50 mM sodium citrate

Column wash solution B: 150 mM sodium hydroxide

Standard solution: Prepare a solution having known concentrations of 8 µg/mL of USP Sodium Chloride RS, 4 µg/mL of 4-hydroxybutane-1-sulfonic acid, and 4 µg/mL of bis(4-sulfobutyl) ether disodium.

Sample solution: 4 mg/mL of Betadex Sulfobutyl Ether Sodium

Chromatographic system

(See *Chromatography* <621>, *System Suitability* and *Ion Chromatography* <1065>.)

Mode: IC

Detector: Conductivity

Range: 30 µS

Current: 100 mA

Column: [NOTE—At the end of each run, clean the column using *Column wash solution A* at a flow rate of 1 mL/min for 35 min then using *Column wash solution B* at the same flow rate for 35 min.]

Guard: 4.0-mm × 5.0-cm anion-exchange; packing L61

Analytical: 4.0-mm × 25-cm anion-exchange; packing L61

Column temperature: 30°

Suppressor: Micromembrane anion autosuppressor¹ or a suitable chemical suppression system

Suppressant: Autosuppression

Flow rate: 1.0 mL/min

Injection size: 20 µL

System suitability

Sample: *Standard solution*

[NOTE—Relative retention times are provided for information only. The relative retention times for 4-hydroxybutane-1-sulfonate ion, chloride ion, and bis(sulfobutyl) ether ion are 1.0, 1.4, and 8.6, respectively.]

¹ Available as Anion Self-Regenerating Suppressor (ASRS) from Dionex Inc., or equivalent.

Suitability requirements**Resolution:** NLT 2.0**Relative standard deviation:** NMT 10.0%**Analysis****Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of sodium chloride, 4-hydroxybutane-1-sulfonic acid, or bis(sulfobutyl) ether disodium in the portion of Betadex Sulfobutyl Ether Sodium taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times F \times 100$$

r_U = peak response for sodium chloride, 4-hydroxybutane-1-sulfonic acid, or bis(sulfobutyl) ether disodium from the *Sample solution*

r_S = peak response for sodium chloride, 4-hydroxybutane-1-sulfonic acid, or bis(sulfobutyl) ether disodium from the *Standard solution*

C_S = concentration of sodium chloride, 4-hydroxybutane-1-sulfonic acid, or bis(sulfobutyl) ether disodium in the *Standard solution* (μg/mL)

C_U = concentration of Betadex Sulfobutyl Ether Sodium in the *Sample solution* (mg/mL)

F = conversion factor (10^{-3} mg/μg)

Acceptance criteria**Sodium chloride:** NMT 0.2%**4-Hydroxybutane-1-sulfonic acid:** NMT 0.09%**Bis(sulfobutyl) ether disodium:** NMT 0.05%**SPECIFIC TESTS**

- **BACTERIAL ENDOTOXINS TEST (85):** The level of bacterial endotoxins is such that the requirement under the relevant dosage form monograph(s) in which Betadex Sulfobutyl Ether Sodium is used can be met. Where the label states that Betadex Sulfobutyl Ether Sodium must be subjected to further processing during the preparation of injectable dosage forms, the level of bacterial endotoxins is such that the requirement under the relevant dosage form monograph(s) in which Betadex Sulfobutyl Ether Sodium is used can be met.

- **MICROBIAL ENUMERATION TESTS (61) and TESTS FOR SPECIFIED MICROORGANISMS (62):** The total aerobic microbial count does not exceed 100 cfu/g, and the total combined molds and yeasts count does not exceed 50 cfu/g. It meets the requirements of the test for absence of *Escherichia coli*.

- **CLARITY OF SOLUTION**

Sample solution: 30% (w/v) solution**Analysis:** Examine the *Sample solution* using a light box against white and black backgrounds, and record the presence of any haze, fluorescence, fibers, specks, or other foreign matter.**Acceptance criteria:** The solution is clear, and essentially free from particles of foreign matter.

- **AVERAGE DEGREE OF SUBSTITUTION**

Run electrolyte: 30 mM benzoic acid and adjusted to a pH that is suitable for the instrument used by addition of 100 mM tris(hydroxymethyl) aminomethane buffer. [NOTE—Due to variation between capillaries, a single universally applicable electrolyte pH is not specified. Instead, the optimal pH associated with each individual capillary should be determined according to the instrumental manual.]

Standard solution: 10 mg/mL of USP Betadex Sulfobutyl Ether Sodium RS**Sample solution:** 10 mg/mL of Betadex Sulfobutyl Ether Sodium

Capillary rinsing procedure: Use separate run electrolyte vials for capillary rinse and sample analysis. Perform pre-analysis rinses on a daily basis before each analysis: rinse the capillary with 0.1 N sodium hydroxide for 30 min, with water for NLT 2 h, and with

Run electrolyte for NLT 1 h. Perform pre-injection rinses prior to each injection as follows. Rinse the capillary with 0.1 N sodium hydroxide for NLT 1 min, and with *Run electrolyte* for NLT 3 min. If a new capillary is being used, in addition to the regular rinses described above, a new capillary requires rinsing before its first use. Rinse the new capillary with 1 M sodium hydroxide for 1 h, followed by a 2-h water rinse.

Electrophoretic system(See *Capillary Electrophoresis* (1053).)**Mode:** High-performance CE**Detector:** Inverse UV 200 nm, with a bandwidth of 20 nm. [NOTE—A detection wavelength of 205 nm with a bandwidth of 10 nm may be used as an alternative.]**Column:** 50-μm × 50-cm fused silica column**Column temperature:** 25°**Applied voltage:** 0.00 to +30.00 kV linear ramp over 10 min, then at 30 kV for a further 20 min**Injection size:** Equal volumes at 0.5 psi for 10 s**System suitability****Sample:** *Standard solution*

[NOTE—See Table 6 for the approximate relative migration times for betadex sulfobutyl ether sodium peaks I–X (betadex sulfobutyl ether sodium peaks I, II, III, ..., X, contains beta cyclodextrin molecule with 1, 2, 3, ..., 10 sulfobutyl substituent(s), respectively). The relative migration times are for informational purposes only to aid in peak identification.]

Table 6

Betadex Sulfobutyl Ether Sodium Peaks I–X	Relative Migration Time
I	0.58
II	0.63
III	0.69
IV	0.77
V	0.83
VI	0.91
VII	1.00
VIII	1.10
IX	1.20
X	1.30

Suitability requirements

Resolution: NLT 0.9, between betadex sulfobutyl ether sodium peak IX and betadex sulfobutyl ether sodium peak X

Analysis**Samples:** *Run electrolyte*, water, *Standard solution*, and *Sample solution*

Inject the *Standard solution* and *Sample solution* by applying differential pressure of 0.5 psi, equivalent to 34 mbar, for 10 s, followed by injection of *Run electrolyte* at 0.5 psi for 2 s. [NOTE—Pressure injections should be made with a vial of water or *Run electrolyte* at the outlet end of the capillary.]

Record the electropherograms, and measure the peak responses for the individual betadex sulfobutyl ether sodium peaks (I to X). Calculate the corrected peak area, A_i , for each peak in the electropherogram:

$$\text{Corrected Peak Area } A_i = \frac{\text{Peak Area} \times \text{Effective Capillary Length (cm)}}{\text{Migration Time}}$$

Normalize the corrected peak areas by presenting each as a percentage of the total corrected substitution envelope area:

$$\text{Normalized Area, } NA_i = \frac{A_i}{\sum_{i=1}^n A_i} \times 100$$

n = highest level of substitution

Determine the average degree of substitution:

$$\text{Average Degree of Substitution} = \frac{\sum_{i=1}^n (\text{Level of Substitution for Peak} \times NA_i)}{100}$$

Acceptance criteria: 6.2–6.9 for average degree of substitution

For each of betadex sulfobutyl ether sodium peaks I–X, see limit range (% peak area) in Table 7.

Table 7

Betadex Sulfobutyl Ether Sodium Peaks I–X	Limit Range (% Peak Area)
I	0–0.3
II	0–0.9
III	0.5–5.0

Boric Acid

H₃BO₃ 61.83
Boric acid (H₃BO₃) [10043-35-3].

DEFINITION

Boric Acid contains NLT 99.5% and NMT 100.5% of boric acid (H₃BO₃), calculated on the dried basis.

IDENTIFICATION

- **A. IDENTIFICATION TESTS—GENERAL**, Borate <191>: Meets the requirements

ASSAY

PROCEDURE

Sample solution: Dissolve 2 g of Boric Acid in 100 mL of a mixture of glycerin and water (1:1), previously neutralized to phenolphthalein TS.

Analysis: Titrate the Sample solution with 1 N sodium hydroxide VS. Discharge the pink color by the addition of 50 mL of glycerin, neutralized to phenolphthalein TS, and continue the titration until the pink color reappears. Each mL of 1 N sodium hydroxide is equivalent to 61.83 mg of H₃BO₃.

Acceptance criteria: 99.5%–100.5% on the dried basis

IMPURITIES

HEAVY METALS, Method I <231>

Test preparation: Dissolve 1 g in 23 mL of water, and add 2 mL of 1 N acetic acid.

Acceptance criteria: 20 µg/g

SPECIFIC TESTS

LOSS ON DRYING <731>

Analysis: Dry over silica gel for 5 h.

Acceptance criteria: NMT 0.5%

SOLUBILITY IN ALCOHOL

Sample solution: 1 g in 10 mL of boiling alcohol

Acceptance criteria: It dissolves completely.

COMPLETENESS OF SOLUTION

Sample solution: 1 g in 25 mL of water

Acceptance criteria: It produces a clear solution.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **LABELING:** Label the container with a warning that it is not for internal use.

Butane

C₄H₁₀ 58.12
n-Butane [106-97-8].

DEFINITION

Butane contains NLT 97.0% of butane (C₄H₁₀).

[**CAUTION**—Butane is highly flammable and explosive.]

IDENTIFICATION

- **A. INFRARED ABSORPTION:** Exhibits maxima, among others, at the following wavelengths, in µm: 3.4 (vs), 6.8 (s), 7.2 (m), and 10.4 (m).

B.

Sample: Use an empty stainless steel cylinder equipped with a stainless steel valve and having a capacity of NLT 200 mL and a pressure rating of 240 psi or more. Dry the cylinder with the valve open at 110° for 2 h, and evacuate the hot cylinder to less than 1 mm of mercury.

Close the valve, cool, and weigh. Connect one end of a charging line tightly to the butane container and the other end loosely to the empty cylinder. Carefully open the butane container, and allow the butane to flush out the charging line through the loose connection. Avoid excessive flushing, which causes moisture to freeze in the charging line and connections. Tighten the fitting on the empty cylinder, and open the empty cylinder valve, allowing the butane to flow into the evacuated cylinder. Continue sampling until the desired amount of butane is obtained, then close the butane container valve, and finally close the sample cylinder valve.

[**CAUTION**—Do not overload the sample cylinder; hydraulic expansion due to temperature change can cause overloaded cylinders to explode.] Weigh the charged sample cylinder, and determine the weight.

Analysis: Determine the vapor pressure of the Sample at 21° by means of a suitable pressure gauge.

Acceptance criteria: 205–235 kPa absolute (30–34 psia)

ASSAY

PROCEDURE

Chromatographic system

(See Chromatography <621>, System Suitability.)

Mode: GC

Detector: Thermal conductivity

Column: 3-mm × 6-m aluminum; packed with 10 weight percent of liquid phase G30 on nonacid-washed support S1C

Column temperature: 33°

Carrier gas: Helium

Flow rate: 50 mL/min

Injection volume: 2 µL

System suitability

Sample: *n*-Butane

Suitability requirements: The peak responses of *n*-butane in the chromatograms from duplicate determinations agree within 1%.

Analysis

Samples: Connect 1 Butane cylinder to the chromatograph through a suitable sampling valve and a flow control valve downstream from the sampling valve.

Flush the liquid specimen through the sampling valve, taking care to avoid entrapment of gas or air in the sampling valve.

Calculate the purity by dividing 100 times the *n*-butane response by the sum of all of the responses.

Acceptance criteria: NLT 97.0%

SPECIFIC TESTS

• HIGH-BOILING RESIDUES

Sample: Use the *Sample* from Identification test B

Analysis: Prepare a cooling coil from copper tubing (about 6-mm outside diameter × about 6.1-m long) to fit into a vacuum-jacketed flask. Immerse the cooling coil in a mixture of dry ice and acetone in a vacuum-jacketed flask, and connect one end of the tubing to the *Sample*. Carefully open the sample cylinder valve, flush the cooling coil with about 50 mL of the *Sample*, and discard this portion of liquefied sample. Continue delivering liquefied sample from the cooling coil, and collect it in a previously chilled 1000-mL sedimentation cone until the cone is filled to the 1000-mL mark. Allow the sample to evaporate, using a warm water bath maintained at about 40° to reduce evaporating time. When all of the liquid has evaporated, rinse the sedimentation cone with two 50-mL portions of pentane, and combine the rinsings in a tared 150-mL evaporating dish. Transfer 100 mL of the pentane solvent to a second tared 150-mL evaporating dish, place both evaporating dishes on a water bath, evaporate to dryness, and heat the dishes in an oven at 100° for 60 min. Cool the dishes in a desiccator, and weigh. Repeat the heating for 15-min periods until successive weighings are within 0.1 mg, and calculate the weight of the residue obtained from the *Sample* as the difference between the weights of the residues in the two evaporating dishes.

Acceptance criteria: NMT 5 µg/mL

• ACIDITY OF RESIDUE

Sample solution: Add 10 mL of water to the residue obtained in the test for *High-Boiling Residues*.

Analysis: Mix the *Sample solution* by swirling for 30 s, add 2 drops of methyl orange TS, insert the stopper in the tube, and shake vigorously.

Acceptance criteria: No pink or red color appears in the aqueous layer.

• LIMIT OF SULFUR COMPOUNDS

Analysis: Carefully open the container valve to produce a moderate flow of gas. Do not direct the gas stream toward the face, but deflect a portion of the stream toward the nose.

Acceptance criteria: The odor is free from the characteristic odor of sulfur compounds.

• WATER DETERMINATION (921)

Sample: 100 g of the *Sample* from Identification test B

Analysis: Proceed as directed in the chapter with the following modifications. (a) Provide the closed-system titrating vessel with an opening through which passes a coarse-porosity gas dispersion tube connected to a sampling cylinder. (b) Dilute the *Reagent* with anhydrous methanol to give a water equivalence factor of 0.2–1.0 mg/mL; age this diluted solution for NLT 16 h

before standardization. (c) Introduce the *Sample* into the titration vessel through the gas dispersion tube at a rate of about 100 mL/min; if necessary, heat the sample cylinder gently to maintain this flow rate.

Acceptance criteria: NMT 0.001%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight cylinders, and prevent exposure to excessive heat.

Butyl Alcohol

DEFINITION

Butyl Alcohol is *n*-butyl alcohol.

IMPURITIES

• BUTYL ETHER

Sample: Butyl Alcohol

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: GC

Detector: Thermal-conductivity detector

Column: 6-mm × 2-m stainless steel column packed with 25% liquid phase G29 3,3'-thiodipropionitrile on 30- to 40-mesh support S1C

Column temperature: 85°

Carrier gas: Helium

Flow rate: 75 mL/min

Injection size: 10 µL

Analysis

Sample: *Sample*

[NOTE—The retention times for butyl ether, 2-butanol, water, isobutyl alcohol, and butyl alcohol are approximately 6.0, 12.0, 17.0, 18.0, and 25.0 min, respectively.]

Acceptance criteria: The response due to butyl ether is NMT 0.2% of the sum of all of the responses.

SPECIFIC TESTS

- **SPECIFIC GRAVITY (841):** 0.807–0.809
- **DISTILLING RANGE, Method II (721):** Butyl Alcohol distills within a range of 1.5°, including 117.7°.

• ACIDITY

Sample: 74 mL (60 g)

Analysis: Titrate the *Sample* with 0.020 N alcoholic potassium hydroxide, using phenolphthalein TS as the indicator, until a pink color persists for NLT 15 s

Acceptance criteria: NMT 2.5 mL is consumed

• WATER DETERMINATION, Method I (921):

• LIMIT OF NONVOLATILE RESIDUE

Sample: 100 mL

Analysis: Evaporate the *Sample* in a tared porcelain dish on a steam bath, and dry at 105° for 30 min

Acceptance criteria: The weight of the residue does not exceed 4 mg (0.004%).

• ALDEHYDES

Sample: 10 mL

Analysis: To 10 mL of silver-ammonia-nitrate TS in a test tube add the *Sample*, and mix. Allow the mixture to stand in a dark place for 30 min

Acceptance criteria: No color is produced, although a slight precipitate may form at the interface of the two layers.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, and prevent exposure to excessive heat.

Butylated Hydroxyanisole

$C_{11}H_{16}O_2$ 180.24
Phenol, (1,1-dimethylethyl)-4-methoxy-;
tert-Butyl-4-methoxyphenol [25013-16-5].

DEFINITION

Butylated Hydroxyanisole contains NLT 98.5% of $C_{11}H_{16}O_2$.

IDENTIFICATION

• A. PROCEDURE

Analysis: To 5 mL of 0.1 mg/mL solution in 72% alcohol add 2 mL of 20 mg/mL sodium borate solution and 1 mL of 0.1 mg/mL solution of 2,6-dichloroquinone-chlorimide in dehydrated alcohol, and mix.

Acceptance criteria: A blue color is produced.

- **B.** The retention times of 3-*tert*-butyl-4-hydroxyanisole and 2-*tert*-butyl-4-hydroxyanisole from the *Sample solution* correspond to those from the *Standard solution*, as obtained in the Assay.

ASSAY

• PROCEDURE

Solution A: 5% acetic acid

Mobile phase: Acetonitrile and *Solution A* (45:55)

Standard solution: 90 µg/mL of USP 3-*tert*-Butyl-4-hydroxyanisole RS and 10 µg/mL of USP 2-*tert*-Butyl-4-hydroxyanisole RS in *Mobile phase*

Sample solution: 100 µg/mL of Butylated Hydroxyanisole in *Mobile phase*

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 290 nm

Column: 4.6-mm × 75-mm; 3.5-µm packing L1

Column temperature: 30°

Flow rate: 1.2 mL/min

Injection size: 20 µL

System suitability

Sample: *Standard solution*

[NOTE—The retention times of 2-*tert*-butyl-4-hydroxyanisole and 3-*tert*-butyl-4-hydroxyanisole are about 4.2 and 4.6 min, respectively.]

Suitability requirements

Resolution: NLT 1.5 between the 3-*tert*-butyl-4-hydroxyanisole isomer and 2-*tert*-butyl-4-hydroxyanisole isomer peaks

Tailing factor: NMT 1.5

Relative standard deviation: NMT 2.0% for the 3-*tert*-butyl-4-hydroxyanisole isomer and 2-*tert*-butyl-4-hydroxyanisole isomer peaks

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the peak areas for each isomer. Calculate the percentage of each isomer in the portion of Butylated Hydroxyanisole taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- r_U = peak area of the corresponding isomer from the *Sample solution*
 r_S = peak area of the corresponding isomer from the *Standard solution*
 C_S = concentration of the appropriate USP Reference Standard in the *Standard solution* (µg/mL)
 C_U = concentration of the *Sample solution* (µg/mL)

[NOTE—Calculate the percentage of $C_{11}H_{16}O_2$ in the portion of Butylated Hydroxyanisole taken by adding the quantities of the two isomers.]

Acceptance criteria: NLT 98.5%

IMPURITIES

Inorganic Impurities

- **RESIDUE ON IGNITION** <281>: NMT 0.01%, determined on a 10-g specimen
- **HEAVY METALS**, *Method II* <231>: NMT 10 ppm

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **USP REFERENCE STANDARDS** <11>
 USP 2-*tert*-Butyl-4-hydroxyanisole RS
 $C_{11}H_{16}O_2$ 180.25
 USP 3-*tert*-Butyl-4-hydroxyanisole RS
 $C_{11}H_{16}O_2$ 180.25

Butylated Hydroxytoluene

$C_{15}H_{24}O$ 220.35
Phenol, 2,6-bis(1,1-dimethylethyl)-4-methyl-;
2,6-Di-*tert*-butyl-*p*-cresol [128-37-0].

DEFINITION

Butylated Hydroxytoluene contains NLT 99.0% of $C_{15}H_{24}O$.

IDENTIFICATION

- **A. INFRARED ABSORPTION** <197K>: On undried sample

IMPURITIES

- **RESIDUE ON IGNITION** <281>

Analysis: Transfer 50 g to a tared crucible, ignite until thoroughly charred, and cool. Moisten the ash with 1 mL of sulfuric acid, and complete the ignition by heating at $800 \pm 25^\circ$ for 15-min periods to constant weight.

Acceptance criteria: NMT 0.002%

- **HEAVY METALS**, *Method II* <231>: NMT 10 ppm

ORGANIC IMPURITIES

Solution A: 50 mg/mL of potassium ferricyanide

Solution B: 105 mg/mL of ferric chloride

Sample solution: 20 mg/mL of Butylated Hydroxytoluene in methanol

Standard solution: 0.1 mg/mL of Butylated Hydroxytoluene from the *Sample solution* diluted with methanol

Chromatographic system

(See *Chromatography* <621>, *Thin-Layer Chromatography*.)

Mode: TLC

Absorbent: 0.25-mm layer of chromatographic silica gel mixture

Developing solvent system: Methylene chloride

Application volume: 10 µL

Spray reagent: *Solution A*, *Solution B*, and water (1:2:7), freshly prepared

Analysis

Samples: *Sample solution* and *Standard solution*

Apply the *Samples*, and allow to dry. Place the plate in the chromatographic chamber, and develop until the solvent front has moved three-fourths of the length of the plate. Remove the plate, and allow the plate to dry. Spray the plate with *Spray reagent*.

Acceptance criteria: Any spot from the *Sample solution*, apart from the principal spot, is not more intense than the spot from the *Standard solution* (NMT 0.5%).

SPECIFIC TESTS

- **CONGEALING TEMPERATURE** (651): NLT 69.2°, corresponding to NLT 99.0% of C₁₅H₂₄O

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **USP REFERENCE STANDARDS** (11)
USP Butylated Hydroxytoluene RS

Butylparaben

C₁₁H₁₄O₃ 194.23
Benzoic acid, 4-hydroxy-, butyl ester;
Butyl *p*-hydroxybenzoate [94-26-8].

DEFINITION

Butylparaben contains NLT 98.0% and NMT 102.0% of butylparaben (C₁₁H₁₄O₃).

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197M)
- **B. MELTING RANGE OR TEMPERATURE** (741): 68°–71°

ASSAY

PROCEDURE

Sample: 1.000 g

Titrimetric system

(See *Titrimetry* (541).)

Mode: Residual titration

Titrant: 1 N sulfuric acid VS

Endpoint detection: Visual

Analysis: To the *Sample* add 20.0 mL of 1 N sodium hydroxide VS, and heat at 70° for 1 h. Cool rapidly in an ice bath. Carry out the titration on the solutions at room temperature. Titrate the excess sodium hydroxide with *Titrant*, continuing the titration until the second point of inflection. Perform a blank determination. Each mL of 1 N sodium hydroxide VS is equivalent to 194.2 mg of butylparaben (C₁₁H₁₄O₃).

Acceptance criteria: 98.0%–102.0%

IMPURITIES

- **RESIDUE ON IGNITION** (281)
Sample: 1.0 g
Acceptance criteria: NMT 0.1%

RELATED COMPOUNDS

Adsorbent: 0.25-mm layer of chromatographic octadecylsilylanized silica gel mixture

Sample solution: 10 mg/mL of Butylparaben in acetone

Standard solution A: Transfer 0.5 mL of the *Sample solution* to a 100-mL volumetric flask, and dilute with acetone to volume.

Standard solution B: Dissolve 10 mg of USP Propylparaben RS in 1 mL of the *Sample solution*, and dilute with acetone to 10 mL.

Chromatographic system

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

Mode: TLC

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture

Application volume: 2 µL

Developing solvent system: Methanol, glacial acetic acid, and water (70:1:30)

Analysis

Samples: *Sample solution* and *Standard solutions*
Develop the chromatogram in the *Developing solvent system* until the solvent front has moved three-fourths of the length of the plate. Examine the plate under short-wavelength UV light, and compare the intensities of any secondary spots observed from the *Sample solution* with that of the principal spot from *Standard solution A*. The test is not valid unless the chromatogram obtained with *Standard solution B* shows two clearly separated principal spots.

Acceptance criteria: NMT 0.5%; the intensity of any individual secondary spot from the *Sample solution* is NMT that of the principal spot obtained from *Standard solution A*.

SPECIFIC TESTS

ACIDITY

Sample solution: To 2 mL of *Sample solution* prepared in the test for *Color of Solution*, add 3 mL of alcohol, 5 mL of carbon dioxide-free water, and 0.1 mL of bromocresol green TS.

Analysis: Titrate with 0.10 N sodium hydroxide.

Acceptance criteria: NMT 0.1 mL is required to produce a blue color.

COLOR OF SOLUTION

Sample solution: 100 mg/mL in alcohol

Comparison solution: Mix 2.4 mL of ferric chloride CS, 1.0 mL of cobaltous chloride CS, and 0.4 mL of cupric sulfate CS with 0.3 N hydrochloric acid to make 10 mL. Dilute 5 mL of this solution with 0.3 N hydrochloric acid to make 100 mL. Prepare and use this solution immediately.

Analysis

Samples: Alcohol, *Sample solution*, and *Comparison solution*

Make the comparison by viewing the solutions downward in matched color-comparison tubes against a white surface (see *Color and Achromicity* (631)).

Acceptance criteria: The *Sample solution* is clear and not more intensely colored than alcohol or the *Comparison solution*.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **USP REFERENCE STANDARDS** (11)
USP Butylparaben RS
USP Propylparaben RS

Calcium Carbonate—see *Calcium Carbonate General Monographs*

Calcium Chloride—see *Calcium Chloride General Monographs*

Tribasic Calcium Phosphate

Ca₅(OH)(PO₄)₃

502.31

Calcium hydroxide phosphate;

Calcium hydroxide phosphate [12167-74-7].

DEFINITION

Tribasic Calcium Phosphate consists of a variable mixture of calcium phosphates having the approximate composition 10CaO · 3P₂O₅ · H₂O. It contains NLT 34.0% and NMT 40.0% of calcium (Ca).

IDENTIFICATION

- A.**
Sample solution: Dissolve 100 mg in 5 mL of diluted nitric acid.
Analysis: Warm the *Sample solution*, and add ammonium molybdate TS.
Acceptance criteria: A yellow precipitate is formed.
- B. IDENTIFICATION TESTS—GENERAL, Calcium (191):** Meets the requirements of the flame test

ASSAY**PROCEDURE**

Sample: 150 mg of Tribasic Calcium Phosphate
Blank: Proceed as directed in the *Analysis*, omitting the test specimen.
Titrimetric system
 (See *Titrimetry* (541).)
Mode: Direct titration
Titrant: 0.05 M edetate disodium VS
Endpoint detection: Visual
Analysis: Dissolve the *Sample*, with the aid of gentle heat if necessary, in a mixture of hydrochloric acid and water (5:3), contained in a 250-mL beaker equipped with a magnetic stirrer, and cautiously add 125 mL of water. With constant stirring, add, in the following order, 0.5 mL of triethanolamine, 300 mg of hydroxy naphthol blue, and from the titration buret, about 23 mL of *Titrant*. Add sodium hydroxide solution (45 in 100) until the initial red color changes to clear blue. Continue to add it dropwise until the color changes to violet, and add an additional 0.5 mL. The pH is 12.3–12.5. Continue the titration dropwise with the *Titrant* to the appearance of a clear blue endpoint that persists for NLT 60 s.
 Calculate the percentage of calcium (Ca) in the *Sample* taken:

$$\text{Result} = \left\{ \left[(V_S - V_B) \times M \times F \right] / W \right\} \times 100$$

V_S = *Titrant* volume consumed by the *Sample* (mL)
 V_B = *Titrant* volume consumed by the *Blank* (mL)
 M = actual molarity of the *Titrant* (mM/mL)
 F = equivalency factor, 40.08 mg/mM
 W = *Sample* weight (mg)
Acceptance criteria: 34.0%–40.0%

IMPURITIES

- CHLORIDE AND SULFATE, Chloride (221)**
Standard: 1.0 mL of 0.020 N hydrochloric acid
Sample: 0.500 g of Tribasic Calcium Phosphate
Analysis: Dissolve the *Sample* in 25 mL of 2 N nitric acid, and add 1 mL of silver nitrate TS.
Acceptance criteria: NMT 0.14%
- CHLORIDE AND SULFATE, Sulfate (221)**
Standard: 1.0 mL of 0.020 N sulfuric acid
Sample: 0.500 g of Tribasic Calcium Phosphate
Analysis: Dissolve the *Sample* in the smallest possible amount of 3 N hydrochloric acid. Dilute with water to 100 mL, and filter, if necessary. To 25 mL of the filtrate add 1 mL of barium chloride TS.
Acceptance criteria: NMT 0.8%
- ARSENIC, Method I (211)**
Test preparation: Dissolve 1.0 g in just sufficient 3 N hydrochloric acid.
Acceptance criteria: NMT 3 ppm
- BARIUM**
Sample: 500 mg of Tribasic Calcium Phosphate
Analysis: Mix the *Sample* with 10 mL of water, heat, add hydrochloric acid, dropwise, until solution is effected, and then add 2 drops of the acid in excess. Filter, and add to the filtrate 1 mL of potassium sulfate TS.
Acceptance criteria: No turbidity appears within 15 min.

HEAVY METALS, Method I (231)

Test preparation: Mix 1.3 g with 9 mL of 3 N hydrochloric acid, dilute with water to 50 mL, and heat to boiling. Cool to room temperature, and filter.
 [NOTE—Filter the mixture after the pH adjustment.]

Acceptance criteria: NMT 30 ppm

CARBONATE

Sample: 2 g of Tribasic Calcium Phosphate
Analysis: Mix the *Sample* with 20 mL of water, and add 3 N hydrochloric acid, dropwise, to effect solution.
Acceptance criteria: No effervescence is produced.

ACID-INSOLUBLE SUBSTANCES

Analysis: If an insoluble residue remains in the test for *Carbonate*, boil the solution, filter, wash the residue well with hot water until the last washing is free from chloride, and ignite the residue to constant weight.

Acceptance criteria: The weight of the residue does not exceed 4 mg (NMT 0.2%).

DIBASIC SALT AND CALCIUM OXIDE

Sample: 1.5 g of Tribasic Calcium Phosphate
Blank: 25.0 mL of *Titrant*

Titrimetric system

(See *Titrimetry* (541).)

Mode: Residual titration

Titrant: 1 N hydrochloric acid VS

Back-titrant: 0.1 N sodium hydroxide VS

Endpoint detection: Potentiometric

Analysis: Dissolve the *Sample* by warming with 25.0 mL of the *Titrant*. Cool, and slowly titrate the excess of *Titrant*, while agitating constantly, with the *Back-titrant* to a pH of 4.0.

Acceptance criteria: 13.0–14.3 mL of 1 N hydrochloric acid is consumed for each g of salt, calculated on the ignited basis.

LIMIT OF FLUORIDE

[NOTE—Prepare and store all solutions in plastic containers.]

Buffer solution: 294 mg/mL of sodium citrate dihydrate in water

Standard stock solution: 1.1052 mg/mL of USP Sodium Fluoride RS in water

Standard solution: Transfer 20.0 mL of *Standard stock solution* to a 100-mL volumetric flask containing 50.0 mL of *Buffer solution*, dilute with water to volume, and mix. Each mL of this solution contains 100 µg of fluoride ion.

Sample solution: Transfer 2.0 g of Tribasic Calcium Phosphate to a beaker containing a plastic-coated stirring bar. Add 20 mL of water and 3.0 mL of hydrochloric acid, and stir until dissolved. Add 50.0 mL of *Buffer solution* and sufficient water to make 100 mL.

Electrode system: Use a fluoride-specific ion-indicating electrode and a silver–silver chloride reference electrode connected to a pH meter capable of measuring potentials with a minimum reproducibility of ±0.2 mV (see pH (791)).

Analysis

Samples: *Standard solution* and *Sample solution*

Standard response line: Transfer 50.0 mL of *Buffer solution* and 3.0 mL of hydrochloric acid to a beaker, and add water to make 100 mL. Add a plastic-coated stirring bar, insert the electrodes into the solution, stir for 15 min, and read the potential, in mV. Continue stirring, and at 5-min intervals add 100, 100, 300, 500, and 500 µL of *Standard solution*, reading the potential 5 min after each addition. Plot the logarithms of the cumulative fluoride ion concentrations (0.1, 0.2, 0.5, 1.0, and 1.5 µg/mL) versus potential, in mV.

Rinse and dry the electrodes, insert them into the *Sample solution*, stir for 5 min, and read the potential, in mV. From the measured potential and the *Standard response line* determine the concentration, C (in µg/mL), of fluoride ion in the *Sample solution*.

Calculate the content of fluoride in the portion of Tribasic Calcium Phosphate taken:

$$\text{Result} = (V \times C)/W$$

- V = volume of the *Sample solution* (mL)
 C = concentration of fluoride ion in the *Sample solution* ($\mu\text{g/mL}$), determined from the *Standard response line*
 W = weight of Tribasic Calcium Phosphate taken to prepare the *Sample solution* (g)

Acceptance criteria: NMT 75 ppm

• **LIMIT OF NITRATE**

Sample: 200 mg of Tribasic Calcium Phosphate

Analysis: Mix the *Sample* with 5 mL of water, and add just sufficient hydrochloric acid to effect solution. Dilute with water to 10 mL, add 0.20 mL of indigo carmine TS, then add, with stirring, 10 mL of sulfuric acid.

Acceptance criteria: The blue color persists for NLT 5 min.

• **WATER-SOLUBLE SUBSTANCES**

Sample: 2 g of Tribasic Calcium Phosphate

Analysis: Digest the *Sample* with 100 mL of water on a steam bath for 30 min. Cool, add sufficient water to restore the original volume, stir well, and filter.

Evaporate 50 mL of the filtrate in a tared porcelain dish on a steam bath to dryness, and dry the residue at 120° to constant weight.

Acceptance criteria: The weight of the residue does not exceed 5 mg (NMT 0.5%).

SPECIFIC TESTS

• **LOSS ON IGNITION** (733)

Analysis: Ignite a sample at 800° for 30 min.

Acceptance criteria: NMT 8.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.

Calcium Propionate

$\text{C}_6\text{H}_{10}\text{CaO}_4$ 186.22
 [4075-81-4].

DEFINITION

Calcium Propionate contains NLT 98.0% and NMT 100.5% of $\text{C}_6\text{H}_{10}\text{CaO}_4$, calculated on the anhydrous basis.

IDENTIFICATION

- **IDENTIFICATION TESTS—GENERAL,** *Calcium* (191): A solution (1 in 20) meets the requirements of the flame test.

ASSAY

• **PROCEDURE**

Sample solution: 4 mg/mL of Calcium Propionate

Analysis: While stirring, preferably with a magnetic stirrer, add 30 mL of 0.05 M disodium EDTA from a 50-mL buret, to 100 mL of *Sample solution*. Add 15 mL of 1 N sodium hydroxide and 300 mg of hydroxy naphthol blue indicator, and continue the titration to a blue endpoint. Each mL of 0.05 M disodium EDTA is equivalent to 9.311 mg of $\text{C}_6\text{H}_{10}\text{CaO}_4$.

Acceptance criteria: 98.0%–100.5% on the anhydrous basis.

IMPURITIES

Inorganic Impurities

• **LIMIT OF FLUORIDE**

Buffer: 294.1 mg/mL of sodium citrate dihydrate

Standard solution: 2.21 mg/mL of USP Sodium Fluoride RS. [NOTE—Store solution in a plastic bottle.] On the day of use, transfer 5.0 mL of the resulting solution

to a 1000-mL volumetric flask, dilute with water to volume, and mix. Each mL of this solution contains 5 μg of fluoride ion.

Electrode system: Use a fluoride-specific, ion-indicating electrode and a silver–silver chloride reference electrode connected to a pH meter capable of measuring potentials with a minimum reproducibility of ± 0.2 mV (see pH (791)).

Standard response line: Transfer 1.0, 2.0, 3.0, 5.0, 10.0, and 15.0 mL of the *Standard solution* into separate 250-mL plastic beakers. Add 50 mL of water, 5 mL of 1 N hydrochloric acid, 10 mL of *Buffer*, and 10 mL of 0.2 M disodium EDTA to each beaker, and mix. Transfer each solution into separate 100-mL volumetric flasks, dilute with water to volume, and mix. Transfer a 50-mL portion of each solution into separate 125-mL plastic beakers, and read the potential, in mV, of each solution using the electrode system. Plot the calibration curve versus potential, in mV, on two-cycle semilogarithmic paper with μg of fluoride/100 mL of solution on the logarithmic scale.¹

Sample: 1.0 g

Analysis: Transfer the *Sample* into a 150-mL glass beaker, add 10 mL of water, and, while stirring continuously, slowly add 20 mL of 1 N hydrochloric acid to dissolve the *Sample*. Boil rapidly for 1 min, then transfer into a 250-mL plastic beaker, and cool rapidly in ice water. Add 15 mL of *Buffer* and 10 mL of 0.2 M disodium EDTA, and mix. Adjust the pH to 5.5 ± 0.1 with 1 N hydrochloric acid or 1 N sodium hydroxide, if necessary. Transfer into a 100-mL volumetric flask, dilute with water to volume, and mix. Transfer a 50-mL portion of this solution into a 125-mL plastic beaker, and record the potential using the electrode system. Determine the concentration of fluoride, in $\mu\text{g/mL}$, in the *Sample*.

Acceptance criteria: NMT 30 ppm

• **LIMIT OF LEAD**

Standard lead solution: Prepare as directed under *Heavy Metals* (231), *Special Reagents*.

Diluted standard lead solutions: On the day of use, transfer 5.0, 10.0, and 20.0 mL of *Standard lead solution* into three separate 100-mL volumetric flasks, add 10 mL of 3 N hydrochloric acid to each, and dilute with water to volume corresponding to 0.5-, 1.0-, and 2.0- $\mu\text{g/mL}$ standards.

25% Sulfuric acid solution: Cautiously add 100 mL of sulfuric acid to 300 mL of water with constant stirring while cooling in an ice bath.

Sample blank: Add 5 mL of 25% *Sulfuric acid solution* into an evaporating dish. Within a hood, place the dish on a steam bath to evaporate most of the water. Place the dish on a burner, and slowly pre-ash the sample by expelling most of the sulfuric acid. Place the dish in a muffle furnace that has been set at 525°, and ash the sample until the residue appears free from carbon. Cool, and cautiously wash down the inside of the evaporation dish with water. Add 5 mL of 1 N hydrochloric acid. Place the dish on a steam bath, and evaporate to dryness. Add 1.0 mL of 3 N hydrochloric acid and approximately 5 mL of water, and heat briefly on a steam bath to dissolve any residue. Transfer the solution quantitatively to a 10-mL volumetric flask, dilute to volume, and mix.

Sample solution: Place 10 g of Calcium Propionate, to the nearest 0.1 mg, into an evaporating dish. Add a sufficient amount of 25% *Sulfuric acid solution*, and distribute the sulfuric acid uniformly through the sample. Proceed as directed under *Sample blank* beginning with "Within a hood".

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* (851).)

¹A suitable source for semilogarithmic paper is provided at the following web-site: <http://statland.org/GraphPaper/gpaper.html>.

Mode: Atomic absorption
Lamp: Lead electrodeless discharge
Flame: Air-acetylene
Analytical wavelength: 283.3 nm
Slit width: 0.7 nm
Instrument blank: Water

Standard curve

Samples: *Diluted standard lead solutions* and *Sample blank*

Plot: Corrected absorbance values versus their corresponding concentration ($\mu\text{g/mL}$). [NOTE—Determine corrected absorbance values by subtracting the absorbance of the *Sample blank* from the absorbance of the *Diluted standard lead solutions*.]

Analysis

Samples: *Sample solution* and *Sample blank*
 [NOTE—Determine corrected absorbance values by subtracting the absorbance of the *Sample blank* from the absorbance of the *Sample solution*.]

From the *Standard curve*, determine the lead concentration in the *Sample solution*. Calculate the lead content, in ppm, in the portion of Calcium Propionate taken:

$$\text{Result} = C_s/W \times V$$

C_s = concentration of lead from the *Standard curve* ($\mu\text{g/mL}$)

W = weight of the sample taken (g)

V = final volume of the sample (mL)

Acceptance criteria: NMT 2 ppm

- MAGNESIUM** (as MgO)

Magnesium standard solution: Dissolve 50.0 mg of magnesium metal in 1 mL of hydrochloric acid in a 1000-mL volumetric flask, dilute with water to volume, and mix.

Sample solution: Place 400.0 mg of Calcium Propionate, 5 mL of 2.7 N hydrochloric acid, and about 10 mL of water in a small beaker, and dissolve the Calcium Propionate by heating on a hot plate.

Analysis: Evaporate the *Sample solution* to a volume of about 2 mL, and cool. Transfer the residual liquid into a 100-mL volumetric flask, dilute with water to volume, and mix. Dilute 7.5 mL of this solution with water to 20 mL, add 2 mL of 1 N sodium hydroxide and 0.05 mL of a 1:1000 solution of thiazole yellow, mix, allow to stand for 10 min, and shake. Any color produced does not exceed that produced by 1.0 mL of *Magnesium standard solution* in the same volume as that of a control containing 2.5 mL of the *Sample solution* (corresponding to 10 mg of Calcium Propionate) and the quantities of the reagents used in the test.

Acceptance criteria: The solution passes the test (about 0.4%).

SPECIFIC TESTS

- WATER INSOLUBLE SUBSTANCES**

Sample: 10 g

Analysis: Dissolve the *Sample* in 100 mL of hot water, pass through a tared filtering crucible, wash the insoluble residue with hot water, and dry at 105° to constant weight.

Acceptance criteria: NMT 0.2%

- PH** (791): 7.5–10.5, in a solution (1 in 10)

- WATER DETERMINATION, Method I** (921): NMT 5.0%

- LOSS ON DRYING** (731): Dry a sample at 105° for 2 h: it loses NMT 4% of its weight.

ADDITIONAL REQUIREMENTS

- PACKAGING AND STORAGE:** Store in tightly closed containers. No storage requirements specified.

- USP REFERENCE STANDARDS** (11)
 USP Sodium Fluoride RS

Calcium Saccharate—see Calcium Saccharate General Monographs

Calcium Silicate

DEFINITION

Calcium Silicate, crystalline or amorphous, is a compound of calcium oxide and silicon dioxide. It contains NLT 4.0% of calcium oxide and NLT 35.0% of silicon dioxide.

IDENTIFICATION

- A. IDENTIFICATION TESTS—GENERAL, Calcium** (191)

Sample solution: Mix 0.5 g with 10 mL of 3 N hydrochloric acid. Filter, and neutralize the filtrate to litmus paper with 6 N ammonium hydroxide.

Acceptance criteria: The neutralized filtrate meets the requirements.

- B.**

Analysis: Prepare a bead by fusing a few crystals of sodium ammonium phosphate on a platinum loop in the flame of a gas burner. Place the hot, transparent bead in contact with the specimen of Calcium Silicate, and again fuse.

Acceptance criteria: Silica floats about in the bead, producing, upon cooling, an opaque bead having a web-like structure.

ASSAY

- SILICON DIOXIDE**

Sample: Calcium Silicate in the appropriate amount (see Table 1)

Table 1

Sample Weight (mg)	Calcium Oxide Content (%)
400	>25
600	11–25
1000	4–10

Analysis: Transfer the *Sample* to a beaker, add 5 mL of water and 10 mL of perchloric acid, and heat until dense white fumes of perchloric acid are evolved. Cover the beaker with a watch glass, and continue to heat for 2 h. Allow to cool, add 30 mL of water, filter, and wash the precipitate with 200 mL of hot water. [NOTE—Retain the combined filtrate and washings for use in the assay for Calcium Oxide.]

Transfer the filter paper and its contents to a platinum crucible, heat slowly to dryness, then heat sufficiently to char the filter paper. Ignite at about 900° – 1000° to constant weight. Moisten the residue with 5 drops of perchloric acid, add 15 mL of hydrofluoric acid, heat cautiously on a hot plate until all of the acid is driven off, and ignite at a temperature NLT 1000° to constant weight. Cool in a desiccator, and weigh: the loss in weight represents the weight of SiO_2 .

Acceptance criteria: NLT 35.0% of silicon dioxide (SiO_2) and 90.0%–110.0% of the content stated in the labeling, or within the range of percentages stated in the labeling

- CALCIUM OXIDE**

Sample solution: Use the combined filtrate and washings retained from the assay for *Silicon Dioxide*.

Titrimetric system

(See *Titrimetry* (541).)

Mode: Direct titration

Titrant: 0.05 M edetate disodium VS

Endpoint detection: Visual

Analysis: Neutralize the *Sample solution* to litmus with 1 N sodium hydroxide. Add, while stirring, 10 mL of 0.05 M edetate disodium VS from a 50-mL buret. Add

15 mL of 1 N sodium hydroxide and 300 mg of hydroxy naphthol blue, and continue the titration to a blue endpoint.

Calculate *Z*, the percentage of calcium oxide (CaO) in the sample taken:

$$Z = [(V \times M \times F)/W] \times 100$$

V = volume of *Titrant* consumed by the *Sample solution* (mL)

M = actual molarity of the *Titrant* (mmol/mL)

F = equivalency factor, 56.08 mg/mmol

W = weight of the sample (mg)

Calculate the percentage of the labeled amount of calcium oxide (CaO):

$$\text{Result} = (Z/L) \times 100$$

Z = percentage of CaO in the sample taken as calculated above

L = labeled amount of CaO

Acceptance criteria: NLT 4.0% of calcium oxide (CaO) and 90.0%–110.0% of the content stated in the labeling, or within the range of percentages stated in the labeling

IMPURITIES

- **LOSS ON IGNITION** (733): Transfer 1 g to a suitable tared crucible, dry at 105° for 2 h, and ignite at 900° to constant weight: it loses NMT 20.0% of its weight.

- **HEAVY METALS** (231)

Test preparation: Boil 4.0 g with a mixture of 50 mL of water and 10 mL of hydrochloric acid for 20 min, adding water to maintain the volume during the boiling. Add ammonium hydroxide until the mixture is only slightly acid to litmus paper. Filter with the aid of suction, and wash with 15–20 mL of water, combining the washing with the original filtrate. Add 2 drops of phenolphthalein TS, then add a slight excess of 6 N ammonium hydroxide. Discharge the pink color with dilute hydrochloric acid (1 in 100). Dilute with water to 100 mL, and use 25 mL of the solution for the test.

Acceptance criteria: NMT 20 ppm

- **LIMIT OF LEAD**

Palladium matrix modifier: Palladium nitrate (1% Pd)¹

Magnesium matrix modifier: Magnesium nitrate (2% Mg)²

Nitric acid, 65% [7697-37-2]: Use a suitable grade with a content of NLT 65.0%.³

Nitric acid diluent: Transfer 42 mL of *Nitric acid*, 65% to a 100-mL volumetric flask. Dilute with water to volume.

Matrix modifier solution: Transfer 1.0 mL of *Palladium matrix modifier* and 100 µL of *Magnesium matrix modifier* to a 20-mL volumetric flask. Dilute with water to volume, and mix.

Lead standard solution: A solution containing Pb(NO₃)₂ in 0.5 M nitric acid corresponding to 1000 mg of lead/mL⁴

Standard solution: Transfer 100 µL of *Lead standard solution* to a 100-mL volumetric flask. Dilute with water to volume, and mix. This solution contains the equivalent of 1.0 µg/mL of lead.

Calibration solutions

Calibration solution A: Transfer 50 mL of *Nitric acid diluent* to a 100-mL volumetric flask, and dilute with water to volume (0 µg/mL of lead).

Calibration solution B: Transfer 1 mL of *Standard solution* and 50 mL of *Nitric acid diluent* to a 100-mL

volumetric flask, and dilute with water to volume (0.01 µg/mL of lead).

Calibration solution C: Transfer 5 mL of *Standard solution* and 50 mL of *Nitric acid diluent* to a 100-mL volumetric flask, and dilute with water to volume (0.05 µg/mL of lead).

Sample solution: Weigh 2.0 g of Calcium Silicate into a 150-mL beaker. Mix with 50 mL of *Nitric acid diluent*. Cover with a watch glass, and boil for 20 min. Allow to cool. With the aid of a vacuum, pass through a glass filter,⁵ and wash the filter several times with water. Transfer the filtrate into a 100-mL volumetric flask. Dilute with water to volume, and mix.

System suitability solution: Transfer 5 mL of *Standard solution* and 50 mL of *Nitric acid diluent* into a 100-mL volumetric flask. Dilute with water to volume, and mix. This solution contains the equivalent of 0.05 µg of lead/mL.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Graphite furnace atomic absorption spectrophotometer

Analytical wavelength: 283.3 nm (lead emission line)

Lamp: Lead hollow-cathode lamp and an adequate means of Zeeman background correction

Carrier gas: Argon

Under typical conditions, the *Sample solution* and *Calibration solutions* volumes are 20 µL, the volume of the *Matrix modifier solution* is 10 µL, the injection temperature is 20°, and the oven conditions are as follows (see *Table 2*).

[NOTE—These conditions may be optimized for each instrument.]

Table 2

Step	Temperature (°)
Drying 1	110
Drying 2	130
Pyrolysis	950
Read	1800
Clean out	2450

Analysis

Samples: *Calibration solutions*, *Sample solution*, and *System suitability solution*

Plot the absorbance of each *Calibration solution* versus its content of lead, in µg/mL, and draw the best straight line fitting the three points. From this plot, determine the concentration, in µg/mL, of lead in the *Sample solution*: the correlation coefficient is NLT 0.99, and the recovery for the *System suitability solution* is 85%–115%. Calculate the quantity, in ppm, of lead in the *Sample solution*.

$$\text{Result} = (C \times V)/W$$

C = concentration of the *Sample solution* (µg/mL)

V = volume of the *Sample solution* (mL)

W = weight of sample taken (g)

Acceptance criteria: NMT 10 ppm

- **LIMIT OF FLUORIDE**

[NOTE—Store all solutions in polytef containers.]

Buffer solution: 294 mg/mL of sodium citrate

Ionic strength adjustment buffer: Transfer 42 mL of hydrochloric acid, 121 g of tris(hydroxymethyl)aminomethane, and 115 g of sodium tartrate to a 500-mL volumetric flask containing 250 mL of water. Stir to dissolve, and dilute with water to volume.

¹ A suitable grade is available as catalog number RCMMPD10KN-50 from VWR, www.vwr.com.

² Available as catalog number RCMIMG20KN-50, from VWR, www.vwr.com.

³ A suitable grade is available as catalog number 441-2 from EMD Chemicals, www.emdchemicals.com.

⁴ A suitable grade is available as catalog number 1.19776 from EMD Chemicals, www.emdchemicals.com.

⁵ Glass filter: Whatman GF/B glass microfiber filters, 1.0 µm, Whatman no. 1821-090, is suitable. Available as catalog number 28497-492, from VWR, www.vwr.com.

Standard stock solution: 221 µg/mL of USP Sodium Fluoride RS. This stock solution contains 100 µg/mL of fluoride ion.

Sample solution: Transfer 2.0 g of Calcium Silicate to a 100-mL polytetrafluoroethylene beaker containing a magnetic stir bar. Add 20 mL of water and 2.0 mL of hydrochloric acid. Cover with a watch glass, and heat to a vigorous boil for 1 min, stirring continuously. Remove from heat, and cool. Transfer the cooled suspension to a 100-mL polytetrafluoroethylene beaker. Add 25 mL of *Buffer solution*, and adjust with ammonium hydroxide or hydrochloric acid to a pH of 5–6. Add 50 mL of *Ionic strength adjustment buffer* and water to make 100 mL of solution.

Electrode system: Use a fluoride-specific ion-indicating electrode and a suitable reference electrode connected to a pH meter capable of measuring potentials with a reproducibility of ±0.2 mV (see pH <791>).

Standard response line: Obtain a standard response line with four standard solutions containing 0, 0.10, 0.20, and 0.40 µg/mL of fluoride as follows. Add 23 mL of water, 2 mL of hydrochloric acid, and 25 mL of *Buffer solution* to a 100-mL plastic beaker. Adjust with ammonium hydroxide to a pH of 5–6, and add *Ionic strength adjustment buffer* to obtain 100 mL of solution. Insert the electrode into the solution, stir for at least 15 min, and record the potential for the standard solution containing 0 µg/mL of fluoride. When the electrode has stabilized, add 100 µL of the *Standard stock solution* to the beaker, and stir. Allow the electrode to stabilize for 5 min, and measure the potential for the standard solution containing 0.10 µg/mL of fluoride. Similarly add another 100 and 200 µL of the *Standard stock solution* and record the potential for the standard solutions, containing 0.20 µg/mL of fluoride and 0.40 µg/mL of fluoride, respectively. After each addition, continue to stir for 5 min before recording the reading.

Analysis: Insert the calibrated electrode into the *Sample solution*, stir for 5 min, and record the measurement. From the measured potential of the *Sample solution* and the *Standard response line*, determine the concentration, *C*, in µg/mL, of fluoride ion in the *Sample solution*. Calculate the quantity, in ppm, of fluoride in Calcium Silicate:

$$\text{Result} = (C \times V)/W$$

C = concentration of fluoride ion in the *Sample solution* (µg/mL)

V = volume of the *Sample solution* (mL)

W = weight of Calcium Silicate in the *Sample solution* (g)

Acceptance criteria: NMT 50 ppm

SPECIFIC TESTS

- **pH <791>:** 8.4–11.2, determined in a well-mixed aqueous suspension (1 in 20)
- **RATIO OF SILICON DIOXIDE TO CALCIUM OXIDE:** Divide the percentage of silicon dioxide obtained in the test for *Silicon Dioxide* by the percentage of calcium oxide obtained in the test for *Calcium Oxide*.
Acceptance criteria: 0.5–2.0
- **SUM OF CaO, SiO₂, AND LOSS ON IGNITION:** The sum of the percentages obtained in the three tests is NLT 90.0%.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **LABELING:** The labeling states the claimed percentage or range of percentages for the content of calcium oxide and for the content of silicon dioxide.
- **USP REFERENCE STANDARDS <11>**
USP Sodium Fluoride RS

Calcium Stearate

Octadecanoic acid, calcium salt;
Calcium stearate [1592-23-0].

DEFINITION

Calcium Stearate is a compound of calcium with a mixture of solid organic acids obtained from fats. It consists chiefly of variable proportions of calcium stearate and calcium palmitate. It contains the equivalent of NLT 9.0% and NMT 10.5% of calcium oxide (CaO).

IDENTIFICATION

- **A. IDENTIFICATION TESTS—GENERAL, Calcium <191>**

Sample: 1 g

Analysis: Heat the *Sample* with a mixture of 25 mL of water and 5 mL of hydrochloric acid.

Acceptance criteria: Fatty acids are liberated and appear as an oily layer floating on the surface of the liquid. The water layer meets the requirements.

- **B.**

Sample: 25 g

Analysis: Mix the *Sample* with 200 mL of hot water, add 60 mL of 2 N sulfuric acid, and heat the mixture, with frequent stirring, until the separated fatty acid layer is clear. Wash the fatty acids with boiling water until free from sulfate, collect them in a small beaker, and warm on a steam bath until the water has separated and the fatty acids are clear. Allow the acids to cool, pour off the water layer, and melt the acids. Filter into a dry beaker, and dry at 105° for 20 min.

Acceptance criteria: The fatty acids so obtained congeal at a temperature NLT 54° (see *Congeeing Temperature* <651>).

ASSAY

- **PROCEDURE**

Sample: 1.2 g

Titrimetric system

(See *Titrimetry* <541>.)

Mode: Direct titration

Titrant: 0.05 M edetate disodium VS

Endpoint detection: Colorimetric

Analysis: Boil the *Sample* with 50 mL of 1 N sulfuric acid for about 3 h using a watch glass cover to avoid splattering, or until the separated fatty acid layer is clear, adding water if necessary, to maintain the original volume. [NOTE—Stirring may be helpful in obtaining a clear layer and decreasing extraction time.] Cool, filter, and wash the filter and the flask thoroughly with water until the last washing is not acid to litmus. Neutralize the filtrate with 1 N sodium hydroxide to litmus. While stirring, preferably with a magnetic stirrer, titrate with 0.05 M edetate disodium VS as follows. Add about 30 mL from a 50-mL buret, then add 15 mL of 1 N sodium hydroxide and 300 mg of hydroxy naphthol blue. Continue the titration to a blue endpoint. Each mL of 0.05 M edetate disodium is equivalent to 2.804 mg of calcium oxide (CaO).

Acceptance criteria: 9.0%–10.5%

IMPURITIES

- **HEAVY METALS <231>**

Test preparation: Place 2.5 g of Calcium Stearate in a porcelain dish, and add 5 mL of a 1-in-4 solution of magnesium nitrate in alcohol. Cover the dish with a 7.5-cm, short-stem funnel so that the stem is straight up. Heat on a hot plate at low heat for 30 min, then heat at medium heat for 30 min, and cool. Remove the funnel, and heat the dish over a suitable burner until most of the carbon is burned off. Cool, add 10 mL of nitric acid, and transfer the solution into a 250-mL beaker. Add 5 mL of 70% perchloric acid, cautiously evaporate to dryness, add 2 mL of hydrochloric acid to

the residue, and wash down the inside of the beaker with water. Evaporate carefully to dryness again, swirling near the dry point to avoid spattering. Repeat the hydrochloric acid treatment, then cool, and dissolve the residue in about 10 mL of water. Add 1 drop of phenolphthalein TS and add sodium hydroxide TS until the solution just turns pink. Then add 3 N hydrochloric acid until the solution becomes colorless. Add 1 mL of 1 N acetic acid and a small amount of charcoal, and pass through filter paper into 50-mL color-comparison tubes. Wash with water, and dilute with water to 40 mL.

Monitor preparation: Place 500 mg of Calcium Stearate in a porcelain dish, and add 5 mL of a 1-in-4 solution of magnesium nitrate in alcohol. Cover the dish with a 7.5-cm, short-stem funnel so that the stem is straight up. Heat on a hot plate at low heat for 30 min, then heat at medium heat for 30 min, and cool. Remove the funnel, add 2 mL of *Standard Lead Solution* (20 µg of Pb), and heat the dish over a suitable burner until most of the carbon is burned off. Cool, add 10 mL of nitric acid, and transfer the solution into a 250-mL beaker. Add 5 mL of 70% perchloric acid, cautiously evaporate to dryness, add 2 mL of hydrochloric acid to the residue, and wash down the inside of the beaker with water. Evaporate carefully to dryness again, swirling near the dry point to avoid spattering. Repeat the hydrochloric acid treatment, then cool, and dissolve the residue in about 10 mL of water. Add 1 drop of phenolphthalein TS and add sodium hydroxide TS until the solution just turns pink. Then add 3 N hydrochloric acid until the solution becomes colorless. Add 1 mL of 1 N acetic acid and a small amount of charcoal, and pass through filter paper into 50-mL color-comparison tubes. Wash with water, and dilute with water to 40 mL.

Analysis: Add 1.2 mL of thioacetamide–glycerin base TS and 2 mL of pH 3.5 acetate buffer to each tube. Allow to stand for 5 min.

Acceptance criteria: The color of the *Test preparation* does not exceed that of the *Monitor preparation* (NMT 10 ppm).

SPECIFIC TESTS

- **LOSS ON DRYING** (731): Dry a sample at 105° to constant weight, using 2-h increments of heating: it loses NMT 4.0% of its weight.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.

Calcium Sulfate

CaSO ₄	136.14
CaSO ₄ · 2H ₂ O	172.17
Sulfuric acid, calcium salt (1:1);	
Calcium sulfate (1:1) [7778-18-9].	
Dihydrate [10101-41-4].	

DEFINITION

Calcium Sulfate is anhydrous or contains two molecules of water of hydration. It contains NLT 98.0% and NMT 101.0% of CaSO₄, calculated on the dried basis.

IDENTIFICATION

- **A. IDENTIFICATION TESTS—GENERAL, Calcium** (191)
Sample solution: Dissolve 200 mg by warming in a mixture of 4 mL of 3 N hydrochloric acid and 16 mL of water.

Acceptance criteria: Meets the requirements

- **B. IDENTIFICATION TESTS—GENERAL, Sulfate** (191)

Sample solution: Dissolve 200 mg by warming in a mixture of 4 mL of 3 N hydrochloric acid and 16 mL of water.

Acceptance criteria: Meets the requirements

ASSAY

- **PROCEDURE**

Sample: Dissolve 300 mg of Calcium Sulfate in 100 mL of water and 4 mL of 3 N hydrochloric acid. Boil, if necessary, to dissolve, and cool before titrating.

Titrimetric system

(See *Titrimetry* (541).)

Mode: Direct titration

Titrant: 0.05 M edetate disodium VS

Blank: 100 mL of water and 4 mL of 3 N hydrochloric acid

Endpoint detection: Visual

Analysis: While stirring, preferably with a magnetic stirrer, add to the *Sample solution*, in the order named, 0.5 mL of triethanolamine, 300 mg of hydroxy naphthol blue, and, from a 50-mL buret, 30 mL of 0.05 M edetate disodium VS. Add sodium hydroxide solution (45 in 100) until the initial red color changes to clear blue, continue to add dropwise until the color changes to violet, and add an additional 0.5 mL. The pH is 12.3–12.5. Continue the titration dropwise with 0.05 M edetate disodium VS to the appearance of a clear-blue endpoint that persists for NLT 60 s.

Perform a blank determination. Calculate the percentage of Calcium Sulfate (CaSO₄) in the *Sample taken*:

$$\text{Result} = [(V - B) \times N \times F \times 100] / W$$

V = volume of titrant consumed by the *Sample* (mL)

B = volume of titrant consumed by the *Blank* (mL)

N = actual normality of the titrant (mEq/mL)

F = equivalency factor, 136.14 mg/mEq

W = weight of the *Sample* (mg)

Acceptance criteria: 98.0%–101.0% on the dried basis

IMPURITIES

- **IRON** (241)

Sample solution: Dissolve 100 mg in 8 mL of 3 N hydrochloric acid, and dilute with water to 47 mL.

Acceptance criteria: NMT 100 ppm

- **HEAVY METALS, Method I** (231): NMT 10 ppm

Test preparation: Mix 2.0 g with 20 mL of water, add 25 mL of 3 N hydrochloric acid, and heat to boiling to dissolve the test specimen. Cool, and add ammonium hydroxide to a pH of 7. Filter, evaporate to a volume of about 25 mL, and refilter, if necessary, to obtain a clear solution.

SPECIFIC TESTS

- **LOSS ON DRYING** (731)

Samples: Neat

Analysis: Dry a sample at a temperature NLT 250° to constant weight.

Acceptance criteria: NMT 1.5% for the anhydrous form and NMT 19.0%–23.0% for the dihydrate

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **LABELING:** Label it to indicate whether it is anhydrous or the dihydrate.

Anhydrous Dibasic Calcium—see
Anhydrous Dibasic Calcium Phosphate General Monographs

Dibasic Calcium Phosphate Dihydrate—
see *Dibasic Calcium Phosphate Dihydrate General Monographs*

Candelilla Wax

[8006-44-8].

DEFINITION

Candelilla Wax is the purified wax obtained from the leaves of the candelilla plant, *Euphorbia antisiphilitica* Zucc.

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197F)
Sample: Use a thin film of melted *Candelilla Wax*.
Acceptance criteria: Meets the requirements
- **B.** It meets the requirements of the test in *Specific Tests for Melting Range or Temperature, Class II* (741).

IMPURITIES

- **LIMIT OF LEAD** (251)
Sample: 3.3 g
Control: 10 µg of lead from a *Diluted Standard Lead Solution* (1 µg/mL of lead)
Analysis: Weigh the *Sample* into a porcelain dish, heat on a hot plate until completely charred, then heat in a muffle furnace at 480° for 8 h or overnight, and cool. Cautiously add 5 mL of nitric acid, evaporate to dryness on a hot plate, then heat again in the muffle furnace for exactly 15 min, and cool. Extract the ash with two 10-mL portions of water, filtering each extract into a separator. Leach any insoluble material on the filter with 6 mL of *Ammonium Citrate Solution*, 2 mL of *Hydroxylamine Hydrochloride Solution*, and 5 mL of water, adding the filtered washings to the separator. Continue as directed in *Lead* (251), *Procedure*, beginning with "Add two drops of phenol red TS", and use 10 mL of *Diluted Standard Lead Solution* for a control.
Acceptance criteria: The color of the *Sample solution* does not exceed that in the control, corresponding to NMT 3 µg/g.
- **HEAVY METALS, Method II** (231): NMT 20 µg/g

SPECIFIC TESTS

- **MELTING RANGE OR TEMPERATURE, Class II** (741): 68.5°–72.5°
- **FATS AND FIXED OILS, Acid Value** (401)
Sample: 3 g
Analysis: Weigh the *Sample* in a 250-mL flask, add 50 mL of a mixture of isopropyl alcohol and toluene (5:4), attach the flask to a reflux condenser, and boil gently until the wax is completely dissolved. Examine the solution: no insoluble particles are present. Remove the flask from the condenser, add 1 mL of phenolphthalein TS, and titrate immediately with 0.5 N alcoholic potassium hydroxide VS to a faint, reddish-yellow color. [NOTE—Do not allow the solution to cool; titrate at a warm temperature after refluxing. After the titration, reserve the solution for use in the test for *Saponification Value*.]
Calculate the acid value as the number of mg of potassium hydroxide required to neutralize the free acids in 1 g of *Candelilla Wax*.

Acceptance criteria: 12–22

- **FATS AND FIXED OILS, Saponification Value** (401)
Sample solution: Use the solution from the test for *Acid Value*.
Analysis: To the *Sample solution* add 15.0 mL of 0.5 N alcoholic potassium hydroxide VS, reflux for 3–4 h, and titrate the excess alkali with 0.5 N hydrochloric acid VS to a yellow-amber color. Perform a blank determination under the same conditions (see *Titrimetry* (541), *Residual Titrations*). The saponification value is the summation of the ester value so obtained and the acid value obtained above.

Acceptance criteria: 43–65

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers. No storage requirements specified.
- **USP REFERENCE STANDARDS** (11)
USP *Candelilla Wax RS*

Canola Oil

Low erucic acid rapeseed oil;
LEAR oil.

DEFINITION

Canola Oil is the refined fixed oil obtained from the seeds of *Brassica napus* or *Brassica campestris* (Fam. Cruciferae). A suitable antioxidant may be added.

IDENTIFICATION

- **A.** It meets the requirements of the test for *Fats and Fixed Oils* (401), *Fatty Acid Composition*.

IMPURITIES

- **HEAVY METALS, Method II** (231): NMT 10 ppm

SPECIFIC TESTS

- **FATS AND FIXED OILS, Fatty Acid Composition** (401)
Canola Oil exhibits the composition profile of fatty acids in *Table 1*.

Table 1

Carbon-Chain Length	Number of Double Bonds	Percentage (%)
<14	—	<0.1
14	0	<0.2
16	0	<6.0
16	1	<1.0
18	0	<2.5
18	1	>50
18	2	<40

24	1	<0.2

^a Erucic acid

- **LIMIT OF ERUCIC ACID:** NMT 2.0%, as determined in the test for *Fats and Fixed Oils* (401), *Fatty Acid Composition*

- **SPECIFIC GRAVITY** (841): 0.906–0.920
- **FATS AND FIXED OILS**, Acid Value (401): NMT 6.0
- **FATS AND FIXED OILS**, Iodine Value (401): 110–126
- **FATS AND FIXED OILS**, Peroxide Value (401): NMT 10.0
- **FATS AND FIXED OILS**, Saponification Value (401): 178–193
- **FATS AND FIXED OILS**, Unsaponifiable Matter (401): NMT 1.5%
- **REFRACTIVE INDEX** (831): 1.465–1.467 at 40°

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, and avoid contact with metals. Fill to the top or flush partially filled containers with nitrogen. No storage requirements specified.
- **LABELING:** Label it to indicate the name and concentration of any added antioxidant.

Add the following:

▲ Caprylic Acid

C₈H₁₆O₂ 144.21
Octanoic acid;
1-Heptanecarboxylic acid [124-07-2].

DEFINITION

Caprylic Acid contains NLT 99.0% of caprylic acid (C₈H₁₆O₂), calculated on the anhydrous basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197F)
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

ASSAY

PROCEDURE

Standard solution: 10 mg/mL of USP Caprylic Acid RS in ethyl acetate

Sample solution: 10 mg/mL of Caprylic Acid in ethyl acetate

System suitability solution: 10 µg/mL of Caprylic Acid in ethyl acetate, prepared from the *Sample solution*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 0.25-mm × 30-cm fused silica capillary column bonded with a 0.25-µm layer of phase G25

Temperatures

Detector: 250°

Injection port: 250°

Column: See Table 1.

Table 1

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
100	—	100	1

Table 1 (Continued)

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
100	5	220	10

Carrier gas: Helium

Flow rate: 1.5 mL/min

Injection volume: 1 µL

Injection type: Split injection. The split ratio is about 1:100.

System suitability

Samples: *Standard solution* and *System suitability solution*

Suitability requirements

Relative standard deviation: NMT 2.0%, *Standard solution*

Signal-to-noise ratio: NLT 5 for the major peak, *System suitability solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of caprylic acid (C₈H₁₆O₂) in the portion of Caprylic Acid taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

r_u = peak response of caprylic acid from the *Sample solution*

r_s = peak response of caprylic acid from the *Standard solution*

C_s = concentration of USP Caprylic Acid RS in the *Standard solution* (mg/mL)

C_u = concentration of Caprylic Acid in the *Sample solution* (mg/mL)

Acceptance criteria: NLT 99.0% on the anhydrous basis

IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.1%

- **HEAVY METALS** (231)

Sample solution: 12 mL of a 100-mg/mL solution of Caprylic Acid in alcohol

Standard solution 1: 1 mL of *Standard Lead Solution* (10 µg/mL of Pb), prepared as directed in the chapter, and 9 mL of alcohol

Standard solution 2: 10 mL of *Standard solution 1* and 2 mL of *Sample solution*

Blank solution: 10 mL of alcohol and 2 mL of *Sample solution*

Analysis

Samples: *Sample solution*, *Standard solution 2*, and *Blank solution*

To each of the *Samples*, add 2 mL of pH 3.5 *Acetate Buffer* prepared as directed in the chapter. Mix, and add to 1.2 mL of thioacetamide–glycerin base TS. Examine the solutions after 2 min.

System suitability

Samples: *Standard solution 2* and *Blank solution*

Suitability requirements: The *Standard solution* shows a slight brown color compared to the *Blank solution*.

Acceptance criteria: The brown color in the *Sample solution* is not more intense than that in *Standard solution 2*, corresponding to NMT 10 µg/g of heavy metals.

• **LIMIT OF RELATED LINEAR AND BRANCHED ALKYL CARBOXYLIC ACIDS, RELATED ESTERS, CYCLIC ESTERS AND KETONE**

Standard solution, System suitability solution, Sample solution, Chromatographic system, and System suitability: Proceed as directed in the Assay.

Analysis

Sample: *Sample solution*

Calculate the percentage of each impurity in the portion of Caprylic Acid taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = peak response of each individual impurity in the *Sample solution*

r_T = sum of all the peaks except the peak due to solvent and peaks below the *Disregard limit* (see Table 2) in the *Sample solution*

Acceptance criteria: See Table 2.

Disregard any peak with an area less than 0.5 times the area of the major peak from the *System suitability solution*.

Table 2

Impurity	Percentage (%)
Each individual	NMT 0.3
Total	NMT 0.5

SPECIFIC TESTS

- **BACTERIAL ENDOTOXINS TEST (85):** The level of bacterial endotoxins is such that the requirement in the relevant dosage form monograph(s) in which Caprylic Acid is used can be met. Where the label states that Caprylic Acid must be subjected to further processing during the preparation of injectable dosage forms, the level of bacterial endotoxins is such that the requirement in the relevant dosage form monograph(s) in which Caprylic Acid is used can be met.

- **FATS AND FIXED OILS, Peroxide Value (401):** NMT 10.0
- **WATER DETERMINATION, Method 1a (921):** NMT 0.7%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, and store at room temperature.
- **LABELING:** Where Caprylic Acid must be subjected to further processing during the preparation of injectable dosage forms to ensure acceptable levels of bacterial endotoxins, it is so labeled.

Caprylocaproyl Polyoxylglycerides

Former Title: Caprylocaproyl Macrogolglycerides

DEFINITION

Caprylocaproyl Polyoxylglycerides is a mixture of monoesters, diesters, and triesters of glycerol and monoesters and diesters of polyethylene glycols. The polyethylene glycols used have a mean molecular weight between 200 and 400. It is produced by partial alcoholysis of medium-chain triglycerides with polyethylene glycol, by esterification of glycerol and polyethylene glycol with caprylic acid and capric acid, or as a mixture of glycerol esters and ethylene oxide condensate with caprylic acid and capric acid. It may contain free polyethylene glycols.

IDENTIFICATION

- **A. INFRARED ABSORPTION (197F)**

- **B. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST (201)**

Standard solution: 50 mg/mL of USP Caprylocaproyl Polyoxylglycerides RS in methylene chloride

Sample solution: 50 mg/mL of Caprylocaproyl Polyoxylglycerides in methylene chloride

Application volume: 50 µL

Developing solvent system: Ether and hexanes (7:3)

Spray reagent: 0.1 mg/mL of rhodamine B in alcohol

Analysis

Samples: *Standard solution* and *Sample solution*

Proceed as directed in the chapter. Then spray the plate with *Spray reagent*, and locate the spots on the plate by examination under UV light at a wavelength of 365 nm.

Acceptance criteria: The R_f values of the principal spots of the *Sample solution* correspond to those of the *Standard solution*.

- **C.** It meets the requirements of the test for *Fats and Fixed Oils (401)*, *Fatty Acid Composition*.

IMPURITIES

- **HEAVY METALS, Method II (231):** NMT 10 ppm
- **ARTICLES OF BOTANICAL ORIGIN, Total Ash (561):** NMT 0.1%
- **ALKALINE IMPURITIES**

Sample: 5.0 g of Caprylocaproyl Polyoxylglycerides

Analysis: To the *Sample* add 10 mL of alcohol and 0.05 mL of bromophenol blue TS, and mix well. Titrate with 0.01 N hydrochloric acid VS to change the color to yellow.

Acceptance criteria: NMT 1.0 mL of 0.01 N hydrochloric acid is required.

Change to read:

- **LIMIT OF FREE ETHYLENE OXIDE AND DIOXANE**

▲ **Analysis:** Proceed as directed in *Ethylene Oxide and Dioxane (228)*, *Method I*.

Acceptance criteria

Ethylene oxide: NMT 1 µg/g

Dioxane: NMT 10 µg/g▲ NF31

- **LIMIT OF FREE GLYCEROL**

Sample: 1.20 g

Blank: 25 mL of methylene chloride

Periodic acetic acid solution: Dissolve 0.446 g of sodium periodate in 2.5 mL of a 25% (v/v) solution of sulfuric acid, and dilute with glacial acetic acid to 100.0 mL.

Potassium iodide solution: 75 mg/mL of potassium iodide

Titrimetric system

(See *Titrimetry (541)*.)

Mode: Direct titration

Titrant: 0.1 M sodium thiosulfate

Analysis: Dissolve the *Sample* in 25 mL of methylene chloride, heating if necessary. Cool, and add 100 mL of water and 25.0 mL of *Periodic acetic acid solution*. Shake, and allow to stand for 30 min. Add 40 mL of *Potassium iodide solution*, and allow to stand for 1 min. Add 1 mL of starch TS, and titrate the liberated iodine with *Titrant*. Perform a blank determination.

Calculate the percentage of free glycerol in the portion of Caprylocaproyl Polyoxylglycerides taken:

$$\text{Result} = [(V_T - V_B) \times N \times E \times F/W] \times 100$$

V_T = *Titrant* volume consumed by the *Sample* (mL)

V_B = *Titrant* volume consumed by the *Blank* (mL)

N = actual normality of the *Titrant* (mEq/mL)

- E* = equivalency factor for glycerol, 23 mg/mEq
F = unit conversion factor, 10⁻³ g/mg
W = Sample weight taken for the titration (g)
 Acceptance criteria: NMT 5.0%

Caramel**DEFINITION**

Caramel is a concentrated solution of the product obtained by heating sugar or glucose until the sweet taste is destroyed and a uniform dark brown mass results, a small amount of alkali or of alkaline carbonate or a trace of mineral acid being added while heating.

[NOTE—Where included in articles for coloring purposes, Caramel complies with the regulations of the FDA concerning color additives (21 CFR 73.85, caramel).]

IMPURITIES

- **ARSENIC**, *Method II* <211>: NMT 3 ppm
- **LEAD** <251>: NMT 10 ppm
- **ASH**: It swells when incinerated, and forms a coke-like charcoal that burns off only after prolonged heating at a high temperature. It yields NMT 8.0% of ash.

SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS** <61> and **TESTS FOR SPECIFIED MICROORGANISMS** <62>: Meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*
- **SPECIFIC GRAVITY** <841>: NLT 1.30
- **PURITY**: The addition of 0.5 mL of phosphoric acid to 20 mL of a solution (1 in 20) produces no precipitate.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE**: Preserve in tight containers.

Caraway**DEFINITION**

Caraway is the dried, ripe fruit of *Carum carvi* L. (Fam. Apiaceae).

SPECIFIC TESTS**• BOTANIC CHARACTERISTICS****Macroscopic**

Unground caraway: Separate mericarps from about 4 to 7 mm in length, and from 1 to 2 mm in diameter.

The mericarp is oblong, curved, and tapers toward the base and apex, to which half of the stylopodium is attached. Externally, it is dark brown to weak brown and shows five lighter-colored, filiform, primary ribs, between each pair of which a secondary rib occurs on the dorsal surface.

Powdered caraway: Moderate yellowish brown to light olive brown

Microscopic

Unground caraway: The mericarp is nearly equilaterally pentagonal in transverse section and shows a fibrovascular bundle in each primary rib. The epicarp consists of tabular polygonal epidermal cells with thick outer walls possessing a striated cuticle and with occasional stomata. The mesocarp, located between primary rib regions, is composed of collapsed, thin-walled parenchyma normally bearing four dorsal vittae in the intervals and two commissural vittae and sometimes one or

more additional vittae. The endocarp consists of broad, slightly undulate, inner epidermal cross cells that are coherent with the collapsed cells of the spermoderm. The endosperm consists of thick-walled reserve parenchyma containing fixed oil and aleurone grains up to 10 µm in diameter, the latter with embedded rosette aggregates of calcium oxalate up to 4 µm in diameter. An embryo is embedded in the upper end of the endosperm.

Powdered caraway: It shows fragments of the epicarp with striped cuticle, numerous polyhedral endosperm cells containing aleurone grains with embedded rosette aggregates of calcium oxalate, few fragments of slightly lignified fibers and spiral vessels, fragments of cross cells of endocarp, orange to yellow fragments of vittae, and no reticulate parenchyma.

- **ARTICLES OF BOTANICAL ORIGIN, Foreign Organic Matter** (561): NMT 3.0%
- **ARTICLES OF BOTANICAL ORIGIN, Acid-Insoluble Ash** (561): NMT 1.5%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers. Preserve against attack by insects.
- **LABELING:** The label states the Latin binomial and, following the official name, the part of the plant contained in the article.

Caraway Oil

DEFINITION

Caraway Oil is the volatile oil distilled from the dried, ripe fruit of *Carum carvi* L. (Fam. Apiaceae). It contains NMT 50.0% of *d*-carvone (C₁₀H₁₄O).

ASSAY

• PROCEDURE

Sample: 10 mL of Caraway Oil

Analysis: Transfer the *Sample* to a cassia flask, and add 50 mL of a saturated solution of sodium sulfite that has been made neutral to 2 drops of phenolphthalein TS by means of a saturated sodium bisulfite solution. Heat the flask in boiling water, and shake it repeatedly, neutralizing the mixture from time to time by adding a few drops of the saturated sodium bisulfite solution. When no coloration appears upon the addition of a few more drops of phenolphthalein TS and heating for 15 min, cool the mixture to room temperature. When the liquids have separated more completely, add a sufficient volume of the saturated sodium bisulfite solution to raise the lower level of the oily layer to the graduated portion of the neck of the flask.

Acceptance criteria: The volume of the residual oily liquid does not exceed 5 mL, indicating the presence of NLT 50.0% of *d*-carvone (C₁₀H₁₄O) in the portion of Oil taken.

IMPURITIES

- **HEAVY METALS, Method II** (231): NMT 40 µg/g

SPECIFIC TESTS

- **SOLUBILITY IN 80% ALCOHOL:** One volume dissolves in 8 volumes of 80% alcohol.
- **SPECIFIC GRAVITY** (841): 0.900–0.910
- **OPTICAL ROTATION, Angular Rotation** (781A): +70° to +80°
- **REFRACTIVE INDEX** (831): 1.484–1.488 at 20°

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.
- **LABELING:** The label states the Latin binomial and, following the official name, the part of the plant source from which the article was derived.

Carbomer 934

DEFINITION

Carbomer 934 is a high molecular weight polymer of acrylic acid cross-linked with allyl ethers of sucrose. Carbomer 934, previously dried under vacuum at 80° for 1 h, contains NLT 56.0% and NMT 68.0% of carboxylic acid (–COOH) groups. The viscosity of a neutralized 0.5% aqueous dispersion of Carbomer 934 is between 30,500 and 39,400 mPa · s.

IDENTIFICATION

• A.

Sample dispersion: 10 mg/mL

Analysis 1: To one portion of the *Sample dispersion* add thymol blue TS.

Acceptance criteria 1: An orange color is produced.

Analysis 2: To another portion of the *Sample dispersion* add cresol red TS.

Acceptance criteria 2: A yellow color is produced.

• B.

Sample dispersion: 10 mg/mL

Analysis: Adjust the *Sample dispersion* with 1 N sodium hydroxide to a pH of 7.5.

Acceptance criteria: A very viscous gel is produced.

ASSAY

• CARBOXYLIC ACID CONTENT

Sample: 400 mg, previously dried

Titrimetric system

(See *Titrimetry* (541).)

Mode: Direct titration

Electrode: Calomel–glass

Titrant: 0.25 N sodium hydroxide VS

Endpoint detection: Potentiometric

Analysis: Slowly add the *Sample* to 400 mL of water in a 1000-mL beaker, while stirring continuously at about 1000 rpm, with the stirrer shaft set at the side of the beaker at an angle of 60° and with the propeller positioned near the bottom of the beaker. Continue stirring for 15 min. Reduce the stirring speed, and titrate potentiometrically with *Titrant*. After each addition of *Titrant* allow 1 min for mixing before recording the pH. Calculate the carboxylic acid content as a percentage of carboxylic acid groups:

$$\text{Result} = [(V \times N/W) \times F] \times 100$$

V = *Titrant* volume consumed (mL)

N = actual normality of the *Titrant* (mEq/mL)

W = *Sample* weight (mg)

F = equivalency factor for the carboxylic acid (–COOH) group, 45.02 mEq/mg

Acceptance criteria: 56.0%–68.0% on the dried basis

IMPURITIES

- **HEAVY METALS, Method II** (231): NMT 20 µg/g

• LIMIT OF BENZENE

Standard solution: 0.2 mg/mL of benzene in methanol. Quantitatively dilute this solution with organic-free water (see *Residual Solvents* (467)) to obtain a solution having a known concentration of about 1.0 µg/mL.

Sample solution: Transfer 20 mg of Carbomer 934 to a 100-mL volumetric flask. Add 75 mL of sodium chloride solution (20 mg/mL), and mix by mechanical means until homogeneous (usually about 30 min). Dilute with sodium chloride solution (20 mg/mL) to volume, and mix until homogeneous (usually less than 1 min). This solution must be analyzed within 3 h of preparation.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: GC

Detector: Flame ionization

Columns

Guard: 0.53-mm × 5-m silica, deactivated with phenylmethyl siloxane

Analytical: 0.53-mm × 30-m fused silica, coated with 3.0-μm G43 stationary phase

Temperatures

Injection port: 140°

Detector: 260°

Column: See Table 1.

Injection volume: 1 μL

Injection type: Splitless

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 15%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of benzene in the portion of Carbomer 934 taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of benzene from the *Sample solution*

r_S = peak response of benzene from the *Standard solution*

C_S = concentration of benzene in the *Standard solution* (μg/mL)

C_U = concentration of Carbomer 934 in the *Sample solution* (μg/mL)

Acceptance criteria: NMT 0.5%

SPECIFIC TESTS

• LOSS ON DRYING (731)

Analysis: Dry a sample under vacuum at 80° for 1 h.

Acceptance criteria: NMT 2.0%

• ROTATIONAL RHEOMETER METHODS (912)

Sample: 2.50 g, dried under vacuum at 80° for 1 h

Titrimetric system

(See *Titrimetry* (541).)

Mode: Direct titration

Electrode: Calomel-glass

Titrant: 180 mg/mL of sodium hydroxide

Endpoint detection: pH

Analysis: Carefully add the *Sample* to 500 mL of water in a 1000-mL beaker, while stirring continuously at 1000 ± 10 rpm, with the stirrer shaft set to the side of the beaker at an angle of 60° and with the propeller positioned near the bottom of the beaker. Allow 45–90 s for addition of the *Sample* at a uniform rate, being sure that loose aggregates of powder are broken up, and continue stirring at 1000 ± 10 rpm for 15 min. Remove the stirrer, and place the beaker containing the dispersion in a $25 \pm 0.1^\circ$ water bath for 30 min. Insert the stirrer to a depth necessary to ensure that air is not drawn into the dispersion, and, while stirring at 300 ± 10 rpm, titrate with *Titrant* to a pH of 7.3–7.8 by adding the *Titrant* below the surface. Stir for 2–3 min until neutralization is complete. Then determine the final pH. If the pH is less than 7.3, raise it with additional sodium hydroxide. If it is more than 7.8,

discard the mucilage, and prepare another, using a smaller amount of sodium hydroxide for titration.

Return the neutralized mucilage to the 25° water bath for 1 h. Measure the pH again, and make certain that the mucilage pH is 7.3–7.8. Perform the viscosity determination without delay to avoid slight viscosity changes that occur 75 min after neutralization.

Equip a suitable rotational viscometer with a spindle having a cylinder 1.5 cm in diameter and 0.2 cm high attached to a shaft 0.3 cm in diameter, the distance from the top of the cylinder to the lower tip of the shaft being 3.02 cm.¹ The spindle rotates at 20 rpm at an immersion depth of 4.9 cm. Follow the instrument manufacturer's directions to measure the apparent viscosity.

Acceptance criteria: 30,500–39,400 mPa · s

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers. No storage requirements specified.

• **LABELING:** Label it to indicate that it is not intended for internal use. A carbomer homopolymer manufactured using benzene and complying with the unique requirements of this monograph will be officially titled Carbomer 934 and will not be referred to as Carbomer Homopolymer.

Carbomer 934P

DEFINITION

Carbomer 934P is a high molecular weight polymer of acrylic acid, cross-linked with allyl ethers of sucrose or pentaerythritol. Carbomer 934P, previously dried under vacuum at 80° for 1 h, contains NLT 56.0% and NMT 68.0% of carboxylic acid (–COOH) groups. The viscosity of a neutralized 0.5% aqueous dispersion of Carbomer 934P is between 29,400 and 39,400 mPa · s.

IDENTIFICATION

• A.

Sample dispersion: 10 mg/mL

Analysis 1: To one portion of the *Sample dispersion* add thymol blue TS.

Acceptance criteria 1: An orange color is produced.

Analysis 2: To another portion of the *Sample dispersion* add cresol red TS.

Acceptance criteria 2: A yellow color is produced.

• B.

Sample dispersion: 10 mg/mL

Analysis: Adjust the *Sample dispersion* with 1 N sodium hydroxide to a pH of 7.5.

Acceptance criteria: A very viscous gel is produced.

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of benzene in the portion of Carbomer 940 taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of benzene from the *Sample solution*

r_S = peak response of benzene from the *Standard solution*

C_S = concentration of benzene in the *Standard solution* (µg/mL)

C_U = concentration of Carbomer 940 in the *Sample solution* (µg/mL)

Acceptance criteria: NMT 0.5%

SPECIFIC TESTS• **LOSS ON DRYING (731)**

Analysis: Dry a sample under vacuum at 80° for 1 h.

Acceptance criteria: NMT 2.0%

• **ROTATIONAL RHEOMETER METHODS (912)**

Sample: 2.50 g, dried under vacuum at 80° for 1 h

Titrimetric system

(See *Titrimetry* (541).)

Mode: Direct titration

Electrode: Calomel–glass

Titrant: 180 mg/mL of sodium hydroxide

Endpoint detection: pH

Analysis: Carefully add the *Sample* to 500 mL of water in a 1000-mL beaker, while stirring continuously at 1000 ± 10 rpm, with the stirrer shaft set to the side of the beaker at an angle of 60° and with the propeller positioned near the bottom of the beaker. Allow 45–90 s for addition of the *Sample* at a uniform rate, being sure that loose aggregates of powder are broken up, and continue stirring at 1000 ± 10 rpm for 15 min. Remove the stirrer, and place the beaker containing the dispersion in a 25 ± 0.1° water bath for 30 min. Insert the stirrer to a depth necessary to ensure that air is not drawn into the dispersion, and, while stirring at 300 ± 10 rpm, titrate with *Titrant* to a pH of 7.3–7.8 by adding the *Titrant* below the surface. Stir for 2–3 min until neutralization is complete. Then determine the final pH. If the pH is less than 7.3, raise it with additional sodium hydroxide. If it is more than 7.8, discard the mucilage, and prepare another, using a smaller amount of sodium hydroxide for titration. Return the neutralized mucilage to the 25° water bath for 1 h. Measure the pH again, and make certain that the mucilage pH is 7.3–7.8. Perform the viscosity determination without delay to avoid slight viscosity changes that occur 75 min after neutralization.

Equip a suitable rotational viscometer with a spindle having a shaft about 0.3 cm in diameter, the distance from the top of the shaft to the lower tip of the shaft being 5.0 cm.¹ The spindle rotates at 20 rpm at an

¹Available as an RV7 spindle from Brookfield, or the equivalent.

immersion depth of 5.5 cm. Follow the instrument manufacturer's directions to measure the apparent viscosity.

Acceptance criteria: 40,000–60,000 mPa · s

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers. No storage requirements specified.
- **LABELING:** Label to indicate that it is not intended for internal use. A carbomer homopolymer manufactured using benzene and complying with the unique requirements of this monograph will be officially titled Carbomer 940 and will not be referred to as Carbomer Homopolymer.

Carbomer 941

DEFINITION

Carbomer 941 is a high molecular weight polymer of acrylic acid cross-linked with allyl ethers of pentaerythritol. Carbomer 941, previously dried under vacuum at 80° for 1 h, contains NLT 56.0% and NMT 68.0% of carboxylic acid (–COOH) groups. The viscosity of a neutralized 0.5% aqueous dispersion of Carbomer 941 is between 4000 and 11,000 mPa · s.

IDENTIFICATION

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **LABELING:** Label to indicate that it is not intended for internal use. A carbomer copolymer manufactured using benzene and complying with the unique requirements of

this monograph will be officially titled Carbomer 1342 and will not be referred to as Carbomer Copolymer.

Carbomer Copolymer

DEFINITION

Carbomer Copolymer is a high molecular weight copolymer of acrylic acid and a long-chain alkyl methacrylate cross-linked with allyl ethers of polyalcohols.

[NOTE—The heading of this monograph does not constitute the official title for a Carbomer Copolymer manufactured with the use of benzene. When benzene is used in the manufacturing process, the name will be Carbomer 1342, provided it complies with the existing requirements in the Carbomer 1342 monograph.]

IDENTIFICATION

- **A. INFRARED ABSORPTION (197K):** Exhibits main bands at or near (±5) wavenumbers (cm⁻¹) 1710, 1454, 1414, 1245, 1172, 1115, and 801, with the strongest band at 1710.

• **B.**

Sample: 5 g

Analysis: Add the *Sample* to 500 mL of water, and stir.

Acceptance criteria: A dispersion is formed, with a foam layer that persists after the dispersion is allowed to stand at room temperature for 1 h.

ASSAY• **CONTENT OF CARBOXYLIC ACID**

Sample: 400 mg, previously dried under vacuum at 80° for 1 h

Titrimetric system

(See *Titrimetry* (541).)

Mode: Direct titration

Electrode: Calomel-glass

Titrant: 0.25 N sodium hydroxide VS

Endpoint detection: Potentiometric

Analysis: Slowly add the *Sample* to 400 mL of water in a 1000-mL beaker, while stirring continually at 1000 rpm. The stirrer shaft is set at an angle of about 60° and to one side of the beaker, and the propeller is positioned near the bottom of the beaker. Continue stirring for 15 min. Reduce the stirring speed, and titrate with *Titrant*. After each addition of *Titrant*, allow 1 min for mixing before recording the pH.

Calculate the carboxylic acid content as a percentage of carboxylic acid groups in the portion of Carbomer Copolymer taken:

$$\text{Result} = [(V \times N \times M_r)/W] \times 100$$

V = *Titrant* volume consumed by the *Sample* (mL)

N = actual normality of the *Titrant* (mEq/mL)

M_r = molecular weight of the carboxylic acid (–COOH) group, 45.02

W = *Sample* weight (mg)

[NOTE—The relative retention times for methyl ethyl ketone, ethyl acetate, and cyclohexane are about 0.7, 0.9, and 1.0, respectively.]

Suitability requirements

Resolution: NLT 1.0 between ethyl acetate and cyclohexane

Relative standard deviation: NMT 2.5%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentages of ethyl acetate and cyclohexane in the portion of Carbomer Copolymer taken:

$$\text{Result} = (R_U/R_S) \times (W_S/W_U) \times 100$$

R_U = peak area ratio of the relevant analyte peak to the methyl ethyl ketone peak from the *Sample solution*

R_S = peak area ratio of the relevant analyte peak to the methyl ethyl ketone peak from the *Standard solution*

W_S = weight of ethyl acetate or cyclohexane in the *Standard solution* (mg)

W_U = weight of Carbomer Copolymer taken to prepare the *Sample solution* (mg)

Acceptance criteria

Ethyl acetate: NMT 0.5%

Cyclohexane: NMT 0.3%

• LIMIT OF BENZENE

Benzene solution: 1.0 mg/mL of benzene in dimethyl sulfoxide

Solvent solution: 0.1 µg/mL of *Benzene solution* in organic-free water (see *Residual Solvents* <467>, *Identification, Control, and Quantification of Residual Solvents*)

Sodium chloride solution: 20 mg/mL of sodium chloride

Sample solution: Transfer 50 mg of Carbomer Copolymer to a 10-mL volumetric flask. Add 7.5 mL of *Sodium chloride solution*, and mix by mechanical means

until homogeneous (usually about 30 min). Dilute with *Sodium chloride solution* to volume, and mix until homogeneous (usually less than 1 min). This solution must be analyzed within 3 h of preparation.

Standard solution: Transfer 50 mg of Carbomer Copolymer to a 10-mL volumetric flask. Add 7.5 mL of *Sodium chloride solution*, and mix by mechanical means until homogeneous (usually about 30 min). Add 1.0 mL of the *Solvent solution*, dilute with *Sodium chloride solution* to volume, and mix until homogeneous (usually less than 1 min). This solution contains 0.01 µg/mL of benzene.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: GC, equipped with a headspace injector

Detector: Flame ionization

Column: 0.53-mm × 30-m fused silica; coated with 3.0-µm G43 stationary phase

Temperatures

Detector: 250°

Injection port: 140°

Column: See *Table 2*.

Table 2

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
40	—	40	20
40	10	240	20

Carrier gas: Helium

Flow rate: Linear velocity of 35 cm/s

Split ratio: 5:1

Injection volume: 1 mL (gaseous phase)

[NOTE—The following headspace conditions may be used: a pressurization time of 30 s and a transfer line temperature of 90°.]

Vial temperature: The vials are maintained at 80° for 60 min before headspace injection.

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 15% for three replicate injections

Analysis

Samples: *Standard solution* and *Sample solution*

Transfer 10.0 mL each of the *Standard solution* and the *Sample solution* to separate headspace vials. Close the vials with a tight rubber membrane stopper coated with polytetrafluoroethylene, and secure with an aluminum crimped cap. Shake to obtain a homogeneous dispersion. Separately inject the gaseous phase of the *Standard solution* and the *Sample solution*.

Acceptance criteria: The benzene peak response from the *Sample solution* is NMT half of that from the *Standard solution*, corresponding to NMT 2 µg/g.

• LIMIT OF ACRYLIC ACID

Mobile phase: Dissolve 6.80 g of monobasic potassium phosphate in 300 mL of water, dilute with water to 500 mL, and mix. Dilute 100 mL of this solution with water to 1 L, adjust with phosphoric acid to a pH of 3.0 ± 0.1, and mix. Filter and degas.

Standard solution: 25 µg/mL of acrylic acid

Sample solution: Transfer 100 mg of Carbomer Copolymer to a tared serum vial. Add water to obtain 10.0 mL of solution. Cap the vial, and shake by mechanical means for 2 h. Add 2 drops of sodium hydroxide solution (500 mg/mL), and shake by hand for 15 s. Add 1.0 mL of calcium chloride solution (100 mg/mL), and shake until the gel collapses. Centrifuge for 15 min, and use the clear supernatant.

Chromatographic system

Titrant: 180 mg/mL of sodium hydroxide

Endpoint detection: Potentiometric

Analysis: Carefully add the *Sample* to 500 mL of water in a 1000-mL beaker, while stirring continuously at 1000 ± 50 rpm, with the stirrer shaft set to one side of the beaker at an angle of 60° and the propeller positioned near the bottom of the beaker. The stirrer used is a three-blade, 2-inch-diameter marine impeller. Add the *Sample* at a uniform rate for 45–90 s, being sure that loose aggregates of powder are broken up, and continue stirring at 1000 ± 50 rpm for 15 min.

Remove the stirrer, and place the beaker containing the dispersion in a $25 \pm 0.1^\circ$ water bath for 30 min. Insert a paddle stirrer to a depth necessary to ensure that air is not drawn into the dispersion; and while stirring at 300 ± 25 rpm, titrate to a pH of 7.3–7.8 by adding *Titrant* below the surface. Stir 2–3 min until neutralization is complete. Then determine the final pH. [NOTE—If the pH is below 7.3, raise it with additional sodium hydroxide. If it is above 7.8, discard the mucilage, and prepare another batch, using a smaller amount of sodium hydroxide for titration.]

Return the beaker containing the neutralized mucilage to the $25 \pm 0.1^\circ$ water bath for 1 h. Measure the pH again, making certain that it is between 7.3 and 7.8. Using a rotational viscometer equipped with a suitable spindle at a spindle immersion depth as defined in *Table 3*, perform the viscosity determination without delay to avoid the slight viscosity changes that occur 75 min after neutralization.

The spindle rotates at 20 rpm. Follow the instrument manufacturer's directions to measure the apparent viscosity.

Acceptance criteria: See *Table 4*.

Table 4

Carbomer Copolymer	1% Viscosity Specification (mPa·s)
A	4,500–13,500
B	10,000–29,000
C	25,000–45,000

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, at a temperature not exceeding 45°.
- **LABELING:** If benzene has been used in the manufacturing process, the name of the article will be Carbomer 1342, provided it complies with and is labeled in accordance with the requirements set forth in that monograph. If benzene is not used in the manufacturing process, label it to indicate whether it is Type A, B, or C; and label it to state the measured viscosity, giving the viscosity measurement parameters, the concentration of the solution, and the type of equipment used; the solvent or solvents used in the polymerization process; and the nominal and residual solvent levels for each solvent.

Carbomer Homopolymer

DEFINITION

Carbomer Homopolymer is a high molecular weight polymer of acrylic acid cross-linked with allyl ethers of polyalcohols. Carbomer Homopolymer, previously dried, contains NLT 56.0% and NMT 68.0% of carboxylic acid (–COOH) groups.

[NOTE—This monograph applies to, but is not limited to, Carbomer 934, Carbomer 934P, Carbomer 940, and Carbomer 941 manufactured without benzene. The heading of this monograph does not constitute the official title for a Carbomer Homopolymer manufactured with the use of benzene. When benzene is used in the manufacturing process, the name of the article will be Carbomer 934, Carbomer 934P, Carbomer 940, or Carbomer 941, whichever is appropriate.]

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K): Exhibits main bands at or near (± 5) wavenumbers (cm^{-1}) 1710, 1454, 1414, 1245, 1172, 1115, and 801, with the strongest band at 1710.
- **B.**
Sample dispersion: 10 mg/mL
Analysis: Adjust the *Sample dispersion* with 1 N sodium hydroxide to a pH of 7.5.
Acceptance criteria: A viscous gel is produced.
- **C.**
Analysis: Add 2 mL of calcium chloride solution (100 mg/mL), while stirring, to 10 mL of the gel obtained from *Identification* test B.
Acceptance criteria: A white precipitate is produced immediately.
- **D.**
Sample dispersion: 10 mg/mL
Analysis 1: Add 0.5 mL of thymol blue TS to 10 mL of the *Sample dispersion*.
Acceptance criteria 1: An orange color is produced.
Analysis 2: To another 10 mL of the *Sample dispersion* add 0.5 mL of cresol red TS.
Acceptance criteria 2: A yellow color is produced.

ASSAY

• CONTENT OF CARBOXYLIC ACID

Sample: 400 mg, previously dried under vacuum at 80° for 1 h

Titrimetric system

(See *Titrimetry* (541).)

Mode: Direct titration

Electrode: Calomel–glass

Titrant: 0.25 N sodium hydroxide VS

Endpoint detection: Potentiometric

Analysis: Slowly add the *Sample* to 400 mL of water in a 1000-mL beaker, while stirring continually at 1000 rpm. The stirrer shaft is set at an angle of about 60° and to one side of the beaker, and the propeller is positioned near the bottom of the beaker. Continue stirring for 15 min. Reduce the stirring speed, and titrate with *Titrant*. After each addition of *Titrant*, allow 1 min for mixing before recording the pH.

Calculate the carboxylic acid content as a percentage of carboxylic acid groups in the portion of Carbomer Homopolymer taken:

$$\text{Result} = [(V \times N \times M_r)/W] \times 100$$

V = *Titrant* volume consumed by the *Sample* (mL)
 N = actual normality of the *Titrant* (mEq/mL)
 M_r = molecular weight of the carboxylic acid (–COOH) group, 45.02
 W = *Sample* weight (mg)

Acceptance criteria: 56.0%–68.0%

IMPURITIES

• RESIDUE ON IGNITION (281)

Sample: 1.0 g

Acceptance criteria: NMT 4.0%

• HEAVY METALS, *Method II* (231): NMT 20 µg/g

• LIMIT OF ETHYL ACETATE AND CYCLOHEXANE

[NOTE—This test is required only for those Carbomer Homopolymers where ethyl acetate or a mixture of ethyl acetate and cyclohexane was used in the polymerization process.]

Standard stock solution: Transfer 5.0 mL of methanol to a 10-mL serum vial, insert a rubber septum, and seal with a metal cap. Add 25.0 µL of ethyl acetate and 20.0 µL of cyclohexane through the septum into the vial, and mix.

Standard solution: Transfer 20.0 mL of methanol to a 30-mL serum vial, insert a rubber septum, and seal with a metal cap. Through the rubber septum add 10 µL of methyl ethyl ketone (internal standard) and 50.0 µL of the *Standard stock solution*, and mix.

Sample solution: Transfer 50 mg of Carbomer Homopolymer to a 30-mL serum vial, add 20.0 mL of methanol, insert a rubber septum, and seal with a metal cap. Through the rubber septum add 10 µL of methyl ethyl ketone, and mix.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 2-mm \times 3-m; packed with 1% liquid phase G25 on 60- to 80-mesh support S12

Temperatures

Detector: 250°

Injection port: 250°

Column: See *Table 1*.

Table 1

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
115	—	115	4
115	6	175	5

Carrier gas: Helium

Flow rate: 33 mL/min

Injection volume: 2 µL

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for methyl ethyl ketone, ethyl acetate, and cyclohexane are about 0.7, 0.9, and 1.0, respectively.]

Suitability requirements

Resolution: NLT 1.0 between ethyl acetate and cyclohexane

Relative standard deviation: NMT 2.5%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentages of ethyl acetate and cyclohexane in the portion of Carbomer Homopolymer taken:

$$\text{Result} = (R_U/R_S) \times (W_S/W_U) \times 100$$

R_U = peak area ratio of the relevant analyte peak to the methyl ethyl ketone peak from the *Sample solution*
 R_S = peak area ratio of the relevant analyte peak to the methyl ethyl ketone peak from the *Standard solution*
 W_S = weight of ethyl acetate or cyclohexane in the *Standard solution* (mg)

W_U = weight of Carbomer Homopolymer taken to prepare the *Sample solution* (mg)

Acceptance criteria

Ethyl acetate: NMT 0.5%

Cyclohexane: NMT 0.3%

• LIMIT OF BENZENE

Benzene solution: 1.0 mg/mL of benzene in dimethyl sulfoxide

Solvent solution: 0.1 µg/mL of *Benzene solution* in organic-free water (see *Residual Solvents* (467), *Identification, Control, and Quantification of Residual Solvents*).

Sodium chloride solution: 20 mg/mL of sodium chloride

Standard solution: Transfer 50 mg of Carbomer Homopolymer to a 10-mL volumetric flask. Add 7.5 mL of *Sodium chloride solution*, and mix by mechanical means until homogeneous (usually about 30 min). Add 1.0 mL of the *Solvent solution*, dilute with *Sodium chloride solution* to volume, and mix until homogeneous (usually less than 1 min). This solution contains 0.01 µg/mL of benzene.

Sample solution: Transfer 50 mg of Carbomer Homopolymer to a 10-mL volumetric flask. Add 7.5 mL of *Sodium chloride solution*, and mix by mechanical means until homogeneous (usually about 30 min). Dilute with *Sodium chloride solution* to volume, and mix until homogeneous (usually less than 1 min). This preparation must be analyzed within 3 h of preparation.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: GC, equipped with a headspace injector

Detector: Flame ionization

Column: 0.53-mm × 30-m fused silica; coated with a 3.0-µm G43 stationary phase

Temperatures

Detector: 250°

Injection port: 140°

Column: See *Table 2*.

Table 2

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
40	—	40	20
40	10	240	20

Carrier gas: Helium

Flow rate: At a linear velocity of 35 cm/s

Injection type: Split ratio, 5:1

Injection volume: 1 mL (gaseous phase)

[NOTE—The following headspace conditions may be used: a pressurization time of 30 s and a transfer line temperature of 90°.]

The vials are maintained at a temperature of 80° for 60 min before headspace injection.

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 15% for three replicate injections

Analysis

Samples: *Standard solution* and *Sample solution*

Transfer 10.0 mL each of the *Standard solution* and *Sample solution* to separate headspace vials. Close the vials with a tight rubber membrane stopper coated with polytetrafluoroethylene, and secure with an aluminum crimped cap. Shake to obtain a homogeneous dispersion. Separately inject the gaseous phase of the *Standard solution* and the *Sample solution*.

Acceptance criteria: NMT 2 µg/g; the benzene peak response from the *Sample solution* is NMT half of that from the *Standard solution*.

• LIMIT OF ACRYLIC ACID

Solution A: 1.361 mg/mL of monobasic potassium phosphate

Solution B: Acetonitrile and *Solution A* (1:1)

Mobile phase: See *Table 3*.

Table 3

Time (min)	Solution A (%)	Solution B (%)
0	100	0
8	100	0
9	0	100
20	0	100
21	100	0
30	100	0

Diluent: 25 mg/mL of potassium alum

Standard solution: 12.5 µg/mL of acrylic acid in *Diluent*

Sample solution: Mix 100 mg of Carbomer

Homopolymer with *Diluent*, and add *Diluent* to obtain 20.0 mL of suspension. Heat the suspension at 50° for 20 min with occasional shaking. Then shake the suspension continuously at room temperature for 60 min. Centrifuge, and use the clear supernatant.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 205 nm

Column: 4.6-mm × 12-cm; packing L1

Flow rate: 1 mL/min

Injection volume: 20 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 5%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of free acrylic acid in the portion of Carbomer Homopolymer taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times F \times 100$$

r_U = peak response of acrylic acid from the *Sample solution*

r_S = peak response of acrylic acid from the *Standard solution*

C_S = concentration of acrylic acid in the *Standard solution* (µg/mL)

C_U = concentration of Carbomer Homopolymer in the *Sample solution* (mg/mL)

F = unit conversion, 10^{-3} mg/µg

Acceptance criteria: NMT 0.25%

SPECIFIC TESTS

• LOSS ON DRYING (731)

Analysis: Dry under vacuum at 80° for 1 h.

Acceptance criteria: NMT 2.0%

• ROTATIONAL RHEOMETER METHODS (912)

Sample: 2.50 g of Carbomer Homopolymer, previously dried

Titrimetric system

(See *Titrimetry* (541).)

Mode: Direct titration

Electrode: Calomel-glass

Titrant: 180 mg/mL of sodium hydroxide

Endpoint detection: Potentiometric

Analysis: Carefully add the *Sample* to 500 mL of water in a 800-mL beaker, while stirring continuously at 1000 ± 50 rpm. The stirrer shaft is set at an angle of 60° and positioned at one side of the beaker, and the propeller is positioned near the bottom of the beaker. The stirrer used should be a three-blade, 2-inch marine

Table 4

Viscosity Ranges (mPa·s)	Spindle No.	A ^a (cm)	B ^b (cm)	C ^c (cm)	D ^d (cm)	E ^e (cm)	Multiplier
100–400	1	5.6	2.2	0.3	2.7	6.1	5
400–1600	2	4.7	0.2	0.3	2.7	4.9	20
1000–4000	3	3.5	0.2	0.3	2.7	4.9	50
2000–8000	4	2.7	0.2	0.3	2.7	4.9	100
4000–16,000	5	2.1	0.2	0.3	2.7	4.9	200
10,000–40,000	6	1.5	0.2	0.3	3.0	4.9	500
40,000–160,000	7	—	—	0.3	—	5.5	2,000

^a Cylinder diameter.^b Cylinder height.^c Shaft diameter.^d Distance from the top of the cylinder to the lower tip of the shaft.^e Spindle immersion depth.

impeller. Add the *Sample* at a uniform rate over a period of 45–60 s, being sure that loose aggregates of powder are broken up, and continue stirring at 1000 ± 50 rpm for 15 min. [NOTE—Proper dispersion of the Carbomer Homopolymer resin is imperative for accurate viscosity readings.] Remove the stirrer, and allow the beaker containing the dispersion to stand at controlled room temperature for 30 min. Insert a paddle stirrer to a depth necessary to ensure that the air is not drawn into the dispersion, and while stirring at 300 ± 25 rpm, titrate with *Titrant* to a pH of 7.3–7.8. After adding the *Titrant*, stir with a paddle mixer at 300 ± 25 rpm for 2–3 min. [NOTE—After neutralization, care must be taken to avoid excessively high shearing, because aggressive mixing will break the polymer chains and reduce the viscosity reading.] Take the final pH reading with a pH meter to make sure it is between 7.3 and 7.8. [NOTE—If the pH is below 7.3, raise it with additional sodium hydroxide. If the pH is above 7.8, discard the mucilage, and prepare another using a smaller amount of sodium hydroxide for titration.] Place the neutralized mucilage into a water bath maintained at $25 \pm 0.1^\circ$ for 1 h. Measure the pH again, and make certain it is between 7.3 and 7.8. Perform the viscosity determination without delay to avoid the slight viscosity changes that occur 75 min after neutralization.

Equip a suitable rotational viscometer¹ with a suitable spindle, as defined in Table 4.

The spindle rotates at 20 rpm. Follow the instrument manufacturer's directions to measure the apparent viscosity.

Acceptance criteria: See Table 5.

Table 5

Carbomer Homopolymer	Viscosity Specified (mPa·s)
A	4,000–11,000
B	25,000–45,000
C	40,000–60,000

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, at a temperature not exceeding 45° .
- **LABELING:** Label it to indicate whether it is Type A, B, or C; and label it to state the measured viscosity, giving the viscosity measurement parameters, the concentration of the solution, and the type of equipment used; the solvent or solvents used in the polymerization process; and the nominal and residual solvent levels for each solvent.

¹ Available as a Brookfield RV viscometer, or equivalent.

Carbomer Interpolymer

DEFINITION

Carbomer Interpolymer is a carbomer homopolymer or copolymer that contains a block copolymer of polyethylene glycol and a long-chain alkyl acid ester.

IDENTIFICATION

- **A. INFRARED ABSORPTION (197K):** Exhibits bands at or near (± 5) wavenumbers (cm^{-1}) 1710, 1454, 1414, 1245, 1172, 1115, and 801, with the strongest band at 1710.
- **B.**
Sample: 2.5 g
Analysis: Without mixing, add the *Sample* to 500 mL of water in an 800-mL beaker, and allow to stand.
Acceptance criteria: The powders wet out in NMT 60 min.
- **C.**
Sample: 5 g
Analysis: Add the *Sample* to 500 mL of water, stir, and adjust with 1 N sodium hydroxide to a pH of 7.5.
Acceptance criteria: A viscous gel is formed.

ASSAY

• CONTENT OF CARBOXYLIC ACID

Sample: 400 mg, previously dried under vacuum at 80° for 1 h

Titrimetric system

(See *Titrimetry* (541).)

Mode: Direct titration

Electrode: Calomel–glass

Titrant: 0.25 N sodium hydroxide VS

Endpoint detection: Potentiometric

Analysis: Slowly add the *Sample* to 400 mL of water in a 1000-mL beaker, while stirring continually at 1000 rpm. The stirrer shaft is set at an angle of about 60° and to one side of the beaker, and the propeller is positioned near the bottom of the beaker. Continue stirring for 15 min. Reduce the stirring speed, and titrate with *Titrant*. After each addition of *Titrant*, allow 1 min for mixing before recording the pH.

Calculate the carboxylic acid content as a percentage of carboxylic acid groups in the portion of Carbomer Interpolymer taken:

$$\text{Result} = [(V \times N \times M_r)/W] \times 100$$

V = *Titrant* volume consumed by the *Sample* (mL)

N = actual normality of the *Titrant* (mEq/mL)

M_r = molecular weight of the carboxylic acid (–COOH) group, 45.02

W = *Sample* weight (mg)

Acceptance criteria: 52.0%–62.0%

IMPURITIES

• **HEAVY METALS**, *Method II* (231): NMT 20 µg/g

• **LIMIT OF ETHYL ACETATE AND CYCLOHEXANE**

[NOTE—This test is required only for those Carbomer Interpolymers where the labeling indicates that ethyl acetate or a mixture of ethyl acetate and cyclohexane was used in the polymerization process.]

Standard stock solution: Transfer 5.0 mL of methanol to a 10-mL serum vial, insert a rubber septum, and seal with a metal cap. Add 20.0 µL of ethyl acetate and 10.0 µL of cyclohexane through the septum into the vial, and mix.

Standard solution: Transfer 20.0 mL of methanol to a 30-mL serum vial, insert a rubber septum, and seal with a metal cap. Through the rubber septum add 10 µL of methyl ethyl ketone (internal standard) and 50.0 µL of the *Standard stock solution*, and mix to obtain a solution containing 0.18 mg of ethyl acetate and 0.078 mg of cyclohexane.

Sample solution: Transfer 50 mg of Carbomer Interpolymer to a 30-mL serum vial, add 20.0 mL of methanol, insert a rubber septum, and seal with a metal cap. Through the rubber septum add 10 µL of methyl ethyl ketone, and mix.

Relative standard deviation: NMT 5%

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of free acrylic acid in the portion of Carbomer Interpolymer taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times F \times 100$$

r_U = peak response of acrylic acid from the *Sample solution*

r_S = peak response of acrylic acid from the *Standard solution*

C_S = concentration of acrylic acid in the *Standard solution* (µg/mL)

C_U = concentration of Carbomer Interpolymer in the *Sample solution* (mg/mL)

F = unit conversion, 10⁻³ mg/µg

Acceptance criteria: NMT 0.25%

SPECIFIC TESTS

• LOSS ON DRYING (731)

Analysis: Dry under vacuum at 80° for 1 h.

Acceptance criteria: NMT 2.0%

• ROTATIONAL RHEOMETER METHODS (912)

Carbomer Interpolymer A

Sample: 2.50 g of Carbomer Interpolymer, previously dried under vacuum at 80° for 1 h (0.5% aqueous dispersion)

Titrimetric system

(See *Titrimetry* (541).)

Mode: Direct titration

Electrode: Calomel-glass

Titrant: 180 mg/mL of sodium hydroxide

Endpoint detection: Potentiometric

Analysis: Carefully add the *Sample* to 500 mL of water in a 1000-mL beaker, while stirring continuously at 1000 ± 50 rpm, with the stirrer shaft set to one side of the beaker at an angle of 60° and the propeller positioned near the bottom of the beaker. The stirrer used is a three-blade, 2-inch-diameter marine impeller. Add the *Sample* at a uniform rate for 45–90 s, being sure that loose aggregates of powder are broken up, and continue stirring at 1000 ± 50 rpm for 15 min. Remove the stirrer, and place the beaker containing the dispersion in a 25 ± 0.1° water bath for 30 min. Insert a paddle stirrer to a depth necessary to ensure that air is not drawn into the dispersion; and while stirring at 300 ± 25 rpm, titrate to a pH of 7.3–7.8 by adding *Titrant* below the surface. Stir 2–3 min until neutralization is complete. Then determine the final pH. [NOTE—If the pH is below 7.3, raise it with additional sodium hydroxide. If it is above 7.8, discard the mucilage, and prepare another batch, using a smaller amount of sodium hydroxide for titration.] Return the beaker containing the neutralized mucilage to the 25 ± 0.1° water bath for 1 h. Measure the mucilage pH again, making certain that it is between 7.3 and 7.8. Using a rotational viscometer equipped with a suitable spindle at a spindle immersion depth as defined in *Table 3*, perform the viscosity determination without delay to avoid the slight viscosity changes that occur 75 min after neutralization.

The spindle rotates at 20 rpm. Follow the instrument manufacturer's directions to measure the apparent viscosity.

Carbomer Interpolymer B

Sample: 5.00 g of Carbomer Interpolymer, previously dried under vacuum at 80° for 1 h (1.0% aqueous dispersion)

Analysis: Proceed as directed for *Rotational Rheometer Methods* (912), *Carbomer Interpolymer A*, except adjust the pH of the dispersion to 5.8–6.3 instead of 7.3–7.8.

Carbomer Interpolymer C

Sample: 2.50 g of Carbomer Interpolymer, previously dried under vacuum at 80° for 1 h (0.5% aqueous dispersion)

Analysis: Proceed as directed for *Rotational Rheometer Methods* (912), *Carbomer Interpolymer A*, except adjust the pH of the dispersion to 5.8–6.3 instead of 7.3–7.8.

Acceptance criteria: See *Table 4*.

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers, at a temperature not exceeding 45°.

Table 4

Carbomer Interpolymer	Viscosity Specifications (mPa·s)
A	45,000–65,000
B	47,000–77,000
C	8,500–16,500

- **LABELING:** Label it to indicate whether it is Type A, B, or C. Also label it to state the measured viscosity, giving the viscosity measurement parameters, the concentration of the solution, and the type of equipment used; the solvent or solvents used in the polymerization process; and the nominal and measured residual solvent levels for each solvent.

Carbon Dioxide—see Carbon Dioxide General Monographs

Carboxymethylcellulose Calcium

Cellulose, carboxymethyl ether, calcium salt;
Cellulose carboxymethyl ether calcium salt [9050-04-8].

DEFINITION

Carboxymethylcellulose Calcium is the calcium salt of a polycarboxymethyl ether of cellulose.

IDENTIFICATION

A. PROCEDURE

Sample solution: Shake thoroughly 0.1 g of Carboxymethylcellulose Calcium with 10 mL of water, followed by 2 mL of 1 N sodium hydroxide, and allow to stand for 10 min.

[NOTE—Save the unused portion of the *Sample solution* for use in *Identification* tests B and C.]

Analysis: To 1 mL of the *Sample solution* add water to make 5 mL. To 1 drop of the resulting solution, add 0.5 mL of chromatropic acid TS, and heat in a water bath for 10 min.

Acceptance criteria: A red-purple color develops.

B. PROCEDURE

Analysis: Shake 5 mL of the *Sample solution* prepared in *Identification* test A with 10 mL of acetone.

Acceptance criteria: A white, flocculent precipitate is formed.

C. PROCEDURE

Analysis: Shake 5 mL of the *Sample solution* prepared in *Identification* test A with 1 mL of ferric chloride TS.

Acceptance criteria: A brown, flocculent precipitate is formed.

D. IDENTIFICATION TESTS—GENERAL, Calcium (191):

Analysis: Ignite 1 g to ash, dissolve the residue in 10 mL of water and 5 mL of 6 N acetic acid, and filter, if necessary. Boil the filtrate, cool, and neutralize with 6 N ammonium hydroxide.

Acceptance criteria: Meets the requirements

IMPURITIES

Inorganic Impurities

- **RESIDUE ON IGNITION (281):** 10.0%–20.0%; use 1.0 g, previously dried
- **HEAVY METALS, Method II (231):** NMT 20 ppm, adding 1 mL of hydroxylamine hydrochloride solution (1 in 5) to the solution of the residue
- **CHLORIDE AND SULFATE, Chloride (221)**
Sample stock solution: Shake thoroughly 0.80 g with 50 mL of water, dissolve in 10 mL of 1 N sodium hydroxide, and add water to make 100 mL.

[NOTE—Retain a portion of the *Sample stock solution* for use in the test for *Sulfate*.]

Sample solution: Heat 20 mL of the *Sample stock solution* with 10 mL of 2 N nitric acid in a water bath until a flocculent precipitate is formed, cool, centrifuge, and remove the supernatant. Wash the precipitate with three 10-mL portions of water by centrifuging each time, combine the supernatant and the washings, add water to make 100 mL, and mix.

Acceptance criteria: A 25-mL portion of the *Sample solution* shows no more chloride than is contained in 0.20 mL of 0.020 N hydrochloric acid (0.36%).

• CHLORIDE AND SULFATE, Sulfate (221)

Sample solution: Heat 10 mL of the *Sample stock solution* prepared in the test for *Chloride* with 1 mL of hydrochloric acid in a water bath until a flocculent precipitate is formed. Cool, centrifuge, and remove the supernatant. Wash the precipitate with three 10-mL portions of water by centrifuging each time, combine the supernatant and the washings, add water to make 100 mL, and mix.

Acceptance criteria: A 25-mL portion of the *Sample solution* shows no more sulfate than is contained in 0.21 mL of 0.020 N sulfuric acid (1.0%).

SPECIFIC TESTS

- **ALKALINITY:** Shake thoroughly 1.0 g with 50 mL of freshly boiled and cooled water, and add 2 drops of phenolphthalein TS: no red color develops.
- **LOSS ON DRYING (731):** Dry a sample at 105° for 4 h: it loses NMT 10.0% of its weight.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.

Low-Substituted Carboxymethylcellulose Sodium

Cellulose, carboxymethyl ether, sodium salt, low-substituted; Carmellose sodium, low-substituted [9004-32-4].

DEFINITION

Low-Substituted Carboxymethylcellulose Sodium is the sodium salt of a partly *O*-(carboxymethylated) cellulose. It contains NLT 2.0% and NMT 4.5% of sodium (Na), calculated on the dried basis.

IDENTIFICATION

A.

Solution A: 100 mg/mL of sodium hydroxide

Sample: 1 g

Analysis: Shake the *Sample* with 100 mL of *Solution A*.

Acceptance criteria: A suspension is produced.

B.

Sample: 1 g

Analysis: Shake the *Sample* with 50 mL of water. Transfer 1 mL to a test tube, and add 1 mL of water and 1 mL of 1-naphthol TS. Incline the test tube, and add carefully 2 mL of sulfuric acid down the side so that it forms a lower layer.

Acceptance criteria: A reddish-purple color develops at the interface.

- **C.** It meets the requirements in *Impurities* for *Residue on Ignition* (281).

- **D. IDENTIFICATION TESTS—GENERAL, Sodium (191):** The *Test preparation* from the *Impurities, Heavy Metals* test meets the requirements for the pyroantimonate precipitate test.

ASSAY**• CONTENT OF SODIUM**

Analysis: Calculate the percentage of sodium in the Low-Substituted Carboxymethylcellulose Sodium taken:

$$\text{Result} = A \times (M \times M_{r1}/M_{r2})$$

A = percentage obtained from the test for *Residue on Ignition*, determined separately

M = number of moles of sodium per mole of sodium sulfate, 2

M_{r1} = atomic weight of sodium, 22.99

M_{r2} = molecular weight of sodium sulfate, 142.04

Acceptance criteria: 2.0%–4.5%

IMPURITIES**• RESIDUE ON IGNITION (281)**

Sample: 1.0 g

Analysis: Determine using a mixture of sulfuric acid and water (1:1) and an ignition temperature of $600 \pm 50^\circ$.

Acceptance criteria: 6.5%–13.5%

• HEAVY METALS, Method II (231)

Test preparation: To the residue obtained in the test for *Residue on Ignition*, add 1 mL of hydrochloric acid, evaporate on a water bath, and dissolve in 20 mL of water. [NOTE—Use this solution in *Identification* test D.]

Acceptance criteria: NMT 20 µg/g

• LIMIT OF SODIUM CHLORIDE AND SODIUM GLYCOLATE**Sodium Chloride**

Sample: 5 g

Titrimetric system

(See *Titrimetry* (541).)

Mode: Direct titration

Electrode: Silver electrode and a mercurous sulfate electrode with a potassium sulfate bridge

Titrant: 0.05 N silver nitrate VS

Endpoint detection: Potentiometric

Analysis: Transfer the *Sample* to a 250-mL conical flask. Add 50 mL of water and 5 mL of 30% hydrogen peroxide, and heat on a water bath for 20 min, stirring occasionally to ensure hydration. Cool, add 100 mL of water and 10 mL of nitric acid. Titrate with *Titrant*.

Calculate the percentage of sodium chloride in the sample taken:

$$\text{Result} = \{[(V \times N \times F)/W] \times [100/(100 - b)]\} \times 100$$

V = volume of silver nitrate (mL)

N = normality of the silver nitrate (mEq/mL)

F = equivalency factor for sodium chloride, 0.05844 g/mEq

b = percentage obtained from the test for *Loss on Drying*, determined separately

W = weight of the sample (g)

Sodium Glycolate

Standard stock solution: Transfer 100 mg of glycolic acid, previously dried overnight in a vacuum desiccator over phosphorus pentoxide, to a 100-mL volumetric flask, and dissolve in and dilute with water to volume.

Standard solution A: Transfer 0.5 mL of the *Standard stock solution* to a 100-mL volumetric flask. Add water to make 5 mL, add 5 mL of glacial acetic acid, then dilute with acetone to volume.

Standard solution B: Transfer 1.0 mL of the *Standard stock solution* to a 100-mL volumetric flask. Add water to make 5 mL, add 5 mL of glacial acetic acid, then dilute with acetone to volume.

Standard solution C: Transfer 1.5 mL of the *Standard stock solution* to a 100-mL volumetric flask. Add water to make 5 mL, add 5 mL of glacial acetic acid, then dilute with acetone to volume.

Standard solution D: Transfer 2.0 mL of the *Standard stock solution* to a 100-mL volumetric flask. Add water

to make 5 mL, add 5 mL of glacial acetic acid, then dilute with acetone to volume.

Sample solution: Transfer 500 mg of Low-Substituted Carboxymethylcellulose Sodium to a beaker, moisten thoroughly with 5 mL of glacial acetic acid, add 5 mL of water, and stir with a glass rod to ensure proper hydration (about 30 min). Add 80 mL of acetone while stirring, add 2 g of sodium chloride, and stir for several min to ensure the complete precipitation of carboxymethylcellulose. Pass through a fast filter paper, previously wetted with a small amount of acetone, and collect the filtrate in a 100-mL volumetric flask. Rinse the beaker and filter with acetone, and add the washings to the flask. Dilute the filtrate with acetone to volume, and mix. Allow to stand for 24 h without shaking, and use the clear supernatant.

Instrumental conditions

Mode: Vis

Analytical wavelength: 540 nm

Blank: Use acetone solution containing 5% of glacial acetic acid and 5% of water.

Analysis: Transfer 2.0 mL of the *Sample solution* and 2.0 mL of each *Standard solution* to separate 25-mL volumetric flasks. Place the uncovered flasks in a boiling water bath for 20 min, accurately timed, to remove the acetone, remove from the bath, and cool. Add to each flask 5.0 mL of 2,7-dihydroxynaphthalene TS, mix, add an additional 15 mL, and again mix. Cover the mouth of each flask with a small piece of aluminum foil. Place the flasks upright in a boiling water bath for 20 min, then remove from the bath, cool, and dilute with sulfuric acid to volume.

Determine the absorbances of the solutions against the *Blank*, and prepare a standard curve using the absorbances obtained from the solutions prepared from the *Standard solutions*. From the standard curve and the absorbance of the *Sample solution*, determine the concentration, in mg/mL, of glycolic acid in the *Sample solution*, and calculate the percentage of sodium glycolate in the sample taken:

$$\text{Result} = \{[(C \times V)/(W \times F)] \times (M_{r1}/M_{r2}) \times [100/(100 - b)]\} \times 100$$

C = concentration of glycolic acid in the sample, determined from the standard curve (mg/mL)

V = volume of *Sample solution* (mL)

W = weight of sample (g)

F = unit conversion factor, 1000 mg/g

M_{r1} = molecular weight of sodium glycolate, 98.03

M_{r2} = molecular weight of glycolic acid, 76.05

b = percentage obtained from the test for *Loss on Drying*, determined separately

Acceptance criteria: The sum of the percentages from the tests for *Sodium Chloride* and *Sodium Glycolate* is NMT 0.5%.

SPECIFIC TESTS**• PH (791)**

Sample: 1 g

Analysis: Shake the *Sample* with 100 mL of carbon dioxide-free water, centrifuge, and test the suspension.

Acceptance criteria: 6.0–8.5

• LOSS ON DRYING (731)

Sample: 1.0 g

Analysis: Dry the *Sample* at 105° for 3 h.

Acceptance criteria: NMT 10.0%

• WATER-SOLUBLE SUBSTANCES

Sample: 5.0 g

Analysis: Disperse the *Sample* in 400 mL of water, and during the first 30 min, stir for 1 min every 10 min. Allow to stand for 1 h, and centrifuge, if necessary. Decant 100.0 mL of the supernatant onto a fast filter paper in a vacuum filtration funnel, apply a vacuum,

and collect 75.0 mL of the filtrate. Evaporate in a tared platinum or porcelain dish, and dry at 105° for 4 h.

Acceptance criteria: NMT 70%

• **SETTLING VOLUME**

[NOTE—The following test, which can relate to excipient function, may be carried out, depending on the intended use in the formulation. In cases where there are no concerns regarding the settling volume of this article, this test may be omitted. Where the labeling states the settling volume, determine the settling volume as follows.]

Sample: 5.0 g

Analysis: In a 100-mL graduated cylinder, transfer 20 mL of isopropyl alcohol, add the *Sample*, and shake vigorously. Dilute with isopropyl alcohol to 30 mL, then with water to 50 mL, and shake vigorously. Within 15 min, repeat the shaking three times. Allow to stand for 4 h, and determine the volume of the settled mass.

Acceptance criteria: 15.0–35.0 mL

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers. No storage requirements specified.
- **LABELING:** When the settling volume is determined, label it to indicate the settling volume value.

Carboxymethylcellulose Sodium—see Carboxymethylcellulose Sodium General Monographs

Carboxymethylcellulose Sodium 12

DEFINITION

Carboxymethylcellulose Sodium 12 is the sodium salt of a polycarboxymethyl ether of cellulose. Its degree of substitution is NLT 1.15 and NMT 1.45, corresponding to a sodium (Na) content of NLT 10.4% and NMT 12.0%, calculated on the dried basis.

IDENTIFICATION

- **A.**
Sample solution: Add 1 g of powdered Carboxymethylcellulose Sodium 12 to 50 mL of water, while stirring to produce a uniform dispersion. Continue the stirring until a clear solution is produced. [NOTE—Save the unused portion of this solution for use in *Identification* tests B and C.]
Analysis: To 1 mL of the *Sample solution*, diluted with an equal volume of water, in a small test tube, add 5 drops of 1-naphthol TS. Incline the test tube, and carefully introduce down the side of the tube 2 mL of sulfuric acid so that it forms a lower layer.
Acceptance criteria: A red-purple color develops at the interface.
- **B.**
Analysis: To 5 mL of the *Sample solution* prepared for *Identification* test A add an equal volume of barium chloride TS.
Acceptance criteria: A fine, white precipitate is formed.
- **C. IDENTIFICATION TESTS—GENERAL, Sodium <191>:** A portion of the *Sample solution* prepared for *Identification* test A meets the requirements.

ASSAY

• **DEGREE OF SUBSTITUTION**

Sample: 200 mg, previously dried at 105° for 3 h

Titrimetric system

(See *Titrimetry* <541>.)

Mode: Direct titration

Titrant: 0.1 N perchloric acid in dioxane VS

Endpoint detection: Potentiometric

Electrode system: A pH meter equipped with a standard glass electrode and a calomel electrode modified as follows. Discard the aqueous potassium chloride solution contained in the electrode, rinse, and fill with the supernatant obtained by shaking thoroughly 2 g each of potassium chloride and silver chloride (or silver oxide) with 100 mL of methanol, then add a few crystals of potassium chloride and silver chloride (or silver oxide) to the electrode.

Analysis: Weigh the *Sample*, and transfer to a glass-stoppered, 250-mL conical flask. Add 75 mL of glacial acetic acid, connect the flask to a water-cooled condenser, and reflux gently on a hot plate for 2 h. Cool, and transfer the solution to a 250-mL beaker with the aid of 50 mL of glacial acetic acid. Titrate with *Titrant* while stirring with a magnetic stirrer. Record the amount, in mL, of *Titrant* versus mV (0- to 700-mV range), and continue the titration to a few mL beyond the endpoint. Plot the titration curve, and read the volume of *Titrant* at the inflection point.

Calculate the degree of substitution in the Carboxymethylcellulose Sodium 12 taken:

$$\text{Result} = (M_{r1} \times N \times V) / (G - \Delta M_{r2} \times N \times V)$$

M_{r1} = molecular weight of 1 anhydroglucose unit, 162

N = *Titrant* normality

V = volume of *Titrant* (mL)

G = weight of Carboxymethylcellulose Sodium 12 taken (mg)

ΔM_{r2} = increase in molecular mass of 1 anhydroglucose unit for each sodium carboxymethyl group added, 80

Acceptance criteria: 1.15–1.45, corresponding to 10.4%–12.0% sodium content, on the dried basis

IMPURITIES

- **HEAVY METALS, Method II <231>:** NMT 20 ppm, using 1.0 g of Carboxymethylcellulose Sodium 12 and adding 1 mL of hydroxylamine hydrochloride solution (1 in 5) to the solution of the residue
- **LIMIT OF SODIUM CHLORIDE**
Sample: 5 g
Titrimetric system
(See *Titrimetry* <541>.)
Mode: Direct titration
Titrant: 0.05 N silver nitrate VS
Endpoint detection: Potentiometric
Electrode system: A silver electrode and a mercurous sulfate electrode having a potassium sulfate bridge
Analysis: Transfer the *Sample* to a 250-mL beaker, add 50 mL of water and 5 mL of 30% hydrogen peroxide, and heat on a water bath for 20 min, stirring occasionally to ensure hydration. Cool, add 100 mL of water and 10 mL of nitric acid, and titrate with *Titrant*, determining the endpoint while stirring constantly. Calculate the percentage of NaCl in the sample taken:

$$\text{Result} = (M_r \times V \times N \times F) / [(100 - b) / 100] \times W \times 100$$

M_r = molecular weight of sodium chloride, 58.44

V = volume of *Titrant* (mL)

N = normality of *Titrant*

F = conversion factor, 10⁻³ g/mg

b = percentage obtained from the test for *Loss on Drying*, determined separately

W = *Sample* weight (g)

Acceptance criteria: See *Limit of Sodium Glycolate*.

• **LIMIT OF SODIUM GLYCOLATE**

Standard stock solution: Transfer 100 mg of glycolic acid, previously dried in a desiccator at room

temperature overnight, to a 100-mL volumetric flask. Dissolve in and dilute with water to volume, and mix. [NOTE—Use this solution within 30 days.]

Standard solutions: Into four separate 100-mL volumetric flasks, transfer 1.0-, 2.0-, 3.0-, and 4.0-mL portions of the *Standard stock solution*, respectively. To each flask, add water to make 5 mL, add 5 mL of glacial acetic acid, dilute with acetone to volume, and mix.

Sample solution: Transfer 500 mg to a 100-mL beaker, moisten thoroughly with 5 mL of glacial acetic acid, followed by 5 mL of water, and stir with a glass rod to ensure proper hydration (usually about 15 min). Slowly add 50 mL of acetone, with stirring, then add 1 g of sodium chloride, and stir for several min to ensure complete precipitation of the carboxymethylcellulose. Filter through a soft, open-textured paper, previously wetted with a small amount of acetone, and collect the filtrate in a 100-mL volumetric flask. Use an additional 30 mL of acetone to facilitate the transfer of the solids and to wash the filter cake, then dilute with acetone to volume.

Blank: Prepare a 25-mL blank flask containing 2.0 mL of a solution containing 5% each of glacial acetic acid and water in acetone.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Spectrophotometry

Analytical wavelength: 540 nm

Analysis: Transfer 2.0 mL of the *Sample solution* and 2.0 mL of each *Standard solution* to separate 25-mL volumetric flasks. The 25-mL volumetric flask containing the *Blank* is included in the following tests. Place the uncovered flasks in a boiling water bath for 20 min, accurately timed, to remove the acetone, remove from the bath, and cool. Add to each flask 5.0 mL of 2,7-dihydroxynaphthalene TS, mix, add an additional 15 mL, and again mix. Cover the mouth of each flask with a small piece of aluminum foil. Place the flasks upright in a boiling water bath for 20 min, then remove from the bath, cool, dilute with sulfuric acid to volume, and mix.

Determine the absorbances of each solution against the *Blank*, and prepare a standard curve using the absorbances obtained from the solutions prepared from the *Standard solutions*. From the standard curve and the absorbance of the *Sample solution*, determine the weight (*w*), in mg, of glycolic acid in the *Sample solution*.

Calculate the percentage of sodium glycolate in the specimen taken:

$$\text{Result} = w \times F / [(100 - b)/100] \times W \times 100$$

- w* = weight of glycolic acid in the sample determined from the standard curve (mg)
F = factor converting glycolic acid to sodium glycolate, 1.29
b = percentage of *Loss on Drying*, determined separately
W = weight of the sample taken (mg)

Acceptance criteria: The sum of the percentages from the tests for *Limit of Sodium Chloride* and *Limit of Sodium Glycolate* is NMT 0.5%.

SPECIFIC TESTS

- PH (791):** 6.5–8.5, in a 10-mg/mL solution
- LOSS ON DRYING (731):** Dry a sample at 105° for 3 h: it loses NMT 10.0% of its weight.
- ROTATIONAL RHEOMETER METHODS (912)**

Analysis: Determine the viscosity in a water solution at the concentration stated on the label. Using undried Carboxymethylcellulose Sodium 12, weigh the amount which, on the dried basis, will provide 200 g of solution of the stated concentration. Add the substance in small amounts to 180 mL of stirred water contained in a

tared, wide-mouth bottle, continue stirring rapidly until the powder is well wetted, add sufficient water to make the mixture weigh 200 g, and allow to stand, with occasional stirring, until solution is complete. Adjust the temperature to 25 ± 0.2°, and determine the viscosity, using a rotational type of viscometer, making certain that the system reaches equilibrium before taking the final reading.

Acceptance criteria: The viscosity of solutions of 2% concentration is NLT 80.0% and NMT 120.0% of that stated on the label; the viscosity of solutions of 1% concentration is NLT 75.0% and NMT 140.0% of that stated on the label or it is between the maximum and minimum values, where stated as a range of viscosities.

ADDITIONAL REQUIREMENTS

- PACKAGING AND STORAGE:** Preserve in tight containers.
- LABELING:** Label it to indicate the nominal viscosity in solutions of stated concentrations of either 1% (w/w) or 2% (w/w). The indicated viscosity may be in the form of a range encompassing 80.0%–120.0% of the nominal viscosity, where the solution concentration is 2% (w/w); or 75.0%–140.0% of the nominal viscosity, where the solution concentration is 1% (w/w).

Carboxymethylcellulose Sodium Paste— see Carboxymethylcellulose Sodium Paste General Monographs

Enzymatically-Hydrolyzed Carboxymethylcellulose Sodium

Sodium salts of polymers containing substituted anhydroglucose units with the general formula:

$[\text{C}_6\text{H}_7\text{O}_2(\text{OH})_x(\text{OCH}_2\text{COONa})_y]_n$
 where *n* is the degree of polymerization;
y is the degree of substitution;
x is between 1.50 and 2.80;
y is between 0.20 and 1.50;
 and *x* + *y* = 3.0

Carboxymethyl cellulose, sodium, partially hydrolyzed enzymatically.

DEFINITION

Enzymatically-Hydrolyzed Carboxymethylcellulose Sodium is the sodium salt of a polycarboxymethyl ether of cellulose, which has been partially hydrolyzed by enzymatic treatment with food grade *Trichoderma reesei* cellulase. Its degree of substitution is NLT 0.20 and NMT 1.50, corresponding to a sodium (Na) content of NLT 2.6% and NMT 12.2%, calculated on the dried basis.

IDENTIFICATION

- A.** Vigorously shake a 0.1% solution of Enzymatically-Hydrolyzed Carboxymethylcellulose Sodium: no layer of foam appears.
- B.** To 5 mL of a 0.5% solution of Enzymatically-Hydrolyzed Carboxymethylcellulose Sodium add 5 mL of a 5% solution of copper or aluminium sulfate: a precipitate appears.
- C.** Add 0.5 g of Enzymatically-Hydrolyzed Carboxymethylcellulose Sodium to 50 mL of water, while stirring, to

produce a uniform dispersion. Continue stirring until a clear solution of 1% is produced. Dilute 1 mL of this solution with 1 mL of water in a small test tube. Add 5 drops of 1-naphthol TS. Incline the tube, and carefully introduce down the side of the tube 2 mL of sulfuric acid, so that it forms a lower layer: a red-purple color develops at the interface.

- **D. IDENTIFICATION TESTS—GENERAL, Sodium (191):** A portion of the 1% solution obtained from *Identification* test C meets the requirements.
- **E.** It meets the requirements of the test for *Viscosity*.

ASSAY

• DEGREE OF SUBSTITUTION

Sample: 2.0 g of Enzymatically-Hydrolyzed Carboxymethylcellulose Sodium

Analysis: Ignite a clean and dry quartz crucible with a Bunsen burner, cool to room temperature in a desiccator, and weigh the crucible accurately. Transfer the *Sample* to the crucible. Carefully ignite on a small flame for about 10 min, and make sure that the *Sample* does not burn or excessively glow. Cool, and moisten the residue with 3–5 mL of sulfuric acid. Heat the crucible cautiously until the fuming is complete, and heat further until the *Sample* turns grayish white. Place the crucible in an oven at about 600°, until no black spots are visible. Cool the crucible in a desiccator to room temperature, and weigh. Place the crucible again in an oven at about 600° for 1 h, cool the crucible to room temperature in a desiccator, and weigh. This last step is repeated until a constant weight is achieved.

Calculate the percentage of sodium, P_{Na} , in the portion of Enzymatically-Hydrolyzed Carboxymethylcellulose Sodium taken:

$$\text{Result} = 100 \times N_{Na} \times A_{Na} \times (W_2 - W_1) / \{M_r \times W[(100 - \text{LOD})/100]\}$$

N_{Na} = number of sodium atoms/molecule of sodium sulfate, 2

A_{Na} = atomic weight of sodium, 22.99

W_2 = weight of the crucible with ash residue (g)

W_1 = weight of the crucible (g)

M_r = molecular weight of sodium sulfate, 142.04

W = weight of Enzymatically-Hydrolyzed Carboxymethylcellulose Sodium taken (g)

LOD = Loss on Drying value of Enzymatically-Hydrolyzed Carboxymethylcellulose Sodium (%)

Calculate the *Degree of Substitution* (DS):

$$\text{Result} = M_{r1} \times (P_{Na} - P_{NaCl} - P_{NaG}) / \{100 \times A_{Na} - [(M_{r2} - A_H) \times (P_{Na} - P_{NaCl} - P_{NaG})]\}$$

M_{r1} = molar mass of one glucose unit, 162.14

P_{NaCl} = percentage of sodium chloride obtained in the test for *Limit of Sodium Chloride and Sodium Glycolate*

P_{NaG} = percentage of sodium glycolate obtained in the test for *Limit of Sodium Chloride and Sodium Glycolate*

A_{Na} = atomic weight of sodium, 22.99

M_{r2} = molar mass of one sodium carboxymethyl unit (CH_2COONa), 81.03

A_H = atomic weight of hydrogen, 1.01

Acceptance criteria: NLT 0.20 and NMT 1.50 carboxymethyl groups (CH_2COOH)/anhydroglucose unit on the dried basis

IMPURITIES

Inorganic Impurities

• LIMIT OF LEAD

Nitric acid solution: Dilute 10 mL of nitric acid with 20 mL of water. Boil this solution to remove nitrous fumes, and allow it to cool to room temperature.

Lead standard stock solution: Dissolve 1.60 g of lead nitrate ($\text{Pb}(\text{NO}_3)_2$) in about 30 mL of *Nitric acid solution* in a 1000-mL volumetric flask, dilute with water to volume, and mix. At 20°, transfer 10.0 mL of this lead solution to a 500-mL volumetric flask, and dilute with water to volume. The *Lead standard stock solution* contains 20 µg/mL of Pb.

Standard solutions: Transfer 0, 1, 2, 3, 4, and 5 mL of the *Lead standard stock solution* to six identical 100-mL volumetric flasks, and add 50 mL of water to each flask. To each flask, add 8 mL of sulfuric acid and 10 mL of hydrochloric acid, and mix well. After complete dissolution, dilute each flask with water to volume, and mix. Transfer 1 mL of each solution to a separate 50-mL volumetric flask, and dilute with water to a final concentration of 0, 4, 8, 12, 16, and 20 µg/L of Pb, respectively.

Sample solution: Transfer 1 g of Enzymatically-Hydrolyzed Carboxymethylcellulose Sodium to a 100-mL beaker, and add 5 mL of 30% hydrogen peroxide. While stirring, add 50 mL of water to the solution, and heat the beaker on a hot plate at 50°, until all solids are dissolved. Quantitatively transfer this solution to a 100-mL volumetric flask, add 300 µL of nitric acid, dilute with water to volume, and mix.

Blank solution: Prepare as directed in the *Sample solution*, but omit the test specimen.

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* (851))

Mode: Graphite furnace atomic absorption spectrophotometer, equipped with a lead hollow-cathode lamp and an adequate means of background correction.

Analytical wavelength: Lead emission line of 283.3 nm

Analysis

Samples: *Standard solutions*, *Sample solution*, and *Blank solution*

Concomitantly determine the absorbances of the *Samples*. Optimize the instrument program for lead as recommended by the manufacturer. The strongest *Standard solution* is aspirated to optimize the instrument settings to give a full-scale reading on the detector. Correct the area responses of all *Sample solution* and *Standard solutions* for the *Blank solution* area response. Generate the appropriate lead calibration curve, and determine the lead concentration, C , in µg/L, in the *Sample solution*. Calculate the content of lead, in µg, in each g of Enzymatically-Hydrolyzed Carboxymethylcellulose Sodium taken:

$$\text{Result} = (V \times C) / W$$

V = volume of the *Sample solution*, 0.1 L

W = weight of Enzymatically-Hydrolyzed Carboxymethylcellulose Sodium taken to prepare the *Sample solution* (g)

Acceptance criteria: NMT 3 µg/g of lead.

• LIMIT OF SODIUM CHLORIDE AND SODIUM GLYCOLATE Sodium Chloride

Ferric solution: Dissolve 20 g of ferric ammonium sulfate ($\text{FeNH}_4(\text{SO}_4)_2 \cdot 12\text{H}_2\text{O}$) in a 100-mL volumetric flask containing 80 mL of water, add 0.3 mL of 10 N nitric acid (dilute 600 mL of nitric acid with water to 1000 mL), dilute with water to volume, and mix.

Analysis: Transfer an accurate quantity of Enzymatically-Hydrolyzed Carboxymethylcellulose Sodium, equivalent to 5.0 g on the dried basis, to a platinum or porcelain crucible. Heat the test specimen first with a small flame so that the test specimen does not ignite. When the charring is complete, heat further in an electric oven at about 600° for 15 min. After cooling, pulverize the ashes thus obtained and extract several times with water.

Filter the extracts into a 500-mL volumetric flask, add 5 mL of 10 N nitric acid, and dilute with water to volume. Transfer 100 mL of this extract to a suitable flask, add 2.0 mL of 0.2 N silver nitrate and 3 g of potassium nitrate, and mix. [NOTE—Silver chloride precipitate may develop. The potassium nitrate will prevent the silver chloride from interfering with the indication reaction.] After complete dissolution of the potassium nitrate, titrate this mixture with 0.02 N ammonium thiocyanate VS by adding 3 mL of *Ferric solution* as an indicator. Titrate until a red color develops and persists for at least 30 s. Each mL of 0.02 N silver nitrate is equivalent to 1.169 mg of sodium chloride.

Calculate the percentage of sodium chloride, P_{NaCl} , in the portion of Enzymatically-Hydrolyzed Carboxymethylcellulose Sodium taken:

$$\text{Result} = (0.001169 \times D \times V/W) \times 100$$

- D = dilution factor, 5
 V = volume of the 0.02 N silver nitrate consumed (mL)
 W = weight of Enzymatically-Hydrolyzed Carboxymethylcellulose Sodium taken, calculated on the dried basis (g)

Sodium Glycolate

Mobile phase: Prepare a filtered and degassed solution of 0.05% phosphoric acid in water.

Standard stock solution: Transfer 100 mg of glycolic acid, previously dried overnight in a vacuum desiccator over phosphorus pentoxide, and accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

Standard solutions: Transfer 0.5-, 1.0-, 1.5-, 2.0-, and 2.5-mL portions of the *Standard stock solution*, respectively, into five identical 100-mL volumetric flasks. To each flask, dilute with *Mobile phase* to volume, and mix. The *Standard solutions* have concentrations of 5.0, 10.0, 15.0, 20.0, and 25.0 mg/L, respectively.

Sample solution: Transfer an accurate quantity of Enzymatically-Hydrolyzed Carboxymethylcellulose Sodium, equivalent to 200 mg on the dried basis, to a flask. Dissolve in and dilute with *Mobile phase* to 20 mL.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 205 nm

Column: 7.8-mm \times 30-cm; packing L22. [NOTE—Two 7.8-mm \times 15-cm columns can be used in place of one 7.8-mm \times 30-cm column, provided that the *System suitability* requirements are met.]

Flow rate: 0.5 mL/min

Injection size: 50 μ L

System suitability

Sample: *Standard solution* with the concentration of 15 mg/L

Suitability requirements

Relative standard deviation: NMT 5.0%

Analysis

Samples: *Standard solutions* and *Sample solution*

Separately inject equal volumes of the *Standard solutions* and the *Sample solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Plot the peak areas from the *Standard solutions* versus the concentration of glycolic acid, in mg/L, in the *Standard solutions*. From the standard curve and the peak area from the *Sample solution*, determine the concentration of glycolic acid, C, in mg/L, in the *Sample solution*.

Calculate the percentage of sodium glycolate, P_{NaG} , in the portion of Enzymatically-Hydrolyzed Carboxymethylcellulose Sodium taken:

$$\text{Result} = \{[V \times (M_{r1}/M_{r2}) \times C]/W\} \times 100$$

- V = volume of the *Sample solution*, 0.02 L
 M_{r1} = molecular weight of sodium glycolate, 98.03
 M_{r2} = molecular weight of glycolic acid, 76.05
 W = weight of Enzymatically-Hydrolyzed Carboxymethylcellulose Sodium taken to prepare the *Sample solution*, calculated on the dried basis (mg)

Acceptance criteria: The sum of the percentages from the tests for sodium chloride and sodium glycolate ($P_{NaCl} + P_{NaG}$) is NMT 0.5%.

Organic Impurities

• PROCEDURE: LIMIT OF RESIDUAL ENZYME

Sample: 20.0 g of the dry Enzymatically-Hydrolyzed Carboxymethylcellulose Sodium

Analysis: Transfer the *Sample* to a 2000-mL beaker. Add 100 mL of sulfuric acid, and mix using a stirring plate, until all particles are wetted. Prevent excessive foam formation during mixing. Add some glass beads to prevent boiling delay, and slowly heat the solution to a temperature not exceeding 150°. Stir for 30 min, and carefully add 5 mL of hydrogen peroxide dropwise at interval steps. After each step, allow the reaction to subside, and ensure that the solution does not contain any particulates. [NOTE—It takes up to approximately 125 mL of hydrogen peroxide.] The temperature is gradually increased to about 300°, until strong fumes of sulfur trioxide appear. Stop the heating. If the solution darkens again during heating, carefully add some drops of hydrogen peroxide until a clear solution is obtained. Allow the solution to cool down, add 10 mL of water, and heat again until strong fumes of sulfur trioxide appear. After the solution becomes clear and is cooled down, flush the sides with water, and transfer the solution quantitatively to a 4000-mL round-bottom flask. Dilute with water to a volume of approximately 500 mL, and place the round-bottom flask under the distillation unit. Pipet 10 mL of 0.1 N sulfuric acid into a 300-mL conical flask, and dilute with water to 100 mL. Place the conical flask at the end of the distillation unit, taking care that the end of the distillation unit is below the surface of the liquid. Through a dropping funnel add 500 mL of a 32% sodium hydroxide solution to the round-bottom flask with heavy stirring. Slowly heat until the solution boils. Boil, and collect the distillate for 20 min. Remove the conical flask, and stop the heating. Flush the inside of the condenser with water into the conical flask. Titrate the solution with 0.1 M sodium hydroxide. Perform a blank determination.

Calculate the percentage of protein in the portion of Enzymatically-Hydrolyzed Carboxymethylcellulose Sodium taken:

$$\text{Result} = \{F \times A_N \times [V_A C_A - (V_{TB} - V_B) \times C_{TB}]/W\} \times 100$$

- F = calculation factor for the theoretical amount of nitrogen present in protein, 6.25
 A_N = atomic weight of nitrogen, 14.01 g/mol
 V_A = volume of 0.1 N sulfuric acid added to the conical flask (mL)
 C_A = exact concentration of sulfuric acid added to the conical flask (N)
 V_{TB} = volume of the sodium hydroxide solution consumed in the titration for the sample determination (mL)
 V_B = volume of the sodium hydroxide solution consumed in the titration for the blank determination (mL)

- C_{TB} = concentration of the sodium hydroxide solution used in the titration (N)
 W = weight of Enzymatically-Hydrolyzed Carboxymethylcellulose Sodium taken (mg)
Acceptance criteria: NMT 0.1% of protein

SPECIFIC TESTS• **ROTATIONAL RHEOMETER METHODS (912)**

Analysis: After determining the *Loss on Drying*, weigh a quantity of undried Enzymatically-Hydrolyzed Carboxymethylcellulose Sodium, equivalent to 60.0 g on the dried basis. In a 400-mL beaker, transfer about 240 mL of water, minus the amount of water in the test specimen. Over a period of seconds, transfer the test specimen to the 400-mL beaker containing water, while slowly and continuously stirring the solution to make the mixture weigh 300 g. When the specimen is well wetted, increase the rate of stirring, taking care to avoid mixing in excess air. Dissolve the test specimen while stirring rapidly. Equilibrate the mixture in a water bath at 25° for 1 h, until all air bubbles dissipate. Stir the solution in the beaker for 5 min at 300 rpm, making sure that no air bubbles are incorporated. Transfer the solution to a 250-mL beaker of 5 cm in internal diameter and about 12 cm in height, for measurement. Determine its viscosity at $25 \pm 0.1^\circ$, using a suitable rotational viscometer with a cylindrical spindle 1.9 cm in diameter and 6.5 cm high, attached to a shaft 0.3 cm in diameter.¹ The spindle rotates at 12 rpm at an immersion depth of 8.1 cm. Follow the instrument manufacturer's directions to measure the apparent viscosity.

Acceptance criteria: The viscosity is between 200 and 500 mPa · s.

- **PH (791):** 6.0–8.5, in a solution prepared in carbon dioxide-free water (1 in 100)
- **LOSS ON DRYING (731):** Dry it at 105° for 3 h: it loses NMT 12.0% of its weight.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, and store in a cool and dry place.
- **LABELING:** Label it to indicate the viscosity, giving the viscosity measurement parameters, concentration of the solution, and the type of equipment used. The labeling also indicates the value for *Degree of Substitution*.

Cardamom Oil

DEFINITION

Cardamom Oil is the volatile oil distilled from the seed of *Elettaria cardamomum* (L.) Maton var. *cardamomum* (Fam. Zingiberaceae).

IMPURITIES

- **ARSENIC, Method II (211):** NMT 3 µg/g
- **LEAD (251)**
 Diluted standard lead solution: 10 mL
Analysis: Proceed as directed in the chapter.
Acceptance criteria: NMT 10 µg/g
- **HEAVY METALS, Method II (231):** NMT 40 µg/g

SPECIFIC TESTS

- **SPECIFIC GRAVITY (841):** 0.917–0.947
- **OPTICAL ROTATION, Angular Rotation (781A):** +22° to +44°
- **REFRACTIVE INDEX (831):** 1.463–1.466 at 20°
- **SOLUBILITY IN 70% ALCOHOL:** One volume dissolves in 5 volumes of 70% alcohol.

¹ A suitable spindle is available from Brookfield as an LV1 spindle, or the equivalent.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.
- **LABELING:** The label states the Latin binomial and, following the official name, the part of the plant source from which the article was derived.

Cardamom Seed

DEFINITION

Cardamom Seed is the dried ripe seed of *Elettaria cardamomum* (L.) Maton var. *cardamomum* (Fam. Zingiberaceae).

[NOTE—Cardamom Seed should be recently removed from the capsule.]

SPECIFIC TESTS• **BOTANIC CHARACTERISTICS****Macroscopic**

Unground cardamom seed: Seeds usually appear in agglutinated groups of 2–7 seeds, and as separate seeds surrounded by an adhering membranous aril. The individual seeds are oblong-ovoid or irregularly three- to four-sided, 3–4 mm in length. They are convex on the dorsal side, strongly longitudinally grooved on the ventral side, coarsely tuberculated, and externally pale orange to dark brown. The odor is aromatic. The taste is aromatic, pungent, and slightly bitter.

Powdered cardamom seed: Brown to weak yellow to light olive green

Microscopic

Unground cardamom seed: Sections show a loosely attached membranous aril; a brownish seed coat consisting of an epidermal layer of thick-walled cells, a pigment layer of small cells with red to orange contents, a layer of volatile oil cells with suberized walls and a single layer of radially elongated, strongly lignified stone cells with inner walls heavily thickened, and a minute lumen containing silica; and a large, colorless perisperm surrounding a central, orange to yellow endosperm in which a small, straight embryo is embedded.

Powdered cardamom seed: It consists chiefly of fragments of perisperm, endosperm, embryo, and seed coat. The endosperm and perisperm cells are filled with starch grains 1–4 µm in diameter, or may contain one or more prisms of calcium oxalate 10–25 µm in diameter. The seed coat is characterized by its red- to orange-colored cells, is polygonal in surface view, and is about 20 µm in diameter. Fragments of pericarp tissue with spiral vessels and with accompanying slightly lignified fibers are relatively few.

- **ARTICLES OF BOTANICAL ORIGIN, Acid-Insoluble Ash (561):** NMT 4.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve against attack by insects.
- **LABELING:** The label states the Latin binomial and the official name.

Compound Cardamom Tincture

DEFINITION

Prepare Compound Cardamom Tincture as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* (795)).

Cardamom Seed, in moderately coarse powder	20 g
Cinnamon, in fine powder	25 g
Caraway, in moderately coarse powder	12 g
Glycerin	50 mL
Diluted Alcohol	950 mL
Diluted Alcohol, a sufficient quantity to make	1000 mL

Macerate the mixed powders in 750 mL of a mixture of 50 mL of *Glycerin* and 950 mL of *Diluted Alcohol* in a container that can be closed, and put it in a warm place. Agitate it frequently during 3 days or until the soluble matter is dissolved. Transfer the mixture to a filter, and when most of the liquid has drained away, wash the residue on the filter by using first the remainder of the mixture of *Glycerin* and *Diluted Alcohol* prepared as directed above, followed by *Diluted Alcohol*, combining the filtrates to produce 1000 mL, and mix. [NOTE—Compound Cardamom Tincture may be colored with one or more colors.]

OTHER COMPONENTS

- **ALCOHOL DETERMINATION**, *Method II* (611): 43.0%–47.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE**: Package in tight, light-resistant containers, and avoid exposure to direct sunlight and excessive heat.

Carmellose

Nonharmonized attributes: Heavy Metals and Packaging and Storage (USP)

Reagents and reference materials: Each pharmacopeia will adapt the text to take account of local reference substances and spectra and reagent specifications.

Carboxymethylcellulose [9000-11-7].

DEFINITION

Carmellose is a carboxymethyl ether of cellulose.

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)
- **B. PH** (791)

Sample solution: 10 mg/mL of Carmellose suspension
Acceptance criteria: 3.5–5.0

IMPURITIES

Inorganic Impurities

- **RESIDUE ON IGNITION** (281): NMT 1.5% on 1 g, calculated on the dried basis
- **CHLORIDES**

Sample solution: Shake well 0.8 g of Carmellose with 50 mL of water, dissolve in 10 mL of sodium hydroxide TS, and add water to make 100 mL. Heat 20 mL of this solution with 10 mL of nitric acid, diluted on a water bath until a flocculent precipitate is produced. Cool, centrifuge, and take out the supernatant. Wash the

precipitate with three 10-mL portions of water by centrifuging each time, combine the supernatant and the washings, and add water to make 100 mL. Take 25 mL of this solution, add 6 mL of nitric acid, diluted, and dilute with water to make 50 mL.

Control solution: 0.40 mL of 0.01 N hydrochloric acid VS and 6 mL of nitric acid, diluted. Add water to make 50 mL.

Analysis: Add 1 mL of silver nitrate TS to the *Sample solution* and to the *Control solution*, mix well, and allow to stand for 5 min protected from direct sunlight. Compare the opalescence developed in both solutions against a black background by viewing downward or transversely.

Acceptance criteria: The turbidity produced in the *Sample solution* is NMT that in the *Control solution* (NMT 0.36%).

• SULFATES

Sample solution: Shake well 0.40 g of Carmellose with 25 mL of water, dissolve in 5 mL of sodium hydroxide TS, and add 20 mL of water. Heat this solution with 2.5 mL of hydrochloric acid in a water bath until a flocculent precipitate is produced. Cool, centrifuge, and take out the supernatant. Wash the precipitate with three 10-mL portions of water by centrifuging each time, combine the supernatant and the washings, and add water to make 100 mL. Filter this solution, discard 5 mL of the first filtrate, take 25 mL of the subsequent filtrate, add 1 mL of hydrochloric acid, and dilute with water to make 50 mL.

Control solution: 1.5 mL of 0.01 N sulfuric acid VS and 1 mL of dilute hydrochloric acid. Add water to make 50 mL.

Analysis: Add 2 mL of barium chloride TS to the *Sample solution* and to the *Control solution*, mix well, and allow to stand for 10 min. Compare the turbidity developed in both solutions against a black background by viewing downward or transversely.

Acceptance criteria: The turbidity produced in the *Sample solution* is NMT that of the *Control solution* (NMT 0.72%).

- **HEAVY METALS**, *Method II* (231): Proceed with 1.0 g of Carmellose and perform the test. Prepare the control solution with 2.0 mL of *Standard Lead Solution*.

Acceptance criteria: NMT 20 ppm.

SPECIFIC TESTS

- **LOSS ON DRYING** (731): Dry 1 g at 105° for 4 h: it loses NMT 8.0% of its weight.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE**: Preserve in tight containers.
- **USP REFERENCE STANDARDS** (11)
USP Carmellose RS.

Carrageenan

Carrageenan [9000-07-1].

DEFINITION

Carrageenan is the hydrocolloid obtained by extraction with water or aqueous alkali, from some members of the class Rhodophyceae (red seaweeds). Carrageenan consists chiefly of potassium, sodium, calcium, magnesium, and ammonium sulfate esters of galactose and 3,6-anhydrogalactose copolymers. These hexoses are alternately linked α -1,3 and β -1,4 in the polymer. The prevalent copolymers in the hydrocolloid are designated *kappa*-, *iota*-, and *lambda*-carrageenan. *kappa*-Carrageenan is mostly the alternating polymer of D-galactose-4-sulfate and 3,6-anhydro-D-galactose. *iota*-Carrageenan is similar, except that the 3,6-anhydrogalactose is sulfated at carbon 2. Be-

tween *kappa*-carrageenan and *iota*-carrageenan there is a continuum of intermediate compositions differing in degree of sulfation at carbon 2. In *lambda*-carrageenan, the alternating monomeric units are mostly D-galactose-2-sulfate (1,3-linked) and D-galactose-2,6-disulfate (1,4-linked). The ester sulfate content for Carrageenan ranges from 18% to 40%. In addition, it contains inorganic salts that originate from the seaweed and from the process of recovery from the extract.

Carrageenan is recovered by alcohol precipitation, by drum drying, or by freezing. The alcohols used during recovery and purification are restricted to methanol, alcohol, and isopropyl alcohol. Carrageenan that is recovered by drum-roll drying may contain mono- and di-glycerides or up to 5% of polysorbate 80 used as roll-stripping agents.

IDENTIFICATION

- **A.**
Sample solution: A 20-mg/mL solution prepared by heating a uniform dispersion in a hot water bath to 80°
Analysis: Cool the *Sample solution*.
Acceptance criteria: The *Sample solution* becomes more viscous upon cooling and may form a gel.
- **B.**
Sample solution: Prepare as directed for the *Sample solution* in Identification test A.
Analysis: To 10 mL of the *Sample solution*, while still hot, add 4 drops of a 0.1-g/mL solution of potassium chloride, mix, and cool.
Acceptance criteria: A short-textured ("brittle") gel indicates a carrageenan of a predominantly *kappa* type; a compliant ("elastic") gel indicates a predominantly *iota* type. If the solution does not gel, the carrageenan is of a predominantly *lambda* type.
- **C.**
Analysis: Dilute a portion of the *Sample solution*, prepared as directed in Identification test A, with 4 parts of water, and add 2–3 drops of methylene blue TS.
Acceptance criteria: A blue, stringy precipitate is formed (also positive for furcellaran, a similar colloid).
- **D. INFRARED ABSORPTION**
Sample 1: Disperse 2 g in 200 mL of a 25-mg/mL solution of potassium chloride, and stir for 1 h. Allow to stand for 18 h, stir again for 1 h, and transfer to a centrifuge tube. (If the transfer cannot be made because the dispersion is too viscous, dilute with up to 200 mL of the potassium chloride solution.) Centrifuge at approximately $1000 \times g$ for 15 min.
Remove the clear supernatant, resuspend the residue in 200 mL of a 25-mg/mL solution of potassium chloride, and centrifuge again. Coagulate the combined supernatants by adding 2 volumes of dilute alcohol (9 in 10). (Retain the sediment for use in preparing *Sample 2*.) Recover the coagulum, and wash with 250 mL of the dilute alcohol. Press the excess liquid from the coagulum, and dry it at 60° for 2 h. The material so obtained is the nongelling fraction (*lambda* carrageenan).
Sample 2: Disperse the sediment retained from the preparation of *Sample 1* in 250 mL of cold water, heat at 90° for 10 min, and cool to 60°. Coagulate the mixture, then recover, wash, and dry the coagulum as described above. The material so obtained is the gelling fraction (*kappa*- and *iota*-carrageenan).
Analysis: Prepare a 2-mg/mL solution of each *Sample*, cast films 5 μ m thick (when dry) on a suitable nonsticking surface, and obtain the IR absorption spectrum of each film.
Acceptance criteria: Carrageenan has strong, broad absorption bands, typical of all polysaccharides, in the 1000 to 1100 cm^{-1} region. Absorption maxima are 1065 cm^{-1} and 1020 cm^{-1} for gelling and nongelling types, respectively. Other characteristic absorption bands and their intensities relative to the absorbance at 1050 cm^{-1} are as shown in Table 1.

Table 1

Wave Number (cm^{-1})	Molecular Assignment	Absorbance Relative to 1050 cm^{-1}		
		<i>kappa</i>	<i>iota</i>	<i>lambda</i>
1220–1260	Ester sulfate	0.7–1.2	1.2–1.6	1.4–2.0
928–933	3,6-Anhydro galactose	0.3–0.6	0.2–0.4	0–0.2
840–850	Galactose-4-sulfate	0.3–0.5	0.2–0.4	—
825–830	Galactose-2-sulfate	—	—	0.2–0.4
810–820	Galactose-6-sulfate	—	—	0.1–0.3
800–805	3,6-Anhydro galactose-2-sulfate	0–0.2	0.2–0.4	—

IMPURITIES

- **HEAVY METALS**, Method II (231): NMT 40 ppm
- **ARSENIC** (211): NMT 3 ppm
- **LEAD** (251): NMT 10 ppm

SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS** (61) and **TESTS FOR SPECIFIED MICROORGANISMS** (62): The total bacterial count does not exceed 200 cfu/g, and the tests for *Salmonella* species and *Escherichia coli* are negative.
- **LOSS ON DRYING** (731): Dry a sample at a pressure not exceeding 10 mm of mercury at 70° for 18 h, cool in a desiccator, and weigh: it loses NMT 12.5% of its weight.
- **SOLUBILITY IN WATER**: NMT 30 mL of water is required to dissolve 1 g at a temperature of 80°.
- **ACID-INSOLUBLE MATTER**
Sample: 2 g
Analysis: Transfer the *Sample* to a 250-mL beaker containing 150 mL of water and 1.5 mL of sulfuric acid. Cover with a watch glass, and heat on a steam bath for 6 h, rubbing down the wall of the beaker frequently with a rubber-tipped stirring rod, and replacing any water lost by evaporation. Transfer 500 mg of a suitable filter aid to the beaker, and filter through a tared filtering crucible provided with a 2.4-cm glass fiber filter. Wash the residue several times with hot water, dry at 105° for 3 h, cool in a desiccator, and weigh. The difference between the total weight and the sum of the weights of the filter aid, crucible, and glass fiber filter is the weight of the acid-insoluble matter.
Acceptance criteria: NMT 2.0% of the weight of Carrageenan taken
- **ROTATIONAL RHEOMETER METHODS** (912)
Sample: 7.5 g
Analysis: Transfer the *Sample* to a tared, tall-form, 600-mL beaker, add 450 mL of water, and disperse with agitation for 15 min. Add water to bring the weight to 500 g, and heat in a water bath, with continuous agitation, until a temperature of 80° is reached. Add water to adjust for loss by evaporation, cool to between 76° and 77°, and place in a constant-temperature bath maintained at 75°. Provide a suitable rotational viscometer with a spindle 1.88 cm in diameter and 6.51 cm high, using an immersion depth of 8.10 cm (No. 1 spindle). Allow the spindle to rotate in the solution at 30 rpm for 6 revolutions, then observe the scale reading. Convert the scale reading to centipoises by multiplying by the constant for the spindle and speed used.
Acceptance criteria: At 75° is NLT 5 centipoises
- **ARTICLES OF BOTANICAL ORIGIN**, Total Ash (561): NMT 35.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, preferably in a cool place.

Castor Oil—see Castor Oil General Monographs

Hydrogenated Castor Oil

DEFINITION

Hydrogenated Castor Oil is refined, bleached, hydrogenated, and deodorized Castor Oil, consisting mainly of the triglyceride of hydroxystearic acid.

IMPURITIES

- **HEAVY METALS**, *Method II* (231): NMT 10 µg/g

SPECIFIC TESTS

- **MELTING RANGE OR TEMPERATURE**, *Class II* (741): 85°–88°
- **FATS AND FIXED OILS**, *Iodine Value* (401): NMT 5
- **FATS AND FIXED OILS**, *Saponification Value* (401): 176–182
- **FATS AND FIXED OILS**, *Acid Value (Free Fatty Acids)* (401)

Sample solution: Melt 20 g in a conical flask on a steam bath, add 75 mL of hot alcohol that has previously been neutralized with 0.1 N sodium hydroxide to phenolphthalein TS, swirl, and add 1 mL of phenolphthalein TS.

Analysis: Titrate with 0.1 N sodium hydroxide VS, swirling vigorously, until the solution remains faintly pink after being shaken for 60 s.

Acceptance criteria: NMT 11.0 mL of 0.1 N sodium hydroxide VS

- **FATS AND FIXED OILS**, *Hydroxyl Value* (401)

Sample solution: 2 g in a glass-stoppered, 250-mL conical flask. Add 5.0 mL of a freshly prepared mixture of acetic anhydride and pyridine (1:3), and swirl to mix. Connect the flask to a reflux condenser, and heat on a steam bath for 2 h. Add 10 mL of water through the condenser, swirl to mix, heat on a steam bath for an additional 10 min, and allow to cool to room temperature. Add through the condenser 15 mL of normal butyl alcohol that has previously been neutralized to phenolphthalein, remove the condenser, wash the tip of the condenser and the sides of the flask with an additional 10 mL of neutralized normal butyl alcohol, and add 1 mL of phenolphthalein TS.

Analysis: Titrate with 0.5 N alcoholic potassium hydroxide VS to a faint pink endpoint. Perform a blank determination on a 5.0-mL portion of the acetic anhydride–pyridine mixture. To determine the amount of free acid in the Oil, weigh 10 g into a 250-mL conical flask, add 10 mL of pyridine that has previously been neutralized to phenolphthalein, swirl to mix, add 1 mL of phenolphthalein TS, and titrate with 0.5 N alcoholic potassium hydroxide VS to a faint pink endpoint.

Calculate the hydroxyl value taken:

$$\text{Result} = M_r \times N \times [A + (B \times W/D) - C]/W$$

M_r = molecular weight of potassium hydroxide, 56.1

N = normality of the alcoholic potassium hydroxide solution

A = volume of 0.5 N alcoholic potassium hydroxide consumed by the blank (mL)

B = volume consumed in the free-acid titration (mL)

W = weight of Oil taken (g)

D = weight of Oil used in the free-acid titration (g)

C = volume consumed in the sample titration (mL)

Acceptance criteria: 154–162

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, and avoid exposure to excessive heat.

Cellaburate

Cellulose, acetate butanoate;
Cellulose, acetate butyrate;
Acetylbutyrylcellulose;
Cellulose butyrate acetate;
Cellulose acetate butyrate [9004-36-8].

DEFINITION

Cellaburate is a reaction product of cellulose, acetic anhydride or acetic acid, and butyric acid or butyric anhydride. It contains NLT 1.0% and NMT 41.0% of acetyl (C₂H₃O) groups, by weight, and NLT 5.0% and NMT 56.0% of butyryl (C₄H₇O) groups, by weight, calculated on the previously dried, acid-free basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197F)

Sample solution: Dissolve 150 mg in 1 mL of acetone. Evenly cast 1 drop of the solution on a sodium chloride plate. Heat the plate at 105° for 10 min.

Acceptance criteria: Meets the requirements

ASSAY

- **ACETYL AND BUTYRYL CONTENT**

Internal standard solution: 4.6 mg/mL of isovaleric acid in pyridine. Store it in a tightly closed container.

Saponification solution: Place 250 mL of *n*-propyl alcohol in a 500-mL volumetric flask, add 65.5 g of potassium hydroxide, and mix to dissolve. Dilute with *n*-propyl alcohol to volume, and mix.

Acid solution: Place 250 mL of *n*-propyl alcohol in a 500-mL volumetric flask, add 166 mL of hydrochloric acid, and mix. Dilute with *n*-propyl alcohol to volume, and mix.

Standard solution: Transfer 0.20 g of glacial acetic acid and 0.31 g of butyric acid to a 50-mL volumetric flask. Dilute with *Internal standard solution* to volume, and mix.

Sample solution: Transfer 0.15 g of Cellaburate, previously dried at 105° for 1 h, into a 25-mm × 160-mm test tube. Pipet 10 mL of *Internal standard solution* into the test tube, and dissolve by stirring and heating at 110° for 30 min. While stirring, add 5 mL of *Saponification solution* slowly into the tube. Heat at 110° for 10 min. Cool, and add 5 mL of the *Acid solution*. Mix on a vortex mixer, and allow the precipitate to settle.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: GC

Cellacefate

Portions of the monograph text that are national *USP* text, and are not part of the harmonized text, are marked with symbols (♦) to specify this fact.Cellulose, acetate, 1,2-benzenedicarboxylate;
Cellulose acetate phthalate [9004-38-0].**DEFINITION**Cellacefate is a reaction product of phthalic anhydride and a partial acetate ester of cellulose. It contains NLT 21.5% and NMT 26.0% of acetyl (C_2H_3O) groups and NLT 30.0% and NMT 36.0% of phthalyl (o-carboxybenzoyl) ($C_8H_5O_3$) groups, calculated on the anhydrous, acid-free basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K): Do not dry specimens.

ASSAY• **PHTHALYL CONTENT**

Sample solution: Transfer 1 g to a conical flask, dissolve in 50 mL of a mixture of alcohol and acetone (3:2), and add phenolphthalein TS.

Analysis: Titrate the *Sample solution* with 0.1 N sodium hydroxide VS. Perform a blank determination, and make any necessary correction (see *Titrimetry* (541)).

Calculate the percentage of phthalyl on the acid-free basis:

$$\text{Result} = \{[(1.491 \times A/W) - (1.795 \times B)] / (100 - B)\} \times 100$$

A = volume of 0.1 N sodium hydroxide consumed, corrected for the blank (mL)

W = weight of Cellacefate taken, calculated on the anhydrous basis (g)

B = percentage of acid found in the test for *Limit of Free Acid*

Acceptance criteria: 30.0%–36.0% of phthalyl ($\text{C}_8\text{H}_5\text{O}_3$) on the anhydrous, acid-free basis

• **CONTENT OF ACETYL**

Sample solution: Transfer 100 mg to a glass-stoppered flask, and add 25.0 mL of 0.1 N sodium hydroxide VS. Connect the flask to a reflux condenser, and reflux for 30 min. Cool, and add phenolphthalein TS.

Analysis: Titrate the *Sample solution* with 0.1 N hydrochloric acid VS. Perform a blank determination (see *Titrimetry* (541)).

Calculate the free and combined acids as acetyl:

$$\text{Result} = 0.4305 \times (A/W)$$

A = volume of 0.1 N sodium hydroxide consumed, corrected for the blank (mL)

W = weight of Cellacefate taken, calculated on the anhydrous basis (g)

Calculate the percentage of acetyl on the acid-free basis:

$$\text{Result} = \{[(P - 0.5182 \times B) / (100 - B)] - (0.5772 \times C)\} \times 100$$

P = free and combined acids, as acetyl

B = percentage of acid found in the test for *Limit of Free Acid*

C = percentage of phthalyl found in the test for *Phthalyl Content*

Acceptance criteria: 21.5%–26.0% of acetyl ($\text{C}_2\text{H}_3\text{O}$) on the anhydrous, acid-free basis

IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.1%
- **HEAVY METALS**, *Method II* (231): NMT 10 µg/g
- **LIMIT OF FREE ACID**

Sample solution: Transfer 3.0 g to a glass-stoppered flask, add 100 mL of dilute methanol (1 in 2), insert the stopper in the flask, and shake for 2 h. Filter, and wash the flask and the filter with two 10-mL portions of the methanol solution, adding the washings to the filtrate.

Analysis: Titrate the combined filtrate and washings from the *Sample solution* with 0.1 N sodium hydroxide VS to a phenolphthalein endpoint. Perform a blank determination on 120 mL of the dilute methanol (1 in 2) (see *Titrimetry* (541)).

Calculate the percentage of free acid, B:

$$\text{Result} = 0.8306 \times A/W$$

A = volume of 0.1 N sodium hydroxide consumed, corrected for the blank (mL)

W = weight of Cellacefate taken, calculated on the anhydrous basis (g)

Acceptance criteria: NMT 3.0%, calculated as phthalic acid

SPECIFIC TESTS• **WATER DETERMINATION**, *Method I* (921)

Sample: 0.5 g

Analysis: Dissolve the *Sample* in a mixture of dehydrated alcohol and methylene chloride (3:2) instead of methanol as the solvent.

Acceptance criteria: NMT 5.0%

• **VISCOSITY—CAPILLARY VISCOMETER METHODS** (911)

Sample: 15 g, calculated on the anhydrous basis

Analysis: Dissolve the *Sample* in 85 g of a mixture of 249 parts of anhydrous acetone and 1 part of water, by weight.

Acceptance criteria: The apparent viscosity (see *Viscosity—Capillary Viscometer Methods* (911), *Method I*) is between 45 and 90 centipoises, determined at $25 \pm 0.2^\circ$.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **USP REFERENCE STANDARDS** (11)
USP Cellacefate RS.

Microcrystalline Cellulose

Cellulose [9004-34-6].

DEFINITION

Microcrystalline Cellulose is purified, partially depolymerized cellulose prepared by treating alpha cellulose, obtained as a pulp from fibrous plant material, with mineral acids.

IDENTIFICATION• **A. PROCEDURE**

Iodinated zinc chloride solution: Dissolve 20 g of zinc chloride and 6.5 g of potassium iodide in 10.5 mL of water. Add 0.5 g of iodine, and shake for 15 min.

Sample: 10 mg

Analysis: Place the *Sample* on a watch glass, and disperse in 2 mL of *Iodinated zinc chloride solution*.

Acceptance criteria: The substance takes on a violet-blue color.

• **B. PROCEDURE**

Sample: 1.3 g of Microcrystalline Cellulose, accurately weighed to 0.1 mg

Analysis: Transfer the *Sample* to a 125-mL conical flask. Add 25.0 mL of water and 25.0 mL of 1.0 M cupriethylenediamine hydroxide solution. Immediately purge the solution with nitrogen, insert the stopper, and shake on a wrist-action shaker, or other suitable mechanical shaker, until completely dissolved. Transfer an appropriate volume of the *Sample solution* to a calibrated number 150 Cannon-Fenske, or equivalent, viscometer. Allow the solution to equilibrate at $25 \pm 0.1^\circ$ for NLT 5 min. Time the flow between the two marks on the viscometer, and record the flow time, t_1 , in s.

Calculate the kinematic viscosity, $(KV)_1$, of the Microcrystalline Cellulose taken:

$$\text{Result} = t_1 \times k_1$$

t_1 = flow time (s)

k_1 = viscometer constant (see *Viscosity—Capillary Viscometer Methods* (911))

Obtain the flow time, t_2 , for 0.5 M cupriethylenediamine hydroxide solutions using a number 100 Cannon-Fenske, or equivalent, viscometer.

Calculate the kinematic viscosity, $(KV)_2$, of the solvent:

$$\text{Result} = t_2 \times k_2$$

t_2 = flow time for 0.5 M cupriethylenediamine hydroxide solutions (s)

k_2 = viscometer constant

Determine the relative viscosity, η_{rel} , of the Microcrystalline Cellulose specimen taken:

$$\text{Result} = (KV)_1 / (KV)_2$$

$(KV)_1$ = kinematic viscosity of the Microcrystalline Cellulose taken

$(KV)_2$ = kinematic viscosity of the solvent

Determine the intrinsic viscosity, $[\eta]_c$, by interpolation, using the *Intrinsic Viscosity Table* in the *Reference Tables* section.

Calculate the degree of polymerization, P:

$$\text{Result} = (95) \times [\eta]_c / W_s \times [(100 - \% \text{LOD}) / 100]$$

$[\eta]_c$ = intrinsic viscosity

W_s = weight of the Microcrystalline Cellulose taken (g)

$\% \text{LOD}$ = value obtained from the test for *Loss on Drying*

Acceptance criteria: The degree of polymerization is not greater than 350.

IMPURITIES

Inorganic Impurities

- **RESIDUE ON IGNITION** (281): NMT 0.1%
- **HEAVY METALS**, *Method II* (231): NMT 10 ppm

SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS** (61) and **TESTS FOR SPECIFIED MICROORGANISMS** (62): The total aerobic microbial count does not exceed 1000 cfu/g, and the total combined molds and yeasts count does not exceed 100 cfu/g. It meets the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa* and for the absence of *Escherichia coli* and *Salmonella species*.

- **CONDUCTIVITY**

Sample: 5 g

Analysis: Shake the *Sample* with 40 mL of water for 20 min, and centrifuge. Retain the supernatant for use in the pH test. Using an appropriate conductivity meter that has been standardized with a potassium chloride conductivity calibration standard having a conductivity of 100 $\mu\text{S}/\text{cm}$, measure the conductivity of the supernatant after a stable reading is obtained, and measure the conductivity of the water used to prepare the test specimen.

Acceptance criteria: The conductivity of the supernatant does not exceed the conductivity of the water by more than 75 $\mu\text{S}/\text{cm}$.

- **pH** (791): 5.0–7.5 in the supernatant obtained in the *Conductivity* test
- **LOSS ON DRYING** (731): Dry a sample at 105° for 3 h: it loses NMT 7.0% of its weight, or some other lower percentage, or is within a percentage range, as specified in the labeling.

- **BULK DENSITY**

Analysis: Use a volumeter that has been fitted with a 10-mesh screen. The volumeter is freestanding of the brass or stainless steel cup, which is calibrated to a capacity of 25.0 ± 0.05 mL and has an inside diameter of 30.0 ± 2.0 mm. Weigh the empty cup, position it under the chute, and slowly pour the powder from a height of 5.1 cm (2 in) above the funnel through the volumeter, at a rate suitable to prevent clogging, until the cup overflows. [NOTE—If excessive clogging of the screen occurs, remove the screen.] Level the excess powder, and weigh the filled cup. Calculate the bulk density by dividing the weight of the powder in the cup by the volume of the cup.

Acceptance criteria: The bulk density is within the labeled specification.

- **PARTICLE SIZE DISTRIBUTION**

[NOTE—In cases where there are no functionality-related concerns regarding the particle size distribution of the article, this test may be omitted.]

Where the labeling states the particle size distribution, determine the particle size distribution as directed in *Particle Size Distribution Estimation by Analytical Sieving* (786), or by a suitable validated procedure.

- **WATER-SOLUBLE SUBSTANCES**

Sample: 5.0 g

Analysis: Shake the *Sample* with 80 mL of water for 10 min, and pass with the aid of a vacuum through filter paper (Whatman No. 42 or equivalent) into a vacuum flask. Transfer the filtrate to a tared beaker, evaporate to dryness without charring, dry at 105° for 1 h, cool in a desiccator, and weigh.

Acceptance criteria: The difference between the weight of the residue and the weight obtained from a blank determination does not exceed 12.5 mg (0.25%).

- **ETHER-SOLUBLE SUBSTANCES**

Sample: 10.0 g

Analysis: Place the *Sample* in a chromatographic column having an internal diameter of about 20 mm, and pass 50 mL of peroxide-free ether through the column. Evaporate the eluate to dryness in a previously dried and tared evaporating dish with the aid of a current of air in a fume hood. After all the ether has evaporated, dry the residue at 105° for 30 min, cool in a desiccator, and weigh.

Acceptance criteria: The difference between the weight of the residue and the weight obtained from a blank determination does not exceed 5.0 mg (0.05%).

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **LABELING:** The labeling indicates the nominal loss on drying, bulk density, and degree of polymerization values. Degree of polymerization compliance is determined using *Identification* test B. Where the particle size distribution is stated in the labeling, proceed as directed in the test for *Particle Size Distribution*. The labeling indicates with which technique the particle size distribution was determined if a technique other than analytical sieving was used; and the labeling indicates the d_{10} , d_{50} , and d_{90} values and the range for each.

Microcrystalline Cellulose and Carboxymethylcellulose Sodium

DEFINITION

Microcrystalline Cellulose and Carboxymethylcellulose Sodium is a colloid-forming, attrited mixture of Microcrystalline Cellulose and Carboxymethylcellulose Sodium. It contains NLT 75.0% and NMT 125.0% of the labeled amount of carboxymethylcellulose sodium, calculated on the dried basis. The viscosity of its aqueous dispersion of percent by weight stated on the label is NLT 60.0% and NMT 140.0% of that stated on the label in centipoises.

IDENTIFICATION

- **A.**

Sample: 6 g

Analysis: Mix the *Sample* with 300 mL of water in a blender at 18,000 rpm for 5 min.

Acceptance criteria: A white, opaque dispersion is produced that does not settle on standing.
- **B.**

Sample: The dispersion obtained in *Identification* test A

Analysis: Add several drops of the *Sample* to a solution of aluminum chloride (100 mg/mL).

Acceptance criteria: Each drop forms a white, opaque globule that does not disperse on standing.

- **C.**
Sample: The dispersion obtained in *Identification* test A
Analysis: Add 3 mL of iodine TS to the *Sample*.
Acceptance criteria: No blue or purplish-blue color is produced.

ASSAY

• CARBOXYMETHYLCELLULOSE SODIUM

Sample solution: Transfer 2000 mg of Microcrystalline Cellulose and Carboxymethylcellulose Sodium to a glass-stoppered, 250-mL conical flask. Add 75 mL of glacial acetic acid, attach a condenser, and reflux for 2 h. Cool, and transfer the mixture to a 250-mL beaker with the aid of small volumes of glacial acetic acid.

Titrimetric conditions

Mode: Direct titration

Titrant: 0.1 N perchloric acid in dioxane VS

Endpoint detection: Potentiometry

Analysis: Titrate the *Sample solution* and calculate the percentage of carboxymethylcellulose sodium in the sample taken:

$$\text{Result} = [(V_S \times N \times F)/W] \times 100$$

V_S = Titrant volume consumed by the *Sample* (mL)

N = actual normality of the *Titrant* (mEq/mL)

F = equivalency factor, 296.0 mg/mEq

W = *Sample* weight (mg)

Acceptance criteria: 75.0%–125.0% on the dried basis

IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 5.0%
- **HEAVY METALS**, *Method II* (231): NMT 10 µg/g

SPECIFIC TESTS

• ROTATIONAL RHEOMETER METHODS (912)

Analysis: Determine the amounts of Microcrystalline Cellulose and Carboxymethylcellulose Sodium needed to prepare 600 g of a suitable dispersion, calculated on the dried basis. Transfer an amount of water to a 1000-mL blender bowl. Begin stirring with an 18,000 rpm blender at a reduced speed obtained by adjusting the voltage to 30 volts by means of a suitable transformer, and immediately add the accurately weighed portion of Microcrystalline Cellulose and Carboxymethylcellulose Sodium, taking care to avoid contacting the sides of the bowl with the powder. Continue stirring at this speed for 15 s following the addition of the powder, then increase the transformer setting to 115 volts, and mix for 2 min, accurately timed, at 18,000 rpm. Stop the blender, and lower the appropriate spindle of a suitable rotational viscometer into the dispersion. Thirty s after cessation of mixing, start the viscometer, and determine the viscosity using the appropriate spindle to obtain a scale reading between 10% and 90% of full-scale at a speed of 20 rpm. Determine the scale reading after 30 s of rotation, and calculate the viscosity, in centipoises, by multiplying the scale reading by the constant for the spindle used at 20 rpm.

Acceptance criteria: 60.0%–140.0% of that stated on the label, in centipoises

• PH (791)

Sample solution: The dispersion prepared in the test for *Viscosity*

Acceptance criteria: 6.0–8.0

• LOSS ON DRYING (731)

Analysis: Dry a sample at 105° to constant weight.

Acceptance criteria: NMT 8.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, store in a dry place, and avoid exposure to excessive heat.

- **LABELING:** Label it to indicate the percentage content of carboxymethylcellulose sodium and the viscosity of the dispersion in water of the designated weight percentage composition.

Silicified Microcrystalline Cellulose

DEFINITION

Silicified Microcrystalline Cellulose is composed of intimately associated microcrystalline cellulose and colloidal silicon dioxide particles, derived from aqueous coprocessing prior to drying the material during manufacture. The microcrystalline cellulose component is purified, partially depolymerized cellulose, prepared by treating alpha cellulose, obtained as a pulp from fibrous plant material, with mineral acids. The colloidal silicon dioxide is a submicroscopic fumed silica prepared by the vapor-phase hydrolysis of a silicon compound. The *Residue on Ignition* result indicates the percentage of colloidal silicon dioxide; the remainder is microcrystalline cellulose.

IDENTIFICATION

• A. INFRARED ABSORPTION (197K)

• B.

Sample: 10 mg

Iodinated zinc chloride solution: Dissolve 20 g of zinc chloride and 6.5 g of potassium iodide in 10.5 mL of water. Add 0.5 g of iodine, and shake for 15 min.

Analysis: Place the *Sample* on a watch glass, and disperse in 2 mL of *Iodinated zinc chloride solution*.

Acceptance criteria: The substance takes on a violet-blue color.

• C.

Sample: 5 mg of residue from the test for *Residue on Ignition*

Analysis: Transfer the *Sample* to a platinum crucible, and mix with about 200 mg of anhydrous potassium carbonate. Ignite at a red heat over a burner for about 10 min, and cool. Dissolve the melt in 2 mL of freshly distilled water, warming if necessary, and slowly add 2 mL of ammonium molybdate TS to the solution.

Acceptance criteria: A deep yellow color is produced.

• D. SILICA DISPERSION UNIFORMITY TEST

Conditioned test substance: Pass Silicified Microcrystalline Cellulose through an 850-µm sieve, disperse it into a suitable scale blender,¹ and tumble/mix the test substance for a minimum of 20 min to condition the material in preparation.

Analysis: Assemble a sieve stack composed of the following nested sieves: 60-, 80-, 120-, 200-, 325-, and 400-US mesh, plus pan. Tare each sieve to the nearest 0.1 g. Weigh 200.0 g of the *Conditioned test substance*, and transfer to the top sieve. Agitate the sieve stack on a suitable sieve shaker for 20 min. Separate and record the weight of each sieve, including the *Conditioned test substance* fraction. Determine the *Conditioned test substance* fraction mass by difference. Analyze a test substance from each sieve fraction, using *Residue on Ignition* (281). Obtain the *Residue on Ignition* (ROI) value in percentage, P_i , for each sieve fraction, excluding any fraction weighing less than 0.5 g. Calculate the average percentage of ROI value, P_A , for P_i ($i = 1-6$). Calculate the variance for the sieve fraction, excluding the pan and any fraction weighing less than 0.5 g:

$$\text{Result} = \frac{\sum_{i=1}^n (P_i - P_A)^2}{(n - 1)}$$

¹ Planetary mixer, Turbula T2F mixer, or V-blender.

Acceptance criteria: NMT 0.02

IMPURITIES

SPECIFIC TESTS

- **RESIDUE ON IGNITION** (281): 1.8%–2.2%
- **MICROBIAL ENUMERATION TESTS** (61) and **TESTS FOR SPECIFIED MICROORGANISMS** (62): The total aerobic microbial count does not exceed 10^3 cfu/g, and the total combined molds and yeasts count does not exceed 10^2 cfu/g.
- **CONDUCTIVITY**
 Sample: 5 g
 Analysis: Shake the *Sample* with 40 mL of water for 20 min, and centrifuge. Retain the supernatant for use in the pH test. Using an appropriate conductivity meter that has been standardized with a potassium chloride conductivity calibration standard having a conductivity of 100 µS/cm, measure the conductivity of the supernatant after a stable reading is obtained, and measure the conductivity of the water used to prepare the test specimen.
 Acceptance criteria: The conductivity of the supernatant does not exceed the conductivity of the water by more than 75 µS/cm.
- **pH** (791): 5.0–7.5 for the supernatant obtained in the Conductivity test
- **LOSS ON DRYING** (731)
 Analysis: Dry at 105° for 3 h.
 Acceptance criteria: NMT 7.0%, within a percentage range, as specified in *Labeling*
- **DEGREE OF POLYMERIZATION**
 Sample: 1.3 g, weighed to 0.1 mg
 Analysis: Transfer the *Sample* to a 125-mL conical flask. Add 25.0 mL of water and 25.0 mL of 1.0 M cupriethylenediamine hydroxide solution. Immediately purge the solution with nitrogen, insert the stopper, and shake on a wrist action shaker or other suitable mechanical shaker until completely dissolved. Transfer an appropriate volume of the solution to a calibrated number 150 Cannon-Fenske, or equivalent, viscometer. Allow the solution to equilibrate at $25 \pm 0.1^\circ$ for NLT 5 min. Time the flow between the two marks on the viscometer. Calculate the kinematic viscosity of the *Sample* taken:

$$v_1 = t_1 \times k_1$$

t_1 = time of flow between the two marks on the viscometer (s)

k_1 = viscometer constant (see *Viscosity—Capillary Viscometer Methods* (911))

Obtain the flow time for a 0.5 M cupriethylenediamine hydroxide solution, using a number 100 Cannon-Fenske, or equivalent, viscometer.

Calculate the kinematic viscosity of the solvent:

$$v_2 = t_2 \times k_2$$

t_2 = time of flow for a 0.5 M cupriethylenediamine hydroxide solution (s)

k_2 = viscometer constant

Determine the relative viscosity of the Silicified Microcrystalline Cellulose taken:

$$\text{Result} = v_1/v_2$$

Calculate the degree of polymerization:

$$\text{Result} = 95 \times [\eta] / \{W_s \times [(100 - ROI)/100] \times [(100 - LOD)/100]\}$$

$[\eta]_c$ = value from interpolation of the relative viscosity, using the *Intrinsic Viscosity Table* in the *Reference Tables* section

W_s = weight of the sample taken (g)

ROI = value from the test for *Residue on Ignition* (%)

LOD = value from the test for *Loss on Drying* (%)

Acceptance criteria: NMT 350

BULK DENSITY

Sample: Silicified Microcrystalline Cellulose powder

Analysis: Use a volumeter that has been fitted with a 10-mesh screen. The volumeter is freestanding of the brass or stainless steel cup, which is calibrated to a capacity of 25.0 ± 0.05 mL and has an inside diameter of 30.0 ± 2.0 mm. Weigh the empty cup, position it under the chute, and slowly pour the powder from a height of 5.1 cm (2 inches) above the funnel through the volumeter, at a rate suitable to prevent clogging, until the cup overflows. [NOTE—If excessive clogging of the screen occurs, remove the screen.] Level the excess powder, and weigh the filled cup. Calculate the bulk density by dividing the weight of the powder in the cup by the volume of the cup.

Acceptance criteria: Within the labeled specification

- **PARTICLE SIZE DISTRIBUTION**: Where the labeling states the particle size distribution, determine the particle size distribution as directed in a suitable validated procedure.

WATER-SOLUBLE SUBSTANCES

Sample: 5.0 g

Analysis: Shake the *Sample* with 80 mL of water for 10 min, and filter with the aid of vacuum through filter paper (Whatman No. 42 or equivalent) into a vacuum flask. Transfer the filtrate to a tared beaker, evaporate to dryness without charring, dry at 105° for 1 h, cool in a desiccator, and weigh.

Acceptance criteria: NMT 0.25%; the difference between the weight of the residue and the weight obtained from a blank determination is NMT 12.5 mg.

ETHER-SOLUBLE SUBSTANCES

Sample: 10.0 g

Analysis: Place the *Sample* in a chromatographic column having an internal diameter of about 20 mm, and pass 50 mL of peroxide-free ether through the column. Evaporate the eluate to dryness in a previously dried and tared evaporating dish with the aid of a current of air in a fume hood. After all the ether has evaporated, dry the residue at 105° for 30 min, cool in a desiccator, and weigh.

Acceptance criteria: NMT 0.05%; the difference between the weight of the residue and the weight obtained from a blank determination is NMT 5.0 mg.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE**: Preserve in tight containers. No storage requirements specified.
- **LABELING**: Label it to indicate the nominal *Loss on Drying*, *Bulk Density*, and *Degree of Polymerization* values. Where the particle size distribution is stated in the labeling, proceed as directed in *Particle Size Distribution*. The labeling indicates the technique with which the particle size distribution was determined, if a technique other than analytical sieving was used. The labeling also indicates the d_{10} , d_{50} , and d_{90} values and the range for each.
- **USP REFERENCE STANDARDS** (11)
 USP Silicified Microcrystalline Cellulose RS

Cellulose, Oxidized—see *Oxidized Cellulose General Monographs*

Cellulose, Oxidized Regenerated—see *Oxidized Regenerated Cellulose General Monographs*

Powdered Cellulose

DEFINITION

Powdered Cellulose is purified, mechanically disintegrated cellulose prepared by processing alpha cellulose obtained as a pulp from fibrous plant materials.

IDENTIFICATION

A. PROCEDURE

Iodinated zinc chloride solution: Dissolve 20 g of zinc chloride and 6.5 g of potassium iodide in 10.5 mL of water. Add 0.5 g of iodine, and shake for 15 min.

Sample: 10 mg

Analysis: Place the *Sample* on a watch glass, and disperse in 2 mL of *Iodinated zinc chloride solution*.

Acceptance criteria: The substance takes on a violet-blue color.

B. PROCEDURE

Sample: 0.25 g of Powdered Cellulose, accurately weighed to 0.1 mg

Analysis: Transfer the *Sample* to a 125-mL conical flask. Add 25.0 mL of water and 25.0 mL of 1.0 M cupriethylenediamine hydroxide solution. Immediately purge the solution with nitrogen, insert the stopper, and shake on a wrist action shaker, or other suitable mechanical shaker, until completely dissolved. Transfer an appropriate volume of the solution to a calibrated number 150 Cannon-Fenske, or equivalent, viscometer. Allow the solution to equilibrate at $25 \pm 0.1^\circ$ for NLT 5 min. Time the flow between the two marks on the viscometer, and record the flow time, t_1 , in s.

Calculate the kinematic viscosity, $(KV)_1$, of the Powdered Cellulose taken:

$$\text{Result} = t_1 \times k_1$$

k_1 = viscometer constant (see *Viscosity—Capillary Viscometer Methods* (911))

Obtain the flow time, t_2 , for a 0.5 M cupriethylenediamine hydroxide solution using a number 100 Cannon-Fenske, or equivalent, viscometer.

Calculate the kinematic viscosity, $(KV)_2$, of the solvent:

$$\text{Result} = t_2 \times k_2$$

k_2 = viscometer constant

Determine the relative viscosity, η_{rel} , of the Powdered Cellulose specimen taken:

$$\text{Result} = (KV)_1 / (KV)_2$$

$(KV)_1$ = kinematic viscosity of the Powdered Cellulose

$(KV)_2$ = kinematic viscosity of the solvent

Determine the intrinsic viscosity, $[\eta]_c$, by interpolation, using the *Intrinsic Viscosity Table* in the *Reference Tables* section.

Calculate the degree of polymerization, P :

$$\text{Result} = 95 \times [\eta]_c / W_s \times [(100 - \% \text{LOD}) / 100]$$

W_s = weight of the Powdered Cellulose taken (g)

$\% \text{LOD}$ = value obtained from the test for *Loss on Drying*

Acceptance criteria: The degree of polymerization is greater than 440.

IMPURITIES

Inorganic Impurities

- **RESIDUE ON IGNITION** (281): NMT 0.3%, calculated on the dried basis
- **HEAVY METALS**, *Method II* (231): NMT 10 ppm

SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS** (61) and **TESTS FOR SPECIFIED MICROORGANISMS** (62): The total aerobic

microbial count does not exceed 1000 cfu/g, the total combined molds and yeasts count does not exceed 100 cfu/g, and it meets the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa* and for absence of *Escherichia coli* and *Salmonella* species.

- **pH** (791): The pH of the supernatant is 5.0–7.5. Mix 10 g with 90 mL of water, and allow to stand with occasional stirring for 1 h.
- **LOSS ON DRYING** (731): Dry a sample at 105° for 3 h: it loses NMT 6.5% of its weight.

WATER-SOLUBLE SUBSTANCES

Sample: 6.0 g

Analysis: Mix the *Sample* with 90 mL of recently boiled and cooled water, and allow to stand with occasional stirring for 10 min. Filter, with the aid of vacuum, discard the first 10 mL of the filtrate, and pass the filtrate through the same filter a second time, if necessary, to obtain a clear filtrate. Evaporate a 15.0-mL portion of the filtrate in a tared evaporating dish to dryness without charring, dry at 105° for 1 h, cool in a desiccator, and weigh.

Acceptance criteria: The difference between the weight of the residue and the weight obtained from a blank determination does not exceed 15.0 mg (1.5%).

ETHER-SOLUBLE SUBSTANCES

Sample: 10.0 g

Analysis: Place the *Sample* in a chromatography column having an internal diameter of about 20 mm, and pass 50 mL of peroxide-free ether through the column. Evaporate the eluate to dryness in a previously dried and tared evaporating dish with the aid of a current of air in a fume hood. After all the ether has evaporated, dry the residue at 105° for 30 min, cool in a desiccator, and weigh.

Acceptance criteria: The difference between the weight of the residue and the weight obtained from a blank determination does not exceed 15.0 mg (0.15%).

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **LABELING:** The labeling indicates the nominal degree of polymerization value. Degree of polymerization compliance is determined using *Identification test B*.

Cellulose Acetate

Cellulose acetate

Cellulose, diacetate [9035-69-2].

Cellulose, triacetate [9012-09-3].

DEFINITION

Cellulose Acetate is partially or completely acetylated cellulose. It contains NLT 29.0% and NMT 44.8%, by weight, of acetyl (C_2H_3O) groups, calculated on the dried basis. Its acetyl content is NLT 90.0% and NMT 110.0% of that indicated on the label.

IDENTIFICATION

• INFRARED ABSORPTION

Sample solution: Prepare a solution (1 in 10) of Cellulose Acetate, previously dried, in dioxane.

Analysis: Spread 1 drop of the *Sample solution* on a sodium chloride plate, place a second sodium chloride plate over it, and spread the specimen between the plates. Separate the plates, heat them both at 105° for 1 h, and reassemble the dried plates.

Acceptance criteria: The IR absorption spectrum exhibits maxima only at the same wavelengths as that of a similar preparation of USP Cellulose Acetate RS, treated in the same manner.

ASSAY**• CONTENT OF ACETYL**

For Cellulose Acetate labeled to contain NMT 42.0% of acetyl groups

Sample: 2 g of Cellulose Acetate

Titrimetric system

(See *Titrimetry* <541>.)

Mode: Residual titration

Titrant: 1.0 N sodium hydroxide VS

Back-titrant: 1.0 N sulfuric acid VS

Endpoint detection: Colorimetric

Analysis

Transfer the *Sample* to a 500-mL flask. Add 100 mL of acetone and 5–10 mL of water to the flask, insert the stopper into the flask, and stir with a magnetic stirrer until solution is complete. Add 30 mL of *Titrant* to the solution, with constant stirring. A finely divided precipitate of regenerated cellulose, free from lumps, is obtained. Insert the stopper into the flask, and stir with a magnetic stirrer for 30 min. Add 100 mL of water that has been preheated to 80°, washing down the sides of the flask, stir for 2 min, and cool to room temperature. Titrate the excess sodium hydroxide solution with *Back-titrant* to a phenolphthalein endpoint. Treat a blank in the same manner.

Calculate the percentage of acetyl in the portion of Cellulose Acetate taken:

$$\text{Result} = 4.305 \times (B - A)/W$$

B = volume of the *Back-titrant* consumed by the blank (mL)

A = volume of the *Back-titrant* consumed by Cellulose Acetate (mL)

W = weight of Cellulose Acetate taken, calculated on the dried basis (g)

Acceptance criteria: 29.0%–44.8%, by weight, of acetyl ($\text{C}_2\text{H}_3\text{O}$) groups, on the dried basis

For Cellulose Acetate labeled to contain more than 42.0% of acetyl groups

Sample: 2 g of Cellulose Acetate

Titrimetric system

(See *Titrimetry* <541>.)

Mode: Residual titration

Titrant: 0.5 N hydrochloric acid VS

Back-titrant: 0.5 N sodium hydroxide VS

Endpoint detection: Colorimetric

Analysis: Transfer the *Sample* to a 500-mL conical flask. Add 30.0 mL of dimethyl sulfoxide and 100 mL of acetone, and stir for 16 h with the aid of a magnetic stirrer. Pipet 30 mL of 1 N sodium hydroxide VS slowly into the flask, with constant stirring. Insert the stopper into the flask, and stir for 6 min. Allow to stand without stirring for 60 min. Resume stirring, and add 100 mL of water that has been preheated to 80°, washing down the sides of the flask. Stir for 2 min, and cool to room temperature. Add 4–5 drops of phenolphthalein TS, and titrate the excess sodium hydroxide solution with *Titrant*. Add an excess of 0.5 mL of *Titrant*. Stir for 5 min. Allow to stand for 30 min. Titrate with *Back-titrant* to a persistent pink endpoint, using a magnetic stirrer for agitation. Calculate the net number of milliequivalents of sodium hydroxide consumed, and correct this value by use of the average of two blank determinations run concomitantly through the entire procedure. Calculate the percentage of acetyl in the portion of Cellulose Acetate taken:

$$\text{Result} = 4.305 \times n/W$$

n = corrected value of the net number of milliequivalents of sodium hydroxide consumed

W = weight of Cellulose Acetate taken, calculated on the dried basis (g)

Acceptance criteria: 29.0%–44.8%, by weight, of acetyl ($\text{C}_2\text{H}_3\text{O}$) groups, on the dried basis

IMPURITIES**Inorganic Impurities**

• **RESIDUE ON IGNITION** <281>: NMT 0.1%

• **HEAVY METALS**, *Method II* <231>: NMT 10 ppm

Organic Impurities**• PROCEDURE: LIMIT OF FREE ACID**

Sample: 5 g

Titrimetric system

(See *Titrimetry* <541>.)

Mode: Direct titration

Titrant: 0.01 N sodium hydroxide VS

Endpoint detection: Colorimetric

Analysis: Transfer the *Sample* to a 250-mL flask. Add 150 mL of freshly boiled, cooled water, insert the stopper into the flask, swirl the suspension gently, and allow it to stand for 3 h. Filter through paper, and wash the flask and the filter with water, adding these washings to the filtrate. Add phenolphthalein TS, and titrate the combined filtrate and washings with the *Titrant*.

Calculate the percentage of free acid in the portion of Cellulose Acetate taken:

$$\text{Result} = 0.06005 \times A/W$$

A = volume of *Titrant* consumed (mL)

W = weight of the Cellulose Acetate taken, calculated on the dried basis (g)

Acceptance criteria: NMT 0.1%, calculated as acetic acid

SPECIFIC TESTS

• **LOSS ON DRYING** <731>: Dry a sample at 105° for 3 h: it loses NMT 5.0% of its weight.

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers.

• **LABELING:** The labeling states the nominal percentage content of acetyl.

• **USP REFERENCE STANDARDS** <11>

USP Cellulose Acetate RS

Cetostearyl Alcohol

DEFINITION

Cetostearyl Alcohol contains NLT 40.0% of stearyl alcohol ($\text{C}_{18}\text{H}_{38}\text{O}$), and the sum of the stearyl alcohol content and the cetyl alcohol ($\text{C}_{16}\text{H}_{34}\text{O}$) content is NLT 90.0%.

IDENTIFICATION

• **A.** The retention times of the major peaks of the *Sample solution* correspond to those of the *System suitability solution*, as obtained in the *Assay*.

ASSAY**• PROCEDURE**

System suitability solution: 5 mg/mL each of USP Cetyl Alcohol RS and USP Stearyl Alcohol RS, in alcohol

Sample solution: 10 mg/mL of Cetostearyl Alcohol, in dehydrated alcohol

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 3-mm × 2-m; 10% liquid phase G2, support S1A

Temperatures

Cetyl Esters Wax

DEFINITION

Cetyl Esters Wax is a mixture consisting primarily of esters of saturated fatty alcohols (C_{14} to C_{18}) and saturated fatty acids (C_{14} to C_{18}).

SPECIFIC TESTS

- **MELTING RANGE OR TEMPERATURE**, Class II (741): 43°–47°
- **FATS AND FIXED OILS**, Acid Value (401): NMT 5
- **FATS AND FIXED OILS**, Iodine Value (401): NMT 1
- **FATS AND FIXED OILS**, Saponification Value (401): 109–120
- **PARAFFIN AND FREE ACIDS**

Sample: 1 g

Analysis: Dissolve the Sample in 50 mL of boiling alcohol.

Acceptance criteria: The Sample dissolves completely, and the resulting solution is neutral or acidic to moistened litmus paper.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, in a dry place, and prevent exposure to excessive heat.

Cetyl Palmitate

$C_{32}H_{64}O_2$

Hexadecanoic acid hexadecyl ester;
Cetyl palmitate [540-10-3].

480.85

DEFINITION

Cetyl Palmitate consists of esters of cetyl alcohol and saturated high molecular weight fatty acids, principally palmitic acid.

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197F)
Sample: Use a thin film of melted test specimen.
Acceptance criteria: Meets the requirements
- **B.** The retention times of cetyl alcohol and palmitic acid from the Sample solution correspond to those from the System suitability solution, as obtained in the test for Content of Palmitic Acid.

ASSAY

- **CONTENT OF PALMITIC ACID**

System suitability solution: Transfer 20 mg each of cetyl alcohol, stearic acid, palmitic acid, and oleic acid

to a 25-mL conical flask fitted with a suitable water-cooled reflux condenser and a magnetic stir bar, and proceed as directed for Test solution in Fats and Fixed Oils, Fatty Acid Composition (401), beginning with "Add 5.0 mL of a solution prepared by dissolving".

Sample solution: Proceed as directed for Test solution in Fats and Fixed Oils, Fatty Acid Composition (401).

Chromatographic system: Prepare as directed in Fats and Fixed Oils, Fatty Acid Composition (401).

Injection volume: 1 μ L

System suitability

Sample: System suitability solution

[NOTE—The relative retention times for methyl palmitate, cetyl alcohol, methyl stearate, and methyl oleate are about 0.87, 0.96, 0.99, and 1.0, respectively.]

Suitability requirements

Resolution: NLT 1.5 between the methyl stearate and methyl oleate peaks

Relative standard deviation: NMT 6.0% for the palmitate and stearate peaks; NMT 2.0% for the ratio of the palmitate peak to the stearate peak

Analysis

Samples: System suitability solution and Sample solution
Identify the methyl palmitate peak of the Sample solution by comparing the retention times of the Sample solution peaks with those of the System suitability solution peaks.

Calculate the percentage of palmitic acid in the portion of Cetyl Palmitate taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = peak area of methyl palmitate

r_T = sum of all the peak areas, excluding the solvent and cetyl alcohol peaks

Acceptance criteria: The palmitate peak is NLT 90% of the total area for all the peaks.

IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.05%
- **HEAVY METALS**, Method II (231): NMT 20 μ g/g

SPECIFIC TESTS

- **MELTING RANGE OR TEMPERATURE**, Class II (741): 46°–53°
- **FATS AND FIXED OILS**, Acid Value (401): NMT 1
- **FATS AND FIXED OILS**, Hydroxyl Value (401): NMT 6
- **FATS AND FIXED OILS**, Iodine Value (401): NMT 1
- **FATS AND FIXED OILS**, Saponification Value (401): 110–130
- **LOSS ON DRYING** (731)

Analysis: Dry at 105° for 1 h.

Acceptance criteria: NMT 3.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers at controlled room temperature, and avoid exposure to excessive heat.
- **USP REFERENCE STANDARDS** (11)

Charcoal General Monographs

Cherry Juice

DEFINITION

Cherry Juice is the liquid expressed from the fresh ripe fruit of *Prunus cerasus* L. (Fam. Rosaceae). It contains NLT 1.0% malic acid ($C_4H_6O_5$).

Coarsely crush washed, stemmed, unpitted, sour cherries in a grinder to break the pits but not mash the kernels. Dissolve 0.1% Benzoic Acid in the mixture, and allow to stand at room temperature until a small portion of the filtered Juice, when mixed with one-half of its volume of alcohol, does not become cloudy within 30 min. Press the Juice from the mixture, and filter it.

IDENTIFICATION

• A.

Sample: 5 mL

Analysis: Add lead acetate TS to the *Sample* until the mixture, when filtered, gives no further precipitation with the lead acetate solution. Filter, and to the clear filtrate add 5 mL of a 100-mg/mL sodium oxalate solution to remove the excess lead. Filter, add 5 mL of alkaline cupric tartrate TS to 5 mL of the clear filtrate, and warm.

Acceptance criteria: A red precipitate is formed.

OTHER COMPONENTS

• MALIC ACID

Solution A: 6 N ammonium hydroxide and water (2:98)

Sample: 10.0 mL

Titrimetric system

(See *Titrimetry* (541).)

Mode: Direct titration

Titrant: 0.1 N potassium permanganate VS

Endpoint detection: Visual

Analysis: Place the *Sample* in a 125-mL flask, and add 1 g of calcium carbonate. Heat on a steam bath for 15 min, mixing occasionally, and pass through a filter. Wash the filter with five 5-mL portions of water, and to the combined filtrate and washings add 1 mL of 6 N ammonium hydroxide and 15 mL of ammonium oxalate TS. Heat on a steam bath for 15 min, pass through hardened filter paper, and wash the flask and the filter with five 5-mL portions of *Solution A*. Puncture the filter paper, and wash the precipitate into the same flask by means of hot water, followed by 30 mL of 12 N sulfuric acid. Heat the solution to 80°. Titrate with *Titrant*. Each mL of *Titrant* is equivalent to 6.704 mg of malic acid ($C_4H_6O_5$).

Acceptance criteria: NLT 1.0%

IMPURITIES

• RESIDUE ON IGNITION (281): 0.35%–0.55%

• ARSENIC, Method I (211)

Sample solution: To 10 mL in a Kjeldahl flask add 5 mL of nitric acid and 5 mL of sulfuric acid, and heat the mixture until the volume is reduced to 5 mL and the color becomes brownish or black. Add a small portion of nitric acid, and continue the heating, adding small portions of nitric acid as often as browning recurs, until the organic matter is destroyed and dense, white fumes are liberated. Dilute the solution with about 10 mL of water, add 200 mg of ammonium oxalate, and continue the heating until dense, white fumes again are evolved and the solution is colorless to pale yellow. Cool, cautiously add water to make 20 mL, and mix.

Acceptance criteria: NMT 0.3 µg/g

• LEAD (251)

Test preparation: Add 1.0 mL of Juice to 10 mL of nitric acid in a 250-mL conical flask, and boil for 5–10

min. Cool in an ice bath, and transfer to a separator with the aid of 5 mL of lead-free water.

Analysis: Proceed as directed in the chapter, except use 15 mL of *Ammonium Citrate Solution*, 500 µL of *Hydroxylamine Hydrochloride Solution*, and 3 mL of *Potassium Cyanide Solution*.

Acceptance criteria: NMT 5 µg/mL

SPECIFIC TESTS

• SPECIFIC GRAVITY (841): 1.045–1.075

• REFRACTIVE INDEX (831): NLT 1.350

• PH (791): 3.0–4.0

• LIMIT OF NONVOLATILE RESIDUE

Sample: 5.0 mL

Analysis: Evenly spread the *Sample* over the bottom of a tared half Petri dish, and place on a steam bath for 1 h. Dry in a vacuum desiccator over silica gel for 16 h.

Acceptance criteria: The weight of the residue is NLT 500 mg. NMT 9.5% is found.

• LIMIT OF VOLATILE ACIDS

Sample: 25 mL

Analysis: Distill the *Sample* with steam to obtain 100 mL of distillate. Add phenolphthalein TS, and titrate with 0.10 N sodium hydroxide.

Acceptance criteria: NMT 1.5 mL is required.

ADDITIONAL REQUIREMENTS

• PACKAGING AND STORAGE:

Package in tight, light-resistant containers, and prevent exposure to excessive heat.

• LABELING:

The label states the Latin binomial name and, following the official name, the part of the plant source from which the article was derived.

Cherry Syrup

DEFINITION

Prepare Cherry Syrup as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* (795)).

Cherry Juice	475 mL
Sucrose	800 g
Alcohol	20 mL
Purified Water, a sufficient quantity to make	1000 mL

Dissolve *Sucrose* in *Cherry Juice* by gently heating on a steam bath, cool, and remove the foam and floating solids. Add *Alcohol* and sufficient *Purified Water* to make 1000 mL, and mix.

OTHER COMPONENTS

• ALCOHOL DETERMINATION, Method I (611): 1.0%–2.0%

ADDITIONAL REQUIREMENTS

• PACKAGING AND STORAGE:

Package in tight, light-resistant containers, and prevent exposure to excessive heat.

• LABELING:

The label states the Latin binomial name and, following the official name, the part of the plant source from which the article was derived.

Chitosan

Poly- β -(1,4)-2-amino-2-deoxy-D-glucose [9012-76-4].

DEFINITION

Chitosan is an unbranched binary polysaccharide consisting of *N*-acetyl-D-glucosamine and D-glucosamine units linked in a β (1 \rightarrow 4) manner. Chitosan is obtained by partial deacetylation of chitin, which is extracted from the shells of edible shrimps and crabs suitable for human use. Its degree of deacetylation is NLT 70.0% and NMT 95.0%.

IDENTIFICATION

• A. INFRARED ABSORPTION (197A)

• B.

Sample: 0.2 g of Chitosan powder

Analysis: Add 80 g of water to the *Sample*, and stir briefly to obtain a dispersion. Separately prepare a glycolic acid solution by dissolving 0.1 g of glycolic acid in 20 g of water. Add the solution in one step to the dispersion. Stir the mixture gently at room temperature until it becomes a clear solution. [NOTE—It takes approximately 30–60 min to obtain a clear solution.] Add 5 g of a 0.5% sodium lauryl sulfate aqueous solution to the clear solution.

Acceptance criteria: A gelatinous mass is formed.

ASSAY

• DEGREE OF DEACETYLATION

[NOTE—If tetramethylsilane is not used as the NMR reference, a suitable signal of the solvent itself can be used as a reference.]

Solvent: Deuterated formic acid

NMR reference: Tetramethylsilane

Sample solution: Into a 20-mL scintillation vial with a screw cap, dissolve 5–10 mg of Chitosan in deuterated formic acid, containing 0.5%–1.0% of tetramethylsilane, to obtain 1 mL of solution. Tightly close the vial, and dissolve Chitosan using a magnetic stirrer. To completely dissolve takes it about 48 h; the stirring is stopped when a clear solution with a high viscosity is obtained. Break up any clumps formed during the dissolution process with a spatula, if necessary.

Analysis

Sample: *Sample solution*

Transfer 0.5–1.0 mL of the *Sample solution* to a standard 5-mm NMR spinning tube. Proceed as directed in *Nuclear Magnetic Resonance* (761), *Relative Method of Quantitation*, scanning the region from 0–7 ppm, and using the calculation formulas below. Record as A_1 the average area of the composite band from about 6–3 ppm, representing the seven protons with oxygen neighbors in the sugar ring. Record as A_2 the average area of the signals at about 2 ppm, due to the methyl groups of the acetyl units, with reference to the tetramethylsilane singlet at 0 ppm.

Calculate the percentage of deacetylation degree, by weight, in the Chitosan taken:

$$\text{Result} = \{1 - [(7 \times A_2)/(3 \times A_1)]\} \times 100$$

Acceptance criteria: The degree of deacetylation is NLT 70.0% and NMT 95.0%.

IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 1.0%
- **HEAVY METALS**, *Method III* (231): NMT 10 ppm
- **LIMIT OF LEAD, MERCURY, CHROMIUM, NICKEL, CADMIUM, AND ARSENIC**

65% Nitric acid: Use ultratrace nitric acid, 65%–70% HNO_3 , ACS reagent grade.

Internal standard: Transfer 0.2 mL of a solution containing 1000 ppm of yttrium [NOTE—Yttrium ICP standard solutions are commercially available.¹] and 0.2 mL of a solution containing 1000 ppm of lutetium [NOTE—Lutetium ICP standard solutions are commercially available.²] to a 100-mL volumetric flask, add 1 mL of 65% *Nitric acid*, dilute with water to volume, and mix.

Blank standard: Transfer 1.0 mL of the *Internal standard* to a 100-mL volumetric flask, add 1 mL of 65% *Nitric acid*, dilute with water to volume, and mix.

Standard solutions: Transfer 0.1 mL of a solution containing 10 ppm of each of lead, mercury, chromium, nickel, cadmium, and arsenic [NOTE—Multi-element ICP standard solutions are commercially available.³] to a 100-mL volumetric flask, add 1 mL of the *Internal standard* and 1 mL of 65% *Nitric acid*, and dilute with water to volume (*Standard solution* 0.01 ppm). Transfer 0.1 mL of a solution containing 10 ppm of each of lead, mercury, chromium, nickel, cadmium, and arsenic to a 1000-mL volumetric flask, add 10 mL of the *Internal standard* and 10 mL of 65% *Nitric acid*, and dilute with water to volume (*Standard solution* 0.001 ppm).

Sample solution: Transfer 1.0 g of Chitosan to a clean, dry, 100-mL Kjeldahl flask. [NOTE—A 300-mL flask may be used if the reaction foams excessively.] Clamp the flask at an angle of 45°, and add a sufficient quantity of a mixture of 8 mL of sulfuric acid and 10 mL of nitric acid to moisten the substance thoroughly. Warm gently until the reaction commences, allow the reaction to subside, and add portions of the same acid mixture, heating after each addition, until a total of 18 mL of the acid mixture has been added. Increase the amount of heat, and boil gently until the solution darkens. Cool, add 2 mL of nitric acid, and heat again until the solution darkens. Continue the heating, followed by addition of nitric acid until no further darkening occurs, then heat strongly to the production of dense, white fumes. Cool, cautiously add 5 mL of water, boil gently to the production of dense, white fumes, and continue heating until the volume is reduced to a few mL. Cool, cautiously add 5 mL of water, and examine the color of the solution. If the color is yellow, cautiously add 1 mL of 30% hydrogen peroxide, and again evaporate to the production of dense, white fumes and a volume of 2–3 mL. If the solution is still yellow, repeat the addition of 5 mL of water and the peroxide treatment. Cool, dilute cautiously with a few mL of water, rinse into a 20-mL volumetric flask, and dilute with water to volume. Transfer 5.0 mL of digestion solution to a 100-mL volumetric flask, and retain the remaining digestion solution for use in the *Limit of Iron*. Add 1 mL of the *Internal standard* to the 100-mL volumetric flask, dilute with water to volume, and mix.

Blank solution: Prepare the blank digestion solution, following the preparation procedure for the *Sample solution*, but without using Chitosan. Transfer 5.0 mL of blank digestion solution to a 100-mL volumetric flask, and retain the remaining digestion solution for use in the *Limit of Iron*. Add 1 mL of the *Internal standard* to

¹ A suitable yttrium ICP standard is available from LGC Promochem (www.lgcpromochem.com) or from Merck KGaA, Frankfurter Str. 250, 64293 Darmstadt, Germany.

² A suitable lutetium ICP standard is available from LGC Promochem (www.lgcpromochem.com) or from Merck KGaA, Frankfurter Str. 250, 64293 Darmstadt, Germany.

³ Suitable multi-element ICP standard solutions are available from LGC Promochem (www.lgcpromochem.com) or from Merck KGaA, Frankfurter Str. 250, 64293 Darmstadt, Germany.

the 100-mL volumetric flask, dilute with water to volume, and mix.

Instrumental conditions

(See *Plasma Spectrochemistry* <730>.)

Mode: Inductively coupled plasma–mass spectrometer (ICP–MS)

Spectrometer: Quadrupole mass spectrometer

Detector: Ion detector maintained under vacuum

Other requirements: The instrument should read all isotopes for the following elements shown in *Table 1*, for the yttrium internal standard (89 amu) and the lutetium internal standard (175 and 176 amu), and should report the total element contents using the most naturally abundant isotopes.

Table 1

Element	Isotope (amu)
Lead	208
	201
Mercury	202
Chromium	53
	58
Nickel	60
Cadmium	114
Arsenic	75

Analysis

Samples: *Blank standard, Standard solutions, Sample solution, and Blank solution*

Instrument performance must be verified to conform to the manufacturer's specifications for resolution and sensitivity. Before analyzing samples, the instrument must pass a suitable performance check. Perform the evaluation using instrument software such as correction equations for interferences and taking the *Internal standard* into account. Generate the calibration curve using the *Blank standard, Standard solution 0.001 ppm*, and *Standard solution 0.01 ppm*: the linear regression coefficient is NLT 0.999.

Aspirate the *Blank solution* and *Sample solution*, respectively, at least in duplicate, and report the average reading as each element content of the sample. Determine the concentration C_B , in $\mu\text{g/mL}$, of each element in the *Blank solution*, and also determine the concentration C_S , in $\mu\text{g/mL}$, of each element in the *Sample solution* using the calibration curve.

Calculate the quantity, in $\mu\text{g/g}$, of each element in the portion of Chitosan taken:

$$\text{Result} = [(C_S - C_B)/W] \times F \times V$$

F = dilution factor, 4

V = volume of the *Sample solution*, 100 mL

W = weight of the Chitosan taken to prepare the *Sample solution* (g)

Acceptance criteria: See *Table 2*.

Table 2

Element	Acceptance Criteria (ppm)
Lead	NMT 0.5
Mercury	NMT 0.2
Chromium	NMT 1.0
Nickel	NMT 1.0
Cadmium	NMT 0.2
Arsenic	NMT 0.5

• LIMIT OF IRON

65% Nitric acid: Use ultratrace nitric acid, 65%–70% HNO_3 , ACS reagent grade.

Blank standard: Prepared as directed in the *Limit of Lead, Mercury, Chromium, Nickel, Cadmium, and Arsenic*.

Standard stock solution 100 ppm: Immediately before use, dilute an appropriate amount of iron standard⁴ with a solution of 65% *Nitric acid* (1 in 100) to prepare an acidic solution containing the equivalent of 100 $\mu\text{g/mL}$ of iron.

Standard solutions: Separately transfer 0.1 and 0.5 mL of *Standard stock solution 100 ppm* to 100-mL volumetric flasks, dilute with a solution of 65% *Nitric acid* (1 in 100) to volume, and mix. These solutions contain, respectively, 0.1 and 0.5 μg of iron/mL (*Standard solution 0.1 ppm* and *Standard solution 0.5 ppm*).

Sample solution: Transfer 10.0 mL of the digestion solution from the test for *Limit of Lead, Mercury, Chromium, Nickel, Cadmium, and Arsenic* to a 100-mL volumetric flask, dilute with water to volume, and mix.

Blank solution: Transfer 10.0 mL of the blank digestion solution from the test for *Limit of Lead, Mercury, Chromium, Nickel, Cadmium, and Arsenic* to a 100-mL volumetric flask, dilute with water to volume, and mix.

Instrumental conditions

(See *Plasma Spectrochemistry* <730>.)

Mode: Inductively coupled plasma–atomic emission spectrometer (ICP–AES)

Analytical wavelength: 238.040 and 239.562 nm with the settings optimized as directed by the manufacturer

Analysis

Samples: *Blank standard, Standard solutions, Sample solution, and Blank solution*

Instrument performance must be verified to conform to the manufacturer's specifications for resolution and sensitivity. Before analyzing samples, the instrument must pass a suitable performance check. Generate the calibration curve using the *Blank standard, Standard solution 0.1 ppm*, and *Standard solution 0.5 ppm*: the linear regression coefficient is NLT 0.999.

Aspirate the *Blank solution* and *Sample solution*, respectively, at least in duplicate, and report the average reading as the iron content of the sample. Determine the concentration C_B , in $\mu\text{g/mL}$, of iron in the *Blank solution*, and also determine the concentration C_S , in $\mu\text{g/mL}$, of iron in the *Sample solution* using the calibration curve.

Calculate the quantity, in $\mu\text{g/g}$, of iron in the portion of Chitosan taken:

$$\text{Result} = [(C_S - C_B)/W] \times F \times V$$

F = dilution factor, 2

V = volume of the *Sample solution*, 100 mL

W = weight of the Chitosan taken to prepare the *Sample solution* (g)

Acceptance criteria: NMT 10 ppm of iron

• LIMIT OF PROTEIN CONTENT

Control solution A: 1.0 mg/mL of bovine serum albumin

Control solution B: 0.1 mg/mL of bovine serum albumin

Sample solution C: Dissolve 100 mg of Chitosan in 4 mL of 100% formic acid, mix, and stir for about 48 h at room temperature using a magnetic stirrer. This solution contains 25 mg/mL of Chitosan in 100% formic acid.

Sample solutions D, E, F: Dilute aliquots of the *Sample solution C* with water to obtain the following solutions with concentrations of 2.5 mg/mL of Chitosan in 10% formic acid, 0.5 mg/mL of Chitosan in 2% formic acid,

⁴ Suitable iron standards are available from LGC Promochem (www.lgcpromochem.com) (Single element standard for ICP, Iron 10,000 $\mu\text{g/mL}$ dilute nitric acid) or from Merck KGaA, Frankfurter Str. 250, 64293 Darmstadt, Germany (iron ICP standard, 10000 mg/L in 10% nitric acid).

and 0.25 mg/mL of Chitosan in 1% formic acid, respectively.

Molecular weight standard preparation G: Use a commercially available preparation of apparent molecular weight protein standards of 10,000–190,000 Da dissolved in the loading buffer consisting of 50 mM of tris(hydroxymethyl)aminomethane hydrochloride (pH 6.8), 5 mM of ethylenediaminetetraacetic acid, 10 mM of dithiothreitol [NOTE—A 2%–5% solution of beta-mercaptoethanol can be used to replace dithiothreitol.], 1% (w/v) sodium dodecyl sulfate, and 10% (w/v) glycerol.⁵ [NOTE—A protein ladder containing the following molecular weight standards in 10, 15, 20, 25, 40, 50, 60, 85, 120, and 190 kDa or other appropriate combinations can be used.]

Sample buffer: Transfer 666 mg of tris(hydroxymethyl)aminomethane hydrochloride, 682 mg of tris(hydroxymethyl)aminomethane, 800 mg of lithium dodecyl sulfate, 6 mg of ethylenediaminetetraacetic acid, 4 g of glycerol, 0.75 mL of 1% solution of Coomassie blue G250, and 0.25 mL of 1% solution of phenol red to a 10-mL volumetric flask, add 8 mL of water to the flask, and mix. If necessary, adjust with hydrochloric acid or sodium hydroxide to pH of 7.2. Dilute with water to volume. [NOTE—Store the buffer at 4°. It is stable for 6 months when stored at 4°.] An equivalent commercially available buffer can also be used.⁶

Running buffer: Prepare a solution containing 1 M of tris(hydroxymethyl)aminomethane, 1 M of 2-(4-morpholinyl) ethanesulfonic acid, 20.5 mM ethylenediaminetetraacetic acid, and 69.3 mM dodecyl sodium sulfate in water. If necessary, adjust with hydrochloric acid or sodium hydroxide to pH of 7.3. An equivalent commercially available appropriate SDS running buffer can be used.⁷

Fixing solution: A solution containing 40% ethanol and 10% acetic acid

Sensitizing solution: Transfer 10 mL of a solution mainly containing 10%–20% of 2-(4-morpholinyl) ethanesulfonic acid, 0.1%–1.0% of sodium hydroxide, and 7%–13% of *N,N*-dimethylformamide into a 100-mL volumetric flask, add 30 mL of alcohol, and dilute with water to volume. Alternatively, follow the instructions of a commercially available silver staining kit⁸ to prepare the *Sensitizing solution*, *Staining solution*, and *Developing solution*.

Staining solution: Transfer 1.0 mL of a solution mainly containing 10%–30% of silver nitrate into a 100-mL volumetric flask, and dilute with water to volume.

Developing solution: Transfer 10 mL of a solution mainly containing 10%–30% of sodium carbonate into a 100-mL volumetric flask, add 1 drop of a solution containing 30%–60% of formaldehyde, and dilute with water to volume.

Stopping solution: A solution containing 10%–30% of ethylenediaminetetraacetic acid and 10%–30% of tris(hydroxymethyl)-aminomethane. A *Stopping solution* is commercially available and included in a silver staining kit.

Analysis: Mix 75 µL each of *Sample solutions C, D, E, and F* with 25 µL of the *Sample buffer*, and incubate at 70° for 10 min. In a suitable device for polyacrylamide gel electrophoresis (see *Electrophoresis* (726) and *Biotechnology-Derived Articles—Polyacrylamide Gel Electrophoresis* (1056)) add appropriate volumes of the *Running buffer* in the upper and the lower buffer chambers. Attach a 4%–12% gradient Bis-Tris ready-

made polyacrylamide gel sandwiched between two glass plates, such that the wells for sample application are exposed to the *Running buffer* in the upper buffer chamber.

Separately apply equal volumes (about 20 µL) of each of the treated *Sample solutions C, D, E, and F*, *Control solution A*, and *Control solution B* onto separate lanes; apply equal volumes (about 10 µL) of the *Molecular weight standard preparation G* to both sides of the gel. [NOTE—Do not apply any solution in the outside lanes.] Connect the lower buffer chamber electrode to the positive terminal and the upper buffer chamber electrode to the negative terminal of a suitable power supply unit, and carry out the electrophoresis at a constant voltage of about 100 V for about 100 min.

Remove the gel from the gel assembly. [NOTE—Do not touch the gel with bare hands. Use gloves.]

Place the gel in a clean staining tray of appropriate size. Rinse the gel briefly with water. Fix the gel in 100 mL of *Fixing solution* for 20 min with gentle rotation.

[NOTE—The gel can be stored in the *Fixing solution* overnight.]

Decant the *Fixing solution*, and wash the gel in 30% ethanol for 10 min. Decant the ethanol, and add 100 mL of *Sensitizing solution* to the washed gel in the staining container. Incubate the gel in the *Sensitizing solution* for about 10 min. [NOTE—All incubations should be performed on a rotary shaker rotating at a speed of 1 revolution/s at room temperature.]

Decant the *Sensitizing solution*, and wash the gel in 100 mL of 30% ethanol for 10 min. Wash the gel in 100 mL of water for 10 min. Incubate the gel in 100 mL of *Staining solution* for 15 min. After staining is complete, decant the *Staining solution*, and wash the gel with 100 mL of water for 20–60 s. [NOTE—Washing the gel for more than 1 min will remove the silver ion from the gel resulting in decreased sensitivity.]

Incubate the gel in 100 mL of *Developing solution* for 4–8 min until bands start to appear and the desired band intensity is reached.

Once the appropriate staining intensity is achieved, immediately add 10 mL of *Stopping solution* directly to the gel still immersed in the *Developing solution*. Gently agitate the gel for 10 min. The color changes from pink to colorless indicating that the development has stopped.

Decant the colorless solution, and wash the gel with 100 mL of water for 10 min.

Use a gel imaging system, ideally with a CCD camera, to record the results.

Acceptance criteria: NMT 0.2% of protein

SPECIFIC TESTS

• BACTERIAL ENDOTOXINS TEST (85)

Sample stock solution: Transfer 0.5 g of Chitosan to a 50-mL volumetric flask, add LAL Reagent Water⁹ and 4.6 mL of 1 N hydrochloric acid, dilute with the LAL Reagent Water to volume, and mix well. Incubate this solution in a water bath at 40° for 48 h.

Sample solution: Dilute the *Sample stock solution* to 1:50 with LAL Reagent Water, including dilution 1:2 with a β -glucan blocker.¹⁰

Acceptance criteria: The level of bacterial endotoxins is such that the requirement under the relevant dosage form monograph(s) in which Chitosan is used can be met. Where the label states that Chitosan must be subjected to further processing during the preparation of wound dressing dosage forms, the level of bacterial endotoxins is such that the requirement under the

⁵ A suitable molecular weight standard preparation is available as BenchMark Prestained Protein Ladder from Invitrogen, product number: 10748010.

⁶ A suitable sample buffer is available as 4X NuPAGE LDS sample buffer from Invitrogen, product number: NP0007.

⁷ A suitable running buffer is available as NuPAGE MES SDS Running Buffer from Invitrogen, product number: NP0002.

⁸ A suitable silver staining kit is available as NuPAGE Silver Staining Kit from Invitrogen, product number: LC6070.

⁹ Use Sterile Water for Injection or other water that shows no reaction with the specific LAL Reagent with which it is to be used, at the limit of sensitivity of such reagent.

¹⁰ Available from Cambrex Europe s.p.a., Verviers, Belgium; Charles River, www.criver.com; or all the major LAL manufacturers.

relevant dosage form monograph(s) in which Chitosan is used can be met.

• **MICROBIAL ENUMERATION TESTS** (61) and **TESTS FOR SPECIFIED MICROORGANISMS** (62)

Sample: Prepare a solution (1 in 50).

Acceptance criteria: The total aerobic microbial count does not exceed 10^3 cfu/g, and the total combined molds and yeasts count does not exceed 10^2 cfu/g. It meets the requirements of the tests for absence of *Pseudomonas aeruginosa* and *Staphylococcus aureus*.

• **APPARENT AVERAGE MOLECULAR WEIGHT AND MOLECULAR WEIGHT DISTRIBUTION**

[NOTE—This test is applicable to Chitosan of an average molecular weight of NMT 1,000,000 Da. In the following test an apparent average molecular weight is determined.]

Mobile phase: Transfer 12.75 g of sodium nitrate to a 1000-mL volumetric flask containing 800 mL of water, add a suitable amount of formic acid, dilute with water to volume, mix well, and make a concentration of formic acid of 0.5 M. The *Mobile phase* contains 0.15 M sodium nitrate in 0.5 M aqueous formic acid.

System suitability solution: 1.0 mg/mL of ethylene glycol in *Mobile phase*

Standard solutions: Prepare several sets of mixtures, containing ten polyethylene glycol (PEG) standards of different known molecular weight, which are used to cover the molecular weight range from about 200 to 1,100,000 g/mol.¹¹ [NOTE—These standards could be mixtures of polyethylene glycols and polyethylene oxides.] Prepare each set of PEG molecular weight standards to have a known concentration of about 1.0 mg/mL for each standard in *Mobile phase*. Allow the *Standard solutions* to stand at room temperature for at least 8 h. Do not filter before use.

Sample solution: Prepare a solution containing 1.0 mg/mL of Chitosan in *Mobile phase*. Cap, and mix well. Allow the solution to stand at room temperature for at least 12 h. Pass the chitosan solution through a membrane filter of 0.45- μ m pore size, discard an appropriate volume of the initial filtrate, and use the rest of the filtered solution for analysis.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: Refractive index

Detector temperature: 35°
